### 46.10.25 USART Receiver Timeout Register

**Name:** FLEX\_US\_RTOR  
**Offset:** 0x224  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |          |     |     |     |     |     |     |           |
|--------|----------|-----|-----|-----|-----|-----|-----|-----------|

| Reset  | 0                 | 1   | 1   | 1   | 0   | 1   | 0   | 0   |

#### Bits 15:0 – FI\_DI\_RATIO[15:0] FI Over DI Ratio Value

| Value   | Description   |
|---------|---|
| 0       | If ISO7816 mode is selected, the baud rate generator generates no signal.                       |
| 1-2     | Do not use.   |
| 3-65535 | If ISO7816 mode is selected, the baud rate is the clock provided on SCK divided by FI_DI_RATIO. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.28 USART Number of Errors Register

**Name:** FLEX\_US\_NER  
**Offset:** 0x244  
**Reset:** –  
**Property:** Read-only

This register is relevant only if USART\_MODE = 0x4 or 0x6 in the [USART Mode Register](#).

**Bits 7:0 – NB\_ERRORS[7:0]** Number of Errors

Total number of errors that occurred during an ISO7816 transfer. This register automatically clears when read.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.29 USART IrDA FILTER Register

**Name:** FLEX\_US\_IF  
**Offset:** 0x24C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x8 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

**Bits 7:0 – IRDA\_FILTER[7:0] IrDA Filter**

The IRDA\_FILTER value must be defined to meet the following criteria:

$$t_{\text{peripheral clock}} \times (\text{IRDA\_FILTER} + 3) < 1.41 \mu\text{s}$$

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.30 USART Manchester Configuration Register

**Name:** FLEX\_US\_MAN  
**Offset:** 0x250  
**Reset:** 0xB0011004  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

| Bit    | 7       | 6     | 5   | 4       | 3   | 2          | 1          | 0   |
|        |         |       |     |         |     | TX_PL[3:0] |            |     |
| Access |         |       |     |         | R/W | R/W        | R/W        | R/W |
| Reset  |         |       |     |         | 0   | 1          | 0          | 0   |

#### Bit 31 – RXIDLEV Receiver Idle Value

| Value | Description                    |
|-------|--------------------------------|
| 0     | Receiver line idle value is 0. |
| 1     | Receiver line idle value is 1. |

#### Bit 30 – DRIFT Drift Compensation

| Value | Description   |
|-------|---|
| 0     | The USART cannot recover from an important clock drift.                     |
| 1     | The USART can recover from clock drift. The 16X Clock mode must be enabled. |

#### Bit 29 – ONE Must Be Set to 1

Bit 29 must always be set to 1 when programming the FLEX\_US\_MAN register.

#### Bit 28 – RX\_MPOL Receiver Manchester Polarity

| Value | Description  |
|-------|--|
| 0     | Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description  |
|-------|--|
| 1     | Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition. |

**Bits 25:24 – RX\_PP[1:0]** Receiver Preamble Pattern detected  
The following values assume that RX\_MPOL field is not set:

| Value | Name     | Description                        |
|-------|----------|------------------------------------|
| 0     | ALL_ONE  | The preamble is composed of '1's.  |
| 1     | ALL_ZERO | The preamble is composed of '0's.  |
| 2     | ZERO_ONE | The preamble is composed of '01's. |
| 3     | ONE_ZERO | The preamble is composed of '10's. |

**Bits 19:16 – RX\_PL[3:0]** Receiver Preamble Length

| Value | Description  |
|-------|--|
| 0     | The receiver preamble pattern detection is disabled. |
| 1-15  | The detected preamble length is RX_PL × Bit Period.  |

**Bit 12 – TX\_MPOL** Transmitter Manchester Polarity

| Value | Description  |
|-------|--|
| 0     | Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition. |
| 1     | Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition. |

**Bits 9:8 – TX\_PP[1:0]** Transmitter Preamble Pattern  
The following values assume that TX\_MPOL field is not set:

| Value | Name     | Description                        |
|-------|----------|------------------------------------|
| 0     | ALL_ONE  | The preamble is composed of '1's.  |
| 1     | ALL_ZERO | The preamble is composed of '0's.  |
| 2     | ZERO_ONE | The preamble is composed of '01's. |
| 3     | ONE_ZERO | The preamble is composed of '10's. |

**Bits 3:0 – TX\_PL[3:0]** Transmitter Preamble Length

| Value | Description  |
|-------|--|
| 0     | The transmitter preamble pattern generation is disabled. |
| 1-15  | The preamble length is TX_PL × Bit Period.               |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.31 USART LIN Mode Register

**Name:** FLEX\_US\_LINMR  
**Offset:** 0x254  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

|        |          |       |     |        |        |        |           |      |
|--------|----------|-------|-----|--------|--------|--------|-----------|------|
| Bit    | 31       | 30    | 29  | 28     | 27     | 26     | 25        | 24   |
|        |          |       |     |        |        |        |           |      |
| Access |          |       |     |        |        |        |           |      |
| Reset  |          |       |     |        |        |        |           |      |
|        |          |       |     |        |        |        |           |      |
| Bit    | 23       | 22    | 21  | 20     | 19     | 18     | 17        | 16   |

| Access |          |       |     |        |        |        | R/W       | R/W  |
| Reset  |          |       |     |        |        |        | 0         | 0    |
|        |          |       |     |        |        |        |           |      |
| Bit    | 15       | 14    | 13  | 12     | 11     | 10     | 9         | 8    |
|        | DLC[7:0] |       |     |        |        |        |           |      |
| Access | R/W      | R/W   | R/W | R/W    | R/W    | R/W    | R/W       | R/W  |
| Reset  | 0        | 0     | 0   | 0      | 0      | 0      | 0         | 0    |
|        |          |       |     |        |        |        |           |      |
| Bit    | 7        | 6     | 5   | 4      | 3      | 2      | 1         | 0    |
|        | WКУPTYP  | FSDIS | DLM | CHKTYP | CHKDIS | PARDIS | NACT[1:0] |      |
| Access | R/W      | R/W   | R/W | R/W    | R/W    | R/W    | R/W       | R/W  |
| Reset  | 0        | 0     | 0   | 0      | 0      | 0      | 0         | 0    |

#### Bit 17 – SYNCDIS Synchronization Disable

| Value | Description   |
|-------|---|
| 0     | The synchronization procedure is performed in LIN slave node configuration.     |
| 1     | The synchronization procedure is not performed in LIN slave node configuration. |

#### Bit 16 – PDCM DMAC Mode

| Value | Description   |
|-------|---|
| 0     | The LIN mode register FLEX_US_LINMR is not written by the DMAC.                   |
| 1     | The LIN mode register FLEX_US_LINMR (excepting that flag) is written by the DMAC. |

#### Bits 15:8 – DLC[7:0] Data Length Control

| Value | Description   |
|-------|---|
| 0–255 | Defines the response data length if DLM = 0, in that case the response data length is equal to DLC+1 bytes. |

#### Bit 7 – WKUPTYP Wake-up Signal Type

| Value | Description   |
|-------|---|
| 0     | Setting the LINWKUP bit in the control register sends a LIN 2.0 wake-up signal. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description   |
|-------|---|
| 1     | Setting the LINWKUP bit in the control register sends a LIN 1.3 wake-up signal. |

### Bit 6 – FSDIS Frame Slot Mode Disable

| Value | Description                      |
|-------|----------------------------------|
| 0     | The Frame Slot mode is enabled.  |
| 1     | The Frame Slot mode is disabled. |

### Bit 5 – DLM Data Length Mode

| Value | Description  |
|-------|--|
| 0     | The response data length is defined by the DLC field of this register.                           |
| 1     | The response data length is defined by the bits 5 and 6 of the identifier (FLEX_US_LINIR.IDCHR). |

### Bit 4 – CHKTYP Checksum Type

| Value | Description                 |
|-------|-----------------------------|
| 0     | LIN 2.0 “enhanced” checksum |
| 1     | LIN 1.3 “classic” checksum  |

### Bit 3 – CHKDIS Checksum Disable

| Value | Description  |
|-------|--|
| 0     | In master node configuration, the checksum is computed and sent automatically. In slave node configuration, the checksum is checked automatically. |
| 1     | Whatever the node configuration is, the checksum is not computed/sent and it is not checked.   |

### Bit 2 – PARDIS Parity Disable

| Value | Description   |
|-------|---|
| 0     | In master node configuration, the identifier parity is computed and sent automatically. In master node and slave node configuration, the parity is checked automatically. |
| 1     | Whatever the node configuration is, the Identifier parity is not computed/sent and it is not checked.   |

### Bits 1:0 – NACT[1:0] LIN Node Action

Values which are not listed in the table must be considered as “reserved”.

| Value | Name      | Description  |
|-------|-----------|--|
| 0     | PUBLISH   | The USART transmits the response.                              |
| 1     | SUBSCRIBE | The USART receives the response.                               |
| 2     | IGNORE    | The USART does not transmit and does not receive the response. |

### 46.10.32 USART LIN Identifier Register

**Name:** FLEX\_US\_LINIR  
**Offset:** 0x258  
**Reset:** 0x00000000  
**Property:** Read/Write

Write is possible only in LIN master node configuration.

This register is relevant only if USART\_MODE = 0xA or 0xB in [USART Mode Register](#).

**Bits 7:0 – IDCHR[7:0] Identifier Character**

If USART\_MODE = 0xA (master node configuration):

- IDCHR is Read/Write and its value is the identifier character to be transmitted.

If USART\_MODE = 0xB (slave node configuration):

- IDCHR is Read-only and its value is the last identifier character that has been received.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.33 USART LIN Baud Rate Register

**Name:** FLEX\_US\_LINBRR  
**Offset:** 0x25C  
**Reset:** 0x00000000  
**Property:** Read-only

This register is relevant only if USART\_MODE = 0xA or 0xB in [USART Mode Register](#).

Returns the baud rate value after the synchronization process completion.

|        |             |    |    |    |    |            |    |    |

| Reset  |     | 0         | 0      | 0   | 0       | 0   | 0   | 0   | 0         |
|        |     |           |        |     |         |     |     |     |           |
|        | Bit | 15        | 14     | 13  | 12      | 11  | 10  | 9   | 8         |
|        |     |           | CMPPAR |     | CMPMODE |     |     |     | VAL1[8:8] |
| Access |     |           | R/W    |     | R/W     |     |     |     | R/W       |
| Reset  |     |           | 0      |     | 0       |     |     |     | 0         |
|        |     |           |        |     |         |     |     |     |           |
|        | Bit | 7         | 6      | 5   | 4       | 3   | 2   | 1   | 0         |
|        |     | VAL1[7:0] |        |     |         |     |     |     |           |
| Access |     | R/W       | R/W    | R/W | R/W     | R/W | R/W | R/W | R/W       |
| Reset  |     | 0         | 0      | 0   | 0       | 0   | 0   | 0   | 0         |

**Bits 24:16 – VAL2[8:0]** Second Comparison Value for Received Character

| Value | Description   |
|-------|---|
| 0–511 | The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_US_CSR.CMP flag. |

**Bit 14 – CMPPAR** Compare Parity

| Value | Description   |
|-------|---|
| 0     | The parity is not checked and a bad parity cannot prevent from waking up the system.  |
| 1     | The parity is checked and a matching condition on data can be cancelled by an error on parity bit, so no wakeup is performed. |

**Bit 12 – CMPMODE** Comparison Mode

| Value | Name            | Description  |
|-------|-----------------|--|
| 0     | FLAG_ONLY       | Any character is received and comparison function drives CMP flag. |
| 1     | START_CONDITION | Comparison condition must be met to start reception.               |
| 2     | FILTER          | Comparison must be met to receive the current data only            |

**Bits 8:0 – VAL1[8:0]** First Comparison Value for Received Character

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

| Value | Description   |
|-------|---|
| 0-511 | The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_US_CSR.CMP flag. |

# SAMA5D2 Series

| Access |       |    | R/W            | R/W | R/W | R/W | R/W         | R/W |
| Reset  |       |    | 0              | 0   | 0   | 0   | 0           | 0   |
|        |       |    |                |     |     |     |             |     |
| Bit    | 15    | 14 | 13             | 12  | 11  | 10  | 9           | 8   |
|        |       |    | TXFTHRES[5:0]  |     |     |     |             |     |
| Access |       |    | R/W            | R/W | R/W | R/W | R/W         | R/W |
| Reset  |       |    | 0              | 0   | 0   | 0   | 0           | 0   |
|        |       |    |                |     |     |     |             |     |
| Bit    | 7     | 6  | 5              | 4   | 3   | 2   | 1           | 0   |
|        | FRTSC |    | RXRDYM[1:0]    |     |     |     | TXRDYM[1:0] |     |
| Access | R/W   |    | R/W            | R/W |     |     | R/W         | R/W |
| Reset  | 0     |    | 0              | 0   |     |     | 0           | 0   |

#### Bits 29:24 – RXFTHRES2[5:0] Receive FIFO Threshold 2

| Value | Description  |
|-------|--|
| 0–32  | Defines the Receive FIFO threshold 2 value (number of data). The FLEX_US_FESR.RXFTHF2 flag will be set when Receive FIFO goes from “above” threshold state to “equal to or below” threshold state. |

#### Bits 21:16 – RXFTHRES[5:0] Receive FIFO Threshold

| Value | Description   |
|-------|---|
| 0–32  | Defines the Receive FIFO threshold value (number of data). The FLEX_US_FESR.RXFTHF flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

#### Bits 13:8 – TXFTHRES[5:0] Transmit FIFO Threshold

| Value | Description   |
|-------|---|
| 0–32  | Defines the Transmit FIFO threshold value (number of data). The FLEX_US_FESR.TXFTHF flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Bit 7 – FRTSC** FIFO RTS Pin Control enable (Hardware Handshaking mode only)

See [Hardware Handshaking](#) for details.

| Value | Description   |
|-------|---|
| 0     | RTS pin is not controlled by Receive FIFO thresholds. |
| 1     | RTS pin is controlled by Receive FIFO thresholds.     |

**Bits 5:4 – RXRDYM[1:0]** Receiver Ready Mode

If FIFOs are enabled, the FLEX\_US\_CSR.RXRDY flag behaves as follows.

| Value | Name      | Description  |
|-------|-----------|--|
| 0     | ONE_DATA  | RXRDY will be at level '1' when at least one unread data is in the Receive FIFO.   |
| 1     | TWO_DATA  | RXRDY will be at level '1' when at least two unread data are in the Receive FIFO.  |
| 2     | FOUR_DATA | RXRDY will be at level '1' when at least four unread data are in the Receive FIFO. |

**Bits 1:0 – TXRDYM[1:0]** Transmitter Ready Mode

If FIFOs are enabled, the FLEX\_US\_CSR.TXRDY flag behaves as follows.

| Value | Name      | Description  |
|-------|-----------|--|
| 0     | ONE_DATA  | TXRDY will be at level '1' when at least one data can be written in the Transmit FIFO  |
| 1     | TWO_DATA  | TXRDY will be at level '1' when at least two data can be written in the Transmit FIFO  |
| 2     | FOUR_DATA | TXRDY will be at level '1' when at least four data can be written in the Transmit FIFO |

| Reset  | 0       | 0       | 0      | 0     | 0     | 0      | 0       | 0       |

**Bit 9 – RXFTHF2** Receive FIFO Threshold Flag 2 (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description   |
|-------|---|
| 0     | Number of unread data in Receive FIFO is above RXFTHRES threshold.  |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES2 threshold since the last RSTSTA command was issued. |

**Bit 8 – TXFLOCK** Transmit FIFO Lock

| Value | Description                      |
|-------|----------------------------------|
| 0     | The Transmit FIFO is not locked. |
| 1     | The Transmit FIFO is locked.     |

**Bit 7 – RXFPTEF** Receive FIFO Pointer Error Flag

See [46.7.11.9 FIFO Pointer Error](#) for details.

| Value | Description  |
|-------|--|
| 0     | No Receive FIFO pointer occurred.                            |
| 1     | Receive FIFO pointer error occurred. Receiver must be reset. |

**Bit 6 – TXFPTEF** Transmit FIFO Pointer Error Flag

See [46.7.11.9 FIFO Pointer Error](#) for details.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description  |
|-------|--|
| 0     | No Transmit FIFO pointer occurred.                               |
| 1     | Transmit FIFO pointer error occurred. Transceiver must be reset. |

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description  |
|-------|--|
| 0     | Number of unread data in Receive FIFO is below RXFTHRES threshold.   |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last RSTSTA command was issued. |

**Bit 4 – RXFFF** Receive FIFO Full Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description  |
|-------|--|
| 0     | Receive FIFO is not empty.   |
| 1     | Receive FIFO has been filled since the last RSTSTA command was issued. |

**Bit 3 – RXFEF** Receive FIFO Empty Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description   |
|-------|---|
| 0     | Receive FIFO is not empty.  |
| 1     | Receive FIFO has been emptied since the last RSTSTA command was issued. |

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description  |
|-------|--|
| 0     | Number of data in Transmit FIFO is above TXFTHRES threshold.   |
| 1     | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last RSTSTA command was issued. |

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description   |
|-------|---|
| 0     | Transmit FIFO is not full.  |
| 1     | Transmit FIFO has been filled since the last RSTSTA command was issued. |

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description  |
|-------|--|
| 0     | Transmit FIFO is not empty.  |
| 1     | Transmit FIFO has been emptied since the last RSTSTA command was issued. |

| Value   | Name   | Description   |
|---------|--------|---|
| 0x55534 | PASSWD | Writing any other value in this field aborts the write operation of bit WPEN. |
| 1       |        | Always reads as 0.  |

#### Bit 0 – WPEN Write Protection Enable

See [USART Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description   |
|-------|---|
| 0     | Disables the write protection on configuration registers if WPKEY corresponds to 0x555341 (“USA” in ASCII). |
| 1     | Enables the write protection on configuration registers if WPKEY corresponds to 0x555341 (“USA” in ASCII).  |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.42 USART Write Protection Status Register

**Name:** FLEX\_US\_WPSR  
**Offset:** 0x2E8  
**Reset:** 0x00000000  
**Property:** Read-only

|        |                   |    |    |    |    |    |    |      |
|--------|-------------------|----|----|----|----|----|----|------|
| Bit    | 31                | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        | [Greyed out bits] |    |    |    |    |    |    |      |
| Access |                   |    |    |    |    |    |    |      |
| Reset  |                   |    |    |    |    |    |    |      |
| Bit    | 23                | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        | WPVSR[15:8]       |    |    |    |    |    |    |      |
| Access | R                 | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0                 | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 15                | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]        |    |    |    |    |    |    |      |
| Access | R                 | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0                 | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7                 | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        | [Greyed out bits] |    |    |    |    |    |    | WPVS |
| Access |                   |    |    |    |    |    |    | R    |
| Reset  |                   |    |    |    |    |    |    | 0    |

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description   |
|-------|---|
| 0     | No write protection violation has occurred since the last read of FLEX_US_WPSR.   |
| 1     | A write protection violation has occurred since the last read of FLEX_US_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

|        |         |        |    |        |    |    |        |          |
| Bit    | 7       | 6      | 5  | 4      | 3  | 2  | 1      | 0        |
|        | SWRST   |        |    |        |    |    | SPIDIS | SPIEN    |
| Access | W       |        |    |        |    |    | W      | W        |
| Reset  | –       |        |    |        |    |    | –      | –        |

#### Bit 31 – FIFODIS FIFO Disable

| Value | Description                             |
|-------|---|
| 0     | No effect.                              |
| 1     | Disables the Transmit and Receive FIFOs |

#### Bit 30 – FIFOEN FIFO Enable

| Value | Description                            |
|-------|--|
| 0     | No effect.                             |
| 1     | Enables the Transmit and Receive FIFOs |

#### Bit 24 – LASTXFER Last Transfer

See [Peripheral Selection](#) for more details.

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | The current NPCS will be de-asserted after the character written in TD has been transferred. When CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 17 – RXFCLR Receive FIFO Clear

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Empties the Receive FIFO. |

### Bit 16 – TXFCLR Transmit FIFO Clear

| Value | Description                |
|-------|----------------------------|
| 0     | No effect.                 |
| 1     | Empties the Transmit FIFO. |

### Bit 12 – REQCLR Request to Clear the Comparison Trigger

SleepWalking enabled:

0: No effect.

1: Clears the potential clock request currently issued by SPI, thus the potential system wakeup is cancelled.

SleepWalking disabled:

0: No effect.

1: Restarts the comparison trigger to enable FLEX\_SPI\_RDR loading.

### Bit 7 – SWRST SPI Software Reset

The SPI is in Slave mode after software reset.

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Resets the SPI. A software-triggered hardware reset of the SPI interface is performed. |

### Bit 1 – SPIDIS SPI Disable

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if the FLEX\_US\_THR is loaded.

All pins are set in Input mode after completion of the transmission in progress, if any.

| Value | Description       |
|-------|-------------------|
| 0     | No effect.        |
| 1     | Disables the SPI. |

### Bit 0 – SPIEN SPI Enable

| Value | Description                                   |
|-------|---|
| 0     | No effect.                                    |
| 1     | Enables the SPI to transfer and receive data. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.44 SPI Mode Register

**Name:** FLEX\_SPI\_MR  
**Offset:** 0x404  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

|        |             |     |       |         |          |        |          |      |
|--------|-------------|-----|-------|---------|----------|--------|----------|------|
| Bit    | 31          | 30  | 29    | 28      | 27       | 26     | 25       | 24   |
|        | DLYBCS[7:0] |     |       |         |          |        |          |      |
| Access | R/W         | R/W | R/W   | R/W     | R/W      | R/W    | R/W      | R/W  |
| Reset  | 0           | 0   | 0     | 0       | 0        | 0      | 0        | 0    |
|        |             |     |       |         |          |        |          |      |
| Bit    | 23          | 22  | 21    | 20      | 19       | 18     | 17       | 16   |
|        |             |     |       |         |          |        | PCS[1:0] |      |
| Access |             |     |       |         |          |        | R/W      | R/W  |
| Reset  |             |     |       |         |          |        | 0        | 0    |
|        |             |     |       |         |          |        |          |      |
| Bit    | 15          | 14  | 13    | 12      | 11       | 10     | 9        | 8    |
|        |             |     |       | CMPMODE |          |        |          |      |
| Access |             |     |       | R/W     |          |        |          |      |
| Reset  |             |     |       | 0       |          |        |          |      |
|        |             |     |       |         |          |        |          |      |
| Bit    | 7           | 6   | 5     | 4       | 3        | 2      | 1        | 0    |
|        | LLB         |     | WDRBT | MODFDIS | BRSRCCLK | PCSDEC | PS       | MSTR |
| Access | R/W         |     | R/W   | R/W     | R/W      | R/W    | R/W      | R/W  |
| Reset  | 0           |     | 0     | 0       | 0        | 0      | 0        | 0    |

**Bits 31:24 – DLYBCS[7:0]** Delay Between Chip Selects

This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time guarantees nonoverlapping chip selects and solves bus contentions in case of peripherals having long data float times.

If DLYBCS is  $\leq 6$ , six peripheral clock periods are inserted by default.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $DLYBCS = \text{Delay Between Chip Selects} \times f_{\text{peripheral clock}}$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $DLYBCS = \text{Delay Between Chip Selects} \times f_{GCLK}$

**Bits 17:16 – PCS[1:0]** Peripheral Chip Select

This field is only used if fixed peripheral select is active (PS = 0).

If PCSDEC = 0:

PCS = x0 NPCS[1:0] = 10

PCS = 01 NPCS[1:0] = 01

PCS = 11 forbidden (no peripheral is selected)

(x = don't care)

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

If PCSDEC = 1:

NPCS[1:0] output signals = PCS

### Bit 12 – CMPMODE Comparison Mode

| Value | Name            | Description   |
|-------|-----------------|---|
| 0     | FLAG_ONLY       | Any character is received and comparison function drives CMP flag.                                  |
| 1     | START_CONDITION | Comparison condition must be met to start reception of all incoming characters until REQCLR is set. |

### Bit 7 – LLB Local Loopback Enable

LLB controls the local loopback on the data shift register for testing in Master mode only (MISO is internally connected on MOSI).

| Value | Description                   |
|-------|-------------------------------|
| 0     | Local loopback path disabled. |
| 1     | Local loopback path enabled.  |

### Bit 5 – WDRBT Wait Data Read Before Transfer

| Value | Description  |
|-------|--|
| 0     | No Effect. In Master mode, a transfer can be initiated regardless of the FLEX_SPI_RDR state.   |
| 1     | In Master mode, a transfer can start only if FLEX_SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception. |

### Bit 4 – MODFDIS Mode Fault Detection

| Value | Description                       |
|-------|-----------------------------------|
| 0     | Mode fault detection is enabled.  |
| 1     | Mode fault detection is disabled. |

### Bit 3 – BR SRCCLK Bit Rate Source Clock

If the bit BR SRCCLK = 1, the FLEX\_US\_CSRx.SCBR field must be programmed with a value greater than 1.

| Value | Name       | Description  |
|-------|------------|--|
| 0     | PERIPH_CLK | The peripheral clock is the source clock for the bit rate generation.  |
| 1     | GCLK       | GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock. |

### Bit 2 – PCSDEC Chip Select Decode

When PCSDEC equals one, up to 3 Chip Select signals can be generated with the two NPCS lines using an external 2- to 4-bit decoder. The Chip Select registers define the characteristics of the 3 chip selects, with the following rules:

FLEX\_SPI\_CSR0 defines peripheral chip select signals 0 to 1.

FLEX\_SPI\_CSR1 defines peripheral chip select signal 2.

| Value | Description   |
|-------|---|
| 0     | The chip selects are directly connected to a peripheral device. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

| Value | Description  |
|-------|--|
| 1     | The two NPCS chip select lines are connected to a 2- to 4-bit decoder. |

### Bit 1 – PS Peripheral Select

| Value | Description                |
|-------|----------------------------|
| 0     | Fixed Peripheral Select    |
| 1     | Variable Peripheral Select |

### Bit 0 – MSTR Master/Slave Mode

| Value | Description            |
|-------|------------------------|
| 0     | SPI is in Slave mode.  |
| 1     | SPI is in Master mode. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.45 SPI Receive Data Register

**Name:** FLEX\_SPI\_RDR  
**Offset:** 0x408  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.RXRDYM = 0, see [SPI Single Data Mode](#) for details.

|        |          |    |    |    |    |    |          |    |
|--------|----------|----|----|----|----|----|----------|----|
| Bit    | 31       | 30 | 29 | 28 | 27 | 26 | 25       | 24 |
|        |          |    |    |    |    |    |          |    |
| Access |          |    |    |    |    |    |          |    |
| Reset  |          |    |    |    |    |    |          |    |
|        |          |    |    |    |    |    |          |    |
| Bit    | 23       | 22 | 21 | 20 | 19 | 18 | 17       | 16 |
|        |          |    |    |    |    |    | PCS[3:0] |    |
| Access |          |    |    |    | R  | R  | R        | R  |
| Reset  |          |    |    |    | 0  | 0  | 0        | 0  |
|        |          |    |    |    |    |    |          |    |
| Bit    | 15       | 14 | 13 | 12 | 11 | 10 | 9        | 8  |
|        | RD[15:8] |    |    |    |    |    |          |    |
| Access | R        | R  | R  | R  | R  | R  | R        | R  |
| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0        | 0  |
|        |          |    |    |    |    |    |          |    |
| Bit    | 7        | 6  | 5  | 4  | 3  | 2  | 1        | 0  |
|        | RD[7:0]  |    |    |    |    |    |          |    |
| Access | R        | R  | R  | R  | R  | R  | R        | R  |
| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0        | 0  |

**Bits 19:16 – PCS[3:0]** Peripheral Chip Select

In Master mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.

**Note:** When using Variable Peripheral Select mode (FLEX\_SPI\_MR.PS = 1), it is mandatory to set the FLEX\_SPI\_MR.WDRBT bit to 1 if the PCS field must be processed in FLEX\_SPI\_RDR.

**Bits 15:0 – RD[15:0]** Receive Data

Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.46 SPI Receive Data Register (FIFO Multiple Data, 8-bit)

**Name:** FLEX\_SPI\_RDR (FIFO\_MULTI\_DATA\_8)  
**Offset:** 0x408  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.RXRDYM > 0, see [SPI Multiple Data Mode](#) for details.

|        |          |    |    |    |    |    |    |    |

#### Bit 24 – LASTXFER Last Transfer

This field is only used if variable peripheral select is active (FLEX\_SPI\_MR.PS = 1).

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | The current NPCS is de-asserted after the transfer of the character written in TD. When FLEX_SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

This field is only used if variable peripheral select is active (FLEX\_SPI\_MR.PS = 1).

If FLEX\_SPI\_MR.PCSDEC = 0:

PCS = x0 NPCS[1:0] = 10

PCS = 01 NPCS[1:0] = 01

PCS = 11 forbidden (no peripheral is selected)

(x = don't care)

If FLEX\_SPI\_MR.PCSDEC = 1:

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

NPCS[1:0] output signals = PCS

**Bits 15:0 – TD[15:0]** Transmit Data

Data to be transmitted by the SPI Interface is stored in this register. Information to be transmitted must be written to the transmit data register in a right-justified format.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.49 SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit)

**Name:** FLEX\_SPI\_TDR (FIFO\_MULTI\_DATA)  
**Offset:** 0x40C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.TXRDYM > 0, see Section 1.8.7.7 “SPI Multiple Data Mode” for details.

|        |         |         |        |       |       |        |         |        |
| Bit    | 7       | 6       | 5      | 4     | 3     | 2      | 1       | 0      |
|        |         |         |        |       | OVRES | MODF   | TDRE    | RDRF   |
| Access |         |         |        |       | R     | R      | R       | R      |
| Reset  |         |         |        |       | 0     | 0      | 0       | 0      |

**Bit 31 – RXFPTEF** Receive FIFO Pointer Error Flag  
 See [46.8.7.8 FIFO Pointer Error](#) for details.

| Value | Description   |
|-------|---|
| 0     | No Receive FIFO pointer occurred                            |
| 1     | Receive FIFO pointer error occurred. Receiver must be reset |

**Bit 30 – TXFPTEF** Transmit FIFO Pointer Error Flag  
 See [46.8.7.8 FIFO Pointer Error](#) for details.

| Value | Description   |
|-------|---|
| 0     | No Transmit FIFO pointer occurred                               |
| 1     | Transmit FIFO pointer error occurred. Transceiver must be reset |

**Bit 29 – RXFTHF** Receive FIFO Threshold Flag

| Value | Description   |
|-------|---|
| 0     | Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared.   |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES threshold (changing states from “below threshold” to “equal to or above threshold”). |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 28 – RXFFF Receive FIFO Full Flag

| Value | Description   |
|-------|---|
| 0     | Receive FIFO is not empty or RXFE flag has been cleared.                  |
| 1     | Receive FIFO has been filled (changing states from “not full” to “full”). |

### Bit 27 – RXFEF Receive FIFO Empty Flag

| Value | Description  |
|-------|--|
| 0     | Receive FIFO is not empty or RXFE flag has been cleared.                     |
| 1     | Receive FIFO has been emptied (changing states from “not empty” to “empty”). |

### Bit 26 – TXFTHF Transmit FIFO Threshold Flag (cleared on read)

| Value | Description  |
|-------|--|
| 0     | Number of data in Transmit FIFO is above TXFTHRES threshold.                                       |
| 1     | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_SPI_SR. |

### Bit 25 – TXFFF Transmit FIFO Full Flag (cleared on read)

| Value | Description   |
|-------|---|
| 0     | Transmit FIFO is not full or TXFF flag has been cleared.          |
| 1     | Transmit FIFO has been filled since the last read of FLEX_SPI_SR. |

### Bit 24 – TXFEF Transmit FIFO Empty Flag (cleared on read)

| Value | Description  |
|-------|--|
| 0     | Transmit FIFO is not empty.  |
| 1     | Transmit FIFO has been emptied since the last read of FLEX_SPI_SR. |

### Bit 16 – SPIENS SPI Enable Status

| Value | Description      |
|-------|------------------|
| 0     | SPI is disabled. |
| 1     | SPI is enabled.  |

### Bit 11 – CMP Comparison Status (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in FLEX_SPI_CMPR since the last read of FLEX_SPI_SR. |
| 1     | A received character matched the comparison criteria since the last read of FLEX_SPI_SR.  |

### Bit 10 – UNDES Underrun Error Status (Slave mode only) (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No underrun has been detected since the last read of FLEX_SPI_SR.                                    |
| 1     | A transfer starts whereas no data has been loaded in FLEX_SPI_TDR, cleared when FLEX_SPI_SR is read. |

### Bit 9 – TXEMPTY Transmission Registers Empty (cleared by writing FLEX\_SPI\_TDR)

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description   |
|-------|---|
| 0     | As soon as data is written in FLEX_SPI_TDR.   |
| 1     | FLEX_SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay. |

**Bit 8 – NSSR** NSS Rising (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No rising edge detected on NSS pin since the last read of FLEX_SPI_SR. |
| 1     | A rising edge occurred on NSS pin since the last read of FLEX_SPI_SR.  |

**Bit 3 – OVRES** Overrun Error Status (cleared on read)

An overrun occurs when FLEX\_SPI\_RDR is loaded at least twice from the shift register since the last read of FLEX\_SPI\_RDR.

| Value | Description  |
|-------|--|
| 0     | No overrun has been detected since the last read of FLEX_SPI_SR. |
| 1     | An overrun has occurred since the last read of FLEX_SPI_SR.      |

**Bit 2 – MODF** Mode Fault Error (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No mode fault has been detected since the last read of FLEX_SPI_SR. |
| 1     | A mode fault occurred since the last read of FLEX_SPI_SR.           |

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing FLEX\_SPI\_TDR)

When FIFOs are disabled:

0: Data has been written to FLEX\_SPI\_TDR and not yet transferred to the internal shift register.

1: The last data written to FLEX\_SPI\_TDR has been transferred to the internal shift register.

TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.

When FIFOs are enabled:

0: Transmit FIFO cannot accept more data.

1: Transmit FIFO can accept data; one or more data can be written according to TXRDYM field configuration.

TDRE behavior with FIFOs enabled is illustrated in [46.8.7.5 TXEMPTY, TDRE and RDRF Behavior](#).

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading FLEX\_SPI\_RDR)

When FIFOs are disabled:

0: No data has been received since the last read of FLEX\_SPI\_RDR.

1: Data has been received and the received data has been transferred from the internal shift register to FLEX\_SPI\_RDR since the last read of FLEX\_SPI\_RDR.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RDRF behavior with FIFOs enabled is illustrated in [46.8.7.5 TXEMPTY, TDRE and RDRF Behavior](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.51 SPI Interrupt Enable Register

**Name:** FLEX\_SPI\_IER  
**Offset:** 0x414  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [SPI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |     |         |         |        |       |       |        |         |       |
|--------|-----|---------|---------|--------|-------|-------|--------|---------|-------|
|        | Bit | 31      | 30      | 29     | 28    | 27    | 26     | 25      | 24    |

### 46.10.52 SPI Interrupt Disable Register

**Name:** FLEX\_SPI\_IDR  
**Offset:** 0x418  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [SPI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |     |         |         |        |       |       |        |         |       |

### 46.10.54 SPI Chip Select Register

**Name:** FLEX\_SPI\_CSRx  
**Offset:** 0x0430 + x\*0x04 [x=0..1]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

FLEX\_SPI\_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

|        |             |     |     |       |        |       |      |     |

#### Bits 31:24 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}} / 32$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{GLK}} / 32$

#### Bits 23:16 – DLYBS[7:0] Delay Before SPCK

This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.

When DLYBS = 0, the delay is half the SPCK clock period.

Otherwise, the following equations determine the delay:

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $DLYBS = \text{Delay Before SPCK} \times f_{\text{peripheral clock}}$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $DLYBS = \text{Delay Before SPCK} \times f_{GCLK}$

### Bits 15:8 – SCBR[7:0] Serial Clock Bit Rate

In Master mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by the bit BRSRCCLK. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $SCBR = f_{\text{peripheral clock}} / \text{SPCK Bit Rate}$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $SCBR = f_{GCLK} / \text{SPCK Bit Rate}$

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

If BRSRCCLK = 1 in FLEX\_SPI\_MR, SCBR must be programmed with a value greater than 1.

At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.

**Note:** If one of the FLEX\_SPI\_CSRx.SCBR fields is set to 1, the other FLEX\_SPI\_CSRx.SCBR fields must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

### Bits 7:4 – BITS[3:0] Bits Per Transfer

See [Note](#).

The BITS field determines the number of data bits transferred. Reserved values should not be used.

| Value | Name     | Description          |
|-------|----------|----------------------|
| 0     | 8_BIT    | 8 bits for transfer  |
| 1     | 9_BIT    | 9 bits for transfer  |
| 2     | 10_BIT   | 10 bits for transfer |
| 3     | 11_BIT   | 11 bits for transfer |
| 4     | 12_BIT   | 12 bits for transfer |
| 5     | 13_BIT   | 13 bits for transfer |
| 6     | 14_BIT   | 14 bits for transfer |
| 7     | 15_BIT   | 15 bits for transfer |
| 8     | 16_BIT   | 16 bits for transfer |
| 9–15  | Reserved |                      |

### Bit 3 – CSAAT Chip Select Active After Transfer

| Value | Description   |
|-------|---|
| 0     | The Peripheral Chip Select Line rises as soon as the last transfer is achieved.   |
| 1     | The Peripheral Chip Select does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select. |

### Bit 2 – CSNAAT Chip Select Not Active After Transfer (Ignored if CSAAT = 1)

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $\frac{DLYBCS}{f_{\text{peripheral clock}}}$  (if DLYBCS ≠ 0)

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $\frac{DLYBCS}{f_{GCLK}}$

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

If DLYBCS < 6, a minimum of six periods is introduced.

| Value | Description   |
|-------|---|
| 0     | The Peripheral Chip Select does not rise between two transfers if the FLEX_SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same Chip Select. |
| 1     | The Peripheral Chip Select rises systematically after each transfer performed on the same slave. It remains inactive after the end of transfer for a minimal duration of:                   |

### Bit 1 – NCPHA Clock Phase

NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

| Value | Description  |
|-------|--|
| 0     | Data are changed on the leading edge of SPCK and captured on the following edge of SPCK. |
| 1     | Data are captured on the leading edge of SPCK and changed on the following edge of SPCK. |

### Bit 0 – CPOL Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between master and slave devices.

| Value | Description   |
|-------|---|
| 0     | The inactive state value of SPCK is logic level zero. |
| 1     | The inactive state value of SPCK is logic level one.  |

| Reset  |    |    | 0             | 0   | 0   | 0   | 0   | 0           |  |
| Bit    | 15 | 14 | 13            | 12  | 11  | 10  | 9   | 8           |  |
|        |    |    |               |     |     |     |     |             |  |
| Access |    |    |               |     |     |     |     |             |  |
| Reset  |    |    |               |     |     |     |     |             |  |
| Bit    | 7  | 6  | 5             | 4   | 3   | 2   | 1   | 0           |  |
|        |    |    | RXRDYM[1:0]   |     |     |     |     | TXRDYM[1:0] |  |
| Access |    |    | R/W           | R/W |     |     | R/W | R/W         |  |
| Reset  |    |    | 0             | 0   |     |     | 0   | 0           |  |

#### Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

| Value | Description   |
|-------|---|
| 0–32  | Defines the Receive FIFO threshold value (number of data). The FLEX_SPI_SR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

#### Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

| Value | Description   |
|-------|---|
| 0–32  | Defines the Transmit FIFO threshold value (number of data). The FLEX_SPI_SR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

#### Bits 5:4 – RXRDYM[1:0] Receive Data Register Full Mode

If FIFOs are enabled, the FLEX\_SPI\_SR.RDRF flag behaves as follows.

| Value | Name     | Description   |
|-------|----------|---|
| 0     | ONE_DATA | RDRF will be at level ‘1’ when at least one unread data is in the Receive FIFO. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Name      | Description  |
|-------|-----------|--|
| 1     | TWO_DATA  | RDRF will be at level '1' when at least two unread data are in the Receive FIFO.<br><br>Cannot be used when FLEX_SPI_MR.MSTR =1, or if FLEX_SPI_MR.PS =1.  |
| 2     | FOUR_DATA | RDRF will be at level '1' when at least four unread data are in the Receive FIFO.<br><br>Cannot be used when FLEX_SPI_CSRx.BITS is greater than 0, or if FLEX_SPI_MR.MSTR =1, or if FLEX_SPI_MR.PS =1. |

**Bits 1:0 – TXRDYM[1:0]** Transmit Data Register Empty Mode  
If FIFOs are enabled, the FLEX\_SPI\_SR.TDRE flag behaves as follows.

| Value | Name     | Description   |
|-------|----------|---|
| 0     | ONE_DATA | TDRE will be at level '1' when at least one data can be written in the Transmit FIFO.   |
| 1     | TWO_DATA | TDRE will be at level '1' when at least two data can be written in the Transmit FIFO.<br><br>Cannot be used if FLEX_SPI_MR.PS =1. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.56 SPI FIFO Level Register

**Name:** FLEX\_SPI\_FLR  
**Offset:** 0x444  
**Reset:** 0x00000000  
**Property:** Read-only

|        |                   |    |           |    |    |    |    |    |                  |
|--------|-------------------|----|-----------|----|----|----|----|----|------------------|
| Bit    | 31                | 30 | 29        | 28 | 27 | 26 | 25 | 24 |                  |
|        | [Greyed out bits] |    |           |    |    |    |    |    |                  |
| Access |                   |    |           |    |    |    |    |    |                  |
| Reset  |                   |    |           |    |    |    |    |    |                  |
| Bit    | 23                | 22 | 21        | 20 | 19 | 18 | 17 | 16 |                  |
|        | [Greyed out bits] |    | RXFL[5:0] |    |    |    |    |    | [Greyed out bit] |
| Access |                   |    | R         | R  | R  | R  | R  | R  |                  |
| Reset  |                   |    | 0         | 0  | 0  | 0  | 0  | 0  |                  |
| Bit    | 15                | 14 | 13        | 12 | 11 | 10 | 9  | 8  |                  |
|        | [Greyed out bits] |    |           |    |    |    |    |    |                  |
| Access |                   |    |           |    |    |    |    |    |                  |
| Reset  |                   |    |           |    |    |    |    |    |                  |
| Bit    | 7                 | 6  | 5         | 4  | 3  | 2  | 1  | 0  |                  |
|        | [Greyed out bits] |    | TXFL[5:0] |    |    |    |    |    | [Greyed out bit] |
| Access |                   |    | R         | R  | R  | R  | R  | R  |                  |
| Reset  |                   |    | 0         | 0  | 0  | 0  | 0  | 0  |                  |

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

| Value | Description  |
|-------|--|
| 0     | There is no unread data in the Receive FIFO.             |
| 1–32  | Indicates the number of unread data in the Receive FIFO. |

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

| Value | Description  |
|-------|--|
| 0     | There is no data in the Transmit FIFO.             |
| 1–32  | Indicates the number of data in the Transmit FIFO. |

| Access |     | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |     | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 31:16 – VAL2[15:0] Second Comparison Value for Received Character

| Value   | Description  |
|---------|--|
| 0–65535 | The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_SPI_CSR.CMP flag. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if condition is met. |

#### Bits 15:0 – VAL1[15:0] First Comparison Value for Received Character

| Value   | Description   |
|---------|---|
| 0–65535 | The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_SPI_SR.CMP flag. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if the condition is met. |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description   |
|----------|--------|---|
| 0x535049 | PASSWD | Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN.<br><br>Always reads as 0. |

#### Bit 2 – WPCREN Write Protection Control Enable

| Value | Description  |
|-------|--|
| 0     | Disables the write protection on control register if WPKEY corresponds to 0x535049 (“SPI” in ASCII). |
| 1     | Enables the write protection on control register if WPKEY corresponds to 0x535049 (“SPI” in ASCII).  |

#### Bit 1 – WPITEN Write Protection Interrupt Enable

| Value | Description   |
|-------|---|
| 0     | Disables the write protection on interrupt registers if WPKEY corresponds to 0x535049 (“SPI” in ASCII). |
| 1     | Enables the write protection on interrupt registers if WPKEY corresponds to 0x535049 (“SPI” in ASCII).  |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

### Bit 0 – WPEN Write Protection Enable

See [46.8.8 SPI Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description  |
|-------|--|
| 0     | Disables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII).  |

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.59 SPI Write Protection Status Register

**Name:** FLEX\_SPI\_WPSR  
**Offset:** 0x4E8  
**Reset:** 0x00000000  
**Property:** Read-only

|        |                   |    |    |    |    |    |    |      |
|--------|-------------------|----|----|----|----|----|----|------|
| Bit    | 31                | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        | [Greyed out bits] |    |    |    |    |    |    |      |
| Access |                   |    |    |    |    |    |    |      |
| Reset  |                   |    |    |    |    |    |    |      |
| Bit    | 23                | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        | [Greyed out bits] |    |    |    |    |    |    |      |
| Access |                   |    |    |    |    |    |    |      |
| Reset  |                   |    |    |    |    |    |    |      |
| Bit    | 15                | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]        |    |    |    |    |    |    |      |
| Access | R                 | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0                 | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7                 | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        | [Greyed out bits] |    |    |    |    |    |    | WPVS |
| Access |                   |    |    |    |    |    |    | R    |
| Reset  |                   |    |    |    |    |    |    | 0    |

**Bits 15:8 – WPVSR[7:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description   |
|-------|---|
| 0     | No write protect violation has occurred since the last read of FLEX_SPI_WPSR.   |
| 1     | A write protect violation has occurred since the last read of FLEX_SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

#### Bit 29 – FIFODIS FIFO Disable

| Value | Description                            |
|-------|--|
| 0     | No effect.                             |
| 1     | Disable the Transmit and Receive FIFOs |

#### Bit 28 – FIFOEN FIFO Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Enable the Transmit and Receive FIFOs |

#### Bit 26 – LOCKCLR Lock Clear

| Value | Description             |
|-------|-------------------------|
| 0     | No effect.              |
| 1     | Clear the TWI FSM lock. |

#### Bit 24 – THRCLR Transmit Holding Register Clear

| Value | Description |
|-------|-------------|
| 0     | No effect.  |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description  |
|-------|--|
| 1     | Clear the Transmit Holding Register and set TXRDY, TXCOMP flags. |

**Bit 17 – ACMDIS** Alternative Command Mode Disable

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | Alternative Command mode disabled. |

**Bit 16 – ACMEN** Alternative Command Mode Enable

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No effect.                        |
| 1     | Alternative Command mode enabled. |

**Bit 15 – CLEAR** Bus CLEAR Command

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | If Master mode is enabled, send a bus clear command. |

**Bit 14 – PECRQ** PEC Request

| Value | Description                               |
|-------|---|
| 0     | No effect.                                |
| 1     | A PEC check or transmission is requested. |

**Bit 13 – PECDIS** Packet Error Checking Disable

| Value | Description                                    |
|-------|--|
| 0     | No effect.                                     |
| 1     | SMBus PEC (CRC) generation and check disabled. |

**Bit 12 – PECEN** Packet Error Checking Enable

| Value | Description                                   |
|-------|---|
| 0     | No effect.                                    |
| 1     | SMBus PEC (CRC) generation and check enabled. |

**Bit 11 – SMBDIS** SMBus Mode Disabled

| Value | Description          |
|-------|----------------------|
| 0     | No effect.           |
| 1     | SMBus mode disabled. |

**Bit 10 – SMBEN** SMBus Mode Enabled

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | If SMBDIS = 0, SMBus mode enabled. |

**Bit 9 – HSDIS** TWI High-Speed Mode Disabled

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | High-speed mode disabled. |

### Bit 8 – HSEN TWI High-Speed Mode Enabled

| Value | Description              |
|-------|--------------------------|
| 0     | No effect.               |
| 1     | High-speed mode enabled. |

### Bit 7 – SWRST Software Reset

| Value | Description                   |
|-------|-------------------------------|
| 0     | No effect.                    |
| 1     | Equivalent to a system reset. |

### Bit 6 – QUICK SMBus Quick Command

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | If Master mode is enabled, an SMBus Quick Command is sent. |

### Bit 5 – SVDIS TWI Slave Mode Disabled

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling. |

### Bit 4 – SVEN TWI Slave Mode Enabled

Switching from Master to Slave mode is only permitted when TXCOMP = 1.

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Enables the Slave mode (SVDIS must be written to 0). |

### Bit 3 – MSDIS TWI Master Mode Disabled

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling. |

### Bit 2 – MSEN TWI Master Mode Enabled

Switching from Slave to Master mode is only permitted when TXCOMP = 1.

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | Enables the Master mode (MSDIS must be written to 0). |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 1 – STOP Send a STOP Condition

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | STOP condition is sent just after completing the current byte transmission in Master Read mode. <ul style="list-style-type: none"><li>– In single data byte master read, both START and STOP must be set.</li><li>– In multiple data bytes master read, the STOP must be set after the last data received but one.</li><li>– In Master Read mode, if a NACK bit is received, the STOP is automatically performed.</li><li>– In master data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li></ul> |

### Bit 0 – START Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (FLEX\_TWI\_THR).

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | A frame beginning with a START bit is transmitted according to the features defined in the TWI Master Mode Register (FLEX_TWI_MMR). |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.61 TWI Control Register (FIFO\_ENABLED)

**Name:** FLEX\_TWI\_CR (FIFO\_ENABLED)  
**Offset:** 0x600  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit), see [46.9.6.8 TWI Multiple Data Mode](#) for details.

This register can only be written if the WPCREN bit is cleared in the [TWI Write Protection Mode Register](#).

| Value | Description                             |
|-------|---|
| 0     | No effect.                              |
| 1     | Disable the Transmit and Receive FIFOs. |

#### Bit 28 – FIFOEN FIFO Enable

| Value | Description                            |
|-------|--|
| 0     | No effect.                             |
| 1     | Enable the Transmit and Receive FIFOs. |

#### Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR

| Value | Description                    |
|-------|--------------------------------|
| 0     | No effect.                     |
| 1     | Clears the Transmit FIFO Lock. |

#### Bit 25 – RXFCLR Receive FIFO Clear

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Empties the Receive FIFO. |

### Bit 24 – TXFCLR Transmit FIFO Clear

| Value | Description                |
|-------|----------------------------|
| 0     | No effect.                 |
| 1     | Empties the Transmit FIFO. |

### Bit 17 – ACMDIS Alternative Command Mode Disable

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | Alternative Command mode disabled. |

### Bit 16 – ACMEN Alternative Command Mode Enable

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No effect.                        |
| 1     | Alternative Command mode enabled. |

### Bit 15 – CLEAR Bus CLEAR Command

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | If Master mode is enabled, send a bus clear command. |

### Bit 14 – PECRQ PEC Request

| Value | Description                               |
|-------|---|
| 0     | No effect.                                |
| 1     | A PEC check or transmission is requested. |

### Bit 13 – PECDIS Packet Error Checking Disable

| Value | Description                                    |
|-------|--|
| 0     | No effect.                                     |
| 1     | SMBus PEC (CRC) generation and check disabled. |

### Bit 12 – PECEN Packet Error Checking Enable

| Value | Description                                   |
|-------|---|
| 0     | No effect.                                    |
| 1     | SMBus PEC (CRC) generation and check enabled. |

### Bit 11 – SMBDIS SMBus Mode Disabled

| Value | Description          |
|-------|----------------------|
| 0     | No effect.           |
| 1     | SMBus mode disabled. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 10 – SMBEN SMBus Mode Enabled

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | If SMBDIS = 0, SMBus mode enabled. |

### Bit 9 – HSDIS TWI High-Speed Mode Disabled

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | High-speed mode disabled. |

### Bit 8 – HSEN TWI High-Speed Mode Enabled

| Value | Description              |
|-------|--------------------------|
| 0     | No effect.               |
| 1     | High-speed mode enabled. |

### Bit 7 – SWRST Software Reset

| Value | Description                   |
|-------|-------------------------------|
| 0     | No effect.                    |
| 1     | Equivalent to a system reset. |

### Bit 6 – QUICK SMBus Quick Command

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | If Master mode is enabled, a SMBus Quick Command is sent. |

### Bit 5 – SVDIS TWI Slave Mode Disabled

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling. |

### Bit 4 – SVEN TWI Slave Mode Enabled

Switching from Master to Slave mode is only permitted when TXCOMP = 1.

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Enables the Slave mode (SVDIS must be written to 0). |

### Bit 3 – MSDIS TWI Master Mode Disabled

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in the case of a write operation. In a read operation, the character being transferred must be completely received before disabling. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 2 – MSEN TWI Master Mode Enabled

Switching from Slave to Master mode is only permitted when TXCOMP = 1.

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | Enables the Master mode (MSDIS must be written to 0). |

### Bit 1 – STOP Send a STOP Condition

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | STOP condition is sent just after completing the current byte transmission in Master Read mode. <ul style="list-style-type: none"><li>– In single data byte master read, both START and STOP must be set.</li><li>– In multiple data bytes master read, the STOP must be set after the last data received but one.</li><li>– In Master Read mode, if a NACK bit is received, the STOP is automatically performed.</li><li>– In master data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li></ul> |

### Bit 0 – START Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (FLEX\_TWI\_THR).

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | A frame beginning with a START bit is transmitted according to the features defined in the TWI Master Mode Register (FLEX_TWI_MMR). |

#### Bit 24 – NOAP No Auto-Stop On NACK Error

| Value | Description  |
|-------|--|
| 0     | A stop condition is sent automatically upon Not-Acknowledge error detection. |
| 1     | No automatic action is performed upon Not-Acknowledge error detection.       |

#### Bits 22:16 – DADR[6:0] Device Address

The device address is used to access slave devices in Read or Write mode. Those bits are only used in Master mode.

#### Bit 12 – MREAD Master Read Direction

| Value | Description             |
|-------|-------------------------|
| 0     | Master write direction. |
| 1     | Master read direction.  |

#### Bits 9:8 – IADRSZ[1:0] Internal Device Address Size

| Value | Name   | Description                      |
|-------|--------|----------------------------------|
| 0     | NONE   | No internal device address       |
| 1     | 1_BYTE | One-byte internal device address |
| 2     | 2_BYTE | Two-byte internal device address |

#### Bit 31 – DATAMEN Data Matching Enable

| Value | Description                                       |
|-------|---|
| 0     | Data matching on first received data is disabled. |
| 1     | Data matching on first received data is enabled.  |

#### Bit 30 – SADR3EN Slave Address 3 Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Slave address 3 matching is disabled. |
| 1     | Slave address 3 matching is enabled.  |

#### Bit 29 – SADR2EN Slave Address 2 Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Slave address 2 matching is disabled. |
| 1     | Slave address 2 matching is enabled.  |

#### Bit 28 – SADR1EN Slave Address 1 Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Slave address 1 matching is disabled. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                          |
|-------|--------------------------------------|
| 1     | Slave address 1 matching is enabled. |

### Bits 22:16 – SADR[6:0] Slave Address

The slave device address is used in Slave mode in order to be accessed by master devices in Read or Write mode.

SADR must be programmed before enabling the Slave mode or after a general call. Writes at other times have no effect.

### Bits 14:8 – MASK[6:0] Slave Address Mask

A mask can be applied on the slave device address in Slave mode in order to allow multiple address answer. For each bit of the MASK field set to one, the corresponding SADR bit will be masked.

If the MASK field is set to 0, no mask is applied to the SADR field.

### Bit 6 – SCLWSDIS Clock Wait State Disable

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Clock stretching disabled in Slave mode, OVRE and UNRE will indicate overrun and underrun. |

### Bit 4 – SADAT Slave Address Treated as Data

| Value | Description   |
|-------|---|
| 0     | Slave address is handled normally (will not trig RXRDY flag and will not fill FLEX_TWI_RHR upon reception).     |
| 1     | Slave address is handled as data field, RXRDY will be set and FLEX_TWI_RHR filled upon slave address reception. |

### Bit 3 – SMHH SMBus Host Header

| Value | Description                                    |
|-------|--|
| 0     | Acknowledge of the SMBus Host Header disabled. |
| 1     | Acknowledge of the SMBus Host Header enabled.  |

### Bit 2 – SMDA SMBus Default Address

| Value | Description  |
|-------|--|
| 0     | Acknowledge of the SMBus Default Address disabled. |
| 1     | Acknowledge of the SMBus Default Address enabled.  |

### Bit 0 – NACKEN Slave Receiver Data Phase NACK Enable

| Value | Description  |
|-------|--|
| 0     | Normal value to be returned in the ACK cycle of the data phase in Slave Receiver mode. |
| 1     | NACK value to be returned in the ACK cycle of the data phase in Slave Receiver mode.   |

|        |            |     |     |          |     |     |            |     |
| Bit    | 7          | 6   | 5   | 4        | 3   | 2   | 1          | 0   |
|        | CLDIV[7:0] |     |     |          |     |     |            |     |
| Access | R/W        | R/W | R/W | R/W      | R/W | R/W | R/W        | R/W |
| Reset  | 0          | 0   | 0   | 0        | 0   | 0   | 0          | 0   |

**Bits 29:24 – HOLD[5:0]** TWD Hold Time Versus TWCK Falling

If High-speed mode is selected TWD is internally modified on the TWCK falling edge to meet the I<sup>2</sup>C specified maximum hold time, else if High-speed mode is not configured TWD is kept unchanged after TWCK falling edge for a period of (HOLD + 3) × t<sub>peripheral clock</sub>.

**Bit 20 – BRSRCCLK** Bit Rate Source Clock

| Value | Name       | Description  |
|-------|------------|--|
| 0     | PERIPH_CLK | The peripheral clock is the source clock for the bit rate generation.  |
| 1     | GCLK       | GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock. |

**Bits 18:16 – CKDIV[2:0]** Clock Divider

The CKDIV is used to increase both SCL high and low periods.

**Bits 15:8 – CHDIV[7:0]** Clock High Divider

The SCL high period is defined as follows:

If BRSRCCLK = 0:  $CHDIV = ((t_{high} / t_{peripheral\ clock}) - 3) / 2^{CKDIV}$

If BRSRCCLK = 1:  $CHDIV = (t_{high} / t_{ext\_ck}) / 2^{CKDIV}$

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

---

**Bits 7:0 – CLDIV[7:0]** Clock Low Divider

The SCL low period is defined as follows:

If BRSRCCLK = 0:  $CLDIV = ((t_{low} / t_{\text{peripheral clock}}) - 3) / 2^{CKDIV}$

If BRSRCCLK = 1:  $CLDIV = (t_{low} / t_{\text{ext\_ck}}) / 2^{CKDIV}$

# SAMA5D2 Series

| Reset  | 0    | 0    | 0      | 0      | 1      | 0     | 0      | 1      |

#### Bit 26 – SR Start Repeated

| Value | Description  |
|-------|--|
| 0     | No repeated start has been detected since last FLEX_TWI_SR read.           |
| 1     | At least one repeated start has been detected since last FLEX_TWI_SR read. |

#### Bit 25 – SDA SDA Line Value

| Value | Description                    |
|-------|--------------------------------|
| 0     | SDA line sampled value is '0'. |
| 1     | SDA line sampled value is '1'. |

#### Bit 24 – SCL SCL Line Value

| Value | Description                    |
|-------|--------------------------------|
| 0     | SCL line sampled value is '0'. |
| 1     | SCL line sampled value is '1'. |

#### Bit 23 – LOCK TWI Lock Due to Frame Errors

| Value | Description            |
|-------|------------------------|
| 0     | The TWI is not locked. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description   |
|-------|---|
| 1     | The TWI is locked due to frame errors (see <a href="#">46.9.3.12 Handling Errors in Alternative Command</a> and <a href="#">46.9.6 TWI FIFOs</a> ). |

**Bit 21 – SMBHHM** SMBus Host Header Address Match (cleared on read)

| Value | Description                               |
|-------|---|
| 0     | No SMBus Host Header Address received.    |
| 1     | A SMBus Host Header Address was received. |

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No SMBus Default Address received.    |
| 1     | A SMBus Default Address was received. |

**Bit 19 – PECERR** PEC Error (cleared on read)

| Value | Description                  |
|-------|------------------------------|
| 0     | No SMBus PEC error occurred. |
| 1     | A SMBus PEC error occurred.  |

**Bit 18 – TOUT** Timeout Error (cleared on read)

| Value | Description                |
|-------|----------------------------|
| 0     | No SMBus timeout occurred. |
| 1     | SMBus timeout occurred.    |

**Bit 16 – MACK** Master Code Acknowledge (cleared on read)

MACK used in Slave mode:

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No master code has been received. |
| 1     | A master code has been received.  |

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)

This bit is only used in Slave mode.

EOSACC behavior can be seen in figures [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description   |
|-------|---|
| 0     | A slave access is being performing.   |
| 1     | The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset. |

**Bit 10 – SCLWS** Clock Wait State

This bit is only used in Slave mode.

SCLWS behavior can be seen in figures [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description  |
|-------|--|
| 0     | The clock is not stretched.  |
| 1     | The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character. |

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)

This bit is only used in Master mode.

| Value | Description   |
|-------|---|
| 0     | Arbitration won.  |
| 1     | Arbitration lost. Another master of the TWI bus has won the multi-master arbitration. TXCOMP is set at the same time. |

**Bit 8 – NACK** Not Acknowledged (cleared on read)

NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWI slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set, the user must not fill FLEX\_TWI\_THR even if TXRDY is set, because it means that the master will stop the data transfer or reinitiate it.

Note that in Slave Write mode, all data are acknowledged by the TWI.

**Bit 7 – UNRE** Underrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description                               |
|-------|---|
| 0     | FLEX_TWI_THR has been filled on time.     |
| 1     | FLEX_TWI_THR has not been filled on time. |

**Bit 6 – OVRE** Overrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description  |
|-------|--|
| 0     | FLEX_TWI_RHR has not been loaded while RXRDY was set.  |
| 1     | FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set. |

**Bit 5 – GACC** General Call Access (cleared on read)

This bit is only used in Slave mode.

GACC behavior can be seen in figure [Master Performs a General Call](#).

| Value | Description                        |
|-------|------------------------------------|
| 0     | No general call has been detected. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description   |
|-------|---|
| 1     | A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes. |

### Bit 4 – SVACC Slave Access

This bit is only used in Slave mode.

SVACC behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description   |
|-------|---|
| 0     | TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.  |
| 1     | Indicates that the address decoding sequence has matched (a master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected. |

### Bit 3 – SVREAD Slave Read

This bit is only used in Slave mode. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description   |
|-------|---|
| 0     | Indicates that a write access is performed by a master. |
| 1     | Indicates that a read access is performed by a master.  |

### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX\_TWI\_THR)

TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX\_TWI\_THR.

1: As soon as a data byte is transferred from FLEX\_TWI\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Master mode can be seen in figures [Master Write with One Data Byte](#), [Master Write with Multiple Data Bytes](#) and [Master Write with One Byte Internal Address and Multiple Data Bytes](#).

TXRDY used in Slave mode:

0: As soon as data is written in FLEX\_TWI\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX\_TWI\_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX\_TWI\_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in figures [Read Access Ordered by a Master](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFOs enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 1 – RXRDY** Receive Holding Register Ready (cleared when reading FLEX\_TWI\_RHR)

When FIFOs are disabled:

0: No character has been received since the last FLEX\_TWI\_RHR read operation.

1: A byte has been received in FLEX\_TWI\_RHR since the last read.

RXRDY behavior in Master mode can be seen in figure [Master Read with Multiple Data Bytes](#).

RXRDY behavior in Slave mode can be seen in figures [Write Access Ordered by a Master](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing FLEX\_TWI\_THR)

TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both the holding register and the internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in figures [Master Write with One Byte Internal Address and Multiple Data Bytes](#) and [Master Read with Multiple Data Bytes](#).

TXCOMP used in Slave mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in figures [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.67 TWI Status Register (FIFO ENABLED)

**Name:** FLEX\_TWI\_SR (FIFO\_ENABLED)  
**Offset:** 0x620  
**Reset:** 0x0300F009  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit), see [TWI Multiple Data Mode](#) for details.

|        |         |      |      |        |        |        |       |        |      |

#### Bit 26 – SR Start Repeated

| Value | Description  |
|-------|--|
| 0     | No repeated start has been detected since last FLEX_TWI_SR read.           |
| 1     | At least one repeated start has been detected since last FLEX_TWI_SR read. |

#### Bit 25 – SDA SDA Line Value

| Value | Description                    |
|-------|--------------------------------|
| 0     | SDA line sampled value is '0'. |
| 1     | SDA line sampled value is '1'. |

#### Bit 24 – SCL SCL Line Value

| Value | Description                    |
|-------|--------------------------------|
| 0     | SCL line sampled value is '0'. |
| 1     | SCL line sampled value is '1'. |

#### Bit 23 – TXFLOCK Transmit FIFO Lock

| Value | Description                      |
|-------|----------------------------------|
| 0     | The Transmit FIFO is not locked. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                  |
|-------|------------------------------|
| 1     | The Transmit FIFO is locked. |

**Bit 21 – SMBHMM** SMBus Host Header Address Match (cleared on read)

| Value | Description                               |
|-------|---|
| 0     | No SMBus Host Header Address received.    |
| 1     | A SMBus Host Header Address was received. |

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No SMBus Default Address received.    |
| 1     | A SMBus Default Address was received. |

**Bit 19 – PECERR** PEC Error (cleared on read)

| Value | Description                  |
|-------|------------------------------|
| 0     | No SMBus PEC error occurred. |
| 1     | A SMBus PEC error occurred.  |

**Bit 18 – TOUT** Timeout Error (cleared on read)

| Value | Description                |
|-------|----------------------------|
| 0     | No SMBus timeout occurred. |
| 1     | SMBus timeout occurred.    |

**Bit 16 – MACK** Master Code Acknowledge (cleared on read)

MACK used in Slave mode:

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No master code has been received. |
| 1     | A master code has been received.  |

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)

This bit is only used in Slave mode.

EOSACC behavior can be seen in figures [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description   |
|-------|---|
| 0     | A Slave Access is being performed.  |
| 1     | The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset. |

**Bit 10 – SCLWS** Clock Wait State

This bit is only used in Slave mode.

SCLWS behavior can be seen in figures [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

| Value | Description                 |
|-------|-----------------------------|
| 0     | The clock is not stretched. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description  |
|-------|--|
| 1     | The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character. |

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)

This bit is only used in Master mode.

| Value | Description   |
|-------|---|
| 0     | Arbitration won.  |
| 1     | Arbitration lost. Another master of the TWI bus has won the multi-master arbitration. TXCOMP is set at the same time. |

**Bit 8 – NACK** Not Acknowledged (cleared on read)

NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWI slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set the user must not fill FLEX\_TWI\_THR even if TXRDY is set, because it means that the master will stop the data transfer or re initiate it.

Note that in Slave Write mode all data are acknowledged by the TWI.

**Bit 7 – UNRE** Underrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description                               |
|-------|---|
| 0     | FLEX_TWI_THR has been filled on time.     |
| 1     | FLEX_TWI_THR has not been filled on time. |

**Bit 6 – OVRE** Overrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description  |
|-------|--|
| 0     | FLEX_TWI_RHR has not been loaded while RXRDY was set.  |
| 1     | FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set. |

**Bit 5 – GACC** General Call Access (cleared on read)

This bit is only used in Slave mode.

GACC behavior can be seen in figure [Master Performs a General Call](#).

| Value | Description   |
|-------|---|
| 0     | No general call has been detected.  |
| 1     | A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 4 – SVACC Slave Access

This bit is only used in Slave mode.

SVACC behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description   |
|-------|---|
| 0     | TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.  |
| 1     | Indicates that the address decoding sequence has matched (a master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected. |

### Bit 3 – SVREAD Slave Read

This bit is only used in Slave mode. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description   |
|-------|---|
| 0     | Indicates that a write access is performed by a master. |
| 1     | Indicates that a read access is performed by a master.  |

### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX\_TWI\_THR)

TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX\_TWI\_THR.

1: As soon as a data byte is transferred from FLEX\_TWI\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Master mode can be seen in figures [Master Write with One Data Byte](#), [Master Write with Multiple Data Bytes](#) and [Master Write with One Byte Internal Address and Multiple Data Bytes](#).

TXRDY used in Slave mode:

0: As soon as data is written in FLEX\_TWI\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX\_TWI\_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX\_TWI\_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in figures [Read Access Ordered by a Master](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

TXRDY behavior with FIFOs enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 1 – RXRDY** Receive Holding Register Ready (cleared when reading FLEX\_TWI\_RHR)

When FIFOs are disabled:

0: No character has been received since the last FLEX\_TWI\_RHR read operation.

1: A byte has been received in FLEX\_TWI\_RHR since the last read.

RXRDY behavior in Master mode can be seen in figure [Master Read with Multiple Data Bytes](#).

RXRDY behavior in Slave mode can be seen in figures [Write Access Ordered by a Master](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing FLEX\_TWI\_THR)

TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both holding register and internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in figures [Master Write with One Byte Internal Address and Multiple Data Bytes](#) and [Master Read with Multiple Data Bytes](#).

TXCOMP used in Slave mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in figures [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.68 TWI Interrupt Enable Register

**Name:** FLEX\_TWI\_IER  
**Offset:** 0x624  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TWI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|

### 46.10.69 TWI Interrupt Disable Register

**Name:** FLEX\_TWI\_IDR  
**Offset:** 0x628  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TWI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Bit    | 31     | 30     | 29     | 28     | 27     | 26     | 25     | 24     |

### 46.10.70 TWI Interrupt Mask Register

**Name:** FLEX\_TWI\_IMR  
**Offset:** 0x62C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Bit    | 31     | 30     | 29     | 28     | 27     | 26     | 25     | 24     |
|        |        |        |        |        |        |        |        |        |
| Access |        |        |        |        |        |        |        |        |
| Reset  |        |        |        |        |        |        |        |        |
|        |        |        |        |        |        |        |        |        |
| Bit    | 23     | 22     | 21     | 20     | 19     | 18     | 17     | 16     |

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.71 TWI Receive Holding Register

**Name:** FLEX\_TWI\_RHR  
**Offset:** 0x630  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_TWI\_CR.FIFOEN bit) and FLEX\_TWI\_FMR.RXRDYM = 0, see [TWI Single Data Mode](#) for details.

**Bits 7:0 – RXDATA[7:0]** Master or Slave Receive Holding Data

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.72 TWI Receive Holding Register (FIFO Enabled)

**Name:** FLEX\_TWI\_RHR (FIFO\_ENABLED)  
**Offset:** 0x630  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_TWI\_CR.FIFOEN bit) and FLEX\_TWI\_FMR.RXRDYM > 0, see [TWI Multiple Data Mode](#) for details.

|        | Bit | 7          | 6   | 5   | 4   | 3   | 2   | 1          | 0   |  |
|        |     |            |     |     |     |     |     | PRESC[3:0] |     |  |
| Access |     |            |     |     | R/W | R/W | R/W | R/W        |     |  |
| Reset  |     |            |     |     | 0   | 0   | 0   | 0          |     |  |

**Bits 31:24 – THMAX[7:0]** Clock High Maximum Cycles  
 Clock cycles in clock high maximum count. Prescaled by PRESC. Used for bus free detection. Used to time THIGH:MAX.

**Bits 23:16 – TLOWM[7:0]** Master Clock Stretch Maximum Cycles

| Value | Description   |
|-------|---|
| 0     | TLOW:MEXT timeout check disabled.   |
| 1-255 | Clock cycles in master maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:MEXT. |

**Bits 15:8 – TLOWS[7:0]** Slave Clock Stretch Maximum Cycles

| Value | Description  |
|-------|--|
| 0     | TLOW:SEXT timeout check disabled.  |
| 1-255 | Clock cycles in slave maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:SEXT. |

**Bits 3:0 – PRESC[3:0]** SMBus Clock Prescaler  
 Used to specify how to prescale the TLOWS, TLOWM and THMAX counters in SMBTR. Counters are prescaled according to the following formula:  $PRESC = \text{Log}(fMCK / f_{\text{Prescaled}}) / \text{Log}(2) - 1$

#### Bit 25 – NPEC Next PEC Request (SMBus Mode only)

| Value | Description                                |
|-------|--|
| 0     | The next transfer does not use a PEC byte. |
| 1     | The next transfer uses a PEC byte.         |

#### Bit 24 – NDIR Next Transfer Direction

| Value | Description      |
|-------|------------------|
| 0     | Write direction. |
| 1     | Read direction.  |

#### Bits 23:16 – NDATAL[7:0] Next Data Length

| Value | Description   |
|-------|---|
| 0     | No data to send (see <a href="#">46.9.3.11 Alternative Command</a> ). |
| 1–255 | Number of bytes to send for the next transfer.                        |

#### Bit 9 – PEC PEC Request (SMBus Mode only)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | The transfer does not use a PEC byte. |
| 1     | The transfer uses a PEC byte.         |

| Reset  |                         |    |    |    |    | 0       | 0          | 0    |     |

#### Bits 10:8 – THRES[2:0] Digital Filter Threshold

| Value | Description   |
|-------|---|
| 0     | No filtering applied on TWI inputs.   |
| 1–7   | Maximum pulse width of spikes which will be suppressed by the input filter, defined in peripheral clock cycles. |

#### Bit 2 – PADFCFG PAD Filter Config

Refer to the section “Electrical Characteristics” for filter configuration details.

#### Bit 1 – PADFEN PAD Filter Enable

| Value | Description  |
|-------|--|
| 0     | PAD analog filter is disabled.   |
| 1     | PAD analog filter is enabled. (The analog filter must be enabled if High-speed mode is enabled.) |

#### Bit 0 – FILT RX Digital Filter

TWI digital input filtering follows a majority decision based on three samples from SDA/SCL lines at peripheral clock frequency.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description  |
|-------|--|
| 0     | No filtering applied on TWI inputs.                              |
| 1     | TWI input filtering is active. (Only in Standard and Fast modes) |

**Bits 31:24 – DATAM[7:0] Data Match**

The TWI module will extend the SleepWalking matching process to the first received data comparing it with DATAM if DATAMEN bit is enabled.

**Bits 22:16 – SADR3[6:0] Slave Address 3**

Slave address 3. The TWI module will match on this additional address if SADR3EN bit is enabled.

**Bits 14:8 – SADR2[6:0] Slave Address 2**

Slave address 2. The TWI module will match on this additional address if SADR2EN bit is enabled.

**Bits 6:0 – SADR1[6:0] Slave Address 1**

Slave address 1. The TWI module will match on this additional address if SADR1EN bit is enabled.

#### Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

| Value | Description  |
|-------|--|
| 0–16  | Defines the Receive FIFO threshold value (number of data). The FLEX_TWI_FSR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

#### Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

| Value | Description  |
|-------|--|
| 0–16  | Defines the Transmit FIFO threshold value (number of data). The FLEX_TWI_FSR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

#### Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode

If FIFOs are enabled, the FLEX\_TWI\_SR.RXRDY flag behaves as follows.

| Value | Name     | Description   |
|-------|----------|---|
| 0     | ONE_DATA | RXRDY will be at level ‘1’ when at least one unread data is in the Receive FIFO |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Name      | Description   |
|-------|-----------|---|
| 1     | TWO_DATA  | RXRDY will be at level '1' when at least two unread data are in the Receive FIFO  |
| 2     | FOUR_DATA | RXRDY will be at level '1' when at least four unread data are in the Receive FIFO |

### Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode

If FIFOs are enabled, the FLEX\_TWI\_SR.TXRDY flag behaves as follows.

| Value | Name      | Description  |
|-------|-----------|--|
| 0     | ONE_DATA  | TXRDY will be at level '1' when at least one data can be written in the Transmit FIFO  |
| 1     | TWO_DATA  | TXRDY will be at level '1' when at least two data can be written in the Transmit FIFO  |
| 2     | FOUR_DATA | TXRDY will be at level '1' when at least four data can be written in the Transmit FIFO |

# SAMA5D2 Series

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

| Value | Description  |
|-------|--|
| 0     | There is no unread data in the Receive FIFO.             |
| 1-16  | Indicates the number of unread data in the Receive FIFO. |

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

| Value | Description  |
|-------|--|
| 0     | There is no data in the Transmit FIFO.             |
| 1-16  | Indicates the number of data in the Transmit FIFO. |

| Reset  | 0                       | 0       | 0      | 0     | 0     | 0      | 0     | 0     |

**Bit 7 – RXFPTEF** Receive FIFO Pointer Error Flag  
 See [46.9.6.10 FIFO Pointer Error](#) for details.

| Value | Description  |
|-------|--|
| 0     | No Receive FIFO pointer occurred.                            |
| 1     | Receive FIFO pointer error occurred. Receiver must be reset. |

**Bit 6 – TXFPTEF** Transmit FIFO Pointer Error Flag  
 See [46.9.6.10 FIFO Pointer Error](#) for details.

| Value | Description  |
|-------|--|
| 0     | No Transmit FIFO pointer occurred.                               |
| 1     | Transmit FIFO pointer error occurred. Transceiver must be reset. |

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag

| Value | Description   |
|-------|---|
| 0     | Number of unread data in Receive FIFO is below RXFTHRES threshold.  |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last read of FLEX_TWI_FSR. |

**Bit 4 – RXFFF** Receive FIFO Full Flag

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description   |
|-------|---|
| 0     | Receive FIFO is not empty.  |
| 1     | Receive FIFO has been filled since the last read of FLEX_TWI_FSR. |

**Bit 3 – RXFEF** Receive FIFO Empty Flag

| Value | Description  |
|-------|--|
| 0     | Receive FIFO is not empty.   |
| 1     | Receive FIFO has been emptied since the last read of FLEX_TWI_FSR. |

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

| Value | Description   |
|-------|---|
| 0     | Number of data in Transmit FIFO is above TXFTHRES threshold.  |
| 1     | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_TWI_FSR. |

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared on read)

| Value | Description  |
|-------|--|
| 0     | Transmit FIFO is not full.   |
| 1     | Transmit FIFO has been filled since the last read of FLEX_TWI_FSR. |

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

| Value | Description   |
|-------|---|
| 0     | Transmit FIFO is not empty.   |
| 1     | Transmit FIFO has been emptied since the last read of FLEX_TWI_FSR. |

### 46.10.82 TWI FIFO Interrupt Enable Register

**Name:** FLEX\_TWI\_FIER  
**Offset:** 0x664  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TWI Write Protection Mode Register](#).

|        |     | WPVS         |    |    |    |    |    |    |    |
| Access |     |              |    |    |    |    |    |    | R  |
| Reset  |     |              |    |    |    |    |    |    | 0  |

**Bits 31:8 – WPVSR[23:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protect Violation Status

| Value | Description  |
|-------|--|
| 0     | No Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR.   |
| 1     | A Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 47. Universal Asynchronous Receiver Transmitter (UART)

### 47.1 Description

The Universal Asynchronous Receiver Transmitter (UART) features a two-pin UART that can be used for communication and trace purposes and offers an ideal medium for in-situ programming solutions.

Moreover, the association with a DMA controller permits packet handling for these tasks with processor time reduced to a minimum.

### 47.2 Embedded Characteristics

- Two-pin UART
  - Independent Receiver and Transmitter with a Common Programmable Baud Rate Generator
  - Baud Rate can be Driven by Processor-Independent Generic Source Clock
  - Even, Odd, Mark or Space Parity Generation
  - Parity, Framing and Overrun Error Detection
  - Automatic Echo, Local Loopback and Remote Loopback Channel Modes
  - Digital Filter on Receive Line
  - Interrupt Generation
  - Support for Two DMA Channels with Connection to Receiver and Transmitter
  - Supports Asynchronous Partial Wake-up on Receive Line Activity (SleepWalking)
  - Comparison Function on Received Character
  - Receiver Time-out
  - Register Write Protection

### 47.3 Block Diagram

**Figure 47-1. UART Block Diagram**

**Table 47-1. UART Pin Description**

| Pin Name | Description        | Type   |
|----------|--------------------|--------|
| URXD     | UART Receive Data  | Input  |
| UTXD     | UART Transmit Data | Output |

## **47.4 Product Dependencies**

### **47.4.1 I/O Lines**

The UART pins are multiplexed with PIO lines. The user must first configure the corresponding PIO Controller to enable I/O line operations of the UART.

### **47.4.2 Power Management**

The UART clock can be controlled through the Power Management Controller (PMC). In this case, the user must first configure the PMC to enable the UART clock. Usually, the peripheral identifier used for this purpose is 1.

In SleepWalking mode (asynchronous partial wake-up), the PMC must be configured to enable SleepWalking for the UART in the Sleepwalking Enable Register (PMC\_SLPWK\_ER). Depending on the instructions (requests) provided by the UART to the PMC, the system clock may or may not be automatically provided to the UART.

### **47.4.3 Interrupt Sources**

The UART interrupt line is connected to one of the interrupt sources of the Interrupt Controller. Interrupt handling requires programming of the Interrupt Controller before configuring the UART.

## **47.5 Functional Description**

The UART operates in Asynchronous mode only and supports only 8-bit character handling (with parity). It has no clock pin.

The UART is made up of a receiver and a transmitter that operate independently, and a common baud rate generator. Receiver timeout and transmitter time guard are not implemented. However, all the implemented features are compatible with those of a standard USART.

### **47.5.1 Baud Rate Generator**

The baud rate generator provides the bit period clock named baud rate clock to both the receiver and the transmitter.

The baud rate clock is the peripheral clock divided by 16 times the clock divisor (CD) value written in the Baud Rate Generator register (UART\_BRGR). If UART\_BRGR is set to 0, the baud rate clock is disabled and the UART remains inactive. The maximum allowable baud rate is peripheral clock or GCLK divided by 16. The minimum allowable baud rate is peripheral clock divided by (16 x 65536). The clock source driving the baud rate generator (peripheral clock or GCLK) can be selected by writing the bit BRSRCK in UART\_MR.

If GCLK is selected, the baud rate is independent of the processor/bus clock. Thus the processor clock can be changed while UART is enabled. The processor clock frequency changes must be performed only by programming the field PRES in PMC\_MCKR (refer to "Power Management Controller (PMC)"). Other methods to modify the processor/bus clock frequency (PLL multiplier, etc.) are forbidden when UART is enabled.

The peripheral clock frequency must be at least three times higher than GCLK.

**Figure 47-2. Baud Rate Generator**

### 47.5.2 Receiver

#### 47.5.2.1 Receiver Reset, Enable and Disable

After device reset, the UART receiver is disabled and must be enabled before being used. The receiver can be enabled by writing the Control Register (UART\_CR) with the bit RXEN at 1. At this command, the receiver starts looking for a start bit.

The programmer can disable the receiver by writing UART\_CR with the bit RXDIS at 1. If the receiver is waiting for a start bit, it is immediately stopped. However, if the receiver has already detected a start bit and is receiving the data, it waits for the stop bit before actually stopping its operation.

The receiver can be put in reset state by writing UART\_CR with the bit RSTRX at 1. In this case, the receiver immediately stops its current operations and is disabled, whatever its current state. If RSTRX is applied when data is being processed, this data is lost.

#### 47.5.2.2 Start Detection and Data Sampling

The UART only supports asynchronous operations, and this affects only its receiver. The UART receiver detects the start of a received character by sampling the URXD signal until it detects a valid start bit. A low level (space) on URXD is interpreted as a valid start bit if it is detected for more than seven cycles of the sampling clock, which is 16 times the baud rate. Hence, a space that is longer than 7/16 of the bit period is detected as a valid start bit. A space which is 7/16 of a bit period or shorter is ignored and the receiver continues to wait for a valid start bit.

When a valid start bit has been detected, the receiver samples the URXD at the theoretical midpoint of each bit. It is assumed that each bit lasts 16 cycles of the sampling clock (1-bit period) so the bit sampling point is eight cycles (0.5-bit period) after the start of the bit. The first sampling point is therefore 24 cycles (1.5-bit periods) after detecting the falling edge of the start bit.

Each subsequent bit is sampled 16 cycles (1-bit period) after the previous one.

**Figure 47-3. Start Bit Detection**

**Figure 47-4. Character Reception**

Example: 8-bit, parity enabled 1 stop

### 47.5.2.3 Receiver Ready

When a complete character is received, it is transferred to the Receive Holding Register (UART\_RHR) and the RXRDY status bit in the Status Register (UART\_SR) is set. The bit RXRDY is automatically cleared when UART\_RHR is read.

**Figure 47-5. Receiver Ready**

### 47.5.2.4 Receiver Overrun

The OVRE status bit in UART\_SR is set if UART\_RHR has not been read by the software (or the DMA Controller) since the last transfer, the RXRDY bit is still set and a new character is received. OVRE is cleared when the software writes a 1 to the bit RSTSTA (Reset Status) in UART\_CR.

**Figure 47-6. Receiver Overrun**

### 47.5.2.5 Parity Error

Each time a character is received, the receiver calculates the parity of the received data bits, in accordance with the field PAR in the Mode Register (UART\_MR). It then compares the result with the received parity bit. If different, the parity error bit PARE in UART\_SR is set at the same time RXRDY is set. The parity bit is cleared when UART\_CR is written with the bit RSTSTA (Reset Status) at 1. If a new character is received before the reset status command is written, the PARE bit remains at 1.

**Figure 47-7. Parity Error**

### 47.5.2.6 Receiver Framing Error

When a start bit is detected, it generates a character reception when all the data bits have been sampled. The stop bit is also sampled and when it is detected at 0, the FRAME (Framing Error) bit in UART\_SR is set at the same time the RXRDY bit is set. The FRAME bit remains high until the Control Register (UART\_CR) is written with the bit RSTSTA at 1.

**Figure 47-8. Receiver Framing Error**

### 47.5.2.7 Receiver Digital Filter

The UART embeds a digital filter on the receive line. It is disabled by default and can be enabled by writing a logical 1 in the FILTER bit of UART\_MR. When enabled, the receive line is sampled using the 16x bit clock and a three-sample filter (majority 2 over 3) determines the value of the line.

### 47.5.2.8 Receiver Time-out

The Receiver Time-out provides support in handling variable-length frames. This feature detects an idle condition on the URXD line. When a time-out is detected, the bit TIMEOUT in the UART\_SR rises and can generate an interrupt, thus indicating to the driver an end of frame.

The time-out delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Time-out register (UART\_RTOR). If the TO field is written to 0, the Receiver Time-out is disabled and no time-out is detected. The TIMEOUT bit in the UART\_SR remains at 0. Otherwise, the receiver loads an 8-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the TIMEOUT bit in the UART\_SR rises. Then, the user can either:

- stop the counter clock until a new character is received. This is performed by writing a one to the STTTO (start Time-out) bit in the UART\_CR. In this case, the idle state on URXD before a new character is received does not provide a time-out. This prevents having to handle an interrupt before a character is received and allows waiting for the next idle state on URXD after a frame is received, or
- obtain an interrupt while no character is received. This is performed by writing a one to the RETTO (Reload and Start Time-out) bit in the UART\_CR. If RETTO is performed, the counter starts counting down immediately from the TO value. This enables generation of a periodic interrupt so that a user time-out can be handled, for example when no key is pressed on a keyboard.

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

If STTTO is performed, the counter clock is stopped until a first character is received. The idle state on URXD before the start of the frame does not provide a time-out. This prevents having to obtain a periodic interrupt and enables a wait of the end of frame when the idle state on URXD is detected.

If RETTO is performed, the counter starts counting down immediately from the TO value. This enables generation of a periodic interrupt so that a user time-out can be handled, for example when no key is pressed on a keyboard.

The figure below shows the block diagram of the Receiver Time-out feature.

**Figure 47-9. Receiver Time-out Block Diagram**

The table below gives the maximum time-out period for some standard baud rates.

**Table 47-2. Maximum Time-out Period**

| Baud Rate (bit/s) | Bit Time ( $\mu\text{s}$ ) | Time-out ( $\mu\text{s}$ ) |
|-------------------|----------------------------|----------------------------|
| 600               | 1,667                      | 425,085                    |
| 1,200             | 833                        | 212,415                    |
| 2,400             | 417                        | 106,335                    |
| 4,800             | 208                        | 53,040                     |
| 9,600             | 104                        | 26,520                     |
| 14,400            | 69                         | 17,595                     |
| 19,200            | 52                         | 13,260                     |
| 28,800            | 35                         | 8,925                      |
| 38,400            | 26                         | 6,630                      |
| 56,000            | 18                         | 4,590                      |
| 57,600            | 17                         | 4,335                      |
| 200,000           | 5                          | 1,275                      |

### 47.5.3 Transmitter

#### 47.5.3.1 Transmitter Reset, Enable and Disable

After device reset, the UART transmitter is disabled and must be enabled before being used. The transmitter is enabled by writing UART\_CR with the bit TXEN at 1. From this command, the transmitter waits for a character to be written in the Transmit Holding Register (UART\_THR) before actually starting the transmission.

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

The programmer can disable the transmitter by writing UART\_CR with the bit TXDIS at 1. If the transmitter is not operating, it is immediately stopped. However, if a character is being processed into the internal shift register and/or a character has been written in the UART\_THR, the characters are completed before the transmitter is actually stopped.

The programmer can also put the transmitter in its reset state by writing the UART\_CR with the bit RSTTX at 1. This immediately stops the transmitter, whether or not it is processing characters.

### 47.5.3.2 Transmit Format

The UART transmitter drives the pin UTXD at the baud rate clock speed. The line is driven depending on the format defined in UART\_MR and the data stored in the internal shift register. One start bit at level 0, then the 8 data bits, from the lowest to the highest bit, one optional parity bit and one stop bit at 1 are consecutively shifted out as shown in the following figure. The field PARE in UART\_MR defines whether or not a parity bit is shifted out. When a parity bit is enabled, it can be selected between an odd parity, an even parity, or a fixed space or mark bit.

**Figure 47-10. Character Transmission**

### 47.5.3.3 Transmitter Control

When the transmitter is enabled, the bit TXRDY (Transmitter Ready) is set in UART\_SR. The transmission starts when the programmer writes in the UART\_THR, and after the written character is transferred from UART\_THR to the internal shift register. The TXRDY bit remains high until a second character is written in UART\_THR. As soon as the first character is completed, the last character written in UART\_THR is transferred into the internal shift register and TXRDY rises again, showing that the holding register is empty.

When both the internal shift register and UART\_THR are empty, i.e., all the characters written in UART\_THR have been processed, the TXEMPTY bit rises after the last stop bit has been completed.

**Figure 47-11. Transmitter Control**

### 47.5.4 DMA Support

Both the receiver and the transmitter of the UART are connected to a DMA Controller (DMAC) channel.

The DMA Controller channels are programmed via registers that are mapped within the DMAC user interface.

### 47.5.5 Comparison Function on Received Character

When a comparison is performed on a received character, the result of the comparison is reported on the CMP flag in UART\_SR when UART\_RHR is loaded with the new received character. The CMP flag is cleared by writing a one to the RSTSTA bit in UART\_CR.

UART\_CMPR (see [UART Comparison Register](#)) can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if either received character equals VAL1 or VAL2.

By programming the CMPMODE bit to 1, the comparison function result triggers the start of the loading of UART\_RHR (see the figure below). The trigger condition occurs as soon as the received character value matches the condition defined by the programming of VAL1, VAL2 and CMPPAR in UART\_CMPR. The comparison trigger event can be restarted by writing a one to the REQCLR bit in UART\_CR.

**Figure 47-12. Receive Holding Register Management**

CMPMODE = 1, VAL1 = VAL2 = 0x06

### 47.5.6 Asynchronous and Partial Wake-up (SleepWalking)

Asynchronous and partial wake-up (SleepWalking) is a means of data pre-processing that qualifies an incoming event, thus allowing the UART to decide whether or not to wake up the system. SleepWalking is used primarily when the system is in Wait mode (refer to section “Power Management Controller (PMC)”) but can also be enabled when the system is fully running.

No access must be performed in the UART between the enable of asynchronous partial wake-up and the wake-up performed by the UART.

If the system is in Wait mode and asynchronous and partial wake-up is enabled, the maximum baud rate that can be achieved equals 19200.

If the system is running or in Sleep mode, the maximum baud rate that can be achieved equals 115200 or higher. This limit is bounded by the peripheral clock frequency divided by 16.

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

---

The UART\_RHR must be read before enabling asynchronous and partial wake-up.

When SleepWalking is enabled for the UART (refer to section "Power Management Controller (PMC)"), the PMC decodes a clock request from the UART. The request is generated as soon as there is a falling edge on the URXD line as this may indicate the beginning of a start bit. If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the UART.

As soon as the clock is provided by the PMC, the UART processes the received frame and compares the received character with VAL1 and VAL2 in UART\_CMPR ([UART Comparison Register](#)).

The UART instructs the PMC to disable the clock if the received character value does not meet the conditions defined by VAL1 and VAL2 fields in UART\_CMPR (see [Asynchronous Event Generating Only Partial Wake-up](#)).

If the received character value meets the conditions, the UART instructs the PMC to exit the full system from Wait mode (see [Asynchronous Wake-up Use Case Examples](#)).

The VAL1 and VAL2 fields can be programmed to provide different comparison methods and thus matching conditions.

- If VAL1 equals VAL2, then the comparison is performed on a single value and the wake-up is triggered if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 wakes up the system.
- If VAL1 is strictly higher than VAL2, then the wake-up is triggered if the received character equals VAL1 or VAL2.
- If VAL1 = 0 and VAL2 = 255, the wake-up is triggered as soon as a character is received.

The matching condition can be configured to include the parity bit (CMPPAR in UART\_CMPR). Thus, if the received data matches the comparison condition defined by VAL1 and VAL2 but a parity error is encountered, the matching condition is cancelled and the UART instructs the PMC to disable the clock (see [Asynchronous Event Generating Only Partial Wake-up](#)).

If the processor and peripherals are running, the UART can be configured in Asynchronous and partial wake-up mode by enabling the PMC\_SLPWK\_ER (refer to "Power Management Controller (PMC)"). When activity is detected on the receive line, the UART requests the clock from the PMC and the comparison is performed. If there is a comparison match, the UART continues to request the clock. If there is no match, the clock is switched off for the UART only, until a new activity is detected.

The CMPMODE configuration has no effect when Asynchronous and Partial Wake-up mode is enabled for the UART (refer to PMC\_SLPWK\_ER in "Power Management Controller (PMC)").

When the system is kept in active/running mode and the UART enters Asynchronous and Partial Wake-up mode, the flag CMP must be programmed as the unique source of the UART interrupt.

When the system exits Wait mode as the result of a matching condition, the RXRDY flag is used to determine if the UART is the source of exit.

**Note:** If the SleepWalking function is enabled on the UART, a divide by 8 of the peripheral clock versus the bus clock is not possible. Other dividers can be used with no constraints.

**Figure 47-13. Asynchronous Wake-up Use Case Examples**

Case with VAL1 = VAL2 = 0x55, CMPPAR = 1

Case with VAL1 = 0x54, VAL2 = 0x56, CMPPAR = 1

Case with VAL1 = 0x75, VAL2 = 0x76, CMPPAR = 0

**Figure 47-14. Asynchronous Event Generating Only Partial Wake-up**

Case with VAL1 = VAL2 = 0x00, CMPPAR = Don't care

Case with VAL1 = 0xF5, VAL2 = 0xF5, CMPPAR = 1

### 47.5.7 Register Write Protection

To prevent any single software error from corrupting UART behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [UART Write Protection Mode Register](#) (UART\_WPMR).

The following registers can be write-protected:

- [UART Mode Register](#)
- [UART Baud Rate Generator Register](#)
- [UART Comparison Register](#)
- [UART Receiver Time-out Register](#)

### 47.5.8 Test Modes

The UART supports three test modes. These modes of operation are programmed by using the CHMODE field in UART\_MR.

The Automatic Echo mode allows a bit-by-bit retransmission. When a bit is received on the URXD line, it is sent to the UTXD line. The transmitter operates normally, but has no effect on the UTXD line.

The Local Loopback mode allows the transmitted characters to be received. UTXD and URXD pins are not used and the output of the transmitter is internally connected to the input of the receiver. The URXD pin level has no effect and the UTXD line is held high, as in idle state.

The Remote Loopback mode directly connects the URXD pin to the UTXD line. The transmitter and the receiver are disabled and have no effect. This mode allows a bit-by-bit retransmission.

| Reset  | –     | –    | –     | –      | –     | –     |    |    |        |

#### Bit 12 – REQCLR Request Clear

- SleepWalking enabled:

0: No effect.

1: Bit REQCLR clears the potential clock request currently issued by UART, thus the potential system wake-up is cancelled.

- SleepWalking disabled:

0: No effect.

1: Bit REQCLR restarts the comparison trigger to enable receive holding register loading.

#### Bit 11 – STTTO Start Time-out

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Starts waiting for a character before clocking the time-out counter. Resets status bit TIMEOUT in UART_SR. |

#### Bit 10 – RETTO Rearm Time-out

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

| Value | Description        |
|-------|--------------------|
| 0     | No effect.         |
| 1     | Restarts time-out. |

### Bit 8 – RSTSTA Reset Status

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Resets the status bits PARE, FRAME, CMP and OVRE in the UART_SR. |

### Bit 7 – TXDIS Transmitter Disable

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | The transmitter is disabled. If a character is being processed and a character has been written in the UART_THR and RSTTX is not set, both characters are completed before the transmitter is stopped. |

### Bit 6 – TXEN Transmitter Enable

| Value | Description                               |
|-------|---|
| 0     | No effect.                                |
| 1     | The transmitter is enabled if TXDIS is 0. |

### Bit 5 – RXDIS Receiver Disable

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | The receiver is disabled. If a character is being processed and RSTRX is not set, the character is completed before the receiver is stopped. |

### Bit 4 – RXEN Receiver Enable

| Value | Description                            |
|-------|--|
| 0     | No effect.                             |
| 1     | The receiver is enabled if RXDIS is 0. |

### Bit 3 – RSTTX Reset Transmitter

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | The transmitter logic is reset and disabled. If a character is being transmitted, the transmission is aborted. |

### Bit 2 – RSTRX Reset Receiver

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | The receiver logic is reset and disabled. If a character is being received, the reception is aborted. |

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### 47.6.2 UART Mode Register

**Name:** UART\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 15:14 – CHMODE[1:0] Channel Mode

| Value | Name            | Description     |
|-------|-----------------|-----------------|
| 0     | NORMAL          | Normal mode     |
| 1     | AUTOMATIC       | Automatic echo  |
| 2     | LOCAL_LOOPBACK  | Local loopback  |
| 3     | REMOTE_LOOPBACK | Remote loopback |

#### Bit 12 – BRSRCCK Baud Rate Source Clock

0 (PERIPH\_CLK): The baud rate is driven by the peripheral clock

1 (GCLK): The baud rate is driven by a PMC-programmable clock GCLK (refer to section "Power Management Controller (PMC)").

#### Bits 11:9 – PAR[2:0] Parity Type

| Value | Name  | Description               |
|-------|-------|---------------------------|
| 0     | EVEN  | Even Parity               |
| 1     | ODD   | Odd Parity                |
| 2     | SPACE | Space: parity forced to 0 |
| 3     | MARK  | Mark: parity forced to 1  |
| 4     | NO    | No parity                 |

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

---

---

**Bit 4 – FILTER** Receiver Digital Filter

0 (DISABLED): UART does not filter the receive line.

1 (ENABLED): UART filters the receive line using a three-sample filter (16x-bit clock) (2 over 3 majority).

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### 47.6.3 UART Interrupt Enable Register

**Name:** UART\_IER  
**Offset:** 0x08  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|     |    |    |    |    |    |    |    |    |
|-----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|     |    |    |    |    |    |    |    |    |

Access  
Reset

|     |    |    |    |    |    |    |    |    |

| Reset  | 0                       | 0                       | 0    |                       |    |    | 0       | 0       |

#### Bit 15 – CMP Comparison Match

| Value | Description  |
|-------|--|
| 0     | No received character matches the comparison criteria programmed in VAL1, VAL2 fields and in CMPPAR bit since the last RSTSTA. |
| 1     | The received character matches the comparison criteria.  |

#### Bit 9 – TXEMPTY Transmitter Empty

| Value | Description   |
|-------|---|
| 0     | There are characters in UART_THR, or characters being processed by the transmitter, or the transmitter is disabled. |
| 1     | There are no characters in UART_THR and there are no characters being processed by the transmitter.                 |

#### Bit 8 – TIMEOUT Receiver Time-out

| Value | Description   |
|-------|---|
| 0     | There has not been a time-out since the last Start Time-out command (STTTO in UART_CR) or the Time-out Register is 0. |
| 1     | There has been a time-out since the last Start Time-out command (STTTO in UART_CR).                                   |

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### Bit 7 – PARE Parity Error

| Value | Description   |
|-------|---|
| 0     | No parity error has occurred since the last RSTSTA.           |
| 1     | At least one parity error has occurred since the last RSTSTA. |

### Bit 6 – FRAME Framing Error

| Value | Description  |
|-------|--|
| 0     | No framing error has occurred since the last RSTSTA.           |
| 1     | At least one framing error has occurred since the last RSTSTA. |

### Bit 5 – OVRE Overrun Error

| Value | Description  |
|-------|--|
| 0     | No overrun error has occurred since the last RSTSTA.           |
| 1     | At least one overrun error has occurred since the last RSTSTA. |

### Bit 1 – TXRDY Transmitter Ready

| Value | Description  |
|-------|--|
| 0     | A character has been written to UART_THR and not yet transferred to the internal shift register, or the transmitter is disabled. |
| 1     | There is no character written to UART_THR not yet transferred to the internal shift register.                                    |

### Bit 0 – RXRDY Receiver Ready

| Value | Description  |
|-------|--|
| 0     | No character has been received since the last read of the UART_RHR, or the receiver is disabled. |
| 1     | At least one complete character has been received, transferred to UART_RHR and not yet read.     |

#### Bits 23:16 – VAL2[7:0] Second Comparison Value for Received Character

| Value | Description   |
|-------|---|
| 0-255 | The received character must be lower or equal to the value of VAL2 and higher or equal to VAL1 to set CMP flag in UART_SR. If asynchronous partial wake-up (SleepWalking) is enabled in PMC_SLPWK_ER, the UART requests a system wake-up if condition is met. |

#### Bit 14 – CMPPAR Compare Parity

| Value | Description  |
|-------|--|
| 0     | The parity is not checked and a bad parity cannot prevent from waking up the system.   |
| 1     | The parity is checked and a matching condition on data can be cancelled by an error on parity bit, so no wake-up is performed. |

#### Bit 12 – CMPMODE Comparison Mode

| Value | Name            | Description  |
|-------|-----------------|--|
| 0     | FLAG_ONLY       | Any character is received and comparison function drives CMP flag. |
| 1     | START_CONDITION | Comparison condition must be met to start reception.               |

#### Bits 7:0 – VAL1[7:0] First Comparison Value for Received Character

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

| Value | Description   |
|-------|---|
| 0-255 | The received character must be higher or equal to the value of VAL1 and lower or equal to VAL2 to set CMP flag in UART_SR. If asynchronous partial wake-up (SleepWalking) is enabled in PMC_SLPWK_ER, the UART requests a system wake-up if the condition is met. |

|        | Bit | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24  |
|        |     | WPKEY[23:16] |    |    |    |    |    |    |     |
| Access |     | W            | W  | W  | W  | W  | W  | W  | W   |
| Reset  |     | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0   |
|        | Bit | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16  |
|        |     | WPKEY[15:8]  |    |    |    |    |    |    |     |
| Access |     | W            | W  | W  | W  | W  | W  | W  | W   |
| Reset  |     | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0   |
|        | Bit | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8   |
|        |     | WPKEY[7:0]   |    |    |    |    |    |    |     |
| Access |     | W            | W  | W  | W  | W  | W  | W  | W   |
| Reset  |     | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0   |
|        | Bit | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0   |
|        |     | WPEN         |    |    |    |    |    |    |     |
| Access |     |              |    |    |    |    |    |    | R/W |
| Reset  |     |              |    |    |    |    |    |    | 0   |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description  |
|----------|--------|--|
| 0x554152 | PASSWD | Writing any other value in this field aborts the write operation. Always reads as 0. |

#### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be protected.

| Value | Description   |
|-------|---|
| 0     | Disables the write protection if WPKEY corresponds to 0x554152 (UART in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x554152 (UART in ASCII).  |

## 48. Serial Peripheral Interface (SPI)

### 48.1 Description

The Serial Peripheral Interface (SPI) circuit is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “master” which controls the data flow, while the other devices act as “slaves” which have data shifted into and out by the master. Different CPUs can take turn being masters (multiple master protocol, contrary to single master protocol where one CPU is always the master while all of the others are always slaves). One master can simultaneously shift data into multiple slaves. However, only one slave can drive its output to write data back to the master at any given time.

A slave device is selected when the master asserts its NSS signal. If multiple slave devices exist, the master generates a separate slave select signal for each slave (NPCS).

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI)—This data line supplies the output data from the master shifted into the input(s) of the slave(s).
- Master In Slave Out (MISO)—This data line supplies the output data from a slave to the input of the master. There may be no more than one slave transmitting data during any particular transfer.
- Serial Clock (SPCK)—This control line is driven by the master and regulates the flow of the data bits. The master can transmit data at a variety of baud rates; there is one SPCK pulse for each bit that is transmitted.
- Slave Select (NSS)—This control line allows slaves to be turned on and off by hardware.

### 48.2 Embedded Characteristics

- Master or Slave Serial Peripheral Bus Interface
  - 8-bit to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delay between consecutive transfers and delay before SPI clock per chip select
  - Programmable delay between chip selects
  - Selectable mode fault detection
- Master Mode can Drive SPCK up to Peripheral Clock
- 16-data Transmit and Receive FIFOs
- Master Mode Bit Rate can be Independent of the Processor/Peripheral Clock
- Slave Mode Operates on SPCK, Asynchronously with Core and Bus Clock
- Four Chip Selects with External Decoder Support Allow Communication with up to 15 Peripherals
- Communication with Serial External Devices Supported
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - External coprocessors

- Connection to DMA Channel Capabilities, Optimizing Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Register Write Protection

### 48.4 Application Block Diagram

Figure 48-2. Application Block Diagram: Single Master/Multiple Slave Implementation

## 48.5 Signal Description

**Table 48-1. Signal Description**

| Pin Name    | Pin Description                     | Type   |        |
|-------------|-------------------------------------|--------|--------|
|             |                                     | Master | Slave  |
| MISO        | Master In Slave Out                 | Input  | Output |
| MOSI        | Master Out Slave In                 | Output | Input  |
| SPCK        | Serial Clock                        | Output | Input  |
| NPCS1–NPCS3 | Peripheral Chip Selects             | Output | Unused |
| NPCS0/NSS   | Peripheral Chip Select/Slave Select | Output | Input  |

## 48.6 Product Dependencies

### 48.6.1 I/O Lines

The pins used for interfacing the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the SPI pins to their peripheral functions.

### 48.6.2 Power Management

The SPI can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the SPI clock.

### 48.6.3 Interrupt

The SPI interface has an interrupt line connected to the interrupt controller. Handling the SPI interrupt requires programming the interrupt controller before configuring the SPI.

### 48.6.4 Direct Memory Access Controller (DMAC)

The SPI interface can be used in conjunction with the DMAC in order to reduce processor overhead. For a full description of the DMAC, refer to the relevant section.

## 48.7 Functional Description

### 48.7.1 Modes of Operation

The SPI operates in Master mode or in Slave mode.

- The SPI operates in Master mode by setting the MSTR bit in the SPI Mode Register (SPI\_MR):
  - Pins NPCS0 to NPCS3 are all configured as outputs
  - The SPCK pin is driven
  - The MISO line is wired on the receiver input
  - The MOSI line is driven as an output by the transmitter.
- The SPI operates in Slave mode if the MSTR bit in SPI\_MR is written to '0':
  - The MISO line is driven by the transmitter output
  - The MOSI line is wired on the receiver input

- The SPCK pin is driven by the transmitter to synchronize the receiver.
- The NPCS0 pin becomes an input, and is used as a slave select signal (NSS)
- The NPCS1 to NPCS3 pins are not driven and can be used for other purposes.

The data transfers are identically programmable for both modes of operation. The baud rate generator is activated only in Master mode.

### 48.7.2 Data Transfer

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the SPI Chip Select registers (SPI\_CSRx). The clock phase is programmed with the NCPHA bit. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Consequently, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are connected and require different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

The table below shows the four modes and corresponding parameter settings.

**Table 48-2. SPI Bus Protocol Modes**

| SPI Mode | CPOL | NCPHA | Shift SPCK Edge | Capture SPCK Edge | SPCK Inactive Level |
|----------|------|-------|-----------------|-------------------|---------------------|
| 0        | 0    | 1     | Falling         | Rising            | Low                 |
| 1        | 0    | 0     | Rising          | Falling           | Low                 |
| 2        | 1    | 1     | Rising          | Falling           | High                |
| 3        | 1    | 0     | Falling         | Rising            | High                |

The following figures show examples of data transfers.

**Figure 48-3. SPI Transfer Format (NCPHA = 1, 8 bits per transfer)**

\* Not defined.

**Figure 48-4. SPI Transfer Format (NCPHA = 0, 8 bits per transfer)**

### 48.7.3 Master Mode Operations

When configured in Master mode, the SPI operates on the clock generated by the internal programmable baud rate generator. It fully controls the data transfers to and from the slave(s) connected to the SPI bus. The SPI drives the chip select line to the slave and the serial clock signal (SPCK).

The SPI features two holding registers, the Transmit Data Register (SPI\_TDR) and the Receive Data Register (SPI\_RDR), and a single shift register. The holding registers maintain the data flow at a constant rate.

After enabling the SPI, a data transfer starts when the processor writes to SPI\_TDR. The written data is immediately transferred into the internal shift register and the transfer on the SPI bus starts. While the data in the shift register is shifted on the MOSI line, the MISO line is sampled and shifted into the shift register. Data cannot be loaded in SPI\_RDR without transmitting data. If there is no data to transmit, dummy data can be used (SPI\_TDR filled with ones). If SPI\_MR.WDRBT is set, transmission can occur only if SPI\_RDR has been read. If Receiving mode is not required, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the SPI Status register (SPI\_SR) can be discarded.

Before writing SPI\_TDR, SPI\_MR.PCS must be set in order to select a slave.

If new data is written in SPI\_TDR during the transfer, it is kept in SPI\_TDR until the current transfer is completed. Then, the received data is transferred from the shift register to SPI\_RDR, the data in SPI\_TDR is loaded in the shift register and a new transfer starts.

As soon as SPI\_TDR is written, the Transmit Data Register Empty (TDRE) flag in SPI\_SR is cleared. When the data written in SPI\_TDR is loaded into the shift register, TDRE in SPI\_SR is set. The TDRE flag is used to trigger the Transmit DMA channel.

See the figure below.

The end of transfer is indicated by the TXEMPTY flag in SPI\_SR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

**Note:** When the SPI is enabled, the TDRE and TXEMPTY flags are set.

**Figure 48-5. TDRE and TXEMPTY Flag Behavior**

The transfer of received data from the internal shift register to SPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in SPI\_SR. When the received data is read, SPI\_SR.RDRF is cleared.

If SPI\_RDR has not been read before new data is received, the Overrun Error (OVRES) flag in SPI\_SR is set. As long as this flag is set, data is loaded in SPI\_RDR. The user has to read SPI\_SR to clear OVRES.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode and a flow chart describing how transfers are handled.

### 48.7.3.1 Master Mode Block Diagram

**Figure 48-6. Master Mode Block Diagram**

### 48.7.3.2 Master Mode Flow Diagram

Figure 48-7. Master Mode Flow Diagram

The figure below shows the behavior of Transmit Data Register Empty (TDRE), Receive Data Register (RDRF) and Transmission Register Empty (TXEMPTY) status flags within SPI\_SR during an 8-bit data transfer in Fixed mode without the DMA involved.

**Figure 48-8. Status Register Flags Behavior**

### 48.7.3.3 Clock Generation

The SPI Baud rate clock is generated by dividing the peripheral clock by a value between 1 and 255.

If SPI\_CSRx.SCBR is programmed to 1, the operating baud rate is peripheral clock (refer to the section “Electrical Characteristics” for the SPCK maximum frequency). Triggering a transfer while SPI\_CSRx.SCBR is at 0 can lead to unpredictable results.

At reset, SPI\_CSRx.SCBR=0 and the user has to program it to a valid value before performing the first transfer.

The divisor can be defined independently for each chip select, as it has to be programmed in SPI\_CSRx.SCBR. This allows the SPI to automatically adapt the baud rate for each interfaced peripheral without reprogramming.

### 48.7.3.4 Transfer Delays

The following figure shows a chip select transfer change and consecutive transfers on the same chip select. Three delays can be programmed to modify the transfer waveforms:

- Delay between the chip selects—programmable only once for all chip selects by writing field SPI\_MR.DLYBCS. The SPI slave device deactivation delay is managed through DLYBCS. If there is only one SPI slave device connected to the master, DLYBCS does not need to be configured. If several slave devices are connected to a master, DLYBCS must be configured depending on the highest deactivation delay. Refer to details on the SPI slave device in the section “Electrical Characteristics”.
- Delay before SPCK— Independently programmable for each chip select by writing SPI\_CSRx.DLYBS. The SPI slave device activation delay is managed through DLYBS. Refer to details on the SPI slave device in the section “Electrical Characteristics” to define DLYBS.

- Delay between consecutive transfers—independently programmable for each chip select by writing SPI\_CSRx.DLYBCT. The time required by the SPI slave device to process received data is managed through DLYBCT. This time depends on the SPI slave system activity.

These delays allow the SPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 48-9. Programmable Delays**

### 48.7.3.5 Peripheral Selection

The serial peripherals are selected through the assertion of the NPCS0 to NPCS3 signals. By default, all NPCS signals are high before and after each transfer.

- **Fixed Peripheral Select Mode:** SPI exchanges data with only one peripheral. Fixed Peripheral Select mode is enabled by clearing SPI\_MR.PS. In this case, the current peripheral is defined by SPI\_MR.PCS. SPI\_TDR.PCS has no effect.
- **Variable Peripheral Select Mode:** Data can be exchanged with more than one peripheral without having to reprogram SPI\_MR.PCS.

Variable Peripheral Select mode is enabled by setting SPI\_MR.PS. SPI\_TDR.PCS is used to select the current peripheral. This means that the peripheral selection can be defined for each new data.

The value must be written in a single access to SPI\_TDR in the following format:

[xxxxxxx(7-bit) + LASTXFER(1-bit)<sup>(1)</sup> + xxxx(4-bit) + PCS (4-bit) + TD (8- to 16-bit data)]

with LASTXFER at 0 or 1 depending on the CSAAT bit, and PCS equal to the chip select to assert, as defined in section [SPI Transmit Data Register](#).

**Note:**

1. Optional

For details on CSAAT, LASTXFER and CSNAAT, see section [Peripheral Deselection with another DMA](#).

If LASTXFER is used, the command must be issued after writing the last character. Instead of LASTXFER, the user can use the SPIDIS command. After the end of the DMA transfer, it is necessary to wait for the TXEMPTY flag and then write SPIDIS into the SPI Control Register (SPI\_CR). This does not change the configuration register values). The NPCS is disabled after the last character transfer. Then, another DMA transfer can be started if SPI\_CR.SPIEN has previously been written.

### 48.7.3.6 SPI Direct Access Memory Controller (DMAC)

In both Fixed and Variable modes, the Direct Memory Access Controller (DMAC) can be used to reduce processor overhead.

The fixed peripheral selection allows buffer transfers with a single peripheral. Using the DMAC is an optimal means, as the size of the data transfer between the memory and the SPI is either 8 bits or 16 bits. However, if the peripheral selection is modified, SPI\_MR must be reprogrammed.

The variable peripheral selection allows buffer transfers with multiple peripherals without reprogramming SPI\_MR. Data written in SPI\_TDR is 32 bits wide and defines the real data to be transmitted and the destination peripheral. Using the DMAC in this mode requires 32-bit wide buffers, with the data in the LSBs and the PCS and LASTXFER fields in the MSBs. However, the SPI still controls the number of bits (8 to 16) to be transferred through MISO and MOSI lines with the chip select configuration registers. This is not the optimal means in terms of memory size for the buffers, but it provides a very effective means to exchange data with several peripherals without any intervention of the processor.

### 48.7.3.7 Peripheral Chip Select Decoding

The user can program the SPI to operate with up to 15 slave peripherals by decoding the four chip select lines, NPCS0 to NPCS3 with an external decoder/demultiplexer (see figure below). This can be enabled by setting SPI\_MR.PCSDEC.

When operating without decoding, the SPI makes sure that in any case only one chip select line is activated, i.e., one NPCS line driven low at a time. If two bits are defined low in a PCS field, only the lowest numbered chip select is driven low.

When operating with decoding, the SPI directly outputs the value defined by the PCS field on the NPCS lines of either SPI\_MR or SPI\_TDR (depending on PS).

As the SPI sets a default value of 0xF on the chip select lines (i.e., all chip select lines at 1) when not processing any transfer, only 15 peripherals can be decoded.

The SPI has four chip select registers (SPI\_CSR0...SPI\_CSR3). As a result, when external decoding is activated, each NPCS chip select defines the characteristics of up to four peripherals. As an example, SPI\_CSR0 defines the characteristics of the externally decoded peripherals 0 to 3, corresponding to the PCS values 0x0 to 0x3. Consequently, the user has to make sure to connect compatible peripherals on the decoded chip select lines 0 to 3, 4 to 7, 8 to 11 and 12 to 14. The following figure shows this type of implementation.

If SPI\_CSRx.CSAAT bit is used, with or without the DMAC, the Mode Fault detection for NPCS0 line must be disabled. This is not needed for all other chip select lines since Mode Fault detection is only on NPCS0.

**Figure 48-10. Chip Select Decoding Application Block Diagram: Single Master/Multiple Slave Implementation**

#### 48.7.3.8 Peripheral Deselection without DMA

During a transfer of more than one unit of data on a chip select without the DMA, SPI\_TDR is loaded by the processor, the TDRE flag rises as soon as the content of SPI\_TDR is transferred into the internal shift register. When this flag is detected high, SPI\_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the chip select is not deasserted between the two transfers. But depending on the application software handling the SPI status register flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload SPI\_TDR in time to keep the chip select active (low). A null DLYBCT value (delay between consecutive transfers) in SPI\_CSR, gives even less time for the processor to reload SPI\_TDR. With some SPI slave peripherals, if the chip select line must remain active (low) during a full set of transfers, communication errors can occur.

To facilitate interfacing with such devices, the chip select registers [SPI\_CSR0...SPI\_CSR3] can be programmed with the Chip Select Active After Transfer (CSAAT) bit at 1. This allows the chip select lines to remain in their current state (low = active) until a transfer to another chip select is required. Even if SPI\_TDR is not reloaded, the chip select remains active. To deassert the chip select line at the end of the transfer, the Last Transfer (LASTXFER) bit in SPI\_CR must be set after writing the last data to transmit into SPI\_TDR.

#### 48.7.3.9 Peripheral Deselection with DMA

DMA provides faster reloads of SPI\_TDR compared to software. However, depending on the system activity, it is not guaranteed that SPI\_TDR is written with the next data before the end of the current transfer. Consequently, data can be lost by the deassertion of the NPCS line for SPI slave peripherals requiring the chip select line to remain active between two transfers. The only way to guarantee a safe transfer in this case is the use of the CSAAT and LASTXFER bits.

When the CSAAT bit is configured to 0, the NPCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a chip select, the TDRE flag rises as soon as the content of SPI\_TDR is transferred into the internal shift register. When this flag is detected, SPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the chip select is not deasserted between the two

transfers. This can lead to difficulties to interface with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, SPI\_CSR can be programmed with the Chip Select Not Active After Transfer (CSNAAT) bit at 1. This allows the chip select lines to be deasserted systematically during a time “DLYBCS” (the value of the CSNAAT bit is processed only if the CSAAT bit is configured to 0 for the same chip select).

The following figure shows different peripheral deselection cases and the effect of the CSAAT and CSNAAT bits.

**Figure 48-11. Peripheral Deselection**

### 48.7.3.10 Mode Fault Detection

The SPI has the capability to operate in multimaster environment. Consequently, the NPCS0/NSS line must be monitored. If one of the masters on the SPI bus is currently transmitting, the NPCS0/NSS line is low and the SPI must not transmit any data. A mode fault is detected when the SPI is programmed in Master mode and a low level is driven by an external master on the NPCS0/NSS signal. In multimaster

environment, NPCS0, MOSI, MISO and SPCK pins must be configured in open drain (through the PIO controller). When a mode fault is detected, SPI\_SR.MODF bit is set until SPI\_SR is read and the SPI is automatically disabled until it is reenabled by setting SPI\_CR.SPIEN bit.

By default, the mode fault detection is enabled. The user can disable it by setting SPI\_MR.MODFDIS bit.

#### 48.7.4 SPI Slave Mode

When operating in Slave mode, the SPI processes data bits on the clock provided on the SPI clock pin (SPCK).

The SPI waits until NSS goes active before receiving the serial clock from an external master. When NSS falls, the clock is validated and the data is loaded in SPI\_RDR depending on the configuration of SPI\_CSR0.BITS. These bits are processed following a phase and a polarity defined respectively by the NCPHA and CPOL bits in SPI\_CSR0. Note that the fields BITS, CPOL and NCPHA of the other chip select registers (SPI\_CSR1...SPI\_CSR3) have no effect when the SPI is programmed in Slave mode.

The bits are shifted out on the MISO line and sampled on the MOSI line.

**Note:** For more information on SPI\_CSRx.BITS, see the note in section [SPI Chip Select Register](#).

When all bits are processed, the received data is transferred in SPI\_RDR and the RDRF bit rises. If SPI\_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in SPI\_SR is set. As long as this flag is set, data is loaded in SPI\_RDR. The user must read SPI\_SR to clear the OVRES bit.

When a transfer starts, the data shifted out is the data present in the internal shift register. If no data has been written in SPI\_TDR, the last data received is transferred. If no data has been received since the last reset, all bits are transmitted low, as the internal shift register resets to 0.

When a first data is written in SPI\_TDR, it is transferred immediately in the internal shift register and the TDRE flag rises. If new data is written, it remains in SPI\_TDR until a transfer occurs, i.e., NSS falls and there is a valid clock on the SPCK pin. When the transfer occurs, the last data written in SPI\_TDR is transferred in the internal shift register and the TDRE flag rises. This enables frequent updates of critical variables with single transfers.

Then, new data is loaded in the internal shift register from SPI\_TDR. If no character is ready to be transmitted, i.e., no character has been written in SPI\_TDR since the last load from SPI\_TDR to the internal shift register, SPI\_TDR is retransmitted. In this case the Underrun Error Status Flag (UNDES) is set in SPI\_SR.

If NSS rises between two characters, it must be kept high for two MCK clock periods or more and the next SPCK capture edge must not occur less than four MCK periods after NSS rise.

The following figure shows a block diagram of the SPI when operating in Slave mode.

**Figure 48-12. Slave Mode Functional Block Diagram**

### 48.7.5 SPI Comparison Function on Received Character

The comparison is only relevant for SPI Slave mode (SPI\_MR.MSTR=0).

The effect of a comparison match changes if the system is in Wait or Active mode.

In Wait mode, if asynchronous partial wakeup is enabled, a system wakeup is performed (see section [SPI Asynchronous and Partial Wakeup \(SleepWalking\)](#)).

In Active mode, the CMP flag in SPI\_SR is raised. It is set when the received character matches the conditions programmed in the SPI Comparison Register (SPI\_CMPR). The CMP flag is set as soon as SPI\_RDR is loaded with the new received character. The CMP flag is cleared by reading SPI\_SR.

SPI\_CMPR (see section [SPI Comparison Register](#)) can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When SPI\_MR.CMPMODE is cleared, all received data is loaded in SPI\_RDR and the CMP flag provides the status of the comparison result.

By setting SPI\_MR.CMPMODE, the comparison result triggers the start of SPI\_RDR loading (see the following figure). The trigger condition exists as soon as the received character value matches the conditions defined by VAL1 and VAL2 in SPI\_CMPR. The comparison trigger event is restarted by setting SPI\_CR.REQCLR if SleepWalking is disabled.

The value programmed in VAL1 and VAL2 fields must not exceed the maximum value of the received character (see SPI\_CSR0.BITS).

**Figure 48-13. Receive Data Register Management**

CMPMODE = 1, VAL1 = VAL2 = 0x06

### 48.7.6 SPI Asynchronous and Partial Wakeup (SleepWalking)

This operating mode is a means of data preprocessing that qualifies an incoming event, thus allowing the SPI to decide whether or not to wake up the system. Asynchronous and partial wakeup is mainly used when the system is in Wait mode (refer to the section “Power Management Controller (PMC)” for further details). It can also be enabled when the system is fully running.

Asynchronous and partial wakeup can be used only when SPI is configured in Slave mode (SPI\_MR.MSTR is cleared).

The maximum SPI clock (SPCK) frequency that can be provided by the SPI master is bounded by the peripheral clock frequency. The SPCK frequency must be lower than or equal to the peripheral clock. The NSS line must be deasserted by the SPI master between two characters. The NSS deassertion duration time must be greater than or equal to six peripheral clock periods. The time between the assertion of NSS line (falling edge) and the first edge of the SPI clock must be higher than 5  $\mu$ s.

SPI\_RDR must be read before enabling the asynchronous and partial wakeup.

When asynchronous and partial wakeup is enabled for the SPI (refer to the section “Power Management Controller (PMC)” ), the PMC decodes a clock request from the SPI. The request is generated as soon as there is a falling edge on the NSS line as this may indicate the beginning of a frame. If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the SPI.

The SPI processes the received frame and compares the received character with SPI\_CMPR.VAL1 and SPI\_CMPR.VAL2 (see section [SPI Comparison Register](#)).

The SPI instructs the PMC to disable the peripheral clock if the received character value does not meet the conditions defined by SPI\_CMPR.VAL1 and SPI\_CMPR.VAL2 (see figure [Asynchronous Event Generating Only Partial Wakeup](#)).

If the received character value meets the conditions, the SPI instructs the PMC to exit the system from Wait mode (see figure [Asynchronous Wakeup Use Case Example](#)).

The VAL1 and VAL2 fields can be programmed to provide different comparison methods and thus matching conditions.

- If VAL1 = VAL2, then the comparison is performed on a single value and the wakeup is triggered if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 wakes up the system.
- If VAL1 is strictly higher than VAL2, the wakeup is triggered if any received character equals VAL1 or VAL2.
- If VAL1 = 0 and VAL2 = 65535, the wakeup is triggered as soon as a character is received.

If the processor and peripherals are running, the SPI can be configured in Asynchronous and Partial Wakeup mode by enabling the PMC\_SLPWK\_ER (refer to the section “Power Management Controller (PMC)”). When activity is detected on the receive line, the SPI requests the clock from the PMC and the comparison is performed. If there is a comparison match, the SPI continues to request the clock. If there is no match, the clock is switched off for the SPI only, until a new activity is detected.

The CMPMODE configuration has no effect when Asynchronous and Partial Wakeup mode is enabled for the SPI (refer to PMC\_SLPWK\_ER in the section “Power Management Controller (PMC)”).

When the system is in Active mode and the SPI enters Asynchronous and Partial Wakeup mode, the flag RDRF must be programmed as the unique source of the SPI interrupt.

When the system exits Wait mode as the result of a matching condition, the RDRF flag is used to determine if the SPI is the source for the exit from Wait mode.

### Figure 48-14. Asynchronous Wakeup Use Case Example

Case with VAL1 = VAL2 = 0x55

**Figure 48-15. Asynchronous Event Generating Only Partial Wakeup**

Case with VAL1 = VAL2 = 0x55

### 48.7.7 FIFOs

#### 48.7.7.1 Overview

The SPI includes two FIFOs which can be enabled/disabled using SPI\_CR.FIFOEN/FIFODIS. The SPI must be disabled (SPI\_CR.SPIDIS) before enabling or disabling the SPI FIFOs.

Writing SPI\_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to SPI\_TDR/RDR. Refer to sections [Single Data Mode](#) and [Multiple Data Mode](#).

**Figure 48-16. FIFOs Block Diagram**

#### 48.7.7.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to SPI\_TDR loads the Transmit FIFO.

The FIFO level is provided in SPI\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor SPI\_SR.TDRE and the data can be successively written in SPI\_TDR.

If the FIFO cannot accept the data due to insufficient space, wait for the TDRE flag to be set before writing the data in SPI\_TDR.

When the space in the FIFO allows only a portion of the data to be written, the TDRE flag must be monitored before writing the remaining data.

**Figure 48-17. Sending Data with FIFO**

### 48.7.7.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, SPI\_RDR access reads the FIFO.

When data are present in the Receive FIFO (RDRF flag set to '1'), the exact number of data can be checked with SPI\_FLR.RXFL. All the data can be read successively in SPI\_RDR without checking the RDRF flag between each access.

**Figure 48-18. Receiving Data with FIFO**

#### 48.7.7.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using SPI\_CR.TXFCLR/RXFCLR.

#### 48.7.7.5 TXEMPTY, TDRE and RDRF Behavior

SPI\_SR.TXEMPTY, SPI\_SR.TDRE and SPI\_SR.RDRF flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TDRE indicates if a data can be written in the Transmit FIFO. Thus the TDRE flag is set as long as the Transmit FIFO can accept new data. Refer to figure [TDRE in Single Data Mode and TXRDYM=0](#).

RDRF indicates if an unread data is present in the Receive FIFO. Thus the RDRF flag is set as soon as one unread data is in the Receive FIFO. Refer to figure [RDRF in Single Data Mode and RXRDYM=0](#).

TDRE and RDRF behavior can be modified using the TXRDYM and RXRDYM fields in the SPI FIFO Mode Register (SPI\_FMR) to reduce the number of accesses to SPI\_TDR/RDR. However, for some configurations, the following constraints apply:

- When the Variable Peripheral Select mode is used (SPI\_MR.PS=1), SPI\_FMR.TXRDYM/RXRDYM must be cleared.
- In Master mode (SPI\_MR.MSTR=1), SPI\_FMR.RXRDYM must be cleared.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See section [SPI FIFO Mode Register](#) for the FIFO configuration.

**Figure 48-19. TDRE in Single Data Mode and TXRDYM=0**

**Figure 48-20. RDRF in Single Data Mode and RXRDYM=0**

### 48.7.7.6 Single Data Mode

In Single Data mode, only one data is written every time SPI\_TDR is accessed, and only one data is read every time SPI\_RDR is accessed.

When SPI\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When SPI\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If Master mode is used (SPI\_MR.MSTR=1), the Receive FIFO must operate in Single Data mode.

If Variable Peripheral Select mode is used (SPI\_MR.PS=1), the Transmit FIFO must operate in Single Data mode.

See sections [SPI Transmit Data Register](#) and [SPI Receive Data Register](#).

### 48.7.7.6.1 DMAC

When FIFOs operate in Single Data mode, the DMAC transfer type must be configured either in bytes, halfwords or words depending on SPI\_MR.PS bit value and SPI\_CSRx.BITS field value.

The same conditions for transfer type apply when FIFOs are disabled.

### 48.7.7.7 Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When SPI\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When SPI\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

Multiple data can be read from the Receive FIFO only in Slave mode (SPI\_MR.MSTR=0).

The Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0 and when SPI\_MR.PS=0.

In Multiple Data mode, up to two data can be written in one SPI\_TDR write access. It is also possible to read up to four data in one SPI\_RDR access if SPI\_CSRx.BITS is configured to '0' (8-bit data size) and up to two data if SPI\_CSRx.BITS is configured to a value other than '0' (more than 8-bit data size).

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a word-size register access, then up to four data are read and up to two data are written.

Written/read data are always right-aligned, as described in sections [SPI Receive Data Register \(FIFO Multiple Data, 8-bit\)](#), [SPI Receive Data Register \(FIFO Multiple Data, 16-bit\)](#) and [SPI Transmit Data Register \(FIFO Multiple Data, 8 to 16-bit\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six SPI\_TDR-byte write accesses
- three SPI\_TDR-halfword write accesses

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six SPI\_RDR-byte read accesses
- three SPI\_RDR-halfword read accesses
- one SPI\_RDR-word read access and one SPI\_RDR-halfword read access

### 48.7.7.7.1 TDRE and RDRF Configuration

In Multiple Data mode, it is possible to write one or more data in the same SPI\_TDR/SPI\_RDR access.

The TDRE flag indicates if one or more data can be written in the FIFO depending on the configuration of SPI\_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in SPI\_TDR, it is useful to configure the TXRDYM field to the value '1' so that the TDRE flag is at '1' only when at least two data can be written in the Transmit FIFO.

Similarly, if four data are read each time in SPI\_RDR, it is useful to configure the RXRDYM field to the value '2' so that the RDRF flag is at '1' only when at least four unread data are in the Receive FIFO.

### 48.7.7.7.2 DMAC

It is mandatory to configure DMAC channel size (byte, halfword or word) according to FLEX\_SPI\_FMR.TXRDYM/RXRDYM configuration. See section [Multiple Data Mode](#) for constraints.

### 48.7.7.8 FIFO Pointer Error

A FIFO overflow is reported in SPI\_SR.

If the Transmit FIFO is full and a write access is performed on SPI\_TDR, it generates a Transmit FIFO pointer error and sets SPI\_SR.TXFPTEF.

In Multiple Data mode, if the number of data written in SPI\_TDR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and SPI\_SR.TXFPTEF is set.

A FIFO underflow is reported in SPI\_SR.

In Multiple Data mode, if the number of data read in SPI\_RDR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and SPI\_SR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in SPI\_TDR/SPI\_RDR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a pointer error occurs, a software reset must be performed using SPI\_CR.SWRST (configuration will be lost).

### 48.7.7.9 FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using SPI\_FMR.TXFTHRES. Each time the Transmit FIFO goes from the 'above threshold' to the 'equal or below threshold' state, SPI\_SR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using SPI\_FMR.RXFTHRES. Each time the Receive FIFO goes from the 'below threshold' to the 'equal or above threshold' state, SPI\_SR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using SPI\_IER and SPI\_IDR.

### 48.7.7.10 FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through SPI\_IER and SPI\_IDR.

FIFO flags state can be read in SPI\_SR. They are cleared when SPI\_SR is read.

### 48.7.8 Register Write Protection

To prevent any single software error from corrupting SPI behavior, certain registers in the address space can be write-protected in the [SPI Write Protection Mode Register](#) (SPI\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [SPI Write Protection Status Register](#) (SPI\_WPSR) is set and the WPVSRC field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading SPI\_WPSR.

The following registers are write-protected when WPEN is set in SPI\_WPMR:

- [SPI Mode Register](#)
- [SPI Chip Select Register](#)

# SAMA5D2 Series

## Serial Peripheral Interface (SPI)

### 48.8 Register Summary

| Offset | Name                            | Bit Pos. |             |         |        |         |          |          |         |         |          |
|--------|---------------------------------|----------|-------------|---------|--------|---------|----------|----------|---------|---------|----------|

### 48.8.1 SPI Control Register

**Name:** SPI\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

|        |         |        |    |        |    |    |        |          |
|--------|---------|--------|----|--------|----|----|--------|----------|
| Bit    | 31      | 30     | 29 | 28     | 27 | 26 | 25     | 24       |
|        | FIFODIS | FIFOEN |    |        |    |    |        | LASTXFER |
| Access | W       | W      |    |        |    |    |        | W        |
| Reset  | –       | –      |    |        |    |    |        | –        |
|        |         |        |    |        |    |    |        |          |
| Bit    | 23      | 22     | 21 | 20     | 19 | 18 | 17     | 16       |
|        |         |        |    |        |    |    | RXFCLR | TXFCLR   |
| Access |         |        |    |        |    |    | W      | W        |
| Reset  |         |        |    |        |    |    | –      | –        |
|        |         |        |    |        |    |    |        |          |
| Bit    | 15      | 14     | 13 | 12     | 11 | 10 | 9      | 8        |
|        |         |        |    | REQCLR |    |    |        |          |
| Access |         |        |    | W      |    |    |        |          |
| Reset  |         |        |    | –      |    |    |        |          |
|        |         |        |    |        |    |    |        |          |
| Bit    | 7       | 6      | 5  | 4      | 3  | 2  | 1      | 0        |
|        | SWRST   |        |    |        |    |    | SPIDIS | SPIEN    |
| Access | W       |        |    |        |    |    | W      | W        |
| Reset  | –       |        |    |        |    |    | –      | –        |

#### Bit 31 – FIFODIS FIFO Disable

| Value | Description                              |
|-------|--|
| 0     | No effect.                               |
| 1     | Disables the Transmit and Receive FIFOs. |

#### Bit 30 – FIFOEN FIFO Enable

| Value | Description                             |
|-------|---|
| 0     | No effect.                              |
| 1     | Enables the Transmit and Receive FIFOs. |

#### Bit 24 – LASTXFER Last Transfer

Refer to section [Peripheral Selection](#) for more details.

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | The current NPCS is deasserted after the character written in TD has been transferred. When SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

#### Bit 17 – RXFCLR Receive FIFO Clear

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Empties the Receive FIFO. |

**Bit 16 – TXFCLR** Transmit FIFO Clear

| Value | Description                |
|-------|----------------------------|
| 0     | No effect.                 |
| 1     | Empties the Transmit FIFO. |

**Bit 12 – REQCLR** Request to Clear the Comparison Trigger

SleepWalking enabled:

0: No effect.

1: Clears the potential clock request currently issued by SPI, thus the potential system wakeup is cancelled.

SleepWalking disabled:

0: No effect.

1: Restarts the comparison trigger to enable SPI\_RDR loading.

**Bit 7 – SWRST** SPI Software Reset

The SPI is in Slave mode after software reset.

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | Reset the SPI. A software-triggered hardware reset of the SPI interface is performed. |

**Bit 1 – SPIDIS** SPI Disable

All pins are set in Input mode after completion of the transmission in progress, if any.

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if SPI\_THR is loaded.

If both SPIEN and SPIDIS are equal to one when SPI\_CR is written, the SPI is disabled.

| Value | Description       |
|-------|-------------------|
| 0     | No effect.        |
| 1     | Disables the SPI. |

**Bit 0 – SPIEN** SPI Enable

| Value | Description                                   |
|-------|---|
| 0     | No effect.                                    |
| 1     | Enables the SPI to transfer and receive data. |

### 48.8.2 SPI Mode Register

**Name:** SPI\_MR  
**Offset:** 0x04  
**Reset:** 0x0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

|        |             |     |       |         |          |        |     |         |
|--------|-------------|-----|-------|---------|----------|--------|-----|---------|
| Bit    | 31          | 30  | 29    | 28      | 27       | 26     | 25  | 24      |
|        | DLYBCS[7:0] |     |       |         |          |        |     |         |
| Access | R/W         | R/W | R/W   | R/W     | R/W      | R/W    | R/W | R/W     |
| Reset  | 0           | 0   | 0     | 0       | 0        | 0      | 0   | 0       |
|        |             |     |       |         |          |        |     |         |
| Bit    | 23          | 22  | 21    | 20      | 19       | 18     | 17  | 16      |
|        |             |     |       |         | PCS[3:0] |        |     |         |
| Access |             |     |       |         | R/W      | R/W    | R/W | R/W     |
| Reset  |             |     |       |         | 0        | 0      | 0   | 0       |
|        |             |     |       |         |          |        |     |         |
| Bit    | 15          | 14  | 13    | 12      | 11       | 10     | 9   | 8       |
|        |             |     |       | CMPMODE |          |        |     | LSBHALF |
| Access |             |     |       | R/W     |          |        |     | R/W     |
| Reset  |             |     |       | 0       |          |        |     | 0       |
|        |             |     |       |         |          |        |     |         |
| Bit    | 7           | 6   | 5     | 4       | 3        | 2      | 1   | 0       |
|        | LLB         |     | WDRBT | MODFDIS | BRSRCCLK | PCSDEC | PS  | MSTR    |
| Access | R/W         |     | R/W   | R/W     | R/W      | R/W    | R/W | R/W     |
| Reset  | 0           |     | 0     | 0       | 0        | 0      | 0   | 0       |

#### Bits 31:24 – DLYBCS[7:0] Delay Between Chip Selects

This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time guarantees nonoverlapping chip selects and solves bus contentions in case of peripherals having long data float times.

If DLYBCS is lower than 6, six peripheral clock periods are inserted by default.

Otherwise, the following equations determine the delay:

If BRSRCCLK = 0:

$$\text{Delay Between Chip Selects} = \frac{\text{DLYBCS}}{f_{\text{peripheral clock}}}$$

If BRSRCCLK = 1:

$$\text{Delay Between Chip Selects} = \frac{\text{DLYBCS}}{f_{\text{GCLK}}}$$

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

This field is only used if fixed peripheral select is active (PS = 0).

If SPI\_MR.PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110  
 PCS = xx01 NPCS[3:0] = 1101  
 PCS = x011 NPCS[3:0] = 1011  
 PCS = 0111 NPCS[3:0] = 0111  
 PCS = 1111 forbidden (no peripheral is selected)

(x = don't care)

If SPI\_MR.PCSDEC = 1:  
 NPCS[3:0] output signals = PCS.

**Bit 12 – CMPMODE** Comparison Mode

| Value | Name            | Description   |
|-------|-----------------|---|
| 0     | FLAG_ONLY       | Any character is received and comparison function drives CMP flag.                                  |
| 1     | START_CONDITION | Comparison condition must be met to start reception of all incoming characters until REQCLR is set. |

**Bit 8 – LSBHALF** LSB Timing Selection

| Value | Description  |
|-------|--|
| 0     | To be used only if SPI slave LSB timing is 100% compliant with SPI standard (LSB duration is a full bit time). This value gives the better margin for SPI slave response delay (less than 1 SPCK clock cycle). |
| 1     | To be selected if the SPI slave LSB timing does not behave as the SPI standard (not triggered by NPCS deassertion in mode), the slave response delay is limited to less than 1/2 SPCK cycle.                   |

**Bit 7 – LLB** Local Loopback Enable

LLB controls the local loopback on the data shift register for testing in Master mode only (MISO is internally connected on MOSI).

| Value | Description                   |
|-------|-------------------------------|
| 0     | Local loopback path disabled. |
| 1     | Local loopback path enabled.  |

**Bit 5 – WDRBT** Wait Data Read Before Transfer

| Value | Description   |
|-------|---|
| 0     | No Effect. In Master mode, a transfer can be initiated regardless of SPI_RDR state.   |
| 1     | In Master mode, a transfer can start only if SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception. |

**Bit 4 – MODFDIS** Mode Fault Detection

| Value | Description                   |
|-------|-------------------------------|
| 0     | Mode fault detection enabled  |
| 1     | Mode fault detection disabled |

**Bit 3 – BRSRCCLK** Bit Rate Source Clock

If bit BRSRCCLK = 1, the SCBR field in SPI\_CSRx must be programmed with a value greater than 1.

0 (PERIPH\_CLK): The peripheral clock is the source clock for the bit rate generation.

1 (GCLK): PMC GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

**Bit 2 – PCSDEC** Chip Select Decode

When PCSDEC = 1, up to 15 chip select signals can be generated with the four NPCS lines using an external 4-bit to 16-bit decoder. The chip select registers define the characteristics of the 15 chip selects, with the following rules:

SPI\_CSR0 defines peripheral chip select signals 0 to 3.

SPI\_CSR1 defines peripheral chip select signals 4 to 7.

SPI\_CSR2 defines peripheral chip select signals 8 to 11.

SPI\_CSR3 defines peripheral chip select signals 12 to 14.

| Value | Description   |
|-------|---|
| 0     | The chip select lines are directly connected to a peripheral device.        |
| 1     | The four NPCS chip select lines are connected to a 4-bit to 16-bit decoder. |

**Bit 1 – PS** Peripheral Select

| Value | Description                |
|-------|----------------------------|
| 0     | Fixed Peripheral Select    |
| 1     | Variable Peripheral Select |

**Bit 0 – MSTR** Master/Slave Mode

| Value | Description           |
|-------|-----------------------|
| 0     | SPI is in Slave mode  |
| 1     | SPI is in Master mode |

### 48.8.3 SPI Receive Data Register

**Name:** SPI\_RDR  
**Offset:** 0x08  
**Reset:** 0x0  
**Property:** Read-only

|        |                            |    |    |    |          |    |    |    |
|--------|----------------------------|----|----|----|----------|----|----|----|

**Bits 19:16 – PCS[3:0]** Peripheral Chip Select

In Master mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.

When using Variable Peripheral Select mode (PS = 1 in SPI\_MR), it is mandatory to set SPI\_MR.WDRBT bit if the PCS field must be processed in SPI\_RDR.

**Bits 15:0 – RD[15:0]** Receive Data

Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

### 48.8.4 SPI Receive Data Register (FIFO Multiple Data, 8-bit)

**Name:** SPI\_RDR (FIFO\_MULTI\_DATA\_8)  
**Offset:** 0x08  
**Reset:** 0x0  
**Property:** Read-only

If FIFO is enabled (FIFOEN bit in SPI\_CR), refer to section [Multiple Data Mode](#).

| Access | W        | W  | W  | W  | W  | W  | W        | W        |
| Reset  | –        | –  | –  | –  | –  | –  | –        | –        |
|        |          |    |    |    |    |    |          |          |
| Bit    | 7        | 6  | 5  | 4  | 3  | 2  | 1        | 0        |
|        | TD[7:0]  |    |    |    |    |    |          |          |
| Access | W        | W  | W  | W  | W  | W  | W        | W        |
| Reset  | –        | –  | –  | –  | –  | –  | –        | –        |

#### Bit 24 – LASTXFER Last Transfer

This field is only used if variable peripheral select is active (SPI\_MR.PS = 1).

| Value | Description  |
|-------|--|
| 0     | No effect  |
| 1     | The current NPCS is deasserted after the transfer of the character written in TD. When SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

This field is only used if variable peripheral select is active (SPI\_MR.PS = 1).

If SPI\_MR.PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110

PCS = xx01 NPCS[3:0] = 1101

PCS = x011 NPCS[3:0] = 1011

PCS = 0111 NPCS[3:0] = 0111

PCS = 1111 forbidden (no peripheral is selected)

(x = don't care)

If SPI\_MR.PCSDEC = 1:

NPCS[3:0] output signals = PCS.

**Bits 15:0 – TD[15:0]** Transmit Data

Data to be transmitted by the SPI interface is stored in this register. Information to be transmitted must be written to this register in a right-justified format.

### 48.8.7 SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit)

**Name:** SPI\_TDR (FIFO\_MULTI\_DATA)  
**Offset:** 0x0C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FIFOEN bit in SPI\_CR), refer to section [Multiple Data Mode](#).

|        |           |    |    |    |    |    |    |    |

|        |         |         |        |       |       |        |         |        |
| Bit    | 7       | 6       | 5      | 4     | 3     | 2      | 1       | 0      |
|        |         |         |        |       | OVRES | MODF   | TDRE    | RDRF   |
| Access |         |         |        |       | R     | R      | R       | R      |
| Reset  |         |         |        |       | 0     | 0      | 0       | 0      |

**Bit 31 – RXFPTEF** Receive FIFO Pointer Error Flag  
 See [FIFO Pointer Error](#) for details.

| Value | Description  |
|-------|--|
| 0     | No Receive FIFO pointer occurred.                            |
| 1     | Receive FIFO pointer error occurred. Receiver must be reset. |

**Bit 30 – TXFPTEF** Transmit FIFO Pointer Error Flag  
 See [FIFO Pointer Error](#) for details.

| Value | Description  |
|-------|--|
| 0     | No Transmit FIFO pointer occurred.                               |
| 1     | Transmit FIFO pointer error occurred. Transceiver must be reset. |

**Bit 29 – RXFTHF** Receive FIFO Threshold Flag

| Value | Description   |
|-------|---|
| 0     | Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared.   |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES threshold (coming from “below threshold” state to “equal or above threshold” state). |

**Bit 28 – RXFFF** Receive FIFO Full Flag

| Value | Description  |
|-------|--|
| 0     | Receive FIFO is not empty or RXFE flag has been cleared.                     |
| 1     | Receive FIFO has become full (coming from “not full” state to “full” state). |

**Bit 27 – RXFEF** Receive FIFO Empty Flag

| Value | Description   |
|-------|---|
| 0     | Receive FIFO is not empty or RXFE flag has been cleared.                        |
| 1     | Receive FIFO has become empty (coming from “not empty” state to “empty” state). |

**Bit 26 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

| Value | Description   |
|-------|---|
| 0     | Number of data in Transmit FIFO is above TXFTHRES threshold.                                  |
| 1     | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of SPI_SR. |

**Bit 25 – TXFFF** Transmit FIFO Full Flag (cleared on read)

| Value | Description  |
|-------|--|
| 0     | Transmit FIFO is not full or TXFF flag has been cleared.     |
| 1     | Transmit FIFO has been filled since the last read of SPI_SR. |

**Bit 24 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

| Value | Description   |
|-------|---|
| 0     | Transmit FIFO is not empty.                                   |
| 1     | Transmit FIFO has been emptied since the last read of SPI_SR. |

**Bit 16 – SPIENS** SPI Enable Status

| Value | Description      |
|-------|------------------|
| 0     | SPI is disabled. |
| 1     | SPI is enabled.  |

**Bit 11 – CMP** Comparison Status (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in SPI_CMPR since the last read of SPI_SR. |
| 1     | A received character matched the comparison criteria since the last read of SPI_SR.   |

**Bit 10 – UNDES** Underrun Error Status (Slave mode only) (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No underrun has been detected since the last read of SPI_SR.  |
| 1     | A transfer starts whereas no data has been loaded in SPI_TDR. |

**Bit 9 – TXEMPTY** Transmission Registers Empty (cleared by writing SPI\_TDR)

| Value | Description  |
|-------|--|
| 0     | As soon as data is written in SPI_TDR.   |
| 1     | SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay. |

**Bit 8 – NSSR** NSS Rising (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No rising edge detected on NSS pin since the last read of SPI_SR. |
| 1     | A rising edge occurred on NSS pin since the last read of SPI_SR.  |

**Bit 3 – OVRES** Overrun Error Status (cleared on read)

An overrun occurs when SPI\_RDR is loaded at least twice from the internal shift register since the last read of SPI\_RDR.

| Value | Description   |
|-------|---|
| 0     | No overrun has been detected since the last read of SPI_SR. |
| 1     | An overrun has occurred since the last read of SPI_SR.      |

**Bit 2 – MODF** Mode Fault Error (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No mode fault has been detected since the last read of SPI_SR. |
| 1     | A mode fault occurred since the last read of SPI_SR.           |

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing SPI\_TDR)

When FIFOs are disabled:

0: Data has been written to SPI\_TDR and not yet transferred to the internal shift register.

1: The last data written in SPI\_TDR has been transferred to the internal shift register.

TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TDRE behavior with FIFOs enabled is illustrated in section [TXEMPTY, TDRE and RDRF Behavior](#).

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading SPI\_RDR)

When FIFOs are disabled:

0: No data has been received since the last read of SPI\_RDR.

1: Data has been received and the received data has been transferred from the internal shift register to SPI\_RDR since the last read of SPI\_RDR.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RDRF behavior with FIFOs enabled is illustrated in section [TXEMPTY, TDRE and RDRF Behavior](#).

### 48.8.9 SPI Interrupt Enable Register

**Name:** SPI\_IER  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit    | 31      | 30      | 29     | 28    | 27    | 26     | 25    | 24    |
|--------|---------|---------|--------|-------|-------|--------|-------|-------|
|        | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | W       | W       | W      | W     | W     | W      | W     | W     |
| Reset  | –       | –       | –      | –     | –     | –      | –     | –     |

| Reset  |   |   |   |   | –     | –    | –    | –    |

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Enable

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Enable

**Bit 29 – RXFTHF** RXFTHF Interrupt Enable

**Bit 28 – RXFFF** RXFFF Interrupt Enable

**Bit 27 – RXFEF** RXFEF Interrupt Enable

**Bit 26 – TXFTHF** TXFTHF Interrupt Enable

**Bit 25 – TXFFF** TXFFF Interrupt Enable

**Bit 24 – TXFEF** TXFEF Interrupt Enable

**Bit 11 – CMP** Comparison Interrupt Enable

**Bit 10 – UNDES** Underrun Error Interrupt Enable

**Bit 9 – TXEMPTY** Transmission Registers Empty Enable

**Bit 8 – NSSR** NSS Rising Interrupt Enable

**Bit 3 – OVRES** Overrun Error Interrupt Enable

**Bit 2 – MODF** Mode Fault Error Interrupt Enable

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Enable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Enable

### 48.8.10 SPI Interrupt Disable Register

**Name:** SPI\_IDR  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit    | 31      | 30      | 29     | 28    | 27    | 26     | 25      | 24    |
|--------|---------|---------|--------|-------|-------|--------|---------|-------|
|        | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF   | TXFEF |
| Access | W       | W       | W      | W     | W     | W      | W       | W     |
| Reset  | –       | –       | –      | –     | –     | –      | –       | –     |
|        |         |         |        |       |       |        |         |       |
| Bit    | 23      | 22      | 21     | 20    | 19    | 18     | 17      | 16    |
|        |         |         |        |       |       |        |         |       |
| Access |         |         |        |       |       |        |         |       |
| Reset  |         |         |        |       |       |        |         |       |
|        |         |         |        |       |       |        |         |       |
| Bit    | 15      | 14      | 13     | 12    | 11    | 10     | 9       | 8     |

| Reset  |         |         |        |       | –     | –      | –       | –     |

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Disable

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Disable

**Bit 29 – RXFTHF** RXFTHF Interrupt Disable

**Bit 28 – RXFFF** RXFFF Interrupt Disable

**Bit 27 – RXFEF** RXFEF Interrupt Disable

**Bit 26 – TXFTHF** TXFTHF Interrupt Disable

**Bit 25 – TXFFF** TXFFF Interrupt Disable

**Bit 24 – TXFEF** TXFEF Interrupt Disable

**Bit 11 – CMP** Comparison Interrupt Disable

**Bit 10 – UNDES** Underrun Error Interrupt Disable

**Bit 9 – TXEMPTY** Transmission Registers Empty Disable

**Bit 8 – NSSR** NSS Rising Interrupt Disable

**Bit 3 – OVRES** Overrun Error Interrupt Disable

**Bit 2 – MODF** Mode Fault Error Interrupt Disable

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Disable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Disable

### 48.8.11 SPI Interrupt Mask Register

**Name:** SPI\_IMR  
**Offset:** 0x1C  
**Reset:** 0x0  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

| Bit    | 31      | 30      | 29     | 28    | 27    | 26     | 25    | 24    |
|--------|---------|---------|--------|-------|-------|--------|-------|-------|
|        | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | R       | R       | R      | R     | R     | R      | R     | R     |
| Reset  | 0       | 0       | 0      | 0     | 0     | 0      | 0     | 0     |

| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|--------|----|----|----|----|----|----|----|----|
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

| Access |   |   |   |   | R     | R    | R    | R    |
| Reset  |   |   |   |   | 0     | 0    | 0    | 0    |

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Mask

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Mask

**Bit 29 – RXFTHF** RXFTHF Interrupt Mask

**Bit 28 – RXFFF** RXFFF Interrupt Mask

**Bit 27 – RXFEF** RXFEF Interrupt Mask

**Bit 26 – TXFTHF** TXFTHF Interrupt Mask

**Bit 25 – TXFFF** TXFFF Interrupt Mask

**Bit 24 – TXFEF** TXFEF Interrupt Mask

**Bit 11 – CMP** Comparison Interrupt Mask

**Bit 10 – UNDES** Underrun Error Interrupt Mask

**Bit 9 – TXEMPTY** Transmission Registers Empty Mask

**Bit 8 – NSSR** NSS Rising Interrupt Mask

**Bit 3 – OVRES** Overrun Error Interrupt Mask

**Bit 2 – MODF** Mode Fault Error Interrupt Mask

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

### 48.8.12 SPI Chip Select Register

**Name:** SPI\_CSRx  
**Offset:** 0x30 + x\*0x04 [x=0..3]  
**Reset:** 0  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

SPI\_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

|        |             |     |     |       |     |        |       |      |
|--------|-------------|-----|-----|-------|-----|--------|-------|------|
| Bit    | 31          | 30  | 29  | 28    | 27  | 26     | 25    | 24   |
|        | DLYBCT[7:0] |     |     |       |     |        |       |      |
| Access | R/W         | R/W | R/W | R/W   | R/W | R/W    | R/W   | R/W  |
| Reset  | 0           | 0   | 0   | 0     | 0   | 0      | 0     | 0    |
|        |             |     |     |       |     |        |       |      |
| Bit    | 23          | 22  | 21  | 20    | 19  | 18     | 17    | 16   |
|        | DLYBS[7:0]  |     |     |       |     |        |       |      |
| Access | R/W         | R/W | R/W | R/W   | R/W | R/W    | R/W   | R/W  |
| Reset  | 0           | 0   | 0   | 0     | 0   | 0      | 0     | 0    |
|        |             |     |     |       |     |        |       |      |
| Bit    | 15          | 14  | 13  | 12    | 11  | 10     | 9     | 8    |
|        | SCBR[7:0]   |     |     |       |     |        |       |      |
| Access | R/W         | R/W | R/W | R/W   | R/W | R/W    | R/W   | R/W  |

|        |             |     |     |       |     |        |       |      |
| Bit    | 7           | 6   | 5   | 4     | 3   | 2      | 1     | 0    |
|        | BITS[3:0]   |     |     | CSAAT |     | CSNAAT | NCPHA | CPOL |
| Access | R/W         | R/W | R/W | R/W   | R/W | R/W    | R/W   | R/W  |
| Reset  | 0           | 0   | 0   | 0     | 0   | 0      | 0     | 0    |

**Bits 31:24 – DLYBCT[7:0]** Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.

Otherwise, the following equations determine the delay:

If SPI\_MR.BRSRCLK = 0:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}} / 32$

If SPI\_MR.BRSRCLK = 1:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{CLK}} / 32$

**Bits 23:16 – DLYBS[7:0]** Delay Before SPCK

This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.

When DLYBS = 0, the delay is half the SPCK clock period.

Otherwise, the following equations determine the delay:

If SPI\_MR.BRSRCCLK = 0: DLYBS = Delay Before SPCK ×  $f_{\text{peripheral clock}}$

If SPI\_MR.BRSRCCLK = 1: DLYBS = Delay Before SPCK ×  $f_{\text{GCLK}}$

### Bits 15:8 – SCBR[7:0] Serial Clock Bit Rate

In Master mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by SPI\_MR.BRSRCCLK bit. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:

If SPI\_MR.BRSRCCLK = 0:  $\text{SCBR} = f_{\text{peripheral clock}} / \text{SPCK Bit Rate}$

If SPI\_MR.BRSRCCLK = 1:  $\text{SCBR} = f_{\text{GCLK}} / \text{SPCK Bit Rate}$

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

If SPI\_MR.BRSRCCLK = 1, SCBR must be programmed with a value greater than 1.

At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.

**Note:** If one of the SCBR fields in SPI\_CSRx is set to 1, the other SCBR fields in SPI\_CSRx must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

### Bits 7:4 – BITS[3:0] Bits Per Transfer

(See Note under the register table in [SPI Chip Select Register](#).)

The BITS field determines the number of data bits transferred. Reserved values should not be used.

| Value | Name   | Description          |
|-------|--------|----------------------|
| 0     | 8_BIT  | 8 bits for transfer  |
| 1     | 9_BIT  | 9 bits for transfer  |
| 2     | 10_BIT | 10 bits for transfer |
| 3     | 11_BIT | 11 bits for transfer |
| 4     | 12_BIT | 12 bits for transfer |
| 5     | 13_BIT | 13 bits for transfer |
| 6     | 14_BIT | 14 bits for transfer |
| 7     | 15_BIT | 15 bits for transfer |
| 8     | 16_BIT | 16 bits for transfer |
| 9     | –      | Reserved             |
| 10    | –      | Reserved             |
| 11    | –      | Reserved             |
| 12    | –      | Reserved             |
| 13    | –      | Reserved             |
| 14    | –      | Reserved             |
| 15    | –      | Reserved             |

### Bit 3 – CSAAT Chip Select Active After Transfer

| Value | Description  |
|-------|--|
| 0     | The Peripheral Chip Select Line rises as soon as the last transfer is achieved.  |
| 1     | The Peripheral Chip Select Line does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select. |

**Bit 2 – CSNAAT** Chip Select Not Active After Transfer (ignored if CSAAT = 1)

| Value | Description  |
|-------|--|
| 0     | The Peripheral Chip Select Line does not rise between two transfers if SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same chip select.  |
| 1     | The Peripheral Chip Select Line rises systematically after each transfer performed on the same slave. It remains inactive after the end of transfer for a minimal duration of:<br><br>If SPI_MR.BRSRCCLK = 0:<br>$\frac{DLYBCS}{f_{\text{peripheral clock}}}$<br>If SPI_MR.BRSRCCLK = 1:<br>$\frac{DLYBCS}{f_{\text{GCLK}}}$<br><br>If field DLYBCS is lower than 6, a minimum of six periods is introduced. |

**Bit 1 – NCPHA** Clock Phase

NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

| Value | Description   |
|-------|---|
| 0     | Data is changed on the leading edge of SPCK and captured on the following edge of SPCK. |
| 1     | Data is captured on the leading edge of SPCK and changed on the following edge of SPCK. |

**Bit 0 – CPOL** Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between master and slave devices.

| Value | Description   |
|-------|---|
| 0     | The inactive state value of SPCK is logic level zero. |
| 1     | The inactive state value of SPCK is logic level one.  |

### 48.8.13 SPI FIFO Mode Register

**Name:** SPI\_FMR  
**Offset:** 0x40  
**Reset:** 0x0  
**Property:** Read/Write

|        |    |    |               |     |     |     |     |             |  |
|--------|----|----|---------------|-----|-----|-----|-----|-------------|--|
| Bit    | 31 | 30 | 29            | 28  | 27  | 26  | 25  | 24          |  |
|        |    |    | RXFTHRES[5:0] |     |     |     |     |             |  |
| Access |    |    | R/W           | R/W | R/W | R/W | R/W | R/W         |  |
| Reset  |    |    | 0             | 0   | 0   | 0   | 0   | 0           |  |
|        |    |    |               |     |     |     |     |             |  |
| Bit    | 23 | 22 | 21            | 20  | 19  | 18  | 17  | 16          |  |
|        |    |    | TXFTHRES[5:0] |     |     |     |     |             |  |
| Access |    |    | R/W           | R/W | R/W | R/W | R/W | R/W         |  |
| Reset  |    |    | 0             | 0   | 0   | 0   | 0   | 0           |  |
|        |    |    |               |     |     |     |     |             |  |
| Bit    | 15 | 14 | 13            | 12  | 11  | 10  | 9   | 8           |  |
|        |    |    |               |     |     |     |     |             |  |
| Access |    |    |               |     |     |     |     |             |  |
| Reset  |    |    |               |     |     |     |     |             |  |
|        |    |    |               |     |     |     |     |             |  |
| Bit    | 7  | 6  | 5             | 4   | 3   | 2   | 1   | 0           |  |
|        |    |    | RXRDYM[1:0]   |     |     |     |     | TXRDYM[1:0] |  |
| Access |    |    | R/W           | R/W |     |     | R/W | R/W         |  |
| Reset  |    |    | 0             | 0   |     |     | 0   | 0           |  |

**Bits 29:24 – RXFTHRES[5:0]** Receive FIFO Threshold

| Value | Description  |
|-------|--|
| 0-16  | Defines the Receive FIFO threshold value (number of data). SPI_SR.RXFTH will be set when the Receive FIFO goes from “below” threshold state to “equal or above” threshold state. |

**Bits 21:16 – TXFTHRES[5:0]** Transmit FIFO Threshold

| Value | Description  |
|-------|--|
| 0-16  | Defines the Transmit FIFO threshold value (number of data). SPI_SR.TXFTH will be set when the Transmit FIFO goes from “above” threshold state to “equal or below” threshold state. |

**Bits 5:4 – RXRDYM[1:0]** Receive Data Register Full Mode

If FIFOs are enabled, the SPI\_SR.RDRF flag behaves as follows:

| Value | Name     | Description   |
|-------|----------|---|
| 0     | ONE_DATA | RDRF will be at level ‘1’ when at least one unread data is in the Receive FIFO. |

# SAMA5D2 Series

## Serial Peripheral Interface (SPI)

| Value | Name      | Description   |
|-------|-----------|---|
| 1     | TWO_DATA  | RDRF will be at level '1' when at least two unread data are in the Receive FIFO.<br><br>Cannot be used when SPI_MR.MSTR =1, or if SPI_MR.PS =1.   |
| 2     | FOUR_DATA | RDRF will be at level '1' when at least four unread data are in the Receive FIFO.<br><br>Cannot be used when SPI_CSRx.BITS is greater than 0, or if SPI_MR.MSTR =1, or if SPI_MR.PS =1. |

**Bits 1:0 – TXRDYM[1:0]** Transmit Data Register Empty Mode  
If FIFOs are enabled, the SPI\_SR.TDRE flag behaves as follows:

| Value | Name     | Description  |
|-------|----------|--|
| 0     | ONE_DATA | TDRE will be at level '1' when at least one data can be written in the Transmit FIFO.  |
| 1     | TWO_DATA | TDRE will be at level '1' when at least two data can be written in the Transmit FIFO.<br><br>Cannot be used if SPI_MR.PS =1. |

### 48.8.14 SPI FIFO Level Register

**Name:** SPI\_FLR  
**Offset:** 0x44  
**Reset:** 0x0  
**Property:** Read-only

|        |                   |    |           |    |    |    |    |    |
|--------|-------------------|----|-----------|----|----|----|----|----|
| Bit    | 31                | 30 | 29        | 28 | 27 | 26 | 25 | 24 |
|        | [Greyed out bits] |    |           |    |    |    |    |    |
| Access |                   |    |           |    |    |    |    |    |
| Reset  |                   |    |           |    |    |    |    |    |
| Bit    | 23                | 22 | 21        | 20 | 19 | 18 | 17 | 16 |
|        | [Greyed out bits] |    | RXFL[5:0] |    |    |    |    |    |
| Access |                   |    | R         | R  | R  | R  | R  | R  |
| Reset  |                   |    | 0         | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15                | 14 | 13        | 12 | 11 | 10 | 9  | 8  |
|        | [Greyed out bits] |    |           |    |    |    |    |    |
| Access |                   |    |           |    |    |    |    |    |
| Reset  |                   |    |           |    |    |    |    |    |
| Bit    | 7                 | 6  | 5         | 4  | 3  | 2  | 1  | 0  |
|        | [Greyed out bits] |    | TXFL[5:0] |    |    |    |    |    |
| Access |                   |    | R         | R  | R  | R  | R  | R  |
| Reset  |                   |    | 0         | 0  | 0  | 0  | 0  | 0  |

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

| Value | Description  |
|-------|--|
| 0     | There is no unread data in the Receive FIFO.             |
| 1-16  | Indicates the number of unread data in the Receive FIFO. |

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

| Value | Description  |
|-------|--|
| 0     | There is no data in the Transmit FIFO.             |
| 1-16  | Indicates the number of data in the Transmit FIFO. |

### 48.8.15 SPI Comparison Register

**Name:** SPI\_CMPR  
**Offset:** 0x48  
**Reset:** 0x0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

|            |     |     |     |     |     |     |     |     |
|------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit        | 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
| VAL2[15:8] |     |     |     |     |     |     |     |     |
| Access     | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset      | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|            |     |     |     |     |     |     |     |     |
| Bit        | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| VAL2[7:0]  |     |     |     |     |     |     |     |     |
| Access     | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset      | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|            |     |     |     |     |     |     |     |     |
| Bit        | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| VAL1[15:8] |     |     |     |     |     |     |     |     |
| Access     | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset      | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|            |     |     |     |     |     |     |     |     |
| Bit        | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| VAL1[7:0]  |     |     |     |     |     |     |     |     |
| Access     | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset      | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 31:16 – VAL2[15:0] Second Comparison Value for Received Character

| Value   | Description  |
|---------|--|
| 0–65535 | The received character must be lower or equal to the value of VAL2 and higher or equal to VAL1 to set CMP flag in SPI_CSR. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if condition is met. |

#### Bits 15:0 – VAL1[15:0] First Comparison Value for Received Character

| Value   | Description   |
|---------|---|
| 0–65535 | The received character must be higher or equal to the value of VAL1 and lower or equal to VAL2 to set CMP flag in SPI_SR. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if the condition is met. |

### 48.8.16 SPI Write Protection Mode Register

**Name:** SPI\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x0  
**Property:** Read/Write

See section [Register Write Protection](#) for the list of registers that can be write-protected.

|        |              |     |     |     |     |     |     |      |
|--------|--------------|-----|-----|-----|-----|-----|-----|------|
| Bit    | 31           | 30  | 29  | 28  | 27  | 26  | 25  | 24   |
|        | WPKEY[23:16] |     |     |     |     |     |     |      |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W  |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0    |
| Bit    | 23           | 22  | 21  | 20  | 19  | 18  | 17  | 16   |
|        | WPKEY[15:8]  |     |     |     |     |     |     |      |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W  |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0    |
| Bit    | 15           | 14  | 13  | 12  | 11  | 10  | 9   | 8    |
|        | WPKEY[7:0]   |     |     |     |     |     |     |      |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W  |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0    |
| Bit    | 7            | 6   | 5   | 4   | 3   | 2   | 1   | 0    |
|        |              |     |     |     |     |     |     | WPEN |
| Access |              |     |     |     |     |     |     | R/W  |
| Reset  |              |     |     |     |     |     |     | 0    |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description   |
|----------|--------|---|
| 0x535049 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. |
| 9        |        | Always reads as 0.  |

#### Bit 0 – WPEN Write Protection Enable

| Value | Description   |
|-------|---|
| 0     | Disables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII) |
| 1     | Enables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII)  |

### 48.8.17 SPI Write Protection Status Register

**Name:** SPI\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x0  
**Property:** Read-only

|        |                   |    |    |    |    |    |    |      |
|--------|-------------------|----|----|----|----|----|----|------|
| Bit    | 31                | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        | [Greyed out bits] |    |    |    |    |    |    |      |
| Access |                   |    |    |    |    |    |    |      |
| Reset  |                   |    |    |    |    |    |    |      |
| Bit    | 23                | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        | [Greyed out bits] |    |    |    |    |    |    |      |
| Access |                   |    |    |    |    |    |    |      |
| Reset  |                   |    |    |    |    |    |    |      |
| Bit    | 15                | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]        |    |    |    |    |    |    |      |
| Access | R                 | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0                 | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7                 | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        | [Greyed out bits] |    |    |    |    |    |    | WPVS |
| Access |                   |    |    |    |    |    |    | R    |
| Reset  |                   |    |    |    |    |    |    | 0    |

**Bits 15:8 – WPVSR[7:0]** Write Protection Violation Source  
 When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description   |
|-------|---|
| 0     | No write protection violation has occurred since the last read of SPI_WPSR.   |
| 1     | A write protection violation has occurred since the last read of SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 49. Quad Serial Peripheral Interface (QSPI)

### 49.1 Description

The Quad Serial Peripheral Interface (QSPI) is a synchronous serial data link that provides communication with external devices in Master mode.

The QSPI can be used in SPI mode to interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors, or in Serial Memory mode to interface to serial Flash memories.

The QSPI allows the system to execute code directly from a serial Flash memory (XIP) without code shadowing to RAM. The serial Flash memory mapping is seen in the system as other memories such as ROM, SRAM, DRAM, embedded Flash memory, etc.

With the support of the Quad SPI protocol, the QSPI allows the system to use high-performance serial Flash memories which are small and inexpensive, in place of larger and more expensive parallel Flash memories.

**Note:** Stacked devices with a rollover in the memory address space at each die boundary are not supported.

### 49.2 Embedded Characteristics

- Master SPI Interface
  - Programmable clock phase and clock polarity
  - Programmable transfer delays between consecutive transfers, between clock and data, between deactivation and activation of chip select
- SPI Mode
  - Interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - 8-bit/16-bit/32-bit programmable data length
- Serial Memory Mode
  - Interface to serial Flash memories operating in Single-bit SPI, Dual SPI and Quad SPI
  - Interface to serial Flash Memories operating in Single Data Rate Mode
  - Supports “Execute In Place” (XIP)— code execution by the system directly from a serial Flash memory
  - Flexible instruction register for compatibility with all serial Flash memories
  - 32-bit address mode (default is 24-bit address) to support serial Flash memories larger than 128 Mbits
  - Continuous read mode
  - Scrambling/unscrambling “On-The-Fly”
- Connection to DMA Channel Capabilities Optimizes Data Transfers
  - One channel for the receiver, one channel for the transmitter
- Register Write Protection

### 49.3 Block Diagram

Figure 49-1. Block Diagram

### 49.4 Signal Description

Table 49-1. Signal Description

| Pin Name                      | Pin Description                   | Type                  |
|-------------------------------|-----------------------------------|-----------------------|
| QSCK                          | Serial Clock                      | Output                |
| MOSI (QIO0) <sup>(1)(2)</sup> | Data Output (Data Input Output 0) | Output (Input/Output) |
| MISO (QIO1) <sup>(1)(2)</sup> | Data Input (Data Input Output 1)  | Input (Input/Output)  |
| QIO2 <sup>(3)</sup>           | Data Input Output 2               | Input/Output          |
| QIO3 <sup>(3)</sup>           | Data Input Output 3               | Input/Output          |
| QCS                           | Peripheral Chip Select            | Output                |

**Note:**

1. MOSI and MISO are used for single-bit SPI operation.
2. QIO0–QIO1 are used for Dual SPI operation.
3. QIO0–QIO3 are used for Quad SPI operation.

### 49.5 Product Dependencies

#### 49.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the QSPI pins to their peripheral functions.

### 49.5.2 Power Management

The QSPI may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the QSPI clock.

### 49.5.3 Interrupt Sources

The QSPI has an interrupt line connected to the Interrupt Controller. Handling the QSPI interrupt requires programming the interrupt controller before configuring the QSPI.

### 49.5.4 Direct Memory Access Controller (DMA)

The QSPI can be used in conjunction with the Direct Memory Access Controller (DMA) in order to reduce processor overhead. For a full description of the DMA, refer to the section “DMA Controller (XDMAC)”.

## 49.6 Functional Description

### 49.6.1 Serial Clock Baud Rate

The QSPI baud rate clock is generated by dividing the peripheral clock by a value between 1 and 256.

### 49.6.2 Serial Clock Phase and Polarity

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the QSPI Serial Clock register (QSPI\_SCR). The CPHA bit in the QSPI\_SCR programs the clock phase. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, the interfaced slave must use the same parameter values to communicate.

The table below shows the four modes and corresponding parameter settings.

**Table 49-2. QSPI Bus Clock Modes**

| QSPI Clock Mode | QSPI_SCR.CPOL | QSPI_SCR.CPHA | Shift QSCK Edge | Capture QSCK Edge | QSCK Inactive Level |
|-----------------|---------------|---------------|-----------------|-------------------|---------------------|
| 0               | 0             | 0             | Falling         | Falling           | Low                 |
| 1               | 0             | 1             | Rising          | Rising            | Low                 |
| 2               | 1             | 0             | Rising          | Rising            | High                |
| 3               | 1             | 1             | Falling         | Falling           | High                |

The following figures show examples of data transfers.

**Figure 49-2. QSPI Transfer Format (QSPI\_SCR.CPHA = 0, 8 bits per transfer)**

\* Not defined, but normally MSB of previous character received.

**Figure 49-3. QSPI Transfer Format (QSPI\_SCR.CPHA = 1, 8 bits per transfer)**

\* Not defined but normally LSB of previous character transmitted.

### 49.6.3 Transfer Delays

The figure below shows several consecutive transfers while the chip select is active. Three delays can be programmed to modify the transfer waveforms:

- The delay between the deactivation and the activation of QCS, programmed by writing QSPI\_MR.DLYCS. Allows to adjust the minimum time of QCS at high level.
- The delay before QSCK, programmed by writing QSPI\_SR.DLYBS. Allows the start of QSCK to be delayed after the chip select has been asserted.

- The delay between consecutive transfers, programmed by writing QSPI\_MR.DLYBCT. Allows insertion of a delay between two consecutive transfers. In Serial Memory mode, this delay is not programmable and DLYBCT is ignored. In this mode, DLYBCT must be written to '0'.

These delays allow the QSPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 49-4. Programmable Delays**

#### 49.6.4 QSPI SPI Mode

In SPI mode, the QSPI acts as a standard SPI Master.

To activate this mode, QSPI\_MR.SMM must be written to '0' in QSPI\_MR.

##### 49.6.4.1 SPI Mode Operations

The QSPI in standard SPI mode operates on the clock generated by the internal programmable baud rate generator. It fully controls the data transfers to and from the slave connected to the SPI bus. The QSPI drives the chip select line to the slave (QCS) and the serial clock signal (QSCK).

The QSPI features two holding registers, the Transmit Data register (QSPI\_TDR) and the Receive Data register (QSPI\_RDR), and a single internal shift register. The holding registers maintain the data flow at a constant rate.

After enabling the QSPI, a data transfer begins when the processor writes to the QSPI\_TDR. The written data is immediately transferred to the internal shift register and transfer on the SPI bus starts. While the data in the internal shift register is shifted on the MOSI line, the MISO line is sampled and shifted to the internal shift register. Receiving data cannot occur without transmitting data. If receiving mode is not needed, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the Status register (QSPI\_SR) can be discarded.

If new data is written in QSPI\_TDR during the transfer, it is retained there until the current transfer is completed. Then, the received data is transferred from the internal shift register to the QSPI\_RDR, the data in QSPI\_TDR is loaded in the internal shift register and a new transfer starts.

The transfer of a data written in QSPI\_TDR in the internal shift register is indicated by the Transmit Data Register Empty (TDRE) bit in the QSPI\_SR. When new data is written in QSPI\_TDR, this bit is cleared. QSPI\_SR.TDRE is used to trigger the Transmit DMA channel.

The end of transfer is indicated by the TXEMPTY flag in the QSPI\_SR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, QSPI\_SR.TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

The transfer of received data from the internal shift register in QSPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in the QSPI\_SR. When the received data is read, QSPI\_SR.RDRF bit is cleared.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

If the QSPI\_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in QSPI\_SR is set. As long as this flag is set, data is loaded in QSPI\_RDR. The user must read the QSPI\_SR to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode, and a flow chart describing how transfers are handled.

### 49.6.4.2 SPI Mode Block Diagram

**Figure 49-5. SPI Mode Block Diagram**

**49.6.4.3 SPI Mode Flow Diagram**

**Figure 49-6. SPI Mode Flow Diagram**

The figure below shows Transmit Data Register Empty (TDRE), Receive Data Register Full (RDRF) and Transmission Register Empty (TXEMPTY) status flags behavior within the QSPI\_SR during an 8-bit data transfer in Fixed mode, without DMA.

**Figure 49-7. Status Register Flags Behavior**

#### 49.6.4.4 Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, the QSPI\_TDR is loaded by the processor and the flag TDRE rises as soon as the content of the QSPI\_TDR is transferred into the internal shift register. When this flag is detected high, the QSPI\_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. Depending on the application software handling the QSPI\_SR flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload the QSPI\_TDR in time to keep the chip select active (low). A null Delay Between Consecutive Transfer (DLYBCT) value in the QSPI\_MR gives even less time for the processor to reload the QSPI\_TDR. With some SPI slave peripherals, requiring the chip select line to remain active (low) during a full set of transfers may lead to communication errors.

To facilitate interfacing with such devices, QSPI\_MR.CSMODE may be configured to '1'. This allows the chip select lines to remain in their current state (low = active) until the end of transfer is indicated by the Last Transfer (LASTXFER) bit in the Control register (QSPI\_CR). Even if the QSPI\_TDR is not reloaded, the chip select remains active. To have the chip select line rise at the end of the last data transfer, QSPI\_CR.LASTXFER must be written to '1' at the same time or after writing the last data to transmit into the QSPI\_TDR.

#### 49.6.4.5 Peripheral Deselection with DMA

When the DMA Controller is used, the Chip Select line remains low during the transfer since the TDRE flag is managed by the DMA itself. Reloading the QSPI\_TDR by the DMA is done as soon as the TDRE flag is set. In this case, writing QSPI\_MR.CSMODE to '1' may not be needed. However, when other DMA channels connected to other peripherals are also in use, the QSPI DMA could be delayed by another DMA with a higher priority on the bus. Having DMA buffers in slower memories like Flash memory or SDRAM compared to fast internal SRAM, may lengthen the reload time of the QSPI\_TDR by the DMA as well. This means that the QSPI\_TDR might not be reloaded in time to keep the chip select line low. In this case, the chip select line may toggle between data transfer and according to some SPI Slave devices, the communication might get lost. It may be necessary to configure QSPI\_MR.CSMODE to '1'.

When QSPI\_MR.CSMODE is configured to '0', the QCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the flag TDRE rises as soon as the content of the QSPI\_TDR is transferred into the internal shifter. When this flag is detected, the QSPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. This might lead to difficulties for interfacing with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, the QSPI\_MR may be configured with QSPI\_MR.CSMODE at '2'.

### 49.6.5 QSPI Serial Memory Mode

In Serial Memory mode, the QSPI acts as a serial Flash memory controller. The QSPI can be used to read data from the serial Flash memory allowing the CPU to execute code from it (XIP execute in place). The QSPI can also be used to control the serial Flash memory (Program, Erase, Lock, etc.) by sending specific commands. In this mode, the QSPI is compatible with single-bit SPI, Dual SPI and Quad SPI protocols.

To activate this mode, QSPI\_MR.SMM must be written to '1'.

In Serial Memory mode, data is transferred either by QSPI\_TDR and QSPI\_RDR or by writing or read in the QSPI memory space (0x90000000/0x98000000/0xD0000000/0xD8000000) depending on TFRTYP and SMRM configuration.

#### 49.6.5.1 Instruction Frame

In order to control serial Flash memories, the QSPI is able to send instructions via the SPI bus (ex: READ, PROGRAM, ERASE, LOCK, etc.). Because the instruction set implemented in serial Flash memories is memory vendor-dependent, the QSPI includes a complete Instruction Frame register (QSPI\_IFR), which makes it very flexible and compatible with all serial Flash memories.

An instruction frame includes:

- An instruction code (size: 8 bits). The instruction is optional in some cases (see section [Continuous Read mode](#)).
- An address (size: 24 bits or 32 bits). The address is optional but is required by instructions such as READ, PROGRAM, ERASE, LOCK. By default the address is 24 bits long, but it can be 32 bits long to support serial Flash memories larger than 128 Mbits (16 Mbytes).
- An option code (size: 1/2/4/8 bits). The option code is not required, but it is useful to activate the XIP mode or the Continuous Read mode (see section [Continuous Read mode](#)) for READ instructions, in some serial Flash memory devices. These modes improve the data read latency.
- Dummy cycles. Dummy cycles are optional but required by some READ instructions.
- Data bytes are optional. Data bytes are present for data transfer instructions such as READ or PROGRAM.

The instruction code, the address/option and the data can be sent with Single-bit SPI, Dual SPI or Quad SPI protocols.

**Figure 49-8. Instruction Frame**

### 49.6.5.2 Instruction Frame Transmission

To send an instruction frame, the user must first configure the address to send by writing the field ADDR in the Instruction Address register (QSPI\_IAR). This step is required if the instruction frame includes an address and no data. When data is present, the address of the instruction is defined by the address of the data accesses in the QSPI memory space, not by QSPI\_IAR.

If the instruction frame includes the instruction code and/or the option code, the user must configure the instruction code and/or the option code to send by writing the fields INST and OPT in the Instruction Code register (QSPI\_ICR).

Then, the user must write QSPI\_IFR to configure the instruction frame depending on which instruction must be sent. If the instruction frame does not include data, writing in this register triggers the send of the instruction frame in the QSPI. If the instruction frame includes data, the send of the instruction frame is triggered by the first data access in the QSPI memory space.

The instruction frame is configured by the following bits and fields of QSPI\_IFR:

- WIDTH field—used to configure which data lanes are used to send the instruction code, the address, the option code and to transfer the data. It is possible to use two unidirectional data lanes (MISO-MOSI Single-bit SPI), two bidirectional data lanes (QIO0-QIO1 Dual SPI) or four bidirectional data lanes (QIO0-QIO3 Quad SPI).
- INSTEN bit—used to enable the send of an instruction code.
- ADDREN bit—used to enable the send of an address after the instruction code.
- OPTEN bit—used to enable the send of an option code after the address.
- DATAEN bit—used to enable the transfer of data (READ or PROGRAM instruction).
- OPTL field—used to configure the option code length. The value written in OPTL must be consistent with the value written in the field WIDTH. For example: OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).
- ADDRRL bit—used to configure the address length.
- TFRYP field—used to define which type of data transfer must be performed.
- NBDUM field—used to configure the number of dummy cycles when reading data from the serial Flash memory. Between the address/option and the data, with some instructions, dummy cycles are inserted by the serial Flash memory.

Refer to [49.6.5.2 Instruction Frame Transmission](#).

If data transfer is enabled, the user can access the serial memory by reading or writing the QSPI memory space:

- To read in the serial memory, but not a memory data, for example a JEDEC-ID or the QSPI\_SR, QSPI\_IFR.TFRTYP must be written to '0'.
- To read in the serial memory, and particularly a memory data, TFRTYP must be written to '1'.
- To write in the serial memory, but not a memory data, for example writing the configuration or the QSPI\_SR, TFRTYP must be written to '2'.
- If the user wants to write in the serial memory in particular to program a memory data, TFRTYP must be written to '3'.

If QSPI\_IFR.TFRTYP has a value other than '1' and QSPI\_MR.SMRM = 0, the address sent in the instruction frame is the address of the first system bus accesses. The addresses of the next accesses are not used by the QSPI. At each system bus access, an SPI transfer is performed with the same size. For example, a halfword system bus access leads to a 16-bit SPI transfer, and a byte system bus access leads to an 8-bit SPI transfer.

If SMRM = 1 and TFRTYP= (0 or 2), accesses are made via the QSPI registers and the address sent in the instruction frame is the address defined in QSPI\_IAR.

Each time QSPI\_IFR is written (in case of read access), or each time QSPI\_TDR is written (in case of write transfer), an SPI transfer is performed with a byte size. Another byte is read each time QSPI\_RDR is read (flag RDRF shows when a data can be read in QSPI\_RDR) or written each time QSPI\_TDR is written (flag TDRE shows when a new data can be written). The SPI transfer ends by writing QSPI\_CR.LASTXFER.

If TFRTYP = 1, the address of the first instruction frame is the one of the first read access in the QSPI memory space. Each time the read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the last system bus access address. In this way, the system can read data at a random location in the serial memory. The size of the SPI transfers may differ from the size of the system bus read accesses.

When data transfer is not enabled, the end of the instruction frame is indicated when QSPI\_SR.INSTRE rises. (The QSPI\_SR.CSR flag indicates when chip select rises. A delay between these flags may exist in case of high clock division or a high DLYBCT value).

When data transfer is enabled, the user must indicate when the data transfer is completed in the QSPI memory space by setting QSPI\_CR.LASTXFER. The end of the instruction frame is indicated when QSPI\_SR.INSTRE rises.

The following figure illustrates instruction transmission management.

### 49.6.5.3 Read Memory Transfer

The user can access the data of the serial memory by sending an instruction with QSPI\_IFR.DATAEN = 1 and QSPI\_IFR.TFRTYP = 1.

In this mode, the QSPI is able to read data at random address into the serial Flash memory, allowing the CPU to execute code directly from it (XIP execute-in-place).

In order to fetch data, the user must first configure the instruction frame by writing the QSPI\_IFR. Then data can be read at any address in the QSPI address space mapping. The address of the system bus read accesses match the address of the data inside the serial Flash memory.

When Fetch mode is enabled, several instruction frames can be sent before writing QSPI\_CR.LASTXFR. Each time the system bus read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the corresponding address.

### 49.6.5.4 Continuous Read Mode

The QSPI is compatible with the Continuous Read mode which is implemented in some serial Flash memories.

In Continuous Read mode, the instruction overhead is reduced by excluding the instruction code from the instruction frame. When the Continuous Read mode is activated in a serial Flash memory by a specific option code, the instruction code is stored in the memory. For the next instruction frames, the instruction code is not required as the memory uses the stored one.

In the QSPI, Continuous Read mode is used when reading data from the memory (QSPI\_IFR.TFR\_TYP = 1). The addresses of the system bus read accesses are often nonsequential and this leads to many instruction frames that have the same instruction code. By disabling the send of the instruction code, the Continuous Read mode reduces the access time of the data.

To be functional, this mode must be enabled in both the QSPI and the serial Flash memory. The Continuous Read mode is enabled in the QSPI by writing CRM to '1' in the QSPI\_IFR (TFR\_TYP must equal 1). The Continuous Read mode is enabled in the serial Flash memory by sending a specific option code.

If the Continuous Read mode is not supported by the serial Flash memory or disabled, CRM bit must not be written to '1', otherwise data read out of the serial Flash memory is unpredictable.

**Figure 49-9. Continuous Read Mode**

### 49.6.5.5 Instruction Frame Transmission Examples

All waveforms in the following examples describe SPI transfers in SPI Clock mode 0 (QSPI\_SCR.CPOL = 0 and QSPI\_SCR.CPHA = 0; see section [Serial Clock Phase and Polarity](#)).

All system bus accesses described below refer to the system bus address phase. System bus wait cycles and system bus data phases are not shown.

Example 1:

Instruction in Single-bit SPI, without address, without option, without data.

Command: CHIP ERASE (C7h).

- Write 0x0000\_00C7 in QSPI\_ICR.
- Write 0x0000\_0010 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-10. Instruction Transmission Waveform 1**

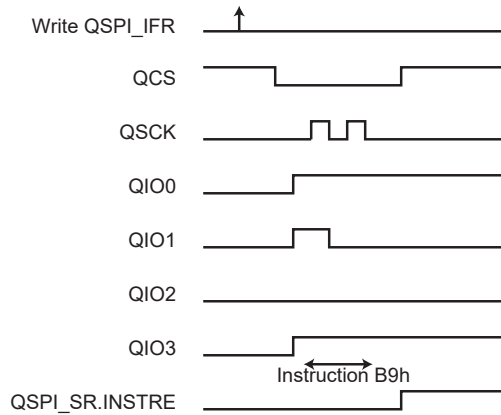

Example 2:

Instruction in Quad SPI, without address, without option, without data.

Command: POWER DOWN (B9h)

- Write 0x0000\_00B9 in QSPI\_ICR.
- Write 0x0000\_0016 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-11. Instruction Transmission Waveform 2**

Example 3:

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, without data.

Command: BLOCK ERASE (20h)

- Write the address (of the block to erase) in QSPI\_AR.
- Write 0x0000\_0020 in QSPI\_ICR.
- Write 0x0000\_0030 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-12. Instruction Transmission Waveform 3**

**Example 4:**

Instruction in Single-bit SPI, without address, without option, with data write in Single-bit SPI.

Command: SET BURST (77h)

- Write 0x0000\_0077 in QSPI\_ICR.
- Write 0x0000\_2090 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Write data in the system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000). The address of system bus write accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-13. Instruction Transmission Waveform 4**

**Example 5:**

Instruction in Single-bit SPI, with address in Dual SPI, without option, with data write in Dual SPI.

Command: BYTE/PAGE PROGRAM (02h)

- Write 0x0000\_0002 in QSPI\_ICR.
- Write 0x0000\_30B3 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Write data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000). The address of the first system bus write access is sent in the instruction frame. The address of the next system bus write accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-14. Instruction Transmission Waveform 5**

### Example 6:

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, with data read in Quad SPI, with eight dummy cycles.

Command: QUAD\_OUTPUT READ ARRAY (6Bh)

- Write 0x0000\_006B in QSPI\_ICR.
- Write 0x0008\_10B2 in QSPI\_IFR.
- Read QSPI\_IR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).  
The address of the first system bus read access is sent in the instruction frame.  
The address of the next system bus read accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-15. Instruction Transmission Waveform 6**

### Example 7:

Instruction in Single-bit SPI, with address and option in Quad SPI, with data read in Quad SPI, with four dummy cycles, with fetch and continuous read.

Command: FAST READ QUAD I/O (EBh) - 8-BIT OPTION (0x30h)

- Write 0x0030\_00EB in QSPI\_ICR.
- Write 0x0004\_33F4 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).  
Fetch is enabled, the address of the system bus read accesses is always used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-16. Instruction Transmission Waveform 7**

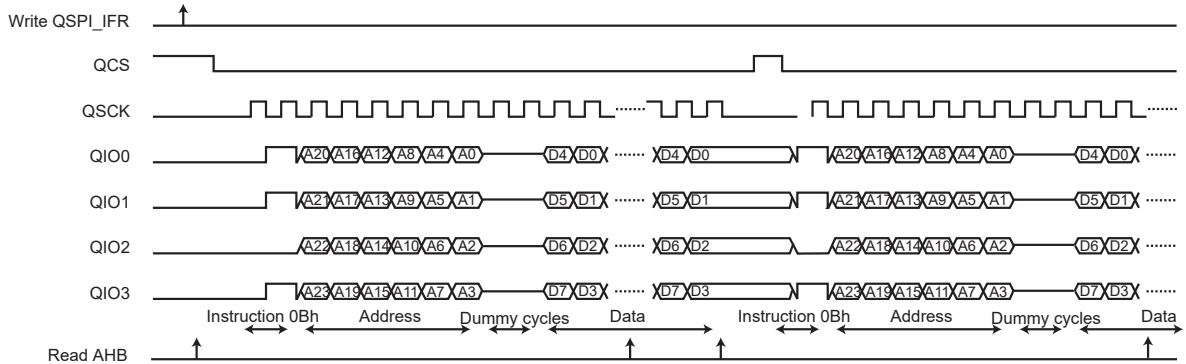

**Example 8:**

Instruction in Quad SPI, with address in Quad SPI, without option, with data read in Quad SPI, with two dummy cycles, with fetch.

Command: HIGH-SPEED READ (0Bh)

- Write 0x0000\_000B in QSPI\_ICR.
- Write 0x0002\_20B6 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000). Fetch is enabled, the address of the system bus read accesses is always used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-17. Instruction Transmission Waveform 8**

**Example 9:**

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch.

Command: HIGH-SPEED READ (05h)

- Write 0x0000\_0005 in QSPI\_ICR.
- Write 0x0000\_0096 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000). Fetch is disabled.
- Write a '1' to QSPI\_CR.LASTXFR.

- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-18. Instruction Transmission Waveform 9**

Example 10:

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch, read launched through APB interface.

Command: HIGH-SPEED READ (05h)

- Set SMRM to '1' in QSPI\_MR
- Write 0x0000\_0005 in QSPI\_ICR.
- Write 0x0100\_0096 in QSPI\_IFR (will start the transfer).
- Wait flag RDRF and Read data in the QSPI\_RDR register  
Fetch is disabled.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-19. Instruction Transmission Waveform 10**

### 49.6.6 Scrambling/Unscrambling Function

The scrambling/unscrambling function cannot be performed on devices other than memories. Data is scrambled when written to memory and unscrambled when data is read.

The external data lines can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the QSPI slave device (e.g., memory).

The scrambling/unscrambling function can be enabled by writing a '1' to the SCREN bit in the QSPI Scrambling Mode Register (QSPI\_SMR).

The scrambling and unscrambling are performed on-the-fly without impacting the throughput.

The scrambling method depends on the user-configurable user scrambling key (field USRK) in the QSPI Scrambling Key Register (QSPI\_SKR). QSPI\_SKR is only accessible in Write mode.

If QSPI\_SMR.RVDIS is written to '0', the scrambling/unscrambling algorithm includes the user scrambling key plus a random value depending on device processing characteristics. Data scrambled by a given microcontroller cannot be unscrambled by another.

If QSPI\_SMR.RVDIS is written to '1', the scrambling/unscrambling algorithm includes only the user scrambling key. No random value is part of the key.

The user scrambling key or the seed for key generation must be securely stored in a reliable nonvolatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

### 49.6.7 Register Write Protection

To prevent any single software error from corrupting QSPI behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the QSPI Write Protection Mode Register (QSPI\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the QSPI Write Protection Status Register (QSPI\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the QSPI\_WPSR.

The following registers can be write-protected when WPEN is set in QSPI\_WPMR:

- [QSPI Mode Register](#)
- [QSPI Serial Clock Register](#)
- [QSPI Scrambling Mode Register](#)
- [QSPI Scrambling Key Register](#)

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

### 49.7 Register Summary

| Offset              | Name     | Bit Pos. |       |             |       |             |      |         |          |
|---------------------|----------|----------|-------|-------------|-------|-------------|------|---------|----------|
| 0x00                | QSPI_CR  | 7:0      | SWRST |             |       |             |      | QSPIDIS | QSPIEN   |
|                     |          | 15:8     |       |             |       |             |      |         |          |
|                     |          | 23:16    |       |             |       |             |      |         |          |

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | The chip select is deasserted after the character written in QSPI_TDR.TD has been transferred. |

#### Bit 7 – SWRST QSPI Software Reset

DMA channels are not affected by software reset.

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | Reset the QSPI. A software-triggered hardware reset of the QSPI interface is performed. |

#### Bit 1 – QSPIDIS QSPI Disable

As soon as QSPIDIS is set, the QSPI finishes its transfer.

All pins are set in Input mode and no data is received or transmitted.

If a transfer is in progress, the transfer is finished before the QSPI is disabled.

If both QSPIEN and QSPIDIS are equal to one when QSPI\_CR is written, the QSPI is disabled.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

---

---

| Value | Description        |
|-------|--------------------|
| 0     | No effect.         |
| 1     | Disables the QSPI. |

### Bit 0 – QSPIEN QSPI Enable

| Value | Description                                    |
|-------|--|
| 0     | No effect.                                     |
| 1     | Enables the QSPI to transfer and receive data. |

### 49.7.2 QSPI Mode Register

**Name:** QSPI\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

|        |             |     |      |     |       |     |     |     |
|--------|-------------|-----|------|-----|-------|-----|-----|-----|
| Bit    | 31          | 30  | 29   | 28  | 27    | 26  | 25  | 24  |

|        | NBBITS[3:0] |     |      |     |       |     |     |     |
| Access |             |     |      |     | R/W   | R/W | R/W | R/W |
| Reset  |             |     |      |     | 0     | 0   | 0   | 0   |
| Bit    | 7           | 6   | 5    | 4   | 3     | 2   | 1   | 0   |
|        | CSMODE[1:0] |     | SMRM |     | WDRBT | LLB | SMM |     |
| Access |             |     | R/W  | R/W | R/W   | R/W | R/W | R/W |
| Reset  |             |     | 0    | 0   | 0     | 0   | 0   | 0   |

#### Bits 31:24 – DLYCS[7:0] Minimum Inactive QCS Delay

This field defines the minimum delay between the deactivation and the activation of QCS. The DLYCS time guarantees the slave minimum deselect time.

If DLYCS written to '0', one peripheral clock period is inserted by default.

Otherwise, the following equation determines the delay:

$$DLYCS = \text{Minimum inactive} \times f_{\text{peripheral clock}}$$

#### Bits 23:16 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT is written to '0', no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers. In Serial Memory mode (SMM = 1), DLYBCT must be written to '0' and no delay is inserted.

Otherwise, the following equation determines the delay:

$$DLYBCT = (\text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}}) / 32$$

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

**Bits 11:8 – NBBITS[3:0]** Number Of Bits Per Transfer

| Value | Name   | Description          |
|-------|--------|----------------------|
| 0     | 8_BIT  | 8 bits for transfer  |
| 8     | 16_BIT | 16 bits for transfer |

**Bits 5:4 – CSMODE[1:0]** Chip Select Mode

The CSMODE field determines how the chip select is deasserted

**Note:** This field is forced to LASTXFER when SMM is written to ‘1’.

| Value | Name           | Description  |
|-------|----------------|--|
| 0     | NOT_RELOADED   | The chip select is deasserted if QSPI_TDR.TD has not been reloaded before the end of the current transfer.                           |
| 1     | LASTXFER       | The chip select is deasserted when the bit LASTXFER is written to ‘1’ and the character written in QSPI_TDR.TD has been transferred. |
| 2     | SYSTEMATICALLY | The chip select is deasserted systematically after each transfer.  |

**Bit 3 – SMRM** Serial Memory Register Mode

| Value | Description   |
|-------|---|
| 0     | Serial Memory registers are written via AHB access. See section <a href="#">Instruction Frame Transmission</a> for details. |
| 1     | Serial Memory registers are written via APB access. See section <a href="#">Instruction Frame Transmission</a> for details. |

**Bit 2 – WDRBT** Wait Data Read Before Transfer

0 (DISABLED): No effect. In SPI mode, a transfer can be initiated whatever the state of the QSPI\_RDR is.

1 (ENABLED): In SPI mode, a transfer can start only if the QSPI\_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

**Bit 1 – LLB** Local Loopback Enable

0 (DISABLED): Local loopback path disabled.

1 (ENABLED): Local loopback path enabled.

LLB controls the local loopback on the data serializer for testing in SPI mode only. (MISO is internally connected on MOSI).

**Bit 0 – SMM** Serial Memory Mode

0 (SPI): The QSPI is in SPI mode.

1 (MEMORY): The QSPI is in Serial Memory mode.

### 49.7.3 QSPI Receive Data Register

**Name:** QSPI\_RDR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

|        |          |    |    |    |    |    |    |    |
|--------|----------|----|----|----|----|----|----|----|

|        |          |    |    |    |    |    |    |    |
| Access |          |    |    |    |    |    |    |    |
| Reset  |          |    |    |    |    |    |    |    |
|        |          |    |    |    |    |    |    |    |
| Bit    | 23       | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |          |    |    |    |    |    |    |    |
| Access |          |    |    |    |    |    |    |    |
| Reset  |          |    |    |    |    |    |    |    |
|        |          |    |    |    |    |    |    |    |
| Bit    | 15       | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | RD[15:8] |    |    |    |    |    |    |    |
| Access | R        | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |          |    |    |    |    |    |    |    |
| Bit    | 7        | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | RD[7:0]  |    |    |    |    |    |    |    |
| Access | R        | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 15:0 – RD[15:0] Receive Data**

Data received by the QSPI is stored in this register right-justified. Unused bits read zero.

### 49.7.4 QSPI Transmit Data Register

**Name:** QSPI\_TDR  
**Offset:** 0x0C  
**Reset:** –  
**Property:** Write-only

|        |          |    |    |    |    |    |    |    |
|--------|----------|----|----|----|----|----|----|----|
| Bit    | 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |          |    |    |    |    |    |    |    |
| Access |          |    |    |    |    |    |    |    |
| Reset  |          |    |    |    |    |    |    |    |
|        |          |    |    |    |    |    |    |    |
| Bit    | 23       | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |          |    |    |    |    |    |    |    |

| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0  | –  |

**Bits 15:0 – TD[15:0] Transmit Data**

Data to be transmitted by the QSPI is stored in this register. Information to be transmitted must be written to the Transmit Data register in a right-justified format.

### 49.7.5 QSPI Status Register

**Name:** QSPI\_SR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |       |         |      |         |
|--------|----|----|----|----|-------|---------|------|---------|
| Bit    | 31 | 30 | 29 | 28 | 27    | 26      | 25   | 24      |
|        |    |    |    |    |       |         |      | QSPIENS |
| Access |    |    |    |    |       |         |      | R       |
| Reset  |    |    |    |    |       |         |      | 0       |
| Bit    | 23 | 22 | 21 | 20 | 19    | 18      | 17   | 16      |
|        |    |    |    |    |       |         |      |         |
| Access |    |    |    |    |       |         |      |         |
| Reset  |    |    |    |    |       |         |      |         |
| Bit    | 15 | 14 | 13 | 12 | 11    | 10      | 9    | 8       |
|        |    |    |    |    |       | INSTRE  | CSS  | CSR     |
| Access |    |    |    |    |       | R       | R    | R       |
| Reset  |    |    |    |    |       | 0       | 0    | 0       |
| Bit    | 7  | 6  | 5  | 4  | 3     | 2       | 1    | 0       |
|        |    |    |    |    | OVRES | TXEMPTY | TDRE | RDRF    |
| Access |    |    |    |    | R     | R       | R    | R       |
| Reset  |    |    |    |    | 0     | 0       | 0    | 0       |

#### Bit 24 – QSPIENS QSPI Enable Status

| Value | Description       |
|-------|-------------------|
| 0     | QSPI is disabled. |
| 1     | QSPI is enabled.  |

#### Bit 10 – INSTRE Instruction End Status (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No instruction end has been detected since the last read of QSPI_SR.           |
| 1     | At least one instruction end has been detected since the last read of QSPI_SR. |

#### Bit 9 – CSS Chip Select Status

| Value | Description                      |
|-------|----------------------------------|
| 0     | The chip select is asserted.     |
| 1     | The chip select is not asserted. |

#### Bit 8 – CSR Chip Select Rise (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No chip select rise has been detected since the last read of QSPI_SR.           |
| 1     | At least one chip select rise has been detected since the last read of QSPI_SR. |

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

### Bit 3 – OVRES Overrun Error Status (cleared on read)

An overrun occurs when QSPI\_RDR is loaded at least twice from the serializer since the last read of the QSPI\_RDR.

| Value | Description   |
|-------|---|
| 0     | No overrun has been detected since the last read of QSPI_SR.            |
| 1     | At least one overrun error has occurred since the last read of QSPI_SR. |

### Bit 2 – TXEMPTY Transmission Registers Empty (cleared by writing QSPI\_TDR)

| Value | Description   |
|-------|---|
| 0     | As soon as data is written in QSPI_TDR.   |
| 1     | QSPI_TDR and the internal shifter are empty. If a transfer delay has been defined, TXEMPTY is set after the completion of such delay. |

### Bit 1 – TDRE Transmit Data Register Empty (cleared by writing QSPI\_TDR)

TDRE equals zero when the QSPI is disabled or at reset. The QSPI enable command sets this bit to one.

| Value | Description   |
|-------|---|
| 0     | Data has been written to QSPI_TDR and not yet transferred to the serializer.  |
| 1     | The last data written in the QSPI_TDR has been transferred to the serializer. |

### Bit 0 – RDRF Receive Data Register Full (cleared by reading QSPI\_RDR)

| Value | Description  |
|-------|--|
| 0     | No data has been received since the last read of QSPI_RDR.   |
| 1     | Data has been received and the received data has been transferred from the serializer to QSPI_RDR since the last read of QSPI_RDR. |

### 49.7.6 QSPI Interrupt Enable Register

**Name:** QSPI\_IER  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |    |    |    |    |       |         |      |      |
|--------|----|----|----|----|-------|---------|------|------|
| Bit    | 31 | 30 | 29 | 28 | 27    | 26      | 25   | 24   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
|        |    |    |    |    |       |         |      |      |
| Bit    | 23 | 22 | 21 | 20 | 19    | 18      | 17   | 16   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
|        |    |    |    |    |       |         |      |      |
| Bit    | 15 | 14 | 13 | 12 | 11    | 10      | 9    | 8    |
|        |    |    |    |    |       | INSTRE  | CSS  | CSR  |
| Access |    |    |    |    |       | W       | W    | W    |
| Reset  |    |    |    |    |       | –       | –    | –    |
|        |    |    |    |    |       |         |      |      |
| Bit    | 7  | 6  | 5  | 4  | 3     | 2       | 1    | 0    |
|        |    |    |    |    | OVRES | TXEMPTY | TDRE | RDRF |
| Access |    |    |    |    | W     | W       | W    | W    |
| Reset  |    |    |    |    | –     | –       | –    | –    |

**Bit 10 – INSTRE** Instruction End Interrupt Enable

**Bit 9 – CSS** Chip Select Status Interrupt Enable

**Bit 8 – CSR** Chip Select Rise Interrupt Enable

**Bit 3 – OVRES** Overrun Error Interrupt Enable

**Bit 2 – TXEMPTY** Transmission Registers Empty Enable

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Enable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Enable

### 49.7.7 QSPI Interrupt Disable Register

**Name:** QSPI\_IDR  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|     |    |    |    |    |    |    |    |    |

### 49.7.8 QSPI Interrupt Mask Register

**Name:** QSPI\_IMR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

|     |    |    |    |    |    |    |    |    |

**Bits 23:16 – DLYBS[7:0]** Delay Before QSCK

This field defines the delay from QCS valid to the first valid QSCK transition.

When DLYBS equals zero, the QCS valid to QSCK transition is 1/2 the QSCK clock period.

Otherwise, the following equation determines the delay:

$$DLYBS = \text{Delay Before QSCK} \times f_{\text{peripheral clock}}$$

**Bits 15:8 – SCBR[7:0]** Serial Clock Baud Rate

The QSPI uses a modulus counter to derive the QSCK baud rate from the peripheral clock. The baud rate is selected by writing a value from 0 to 255 in the SCBR field. The following equation determines the QSCK baud rate:

$$SCBR = (f_{\text{peripheral clock}} / \text{QSCK Baudrate}) - 1$$

**Bit 1 – CPHA** Clock Phase

CPHA determines which edge of QSCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

| Value | Description   |
|-------|---|
| 0     | Data is captured on the leading edge of QSCK and changed on the following edge of QSCK. |

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

| Value | Description   |
|-------|---|
| 1     | Data is changed on the leading edge of QSCK and captured on the following edge of QSCK. |

### Bit 0 – CPOL Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (QSCK). It is used with CPHA to produce the required clock/data relationship between master and slave devices.

| Value | Description   |
|-------|---|
| 0     | The inactive state value of QSCK is logic level zero. |
| 1     | The inactive state value of QSCK is logic level one.  |

### 49.7.10 QSPI Instruction Address Register

**Name:** QSPI\_IAR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 20:16 – NBDUM[4:0]** Number Of Dummy Cycles  
 The NBDUM field defines the number of dummy cycles required by the serial Flash memory before data transfer.

**Bit 14 – CRM** Continuous Read Mode  
 0 (DISABLED): Continuous Read mode is disabled.  
 1 (ENABLED): Continuous Read mode is enabled.

**Bits 13:12 – TFRTYP[1:0]** Data Transfer Type

| Value | Name              | Description   |
|-------|-------------------|---|
| 0     | TRSFR_READ        | Read transfer from the serial memory.<br><br>Scrambling is not performed.<br><br>Read at random location (fetch) in the serial Flash memory is not possible.          |
| 1     | TRSFR_READ_MEMORY | Read data transfer from the serial memory.<br><br>If enabled, scrambling is performed.<br><br>Read at random location (fetch) in the serial Flash memory is possible. |

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

| Value | Name               | Description   |
|-------|--------------------|---|
| 2     | TRSFR_WRITE        | Write transfer into the serial memory.<br>Scrambling is not performed.              |
| 3     | TRSFR_WRITE_MEMORY | Write data transfer into the serial memory.<br>If enabled, scrambling is performed. |

### Bit 10 – ADDRL Address Length

The ADDRL bit determines the length of the address.

0 (24\_BIT): The address is 24 bits long.

1 (32\_BIT): The address is 32 bits long.

### Bits 9:8 – OPTL[1:0] Option Code Length

The OPTL field determines the length of the option code. The value written in OPTL must be consistent with the value written in the field WIDTH. For example, OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).

| Value | Name        | Description                     |
|-------|-------------|---------------------------------|
| 0     | OPTION_1BIT | The option code is 1 bit long.  |
| 1     | OPTION_2BIT | The option code is 2 bits long. |
| 2     | OPTION_4BIT | The option code is 4 bits long. |
| 3     | OPTION_8BIT | The option code is 8 bits long. |

### Bit 7 – DATAEN Data Enable

| Value | Description   |
|-------|---|
| 0     | No data is sent/received to/from the serial Flash memory. |
| 1     | Data is sent/received to/from the serial Flash memory.    |

### Bit 6 – OPTEN Option Enable

| Value | Description  |
|-------|--|
| 0     | The option is not sent to the serial Flash memory. |
| 1     | The option is sent to the serial Flash memory.     |

### Bit 5 – ADDREN Address Enable

| Value | Description  |
|-------|--|
| 0     | The transfer address is not sent to the serial Flash memory. |
| 1     | The transfer address is sent to the serial Flash memory.     |

### Bit 4 – INSTEN Instruction Enable

| Value | Description   |
|-------|---|
| 0     | The instruction is not sent to the serial Flash memory. |
| 1     | The instruction is sent to the serial Flash memory.     |

### Bits 2:0 – WIDTH[2:0] Width of Instruction Code, Address, Option Code and Data

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

| Value | Name           | Description   |
|-------|----------------|---|
| 0     | SINGLE_BIT_SPI | Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Single-bit SPI |

### 49.7.13 QSPI Scrambling Mode Register

**Name:** QSPI\_SMR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

**Bit 1 – RVDIS** Scrambling/Unscrambling Random Value Disable

| Value | Description   |
|-------|---|
| 0     | The scrambling/unscrambling algorithm includes the user scrambling key plus a random value that may differ between devices. |
| 1     | The scrambling/unscrambling algorithm includes only the user scrambling key.  |

**Bit 0 – SCREN** Scrambling/Unscrambling Enable

0 (DISABLED): The scrambling/unscrambling is disabled.

1 (ENABLED): The scrambling/unscrambling is enabled.

### 49.7.14 QSPI Scrambling Key Register

**Name:** QSPI\_SKR  
**Offset:** 0x44  
**Reset:** –  
**Property:** Write-only

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

|        |             |    |    |    |    |    |    |    |

| Access |              |    |    |    |    |    |    | WPEN |
| Reset  |              |    |    |    |    |    |    | 0    |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value   | Name   | Description   |
|---------|--------|---|
| 0x51535 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. |
| 0       |        | Always reads as 0.  |

#### Bit 0 – WPEN Write Protection Enable

See section [Register Write Protection](#) for the list of registers that can be protected.

| Value | Description   |
|-------|---|
| 0     | Disables the write protection if WPKEY corresponds to 0x515350 (QSP in ASCII) |
| 1     | Enables the write protection if WPKEY corresponds to 0x515350 (QSP in ASCII)  |

### 49.7.16 QSPI Write Protection Status Register

**Name:** QSPI\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

|        |                   |    |    |    |    |    |    |      |
|--------|-------------------|----|----|----|----|----|----|------|
| Bit    | 31                | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        | [Greyed out bits] |    |    |    |    |    |    |      |
| Access |                   |    |    |    |    |    |    |      |
| Reset  |                   |    |    |    |    |    |    |      |
| Bit    | 23                | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        | [Greyed out bits] |    |    |    |    |    |    |      |
| Access |                   |    |    |    |    |    |    |      |
| Reset  |                   |    |    |    |    |    |    |      |
| Bit    | 15                | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]        |    |    |    |    |    |    |      |
| Access | R                 | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0                 | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7                 | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        | [Greyed out bits] |    |    |    |    |    |    | WPVS |
| Access |                   |    |    |    |    |    |    | R    |
| Reset  |                   |    |    |    |    |    |    | 0    |

**Bits 15:8 – WPVSR[7:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description  |
|-------|--|
| 0     | No write protection violation has occurred since the last read of the QSPI_WPSR.   |
| 1     | A write protection violation has occurred since the last read of the QSPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 50. Secure Digital MultiMedia Card Controller (SDMMC)

### 50.1 Description

The Secure Digital MultiMedia Card Controller (SDMMC) supports the embedded MultiMedia Card (e.MMC) Specification V4.51, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification.

The SDMMC includes the register set defined in the “SD Host Controller Simplified Specification V3.00” and additional registers to manage e.MMC devices, sampling tuning procedure, PAD calibration and enhanced features.

The SDMMC is clocked by three asynchronous clocks and requires the PMC to be configured first.

### 50.2 Embedded Characteristics

- Compatible with SD Host Controller Standard Specification Version 3.00
- Compatible with MultiMedia Card Specification Version V4.51
- Compatible with SD Memory Card Specification Version 3.00
- Compatible with SDIO Specification Version 3.00
- Support for 1-bit/ 4-bit SD/SDIO Devices
- Support for 1-bit/4-bit/8-bit e.MMC Devices
- Support for SD/SDIO Default Speed (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO High Speed (Maximum SDCLK Frequency = 50 MHz)
- Support for SD/SDIO UHS-I SDR12 (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO UHS-I SDR25 (Maximum SDCLK Frequency = 50 MHz)
- Support for SD/SDIO UHS-I SDR50 (Maximum SDCLK Frequency = 100 MHz)
- Support for SD/SDIO UHS-I SDR104 (Maximum SDCLK Frequency = 120 MHz)
- Support for SD/SDIO UHS-I DDR50 (Maximum SDCLK Frequency = 50 MHz)
- Support for SDSC, SDHC and SDXC
- Support for MMC/e.MMC Default Speed (Maximum SDCLK Frequency = 26 MHz)
- Support for MMC/e.MMC High Speed (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC High Speed DDR (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC HS200 (Maximum SDCLK Frequency = 120 MHz)
- e.MMC Boot Operation Mode Support
- Support for Block Size from 1 to 512 Bytes
- Support for Stream, Block and Multiblock Data Read and Write
  - Advanced DMA and SDMA Capability
- Internal 1024-byte Dual Port RAM
- Support for both Synchronous and Asynchronous Abort
- Supports for SDIO Card Interrupt

### 50.3 Reference Documents

**Table 50-1. Reference Documents**

| Name  | Link  |
|---|---|
| SD Host Controller Simplified Specification V3.00         | <a href="https://www.sdcard.org">https://www.sdcard.org</a> |
| SDIO Simplified Specification V3.00                       |   |
| Physical Layer Simplified Specification V3.01             |   |
| Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51 | <a href="http://www.jedec.org">http://www.jedec.org</a>     |

### 50.4 Block Diagram

Figure 50-1. Block Diagram

- Notes:
1. SDMMC\_1V8SEL not available on SDMMC1.
  2. Limited to SDMMC\_DAT[3..0] on SDMMC1.

## 50.5 Application Block Diagram

Figure 50-2. Application Block Diagram

## 50.6 Pin Name List

Table 50-2. I/O Lines Description for 8-bit Configuration

| Pin Name <sup>(1)</sup> | Pin Description                             | Type   |
|-------------------------|---|--------|
| SDMMC_CD                | SDCard / SDIO / e.MMC Card Detect           | Input  |
| SDMMC_CMD               | SDCard / SDIO / e.MMC Command/Response Line | I/O    |
| SDMMC_WP                | SDCard Connector Write Protect Signal       | Input  |
| SDMMC_RSTN              | e.MMC Reset Signal                          | Output |
| SDMMC_1V8SEL            | SDCard Signal Voltage Selection             | Output |
| SDMMC_CK                | SDCard / SDIO / e.MMC Clock Signal          | Output |
| SDMMC_DAT[7..0]         | SDCard / SDIO / e.MMC Data Lines            | I/O    |

Notes: 1. When several SDMMCs are embedded in a product, SDMMC\_CK refers to SDMMCx\_CK, SDMMC\_CMD to SDMMCx\_CMD, SDMMC\_DATy to SDMMCx\_DATy, SDMMC\_WP to SDMMCx\_WP, SDMMC\_1V8SEL to SDMMCx\_1V8SEL, SDMMC\_CD to SDMMCx\_CD and SDMMC\_RSTN to SDMMCx\_RSTN.

## 50.7 Product Dependencies

### 50.7.1 I/O Lines

The pins used for interfacing the Secure Digital MultiMedia Card (SDMMC) Controller are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the peripheral functions to SDMMC pins.

### 50.7.2 Power Management

The SDMMC is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SDMMC clocks.

### 50.7.3 Interrupt Sources

The SDMMC has an interrupt line connected to the interrupt controller.

Handling the SDMMC interrupt requires programming the interrupt controller before configuring the SDMMC.

## 50.8 SD/SDIO Operating Mode

The SDMMC is fully compliant with the “SD Host Controller Simplified Specification V3.00” for SD/SDIO devices. See this specification for the SDMMC configuration.

See “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00” for SD/SDIO management.

## 50.9 e.MMC Operating Mode

The SDMMC supports management of e.MMC devices. As the “SD Host Controller Simplified Specification V3.00” does not apply to e.MMC devices, some registers have been added to those described in this specification in order to manage e.MMC devices. Most of the registers described in the “SD Host Controller Simplified Specification V3.00” must be used for e.MMC management, but e.MMC-specific features are managed using SDMMC\_MC1R and SDMMC\_MC2R.

### 50.9.1 Boot Operation Mode

In Boot Operation mode, the processor can read boot data from the e.MMC device by keeping the CMD line low after poweron before issuing the CMD1. The data can be read from either one of the boot partitions or the user area according to BOOT\_PARTITION\_ENABLE in the Extended CSD register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).

#### 50.9.1.1 Boot Procedure, Processor Mode

1. Configure the SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to the BOOT\_BUS\_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).
  - b. Select the speed mode (using SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD Register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the e.MMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to ‘1’ (SDMMC\_MC1R.BOOTA = 1).

- e. Enable the interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the e.MMC Command Type to BOOT (SDMMC\_MC1R.COMDTYP = 3)
  - g. Set SDMMC\_TMR to read multiple blocks for the e.MMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.DTDSEL = 1).
  - h. Select the NonDMA transfer (SDMMC\_TMR.DMAEN = 0).
  - i. Optional: select the Auto CMD method (using SDMMC\_TMR.ACMDEN).
  - j. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - k. Set the required number of read blocks (using SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to '1'.
2. Write SDMMC\_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
  3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
  4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
  5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to '1'.

#### 50.9.1.2 Boot Procedure, SDMA Mode

1. Configure SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to BOOT\_BUS\_WIDTH in the Extended CSD Register (see "Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51" ).
  - b. Select the speed mode (SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD Register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the e.MMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to 1 (SDMMC\_MC1R.BOOTA = 1).
  - e. Enable interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the e.MMC Command Type to BOOT (SDMMC\_MC1R.COMDTYP = 3).
  - g. Set SDMMC\_TMR to read multiple blocks for the e.MMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.TDSEL = 1).
  - h. Select the SDMA transfer (SDMMC\_TMR.DMAEN = 1 and SDMMC\_HC1R.DMASEL = 0).
  - i. Write the SDMA system address where the boot data will be copied (SDMMC\_SSAR.ADDR).
  - j. Optional: select the Auto CMD method (SDMMC\_TMR.ACMDEN).  
Note: Auto CMD23 cannot be used with SDMA.
  - k. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - l. Set the required number of read blocks (SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to 1.
2. Write SDMMC\_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.

5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to '1'.

#### 50.9.1.3 Boot Procedure, ADMA Mode

1. Configure the SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to BOOT\_BUS\_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).
  - b. Select the speed mode (SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the e.MMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to '1' (SDMMC\_MC1R.BOOTA = 1).
  - e. Enable interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the e.MMC Command Type to BOOT (SDMMC\_MC1R.COMDTYP = 3).
  - g. Set SDMMC\_TMR to read multiple blocks for the e.MMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.DTDSEL = 1).
  - h. Select the ADMA transfer (SDMMC\_TMR.DMAEN = 1 and SDMMC\_HC1R.DMASEL = 2 or 3).
  - i. Write the address of the descriptor table in the ADMA system address (SDMMC\_ASARx [0..1].ADMASA).
  - j. Optional: select the Auto CMD method (SDMMC\_TMR.ACMDEN).
  - k. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - l. Set the required number of read blocks (SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to '1'.
2. Write SDMMC\_CR = 20(hexa) to set the e.MMC in Boot Operation Mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to '1'.

## 50.10 SDR104 / HS200 Tuning

### 50.10.1 DLL and Sampling Point

In SD/SDIO SDR104 mode (SDMMC\_HC2R.VS18EN = 1 and SDMMC\_HC2R.UHSMS = 3) or e.MMC HS200 mode (HS200EN = B<sub>(hexa)</sub>), a tuning procedure must be performed first in order to adjust the sampling point for read transactions. For more details regarding the basic tuning procedure, see section “Sampling Clock Tuning Procedure” in the “SD Host Controller Simplified Specification V3.00” .

As the position of data and command coming from the device varies, a DLL is used to generate an accurate sampling point (DLL\_CLKOUT) (see the figure below).

**Figure 50-3. DLL Sampling Point**

Note: 1.  $t_{OUTPUT}$  varies from 0 to  $2 \times t_{SDCLK}$

The minimum SDCLK frequency is 100 MHz when SD/SDIO SDR104 or e.MMC HS200 is selected.

The sampling point can be selected to be located at 50% or 75% of the data window to anticipate the effect of the temperature rise. If SDMMC\_TUNCR.SMPLPT is cleared, the sampling point is centered (50% of the data window). If SDMMC\_TUNCR.SMPLPT is set to '1', the sampling point is set at 75% of the data window (see the figure below).

**Figure 50-4. SDR104/HS200 Sampling Point Selection**

### 50.10.2 Retuning Method

Once the data window sampling point has been tuned following the tuning procedure, the data window can be shifted by temperature drift. Thus, the tuning procedure must be applied periodically to adjust the sampling point position. The SDMMC implements a retuning timer which periodically instructs the software to restart the tuning procedure.

**Figure 50-5. Temperature Effect on Data Window**

Note: 1.  $t_{OUTPUT}$  varies from 0 to  $2 \times t_{SDCLK}$

### 50.10.2.1 SDMMC Tuning Sequence

The SDMMC tuning sequence must only be done when SD/SDIO SDR104 or e.MMC HS200 is selected and for a 100-MHz SDCLK frequency or higher.

1. Enable the retuning timer (`SDMMC_RTC1R.TMREN = 1`).
2. Configure the retuning period by setting `SDMMC_RTCVR.TCVAL`.
3. Set `SDMMC_RTISTR.TEVT` to '1' so that the TEVT status flag in `SDMMC_RTISTR` rises each time the retuning timer counter period elapses.
4. Set `SDMMC_RTISIER.TEVT` to '1' to generate an interrupt on the TEVT status flag assertion (optional).
5. Execute the tuning procedure as defined in "Sampling Clock Tuning Procedure" in the "SD Host Controller Simplified Specification V3.00".
6. Start the retuning timer count (write `SDMMC_RTC2R.RLD` to 1). At this step, data can be read by the SDMMC.
7. Each time `SDMMC_RTISTR.TEVT` is set to '1':
  - a. Execute the tuning procedure as defined in "Sampling Clock Tuning Procedure" in the "SD Host Controller Simplified Specification V3.00" before issuing the next command.
  - b. Restart the retuning timer count (write `SDMMC_RTC2R.RLD` to '1').
  - c. Resume data reading from the device.

When several instances of SDMMC are implemented in a product, the TEVT status flag of each SDMMC instance can be checked by reading `SDMMC_RTSSR`.

## 50.11 I/O Calibration

The need for output impedance calibration arises with higher data rates. As the data rate increases, some transmission line effects can occur and lead to the generation of undershoots and overshoots, hence degrading the signal quality.

To avoid these transmission problems, an I/O calibration cell is used to adjust the output impedance to the driven I/Os.

The I/O calibration sequence is mandatory when one of the SD/SDIO UHS-I modes (SDMMC\_HC2R.VS18EN = 1) or e.MMC HS200 (HS200EN = B<sub>(hexa)</sub>) is selected. It must be performed periodically to prevent the output impedance drift. Once the calibration is finished, the I/O calibration cell provides two four-bit control words (CALP[3:0] and CALN[3:0]) in the Calibration Control register (SDMMC\_CALCR) to tune the output impedance, and thus reach the best transmission performances.

The I/O calibration sequence can be started manually by writing a '1' to SDMMC\_CALCR.EN. This bit is cleared automatically at the end of the calibration.

The I/O calibration sequence can also be performed automatically if SDMMC\_CALCR.TUNDIS is cleared. In this case, the calibration starts automatically at the beginning of the tuning procedure when writing a '1' to SDMMC\_HC2R.EXTUN.

The I/O calibration cell requires a startup time defined by SDMMC\_CALCR.CNTVAL. Thus, CNTVAL must be configured prior to start the calibration sequence. If SDMMC\_CALCR.ALWYSON is set to '1', the startup time is only required for the first calibration sequence as the analog circuitry is not shut down at the end of the calibration. In order to reduce the power consumption, the analog circuitry can be shut down at the end of the calibration sequence by clearing ALWYSON. In this case, the startup time is performed each time a calibration sequence is started.

### 50.12.1 SDMMC SDMA System Address / Argument 2 Register

**Name:** SDMMC\_SSAR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register contains the physical system memory address used for SDMA transfers or the second argument for Auto CMD23.

|        |                  |    |    |    |    |    |    |    |
|--------|------------------|----|----|----|----|----|----|----|
| Bit    | 31               | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | ADDR/ARG2[31:24] |    |    |    |    |    |    |    |
| Access |                  |    |    |    |    |    |    |    |
| Reset  | 0                | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 23               | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | ADDR/ARG2[23:16] |    |    |    |    |    |    |    |
| Access |                  |    |    |    |    |    |    |    |
| Reset  | 0                | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15               | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | ADDR/ARG2[15:8]  |    |    |    |    |    |    |    |
| Access |                  |    |    |    |    |    |    |    |
| Reset  | 0                | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7                | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | ADDR/ARG2[7:0]   |    |    |    |    |    |    |    |
| Access |                  |    |    |    |    |    |    |    |
| Reset  | 0                | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 31:0 – ADDR/ARG2[31:0] SDMA System Address/Argument 2**

**ADDR:** This field is the system memory address for a SDMA transfer. When the SDMMC stops an SDMA transfer, this field points to the system address of the next contiguous data position. This field can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. An interrupt can be generated to instruct the software to update this field. Writing the next system address of the next data position restarts the SDMA transfer.

**ARG2:** This field is used with Auto CMD23 to set a 32-bit block count value to the CMD23 argument while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by SDMMC\_BCR. In this case, 65535 blocks is the maximum value.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.2 SDMMC Block Size Register

**Name:** SDMMC\_BSR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |               |     |     |     |     |     |              |     |
|--------|---------------|-----|-----|-----|-----|-----|--------------|-----|
| Bit    | 15            | 14  | 13  | 12  | 11  | 10  | 9            | 8   |
|        | BOUNDARY[2:0] |     |     |     |     |     | BLKSIZE[9:8] |     |
| Access |               | R/W | R/W | R/W |     |     | R/W          | R/W |
| Reset  |               | 0   | 0   | 0   |     |     | 0            | 0   |
|        |               |     |     |     |     |     |              |     |
| Bit    | 7             | 6   | 5   | 4   | 3   | 2   | 1            | 0   |
|        | BLKSIZE[7:0]  |     |     |     |     |     |              |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W          | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0            | 0   |

#### Bits 14:12 – BOUNDARY[2:0] SDMA Buffer Boundary

This field specifies the size of the contiguous buffer in the system memory. The SDMA transfer waits at every boundary specified by this field and the SDMMC generates the DMA Interrupt to instruct the software to update SDMMC\_SSAR. If this field is set to 0 (buffer size = 4 Kbytes), the lowest 12 bits of SDMMC\_SSAR.ADDRESS point to data in the contiguous buffer, and the upper 20 bits point to the location of the buffer in the system memory. This function is active when SDMMC\_TMR.DMAEN is set.

| Value | Name | Description        |
|-------|------|--------------------|
| 0     | 4K   | 4-Kbyte boundary   |
| 1     | 8K   | 8-Kbyte boundary   |
| 2     | 16K  | 16-Kbyte boundary  |
| 3     | 32K  | 32-Kbyte boundary  |
| 4     | 64K  | 64-Kbyte boundary  |
| 5     | 128K | 128-Kbyte boundary |
| 6     | 256k | 256-Kbyte boundary |
| 7     | 512K | 512-Kbyte boundary |

#### Bits 9:0 – BLKSIZE[9:0] Transfer Block Size

This field specifies the block size of data transfers for CMD14, CMD17, CMD18, CMD19, CMD24, CMD25, CMD53 and other data transfer commands such as CMD6, CMD8, ACMD13 and ACMD51. Values ranging from 1 to 512 can be set. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations are ignored.

### 50.12.3 SDMMC Block Count Register

**Name:** SDMMC\_BCR  
**Offset:** 0x06  
**Reset:** 0x0000  
**Property:** Read/Write

| Bit    | 15           | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|--------|--------------|-----|-----|-----|-----|-----|-----|-----|
|        | BLKCNT[15:8] |     |     |     |     |     |     |     |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7            | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | BLKCNT[7:0]  |     |     |     |     |     |     |     |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 15:0 – BLKCNT[15:0]** Block Count for Current Transfer

This field is used only if SDMMC\_TMR.BCEN (Block Count Enable) is set to 1 and is valid only for multiple block transfers. BLKCNT is the number of blocks to be transferred and it must be set to a value between 1 and the maximum block count. The SDMMC decrements the block count after each block transfer and stops when the count reaches 0. When this field is set to 0, no data block is transferred.

This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored.

When a suspend command is completed, the number of blocks yet to be transferred can be determined by reading this register. Before issuing a resume command, the previously saved block count is restored.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.4 SDMMC Argument 1 Register

**Name:** SDMMC\_ARG1R  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

|             |     |     |     |     |     |     |     |     |
|-------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit         | 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
| ARG1[31:24] |     |     |     |     |     |     |     |     |
| Access      | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset       | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit         | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| ARG1[23:16] |     |     |     |     |     |     |     |     |
| Access      | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset       | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit         | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| ARG1[15:8]  |     |     |     |     |     |     |     |     |
| Access      | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset       | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit         | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| ARG1[7:0]   |     |     |     |     |     |     |     |     |
| Access      | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset       | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – ARG1[31:0] Argument 1**

This register contains the SD command argument which is specified as the bit 39-8 of Command-Format in the “Physical Layer Simplified Specification V3.01” or “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” .

### 50.12.5 SDMMC Transfer Mode Register

**Name:** SDMMC\_TMR  
**Offset:** 0x0C  
**Reset:** 0x0000  
**Property:** Read/Write

This register is used to control data transfers. The user shall set this register before issuing a command which transfers data (see SDMMC\_CR.DPSEL), or before issuing a Resume command. The user must save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, this register cannot be written while data transactions are in progress. Writes to this register are ignored when SDMMC\_PSR.CMDINHD is 1.

**Table 50-3. Determining the Transfer Type**

| MSBSEL | BCEN       | BLKCNT (SDMMC_BCR) | Function               |
|--------|------------|--------------------|------------------------|
| 0      | Don't care | Don't care         | Single Transfer        |
| 1      | 0          | Don't care         | Infinite Transfer      |
| 1      | 1          | Not Zero           | Multiple Transfer      |
| 1      | 1          | Zero               | Stop Multiple Transfer |

|        |    |    |     |     |     |     |     |     |
|--------|----|----|-----|-----|-----|-----|-----|-----|
| Bit    | 15 | 14 | 13  | 12  | 11  | 10  | 9   | 8   |
| Access |    |    |     |     |     |     |     |     |
| Reset  |    |    |     |     |     |     |     |     |
| Bit    | 7  | 6  | 5   | 4   | 3   | 2   | 1   | 0   |
| Access |    |    | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |    |    | 0   | 0   | 0   | 0   | 0   | 0   |

**Bit 5 – MSBSEL** Multi/Single Block Selection

This bit is set to 1 when issuing multiple-block transfer commands using DAT line(s). For any other commands, set this bit to 0. If this bit is 0, it is not necessary to set SDMMC\_BCR (see the table above, “Determining the Transfer Type”).

**Bit 4 – DTDSEL** Data Transfer Direction Selection

This bit defines the direction of the DAT lines data transfers. Set this bit to 1 to transfer data from the device (SD Card/SDIO/e.MMC) to the SDMMC, and to 0 for all other commands.

0 (WRITE): Writes data from the SDMMC to the device.

1 (READ): Reads data from the device to the SDMMC.

**Bits 3:2 – ACMDEN[1:0]** Auto Command Enable

Two methods can be used to stop Multiple-block read and write operation:

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

- Auto CMD12: when the ACMDEN field is set to 1, the SDMMC issues CMD12 automatically when the last block transfer is completed. An Auto CMD12 error is indicated to SDMMC\_ACESR. Auto CMD12 is not enabled if the command does not require CMD12.
- Auto CMD23: when the ACMDEN field is set to 2, the SDMMC issues a CMD23 automatically before issuing a command specified in SDMMC\_CR.

The following conditions are required to use Auto CMD23:

- A memory card that supports CMD23 (SCR[33] = 1)
- If DMA is used, it must be ADMA (SDMA not supported).
- Only CMD18 or CMD25 is issued.

**Note:** The SDMMC does not check the command index.

Auto CMD23 can be used with or without ADMA. By writing SDMMC\_CR, the SDMMC issues a CMD23 first and then issues a command specified by the SDMMC\_CR.CMDIDX field. If CMD23 response errors are detected, the second command is not issued. A CMD23 error is indicated in SDMMC\_ACESR. The CMD23 argument (32-bit block count value) is set in SDMMC\_SSAR.

This field determines the use of auto command functions.

| Value | Name     | Description           |
|-------|----------|-----------------------|
| 0     | DISABLED | Auto Command Disabled |
| 1     | CMD12    | Auto CMD12 Enabled    |
| 2     | CMD23    | Auto CMD23 Enabled    |
| 3     | –        | Reserved              |

### Bit 1 – BCEN Block Count Enable

This bit is used to enable SDMMC\_BCR, which is only relevant for multiple block transfers. When this bit is 0, SDMMC\_BCR is disabled, which is useful when executing an infinite transfer (see the table above). If an ADMA2 transfer is more than 65535 blocks, this bit is set to 0 and the data transfer length is designated by the Descriptor Table.

0 (DISABLED): Block count is disabled.

1 (ENABLED): Block count is enabled.

### Bit 0 – DMAEN DMA Enable

This bit enables the DMA functionality described in section “Supporting DMA” in “SD Host Controller Simplified Specification V3.00”. DMA can be enabled only if it is supported as indicated by the bit SDMMC\_CA0R.ADMA2SUP. One of the DMA modes can be selected using the field SDMMC\_HC1R.DMASEL. If DMA is not supported, this bit is meaningless and then always reads 0. When this bit is set to 1, a DMA operation begins when the user writes to the upper byte of SDMMC\_CR.

0 (DISABLED): DMA functionality is disabled.

1 (ENABLED): DMA functionality is enabled.

### 50.12.6 SDMMC Command Register

**Name:** SDMMC\_CR  
**Offset:** 0x0E  
**Reset:** 0x0000  
**Property:** Read/Write

|        |             |     |       |         |         |     |              |     |
|--------|-------------|-----|-------|---------|---------|-----|--------------|-----|
| Bit    | 15          | 14  | 13    | 12      | 11      | 10  | 9            | 8   |
|        | CMDIDX[5:0] |     |       |         |         |     |              |     |
| Access |             |     | R/W   | R/W     | R/W     | R/W | R/W          | R/W |
| Reset  |             |     | 0     | 0       | 0       | 0   | 0            | 0   |
| Bit    | 7           | 6   | 5     | 4       | 3       | 2   | 1            | 0   |
|        | CMDTYP[1:0] |     | DPSEL | CMDICEN | CMDCCEN |     | RESPTYP[1:0] |     |
| Access | R/W         | R/W | R/W   | R/W     | R/W     |     | R/W          | R/W |
| Reset  | 0           | 0   | 0     | 0       | 0       |     | 0            | 0   |

#### Bits 13:8 – CMDIDX[5:0] Command Index

This bit shall be set to the command number (CMD0–63, ACMD0–63) that is specified in bits 45–40 of the Command-Format in the “Physical Layer Simplified Specification V3.01”, “SDIO Simplified Specification V3.00”, and “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”.

#### Bits 7:6 – CMDTYP[1:0] Command Type

| Value | Name    | Description   |
|-------|---------|---|
| 0     | NORMAL  | Other commands  |
| 1     | SUSPEND | CMD52 to write “Bus Suspend” in the Card Common Control Registers (CCCR) (for SDIO only)      |
| 2     | RESUME  | CMD52 to write “Function Select” in the Card Common Control Registers (CCCR) (for SDIO only)  |
| 3     | ABORT   | CMD12, CMD52 to write “I/O Abort” in the Card Common Control Registers (CCCR) (for SDIO only) |

#### Bit 5 – DPSEL Data Present Select

This bit is set to 1 to indicate that data is present and shall be transferred using the DAT lines. It is set to 0 for the following:

- Commands using only CMD line (Ex. CMD52)
- Commands with no data transfer but using Busy signal on DAT[0] line (Ex. CMD38)
- Resume command

| Value | Description     |
|-------|-----------------|
| 0     | No data present |
| 1     | Data present    |

#### Bit 4 – CMDICEN Command Index Check Enable

If this bit is set to 1, the SDMMC checks the Index field in the response to see if it has the same value as the command index. If it has not, it is reported as a Command Index Error (CMDIDX) in SDMMC\_EISTR. If this bit is set to 0, the Index field of the response is not checked.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

0 (DISABLED): The Command Index Check is disabled.

1 (ENABLED): The Command Index Check is enabled.

### Bit 3 – CMDCCEN Command CRC Check Enable

If this bit is set to 1, the SDMMC checks the CRC field in the response. If an error is detected, it is reported as a Command CRC Error (CMDCRC) in SDMMC\_EISTR. If this bit is set to 0, the CRC field is not checked. The position of the CRC field is determined according to the length of the response.

0 (DISABLED): The Command CRC Check is disabled.

1 (ENABLED): The Command CRC Check is enabled.

### Bits 1:0 – RESPTYP[1:0] Response Type

This field is set according to the response type expected for the command index (CMDIDX).

| Value | Name     | Description                  |
|-------|----------|------------------------------|
| 0     | NORESP   | No Response                  |
| 1     | RL136    | Response Length 136          |

#### Bits 31:0 – CMDRESP[31:0] Command Response

The table below describes the mapping of command responses from the SD\_SDIO/e.MMC bus to these registers for each responses type. In this table, R[] refers to a bit range of the response data as transmitted on the SD\_SDIO/e.MMC bus.

| Type of response          | Meaning of response        | Response field | Response register  |
|---------------------------|----------------------------|----------------|--|
| R1, R1b (normal response) | Card Status                | R[39:8]        | SDMMC_RR0[31:0]  |
| R1b (Auto CMD12 response) | Card Status for Auto CMD12 | R[39:8]        | SDMMC_RR3[31:0]  |
| R1 (Auto CMD23 response)  | Card Status for Auto CMD23 | R[39:8]        | SDMMC_RR3[31:0]  |
| R2 (CID, CSD register)    | CID or CSD register        | R[127:8]       | SDMMC_RR0[31:0]<br>SDMMC_RR1[31:0]<br>SDMMC_RR2[31:0]<br>SDMMC_RR3[23:0] |
| R3 (OCR register)         | OCR register for memory    | R[39:8]        | SDMMC_RR0[31:0]  |
| R4 (OCR register)         | OCR register for I/O       | R[39:8]        | SDMMC_RR0[31:0]  |
| R5, R5b                   | SDIO response              | R[39:8]        | SDMMC_RR0[31:0]  |

| Access |            |    |    |    | R       | R       | R        | R        |
| Reset  |            |    |    |    | 0       | 0       | 0        | 0        |
| Bit    | 7          | 6  | 5  | 4  | 3       | 2       | 1        | 0        |
|        |            |    |    |    |         | DLACT   | CMDINHDL | CMDINHCL |
| Access |            |    |    |    |         | R       | R        | R        |
| Reset  |            |    |    |    |         | 0       | 0        | 0        |

**Bit 24 – CMDLL** CMD Line Level

This status is used to check the CMD line level to recover from errors, and for debugging.

**Bits 23:20 – DATLL[3:0]** DAT[3:0] Line Level

This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the Busy signal level from DAT[0].

**Bit 19 – WRPPL** Write Protect Pin Level

The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDMMC\_WP pin.

| Value | Description                    |
|-------|--------------------------------|
| 0     | Write protected (SDMMC_WP = 0) |
| 1     | Write enabled (SDMMC_WP = 1)   |

**Bit 18 – CARDDPL** Card Detect Pin Level

This bit reflects the inverse value of the SDMMC\_CD pin. Debouncing is not performed on this bit. This bit may be valid when CARDSS is set to 1, but it is not guaranteed because of the propagation delay. Use of this bit is limited to testing since it must be debounced by software.

| Value | Description                     |
|-------|---------------------------------|
| 0     | No card present (SDMMC_CD = 1). |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| Value | Description                  |
|-------|------------------------------|
| 1     | Card present (SDMMC_CD = 0). |

### Bit 17 – CARDSS Card State Stable

This bit is used for testing. If it is 0, the CARDDPL is not stable. If this bit is set to 1, it means that the CARDDPL is stable. No Card state can be detected if this bit is set to 1 and CARDINS is set to 0.

The Software Reset For All (SWRSTALL) in SDMMC\_SRR does not affect this bit.

| Value | Description               |
|-------|---------------------------|
| 0     | Reset or debouncing.      |
| 1     | No card or card inserted. |

### Bit 16 – CARDINS Card Inserted

This bit indicates whether a card has been inserted. The SDMMC debounces this signal so that the user does not need to wait for it to stabilize.

A change from 0 to 1 raises the Card Insertion (CINS) status flag in SDMMC\_NISTR if SDMMC\_NISTER.CINS is set to 1. An interrupt is generated if SDMMC\_NISIER.CINS is set to 1.

A change from 1 to 0 raises the Card Removal (CREM) status flag in SDMMC\_NISTR if SDMMC\_NISTER.CREM is set to 1. An interrupt is generated if SDMMC\_NISIER.CREM is set to 1.

The Software Reset For All (SWRSTALL) in SDMMC\_SRR does not affect this bit.

### Bit 11 – BUFRDEN Buffer Read Enable

This bit is used for nonDMA read transfers. This flag indicates that valid data exists in the SDMMC data buffer. If this bit is 1, readable data exists in the buffer.

A change from 1 to 0 occurs when all the block data is read from the buffer.

A change from 0 to 1 occurs when block data is ready in the buffer. This raises the Buffer Read Ready (BRDRDY) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BRDRDY is set to 1. An interrupt is generated if SDMMC\_NISIER.BRDRDY is set to 1.

### Bit 10 – BUFWREN Buffer Write Enable

This bit is used for nonDMA write transfers. This flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer.

A change from 1 to 0 occurs when all the block data are written to the buffer.

A change from 0 to 1 occurs when top of block data can be written to the buffer. This raises the Buffer Write Ready (BWRRDY) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BWRRDY is set to 1. An interrupt is generated if SDMMC\_NISIER.BWRRDY is set to 1.

### Bit 9 – RTACT Read Transfer Active

This bit is used to detect completion of a read transfer. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit is set to 1 in either of the following conditions:

- After the end bit of the read command.
- When a read operation is restarted by writing a 1 to SDMMC\_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- When the last data block as specified by Transfer Block Size (BLKSIZE) is transferred to the system.
- In case of ADMA2, end of read is designated by the descriptor table.
- When all valid data blocks in the SDMMC have been transferred to the system and no current block transfers are being sent as a result of the Stop At Block Gap Request (STPBGR) of SDMMC\_BGCR being set to 1.

A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1.

### **Bit 8 – WTACT** Write Transfer Active

This bit indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the SDMMC. See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit is set to 1 in either of the following conditions:

- After the end bit of the write command.
- When a write operation is restarted by writing a 1 to SDMMC\_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- After getting the CRC status of the last data block as specified by the transfer count (single and multiple). In case of ADMA2, transfer count is designated by the descriptor table.
- After getting the CRC status of any block where a data transmission is about to be stopped by a Stop At Block Gap Request (STPBGR) of SDMMC\_BGCR.

During a write transaction and as the result of the Stop At Block Gap Request (STPBGR) being set, a change from 1 to 0 raises the Block Gap Event (BLKGE) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BLKGE is set to 1. An interrupt is generated if BLKGE is set to 1 in SDMMC\_NISIER. This status is useful to determine whether nonDAT line commands can be issued during Write Busy.

### **Bit 2 – DLACT** DAT Line Active

This bit indicates whether one of the DAT lines on the bus is in use.

In the case of read transactions:

- This status indicates whether a read transfer is executing on the bus. A change from 1 to 0 resulting from setting the Stop At Block Gap Request (STPBGR) raises the Block Gap Event (BLKGE) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BLKGE is set to 1. An interrupt is generated if SDMMC\_NISIER.BLKGE is set to 1. See the section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the read command.
  - When writing 1 to SDMMC\_BGCR.CONTR (Continue Request) to restart a read transfer.
- This bit is SDMMC cleared in either of the following cases:
  - When the end bit of the last data block is sent from the bus to the SDMMC. In case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  - When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request (STPBGR).
- The SDMMC stops a read operation at the start of the interrupt cycle by driving the Read Wait (DAT[2] line) or by stopping the SD Clock. If the Read Wait signal is already driven (due to the fact

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

that the data buffer cannot receive data), the SDMMC can continue to stop the read operation by driving the Read Wait signal. It is necessary to support the Read Wait in order to use the Suspend/Resume operation.

In the case of write transactions:

- This status indicates that a write transfer is executing on the bus. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1. See the section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the write command.
  - When writing 1 to SDMMC\_BGCR.CONTR (Continue Request) to continue a write transfer.
- This bit is cleared in either of the following cases:
  - When the card releases Write Busy of the last data block. If the card does not drive a Busy signal for 8 SDCLK, the SDMMC considers the card drive “Not Busy”. In the case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  - When the card releases Write Busy prior to wait for write transfer as a result of a Stop At Block Gap Request (STPBGR).

Command with Busy:

This status indicates whether a command that indicates Busy (ex. erase command for memory) is executing on the bus. This bit is set to 1 after the end bit of the command with Busy and cleared when Busy is deasserted. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1. See Figures 2.11 to 2.13 in the “SD Host Controller Simplified Specification V3.00” .

| Value | Description        |
|-------|--------------------|
| 0     | DAT line inactive. |
| 1     | DAT line active.   |

### Bit 1 – CMDINH D Command Inhibit (DAT)

This status bit is 1 if either the DAT Line Active (DLACT) or the Read Transfer Active (RTACT) is set to 1. If this bit is 0, it indicates that the SDMMC can issue the next command. Commands with a Busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1.

Note: The software can save registers in the 000–00Dh range for a suspend transaction after this bit has changed from 1 to 0.

| Value | Description  |
|-------|--|
| 0     | Can issue a command which uses the DAT line(s).    |
| 1     | Cannot issue a command which uses the DAT line(s). |

### Bit 0 – CMDINH C Command Inhibit (CMD)

If this bit is 0, it indicates the CMD line is not in use and the SDMMC can issue a command using the CMD line. This bit is set to 1 immediately after SDMMC\_CR is written. This bit is cleared when the

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the CMD12 or CMD23 response, but by the Read/Write command response.

Status issuing Auto CMD12 is not read from this bit. So, if a command is issued during Auto CMD12 operation, the SDMMC manages to issue both commands: CMD12 and a command set by SDMMC\_CR.

Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0.

A change from 1 to 0 raises the Command Complete (CMDC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.CMDC is set to 1. An interrupt is generated if SDMMC\_NISIER.CMDC is set to 1.

If the SDMMC cannot issue the command because of a command conflict error (see SDMMC\_EISTR.CMDCRC) or because of a 'Command Not Issued By Auto CMD12' error (see section "SDMMC Auto CMD Error Status Register"), this bit remains 1 and Command Complete is not set.

| Value | Description                              |
|-------|--|
| 0     | Can issue a command using only CMD line. |
| 1     | Cannot issue a command.                  |

### 50.12.10 SDMMC Host Control 1 Register (SD\_SDIO)

**Name:** SDMMC\_HC1R (SD\_SDIO)  
**Offset:** 0x28  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

| Bit    | 7        | 6       | 5 | 4           | 3   | 2    | 1   | 0       |
|--------|----------|---------|---|-------------|-----|------|-----|---------|
|        | CARDDSEL | CARDDTL |   | DMASEL[1:0] |     | HSEN | DW  | LEDCTRL |
| Access | R/W      | R/W     |   | R/W         | R/W | R/W  | R/W | R/W     |
| Reset  | 0        | 0       |   | 0           | 0   | 0    | 0   | 0       |

**Bit 7 – CARDDSEL** Card Detect Signal Selection  
This bit selects the source for the card detection.

| Value | Description   |
|-------|---|
| 0     | The SDMMC_CD pin is selected.   |
| 1     | The Card Detect Test Level (CARDDTL) is selected (for test purposes). |

**Bit 6 – CARDDTL** Card Detect Test Level  
This bit is enabled while the Card Detect Signal Selection (CARDDSEL) is set to 1 and it indicates whether the card is inserted or not.

| Value | Description    |
|-------|----------------|
| 0     | No card.       |
| 1     | Card inserted. |

**Bits 4:3 – DMASEL[1:0]** DMA Select  
One of the supported DMA modes can be selected. The DMA modes supported are given in SDMMC\_CA0R. Use of a selected DMA is determined by DMA Enable (DMAEN) in SDMMC\_TMR.

| Value | Name   | Description                      |
|-------|--------|----------------------------------|
| 0     | SDMA   | SDMA is selected                 |
| 1     | –      | Reserved                         |
| 2     | ADMA32 | 32-bit Address ADMA2 is selected |
| 3     | –      | Reserved                         |

**Bit 2 – HSEN** High Speed Enable  
Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC\_CA0R.

If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).

If Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, the user needs to reset SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLLEN to 1 again.

**Note:** This bit is effective only if SDMMC\_MC1R.DDR is set to 0.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

**Note:** The clock divider (DIV) in SDMMC\_CCR must be set to a value different from 0 when HSEN is 1.

| Value | Description        |
|-------|--------------------|
| 0     | Normal Speed mode. |
| 1     | High Speed mode.   |

### Bit 1 – DW Data Width

This bit selects the data width of the SDMMC. It must be set to match the data width of the card.

0 (1\_BIT): 1-bit mode.

1 (4\_BIT): 4-bit mode.

**Note:** If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

### Bit 0 – LEDCTRL LED Control

This bit is used to caution the user not to remove the card while it is being accessed. If the software is going to issue multiple commands, this bit is set to 1 during all transactions.

0 (OFF): LED off.

1 (ON): LED on.

### 50.12.11 SDMMC Host Control 1 Register (e.MMC)

**Name:** SDMMC\_HC1R (e.MMC)  
**Offset:** 0x28  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |   |   |       |             |     |      |     |   |
|--------|---|---|-------|-------------|-----|------|-----|---|
| Bit    | 7 | 6 | 5     | 4           | 3   | 2    | 1   | 0 |
|        |   |   | EXTDW | DMASEL[1:0] |     | HSEN | DW  |   |
| Access |   |   | R/W   | R/W         | R/W | R/W  | R/W |   |
| Reset  |   |   | 0     | 0           | 0   | 0    | 0   |   |

**Bit 5 – EXTDW** Extended Data Width

This bit controls the 8-bit Bus Width mode for embedded devices. Support of this function is indicated in 8-bit Support for Embedded Device in SDMMC\_CA0R. If a device supports the 8-bit mode, this may be set to 1. If this bit is 0, the bus width is controlled by Data Width (DW).

**Bits 4:3 – DMASEL[1:0]** DMA Select

One of the supported DAM modes can be selected. The DMA modes supported are given in SDMMC\_CA0R. Use of selected DMA is determined by DMA Enable (DMAEN) in SDMMC\_TMR.

| Value | Name   | Description                      |
|-------|--------|----------------------------------|
| 0     | SDMA   | SDMA is selected                 |
| 1     | –      | Reserved                         |
| 2     | ADMA32 | 32-bit Address ADMA2 is selected |
| 3     | –      | Reserved                         |

**Bit 2 – HSEN** High Speed Enable

Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC\_CA0R.

If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).

If Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, the user needs to reset the SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.

**Note:** This bit is effective only if SDMMC\_MC1R.DDR is set to 0.

**Note:** The clock divider (DIV) in SDMMC\_CCR must be set to a value different from 0 when HSEN is 1.

| Value | Description        |
|-------|--------------------|
| 0     | Normal Speed mode. |
| 1     | High Speed mode.   |

**Bit 1 – DW** Data Width

This bit selects the data width of the SDMMC. It must be set to match the data width of the card.

0 (1\_BIT): 1-bit mode.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

---

1 (4\_BIT): 4-bit mode.

**Note:** If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

**50.12.12 SDMMC Power Control Register**

**Name:** SDMMC\_PCR  
**Offset:** 0x29  
**Reset:** 0x0E  
**Property:** Read/Write

| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0      |
|--------|---|---|---|---|---|---|---|--------|
|        |   |   |   |   |   |   |   | SDBPWR |
| Access |   |   |   |   |   |   |   | R/W    |
| Reset  |   |   |   |   |   |   |   | 0      |

**Bit 0 – SDBPWR** SD Bus Power

This bit is automatically cleared by the SDMMC if the card is removed. If this bit is cleared, the SDMMC stops driving SDMMC\_CMD and SDMMC\_DAT[7:0] (tri-state) and drives SDMMC\_CK to low level.

### 50.12.13 SDMMC Block Gap Control Register (SD\_SDIO)

**Name:** SDMMC\_BGCR (SD\_SDIO)  
**Offset:** 0x2A  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |   |   |   |   |       |        |       |        |
|--------|---|---|---|---|-------|--------|-------|--------|
| Bit    | 7 | 6 | 5 | 4 | 3     | 2      | 1     | 0      |
|        |   |   |   |   | INTBG | RWCTRL | CONTR | STPBGR |
| Access |   |   |   |   | R/W   | R/W    | R/W   | R/W    |
| Reset  |   |   |   |   | 0     | 0      | 0     | 0      |

**Bit 3 – INTBG** Interrupt at Block Gap

This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. If the SDIO card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the software detects an SDIO card insertion, it sets this bit according to the CCCR of the SDIO card.

| Value | Name     | Description                   |
|-------|----------|-------------------------------|
| 0     | DISABLED | Interrupt detection disabled. |
| 1     | ENABLED  | Interrupt detection enabled.  |

**Bit 2 – RWCTRL** Read Wait Control

The Read Wait control is optional for SDIO cards. If the card supports Read Wait, set this bit to enable use of the Read Wait protocol to stop read data using the SDMMC\_DAT[2] line. Otherwise, the SDMMC stops the SDCLK to hold read data, which restricts command generation. When the software detects an SD card insertion, this bit must be set according to the CCCR of the SDIO card. If the card does not support Read Wait, this bit shall never be set to 1, otherwise an SDMMC\_DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.

| Value | Description                 |
|-------|-----------------------------|
| 0     | Disables Read Wait control. |
| 1     | Enables Read Wait control.  |

**Bit 1 – CONTR** Continue Request

This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.

The SDMMC automatically clears this bit in either of the following cases:

- In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
- In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.

Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| Value | Description |
|-------|-------------|
| 0     | No effect.  |
| 1     | Restart.    |

### Bit 0 – STPBGR Stop At Block Gap Request

This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in SDMMC\_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not.

During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC\_DAT[2]) if supported, or by stopping the SD clock otherwise.

In case of write transfers in which the user writes data to SDMMC\_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC\_BDPR.

This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

| Value | Description |
|-------|-------------|
| 0     | Transfer    |
| 1     | Stop        |

### 50.12.14 SDMMC Block Gap Control Register (e.MMC)

**Name:** SDMMC\_BGCR (e.MMC)  
**Offset:** 0x2A  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |   |   |   |   |   |   |       |        |
|--------|---|---|---|---|---|---|-------|--------|
|        | 7 | 6 | 5 | 4 | 3 | 2 | 1     | 0      |
|        |   |   |   |   |   |   | CONTR | STPBGR |
| Access |   |   |   |   |   |   | R/W   | R/W    |
| Reset  |   |   |   |   |   |   | 0     | 0      |

**Bit 1 – CONTR** Continue Request

This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.

The SDMMC automatically clears this bit in either of the following cases:

- In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
- In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.

Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

| Value | Description |
|-------|-------------|
| 0     | No effect.  |
| 1     | Restart.    |

**Bit 0 – STPBGR** Stop At Block Gap Request

This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in SDMMC\_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not.

During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC\_DAT[2]) if supported, or by stopping the SD clock otherwise.

In case of write transfers in which the user writes data to SDMMC\_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC\_BDPR.

This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

| Value | Description |
|-------|-------------|
| 0     | Transfer    |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

---

| Value | Description |
|-------|-------------|
| 1     | Stop        |

**50.12.15 SDMMC Wakeup Control Register (SD\_SDIO)**

**Name:** SDMMC\_WCR (SD\_SDIO)  
**Offset:** 0x2B  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |   |   |   |   |   |          |          |          |
|--------|---|---|---|---|---|----------|----------|----------|
|        | 7 | 6 | 5 | 4 | 3 | 2        | 1        | 0        |
|        |   |   |   |   |   | WKENCREM | WKENCINS | WKENCINT |
| Access |   |   |   |   |   | R/W      | R/W      | R/W      |
| Reset  |   |   |   |   |   | 0        | 0        | 0        |

**Bit 2 – WKENCREM** Wakeup Event Enable on Card Removal

This bit enables a wakeup event via Card Removal (CREM) in SDMMC\_NISTR. FN\_WUS (Wakeup Support) in the CIS (Card Information Structure) does not affect this bit.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

**Bit 1 – WKENCINS** Wakeup Event Enable on Card Insertion

This bit enables a wakeup event via Card Insertion (CINS) in SDMMC\_NISTR. FN\_WUS (Wakeup Support) in the CIS (Card Information Structure) does not affect this bit.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

**Bit 0 – WKENCINT** Wakeup Event Enable on Card Interrupt

This bit enables a wakeup event via Card Interrupt (CINT) in SDMMC\_NISTR. This bit can be set to 1 if FN\_WUS (Wakeup Support) in the CIS (Card Information Structure) is set to 1 in the SDIO card.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

### 50.12.16 SDMMC Clock Control Register

**Name:** SDMMC\_CCR  
**Offset:** 0x2C  
**Reset:** 0x0000  
**Property:** Read/Write

|        |                 |     |         |     |     |         |         |          |
|--------|-----------------|-----|---------|-----|-----|---------|---------|----------|
| Bit    | 15              | 14  | 13      | 12  | 11  | 10      | 9       | 8        |
|        | SDCLKFSEL[7:0]  |     |         |     |     |         |         |          |
| Access | R/W             | R/W | R/W     | R/W | R/W | R/W     | R/W     | R/W      |
| Reset  | 0               | 0   | 0       | 0   | 0   | 0       | 0       | 0        |
|        |                 |     |         |     |     |         |         |          |
| Bit    | 7               | 6   | 5       | 4   | 3   | 2       | 1       | 0        |
|        | USDCLKFSEL[1:0] |     | CLKGSEL |     |     | SDCLKEN | INTCLKS | INTCLKEN |
| Access | R/W             | R/W | R/W     |     |     | R/W     | R/W     | R/W      |
| Reset  | 0               | 0   | 0       |     |     | 0       | 0       | 0        |

**Bits 15:8 – SDCLKFSEL[7:0]** SDCLK Frequency Select

This register is used to select the frequency of the SDCLK pin. There are two SDCLK Frequency modes according to Clock Generator Select (CLKGSEL).

The length of the clock divider (DIV) is extended to 10 bits (DIV[9:8] = USDCLKFSEL, DIV[7:0] = SDCLKFSEL)

– 10-bit Divided Clock Mode (CLKGSEL = 0):  $f_{SDCLK} = f_{BASECLK} / (2 \times DIV)$ . If DIV = 0 then  $f_{SDCLK} = f_{BASECLK}$

– Programmable Clock Mode (CLKGSEL = 1):  $f_{SDCLK} = f_{MULTCLK} / (DIV + 1)$

When HSEN is set in SDMMC\_HC1R, or DDR is set in SDMMC\_MC1R, the clock divider (DIV) must be non-zero. This field depends on the setting of Preset Value Enable (PVALEN) in SDMMC\_HC2R.

If PVALEN = 0, this field is set by the user.

If PVALEN = 1, this field is automatically set to a value specified in one of the SDMMC\_PVR.

**Bits 7:6 – USDCLKFSEL[1:0]** Upper Bits of SDCLK Frequency Select

These bits expand the SDCLK Frequency Select (SDCLKFSEL) to 10 bits. These two bits are assigned to bit 09-08 of the clock divider as described in SDCLKFSEL.

**Bit 5 – CLKGSEL** Clock Generator Select

This bit is used to select the clock generator mode in the SDCLK Frequency Select field. If the Programmable mode is not supported (SDMMC\_CA1R.CLKMULT (Clock Multiplier) set to 0), then this bit cannot be written and is always read at 0.

This bit depends on the setting of Preset Value Enable (PVALEN) in SDMMC\_HC2R.

If PVALEN = 0, this bit is set by the user.

If PVALEN = 1, this bit is automatically set to a value specified in one of the SDMMC\_PVRx.

| Value | Description   |
|-------|---|
| 0     | Divided Clock mode (BASECLK is used to generate SDCLK). |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| Value | Description  |
|-------|--|
| 1     | Programmable Clock mode (MULTCLK is used to generate SDCLK). |

### Bit 2 – SDCLKEN SD Clock Enable

The SDMMC stops the SD Clock when writing this bit to 0. SDCLK Frequency Select (SDCLKFSEL) can be changed when this bit is 0. Then, the SDMMC maintains the same clock frequency until SDCLK is stopped (Stop at SDCLK = 0). If Card Inserted (CARDINS) in SDMMC\_PSR is cleared, this bit is also cleared.

| Value | Description       |
|-------|-------------------|
| 0     | SD Clock disabled |
| 1     | SD Clock enabled  |

### Bit 1 – INTCLKS Internal Clock Stable

This bit is set to 1 when the SD clock is stable after setting SDMMC\_CCR.INTCLKEN (Internal Clock Enable) to 1. The user must wait to set SD Clock Enable (SDCLKEN) until this bit is set to 1.

| Value | Description               |
|-------|---------------------------|
| 0     | Internal clock not ready. |
| 1     | Internal clock ready.     |

### Bit 0 – INTCLKEN Internal Clock Enable

This bit is set to 0 when the SDMMC is not used or is awaiting a wakeup interrupt. In this case, its internal clock is stopped to reach a very low power state. Registers are still able to be read and written. The clock starts to oscillate when this bit is set to 1. Once the clock oscillation is stable, the SDMMC sets Internal Clock Stable (INTCLKS) in this register to 1.

This bit does not affect card detection.

| Value | Description                    |
|-------|--------------------------------|
| 0     | The internal clock stops.      |
| 1     | The internal clock oscillates. |

### 50.12.17 SDMMC Timeout Control Register

**Name:** SDMMC\_TCR  
**Offset:** 0x2E  
**Reset:** 0x00  
**Property:** Read/Write

|        |   |   |   |   |             |     |     |     |
|--------|---|---|---|---|-------------|-----|-----|-----|
|        | 7 | 6 | 5 | 4 | 3           | 2   | 1   | 0   |
|        |   |   |   |   | DTCVAL[3:0] |     |     |     |
| Access |   |   |   |   | R/W         | R/W | R/W | R/W |
| Reset  |   |   |   |   | 0           | 0   | 0   | 0   |

**Bits 3:0 – DTCVAL[3:0]** Data Timeout Counter Value

This value determines the interval at which DAT line timeouts are detected. For more information about timeout generation, see Data Timeout Error (DATTEO) in SDMMC\_EISTR. When setting this register, the user can prevent inadvertent timeout events by clearing the Data Timeout Error Status Enable (in SDMMC\_EISTER).

$$\text{TIMEOUT}_{(\mu\text{s})} = \frac{2^{13 + \text{DTCVAL}}}{f_{\text{FTEOCLK}}(\text{MHz})}$$

**Note:** DTCVAL = f<sub>(Hexa)</sub> is reserved.

### 50.12.18 SDMMC Software Reset Register

**Name:** SDMMC\_SRR  
**Offset:** 0x2F  
**Reset:** 0x00  
**Property:** Read/Write

|        |   |   |   |   |   |          |          |          |
|--------|---|---|---|---|---|----------|----------|----------|
|        | 7 | 6 | 5 | 4 | 3 | 2        | 1        | 0        |
|        |   |   |   |   |   | SWRSTDAT | SWRSTCMD | SWRSTALL |
| Access |   |   |   |   |   | R/W      | R/W      | R/W      |
| Reset  |   |   |   |   |   | 0        | 0        | 0        |

**Bit 2 – SWRSTDAT** Software Reset for DAT Line  
 Only part of a data circuit is reset. The DMA circuit is also reset.

The following registers and bits are cleared by this bit:

[“SDMMC Buffer Data Port Register”](#)

- Buffer is cleared and initialized.

[“SDMMC Present State Register”](#)

- Buffer Read Enable (BUFRDEN)
- Buffer Write Enable (BUFWREN)
- Read Transfer Active (RTACT)
- Write Transfer Active (WTACT)
- DAT Line Active (DATLL)
- Command Inhibit (DAT) (CMDINH)

[“SDMMC Block Gap Control Register \(SD\\_SDIO\)”](#)

- Continue Request (CONTR)
- Stop At Block Gap Request (STPBGR)

[“SDMMC Normal Interrupt Status Register \(SD\\_SDIO\)”](#)

- Buffer Read Ready (BRDRDY)
- Buffer Write Ready (BWRRDY)
- DMA Interrupt (DMAINT)
- Block Gap Event (BLKGE)
- Transfer Complete (TRFC)

| Value | Description |
|-------|-------------|
| 0     | Work        |
| 1     | Reset       |

**Bit 1 – SWRSTCMD** Software Reset for CMD Line  
 Only part of a command circuit is reset.

The following registers and bits are cleared by this bit:

“SDMMC Present State Register”

– Command Inhibit (CMD) (CMDINHC)

“SDMMC Normal Interrupt Status Register (SD\_SDIO)” and “SDMMC Normal Interrupt Status Register (e.MMC)”

– Command Complete (CMDC)

| Value | Description |
|-------|-------------|
| 0     | Work        |
| 1     | Reset       |

**Bit 0 – SWRSTALL** Software Reset for All

This reset affects the entire SDMMC except the card detection circuit. During initialization, the SDMMC must be reset by setting this bit to '1'. This bit is automatically cleared to '0' when SDMMC\_CA0R and SDMMC\_CA1R are valid and the user can read them. If this bit is set to '1', the user should issue a reset command and reinitialize the card.

List of registers cleared to '0':

- “SDMMC SDMA System Address / Argument 2 Register”
- “SDMMC Block Size Register”
- “SDMMC Block Count Register”
- “SDMMC Argument 1 Register”
- “SDMMC Command Register”
- “SDMMC Transfer Mode Register”
- “SDMMC Response Register”
- “SDMMC Buffer Data Port Register”
- “SDMMC Present State Register” (except CMDLL, DATLL, WRPPL, CARDDDPL, CARDSS, CARDINS)
- “SDMMC Host Control 1 Register (SD\_SDIO)”
- “SDMMC Host Control 1 Register (e.MMC)”
- “SDMMC Power Control Register”
- “SDMMC Block Gap Control Register (SD\_SDIO)”
- “SDMMC Block Gap Control Register (e.MMC)”
- “SDMMC Wakeup Control Register (SD\_SDIO)”
- “SDMMC Clock Control Register”
- “SDMMC Timeout Control Register”
- “SDMMC Normal Interrupt Status Register (SD\_SDIO)”
- “SDMMC Error Interrupt Status Register (SD\_SDIO)”
- “SDMMC Normal Interrupt Status Enable Register (SD\_SDIO)”
- “SDMMC Error Interrupt Status Enable Register (SD\_SDIO)”

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

- “SDMMC Normal Interrupt Signal Enable Register (SD\_SDIO)”
- “SDMMC Error Interrupt Signal Enable Register (SD\_SDIO)”
- “SDMMC Auto CMD Error Status Register”
- “SDMMC Host Control 2 Register (SD\_SDIO)”
- “SDMMC ADMA Error Status Register”
- “SDMMC ADMA System Address Register”
- “SDMMC Slot Interrupt Status Register”
- “SDMMC e.MMC Control 1 Register”
- “SDMMC e.MMC Control 2 Register”
- “SDMMC AHB Control Register”
- “SDMMC Clock Control 2 Register”
- “SDMMC Retuning Control 1 Register”
- “SDMMC Retuning Counter Value Register”
- “SDMMC Retuning Interrupt Status Enable Register”
- “SDMMC Retuning Interrupt Signal Enable Register”
- “SDMMC Retuning Interrupt Status Register”
- “SDMMC Tuning Control Register”
- “SDMMC Capabilities Control Register” (except KEY)
- “SDMMC Calibration Control Register” (except CALN, CALP)

| Value | Description |
|-------|-------------|
| 0     | Work        |
| 1     | Reset       |

### 50.12.19 SDMMC Normal Interrupt Status Register (SD\_SDIO)

**Name:** SDMMC\_NISTR (SD\_SDIO)  
**Offset:** 0x30  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |     |        |      |        |        |        |       |      |      |
|--------|-----|--------|------|--------|--------|--------|-------|------|------|
|        | Bit | 15     | 14   | 13     | 12     | 11     | 10    | 9    | 8    |
|        |     | ERRINT |      |        |        |        |       |      | CINT |
| Access |     | R      |      |        |        |        |       |      | R/W  |
| Reset  |     | 0      |      |        |        |        |       |      | 0    |
|        |     |        |      |        |        |        |       |      |      |
|        | Bit | 7      | 6    | 5      | 4      | 3      | 2     | 1    | 0    |
|        |     | CREM   | CINS | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access |     | R/W    | R/W  | R/W    | R/W    | R/W    | R/W   | R/W  | R/W  |
| Reset  |     | 0      | 0    | 0      | 0      | 0      | 0     | 0    | 0    |

**Bit 15 – ERRINT** Error Interrupt

If any of the bits in SDMMC\_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 8 – CINT** Card Interrupt

Writing this bit to '1' does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the SDMMC detects the Card Interrupt without SDCLK to support wakeup. In 4-bit mode, the Card Interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the system.

When this bit has been set to '1' and the user needs to start this interrupt service, Card Interrupt Status Enable (CINT) in SDMMC\_NISTER may be set to '0' in order to clear the card interrupt statuses latched in the SDMMC and to stop driving the interrupt signal to the system. After completion of the card interrupt service (it should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set SDMMC\_NISTER.CINT to '1' and start sampling the interrupt signal again.

Interrupt detected by DAT[1] is supported when there is one card per slot.

This bit can only be set to '1' if SDMMC\_NISTER.CREM is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CREM is set to '1'.

| Value | Description        |
|-------|--------------------|
| 0     | No card interrupt. |
| 1     | Card interrupt.    |

**Bit 7 – CREM** Card Removal

This status is set to '1' if Card Inserted (CARDINS) in SDMMC\_PSR changes from '1' to '0'. When the user writes this bit to '1' to clear this status, the status of SDMMC\_PSR.CARDINS must be confirmed

because the card detect state may possibly be changed when the user clears this bit and no interrupt event can be generated.

This bit can only be set to '1' if SDMMC\_NISTER.CREM is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CREM is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Card state unstable or card inserted. |
| 1     | Card removed.                         |

### Bit 6 – CINS Card Insertion

This status is set if Card Inserted (CARDINS) in SDMMC\_PSR changes from '0' to '1'. When the user writes this bit to '1' to clear this status, the status of SDMMC\_PSR.CARDINS must be confirmed because the card detect state may possibly be changed when the user clears this bit and no interrupt event can be generated.

This bit can only be set to '1' if SDMMC\_NISTER.CINS is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CINS is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                          |
|-------|--------------------------------------|
| 0     | Card state unstable or card removed. |
| 1     | Card inserted.                       |

### Bit 5 – BRDRDY Buffer Read Ready

This status is set to '1' if the Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See BUFRDEN in SDMMC\_PSR. While processing the tuning procedure (Execute Tuning (EXTUN) in SDMMC\_HC2R is set to '1'), BRDRDY is set to '1' for every CMD19 execution.

This bit can only be set to '1' if SDMMC\_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BRDRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description               |
|-------|---------------------------|
| 0     | Not ready to read buffer. |
| 1     | Ready to read buffer.     |

### Bit 4 – BWRRDY Buffer Write Ready

This status is set to '1' if the Buffer Write Enable (BUFWREN) changes from '0' to '1'. See BUFWREN in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BWRRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                |
|-------|----------------------------|
| 0     | Not ready to write buffer. |
| 1     | Ready to write buffer.     |

### Bit 3 – DMAINT DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC\_BSR.

In case of ADMA, by setting the “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after Transfer Complete (TRFC).

This bit can only be set to '1' if SDMMC\_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.DMAINT is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description       |
|-------|-------------------|
| 0     | No DMA Interrupt. |
| 1     | DMA Interrupt.    |

### Bit 2 – BLKGE Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR is set to 1, this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to 1, this bit is not set to 1.

#### In the case of a Read transaction:

This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.

#### In the case of a Write transaction:

This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit can only be set to '1' if SDMMC\_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BLKGE is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No block gap event.               |
| 1     | Transaction stopped at block gap. |

### Bit 1 – TRFC Transfer Complete

This bit is set when a read/write transfer and a command with Busy is completed.

#### In the case of a Read Transaction:

This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data has been read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR (after valid data has been read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

#### In the case of a Write Transaction:

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

### In the case of command with Busy:

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.TRFC is set to '1'.

Writing this bit to '1' clears this bit.

The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

| TRFC | DATTEO     | Meaning of the status            |
|------|------------|----------------------------------|
| 0    | 0          | Interrupted by another factor    |
| 0    | 1          | Timeout occurred during transfer |
| 1    | Don't Care | Command execution complete       |

| Value | Description                        |
|-------|------------------------------------|
| 0     | Command execution is not complete. |
| 1     | Command execution is complete.     |

### Bit 0 – CMDC Command Complete

This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See Command Inhibit (CMD) in SDMMC\_PSR for details on how to control this bit.

This bit can only be set to 1 if SDMMC\_NISTER.CMDC is set to 1. An interrupt can only be generated if SDMMC\_NISIER.CMDC is set to 1.

Writing this bit to 1 clears this bit.

The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to 1, it can be considered that the response was not received correctly.

| CMDC       | CMDTEO | Meaning of the status                        |
|------------|--------|--|
| 0          | 0      | Interrupted by another factor                |
| Don't care | 1      | Response not received within 64 SDCLK cycles |
| 1          | 0      | Response received                            |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

---

| Value | Description          |
|-------|----------------------|
| 0     | No command complete. |
| 1     | Command complete.    |

### 50.12.20 SDMMC Normal Interrupt Status Register (e.MMC)

**Name:** SDMMC\_NISTR (e.MMC)  
**Offset:** 0x30  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |        |        |        |        |        |       |      |      |
|--------|--------|--------|--------|--------|--------|-------|------|------|
| Bit    | 15     | 14     | 13     | 12     | 11     | 10    | 9    | 8    |
|        | ERRINT | BOOTAR |        |        |        |       |      |      |
| Access | R      | R/W    |        |        |        |       |      |      |
| Reset  | 0      | 0      |        |        |        |       |      |      |
| Bit    | 7      | 6      | 5      | 4      | 3      | 2     | 1    | 0    |
|        |        |        | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access |        |        | R/W    | R/W    | R/W    | R/W   | R/W  | R/W  |
| Reset  |        |        | 0      | 0      | 0      | 0     | 0    | 0    |

**Bit 15 – ERRINT** Error Interrupt

If any of the bits in SDMMC\_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 14 – BOOTAR** Boot Acknowledge Received

This bit is set to '1' when the SDMMC received a Boot Acknowledge pattern from the e.MMC.

This bit can only be set to '1' if SDMMC\_NISTER.BOOTAR is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BOOTAR is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                            |
|-------|--|
| 0     | Boot Acknowledge pattern not received. |
| 1     | Boot Acknowledge pattern received.     |

**Bit 5 – BRDRDY** Buffer Read Ready

This status is set to '1' if Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See Buffer Read Enable (BUFRDEN) in SDMMC\_PSR. While processing the tuning procedure (Execute Tuning (EXTUN) in SDMMC\_HC2R is set to '1'), BRDRDY is set to '1' for every CMD19 execution.

This bit can only be set to '1' if SDMMC\_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BRDRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description               |
|-------|---------------------------|
| 0     | Not ready to read buffer. |
| 1     | Ready to read buffer.     |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 4 – BWRRDY Buffer Write Ready

This status is set to 1 if Buffer Write Enable (BUFWREN) changes from '0' to '1'. See Buffer Write Enable (BUFWREN) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BWRRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                |
|-------|----------------------------|
| 0     | Not ready to write buffer. |
| 1     | Ready to write buffer.     |

### Bit 3 – DMAINT DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC\_BSR.

In case of ADMA, by setting “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after the Transfer Complete (TRFC).

This bit can only be set to '1' if SDMMC\_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.DMAINT is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description       |
|-------|-------------------|
| 0     | No DMA interrupt. |
| 1     | DMA interrupt.    |

### Bit 2 – BLKGE Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR is set to '1', this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to '1', this bit is not set to '1'.

#### In the case of a Read transaction:

This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.

#### In the case of a Write transaction:

This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit can only be set to '1' if SDMMC\_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BLKGE is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No block gap event.               |
| 1     | Transaction stopped at block gap. |

### Bit 1 – TRFC Transfer Complete

This bit is set when a read/write transfer and a command with Busy is completed.

#### In the case of a Read Transaction:

This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data has been read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR (after valid data has been read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

#### In the case of a Write Transaction:

This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

#### In the case of command with Busy:

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.TRFC is set to '1'.

Writing this bit to '1' clears this bit.

The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

| TRFC | DATTEO     | Meaning of the status            |
|------|------------|----------------------------------|
| 0    | 0          | Interrupted by another factor    |
| 0    | 1          | Timeout occurred during transfer |
| 1    | Don't Care | Command execution complete       |

| Value | Description                        |
|-------|------------------------------------|
| 0     | Command execution is not complete. |
| 1     | Command execution is complete.     |

### Bit 0 – CMDC Command Complete

This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See CMRINHC in SDMMC\_PSR for details on how to control this bit.

This bit can only be set to '1' if SDMMC\_NISTER.CMDC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CMDC is set to '1'.

Writing this bit to '1' clears this bit.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to '1', it can be considered that the response was not received correctly.

| CMDC       | CMDTEO | Meaning of the status                        |
|------------|--------|--|
| 0          | 0      | Interrupted by another factor                |
| Don't care | 1      | Response not received within 64 SDCLK cycles |
| 1          | 0      | Response received                            |

| Value | Description          |
|-------|----------------------|
| 0     | No command complete. |
| 1     | Command complete.    |

### 50.12.21 SDMMC Error Interrupt Status Register (SD\_SDIO)

**Name:** SDMMC\_EISTR (SD\_SDIO)  
**Offset:** 0x32  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Bit    | 15     | 14     | 13     | 12     | 11     | 10     | 9      | 8      |

| Access | R/W    | R/W    | R/W    |        | R/W    | R/W    | R/W    | R/W    |
| Reset  | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      |

**Bit 9 – ADMA** ADMA Error

This bit is set to '1' when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC\_AESR.

In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST\_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC\_AESR indicates that an error occurred in ST\_FDS state. The user may find that the Valid bit is not set at the error descriptor.

This bit can only be set to '1' if SDMMC\_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ADMA is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 8 – ACMD** Auto CMD Error

Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC\_ACESR[4:0] has changed from '0' to '1'. In the case of Auto CMD12, this bit is set to '1', not only when errors occur in Auto CMD12 but also when auto CMD12 is not executed due to the previous command error.

This bit can only be set to '1' if SDMMC\_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ACMD is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 7 – CURLIM Current Limit Error

By setting SD Bus Power (SDBPWR) in SDMMC\_PCR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.

This bit can only be set to '1' if SDMMC\_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CURLIM is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.

This bit can only be set to '1' if SDMMC\_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 5 – DATCRC Data CRC error

This bit is set to '1' when detecting a CRC error when transferring read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATCRC is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 4 – DATTEO Data Timeout Error

This bit is set to '1' when detecting one of following timeout conditions.

- Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SD Host Controller Simplified Specification V3.00”).
- Busy timeout after Write CRC status.
- Write CRC Status timeout.
- Read data timeout

This bit can only be set to '1' if SDMMC\_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATTEO is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 3 – CMDIDX** Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.

This bit can only be set to '1' if SDMMC\_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDIDX is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 2 – CMDEND** Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.

This bit can only be set to '1' if SDMMC\_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 1 – CMDCRC** Command CRC Error

The Command CRC Error is generated in two cases.

If a response is returned and the Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.

The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see the table above).

This bit can only be set to '1' if SDMMC\_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDCRC is set to '1'.

Writing this bit to '1' clears this bit.

**Bit 0 – CMDTEO** Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table below, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.

This bit can only be set to '1' if SDMMC\_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDTEO is set to '1'.

Writing this bit to '1' clears this bit.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| CMDCRC | CMDTEO | Types of error         |
|--------|--------|------------------------|
| 0      | 0      | No error               |
| 0      | 1      | Response timeout error |
| 1      | 0      | Response CRC error     |
| 1      | 1      | CMD line conflict      |

### 50.12.22 SDMMC Error Interrupt Status Register (e.MMC)

**Name:** SDMMC\_EISTR (e.MMC)  
**Offset:** 0x32  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

| Reset  |     |        |        |        | 0      |        |        | 0      | 0      |
|        |     |        |        |        |        |        |        |        |        |
|        | Bit | 7      | 6      | 5      | 4      | 3      | 2      | 1      | 0      |
|        |     | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access |     | R/W    | R/W    | R/W    | R/W    | R/W    | R/W    | R/W    | R/W    |
| Reset  |     | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      |

**Bit 12 – BOOTAE** Boot Acknowledge Error

This bit is set to '1' when detecting that the e.MMC Boot Acknowledge Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.BOOTAE is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.BOOTAE is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 9 – ADMA** ADMA Error

This bit is set to 1 when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC\_AESR.

In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST\_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00” ). ADMA Error Status (ERRST) in SDMMC\_AESR indicates that an error occurred in ST\_FDS state. The user may find that the Valid bit is not set at the error descriptor.

This bit can only be set to '1' if SDMMC\_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ADMA is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 8 – ACMD** Auto CMD Error

Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC\_ACESR[4:0] has changed from 0 to 1. In the case of Auto CMD12, this bit is set to

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

'1', not only when errors occur in Auto CMD12, but also when Auto CMD12 is not executed due to the previous command error.

This bit can only be set to '1' if SDMMC\_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ACMD is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 7 – CURLIM Current Limit Error

By setting SD Bus Power (SDBPWR) in SDMMC\_PSR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.

This bit can only be set to '1' if SDMMC\_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CURLIM is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.

This bit can only be set to '1' if SDMMC\_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 5 – DATCRC Data CRC Error

This bit is set to '1' when detecting a CRC error during a transfer of read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATCRC is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 4 – DATTEO** Data Timeout error

This bit is set to '1' when detecting one of following timeout conditions.

- Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00” ).
- Busy timeout after Write CRC Status.
- Write CRC Status timeout.
- Read data timeout

This bit can only be set to '1' if SDMMC\_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATTEO is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 3 – CMDIDX** Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.

This bit can only be set to '1' if SDMMC\_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDIDX is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 2 – CMDEND** Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.

This bit can only be set to '1' if SDMMC\_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 1 – CMDCRC** Command CRC Error

The Command CRC Error is generated in two cases.

If a response is returned and Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.

The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see the table “Relations between CMDCRC and CMDTEO”).

This bit can only be set to '1' if SDMMC\_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDCRC is set to '1'.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

Writing this bit to 1 clears this bit.

### Bit 0 – CMDTEO Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table “Relations between CMDCRC and CMDTEO”, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.

This bit can only be set to '1' if SDMMC\_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDTEO is set to '1'.

Writing this bit to '1' clears this bit.

| CMDCRC | CMDTEO | Types of error         |
|--------|--------|------------------------|
| 0      | 0      | No error               |
| 0      | 1      | Response timeout error |
| 1      | 0      | Response CRC error     |
| 1      | 1      | CMD line conflict      |

### 50.12.23 SDMMC Normal Interrupt Status Enable Register (SD\_SDIO)

**Name:** SDMMC\_NISTR (SD\_SDIO)  
**Offset:** 0x34  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |     |      |      |        |        |        |       |      |      |
|--------|-----|------|------|--------|--------|--------|-------|------|------|
|        | Bit | 15   | 14   | 13     | 12     | 11     | 10    | 9    | 8    |
|        |     |      |      |        |        |        |       |      | CINT |
| Access |     |      |      |        |        |        |       |      | R/W  |
| Reset  |     |      |      |        |        |        |       |      | 0    |
|        |     |      |      |        |        |        |       |      |      |
|        | Bit | 7    | 6    | 5      | 4      | 3      | 2     | 1    | 0    |

**Bit 8 – CINT** Card Interrupt Status Enable

If this bit is set to 0, the SDMMC clears interrupt requests to the system. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1. The user may clear this bit before servicing the Card Interrupt and may set this bit again after all interrupt requests from the card are cleared to prevent inadvertent interrupts.

0 (MASKED): The CINT status flag in SDMMC\_NISTR is masked.

**Bit 4 – BWRRDY** Buffer Write Ready Status Enable  
 0 (MASKED): The BWRRDY status flag in SDMMC\_NISTR is masked.  
 1 (ENABLED): The BWRRDY status flag in SDMMC\_NISTR is enabled.

**Bit 3 – DMAINT** DMA Interrupt Status Enable  
 0 (MASKED): The DMAINT status flag in SDMMC\_NISTR is masked.  
 1 (ENABLED): The DMAINT status flag in SDMMC\_NISTR is enabled.

**Bit 2 – BLKGE** Block Gap Event Status Enable  
 0 (MASKED): The BLKGE status flag in SDMMC\_NISTR is masked.  
 1 (ENABLED): The BLKGE status flag in SDMMC\_NISTR is enabled.

**Bit 1 – TRFC** Transfer Complete Status Enable  
 0 (MASKED): The TRFC status flag in SDMMC\_NISTR is masked.  
 1 (ENABLED): The TRFC status flag in SDMMC\_NISTR is enabled.

**Bit 0 – CMDC** Command Complete Status Enable  
 0 (MASKED): The CMDC status flag in SDMMC\_NISTR is masked.  
 1 (ENABLED): The CMDC status flag in SDMMC\_NISTR is enabled.

### 50.12.25 SDMMC Error Interrupt Status Enable Register (SD\_SDIO)

**Name:** SDMMC\_EISTER (SD\_SDIO)  
**Offset:** 0x36  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |     |        |        |        |        |        |        |        |        |

| Access | R/W  | R/W  | R/W    | R/W    | R/W    | R/W   | R/W  | R/W  |
| Reset  | 0    | 0    | 0      | 0      | 0      | 0     | 0    | 0    |

**Bit 8 – CINT** Card Interrupt Signal Enable

0 (MASKED): No interrupt is generated when the CINT status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the CINT status rises in SDMMC\_NISTR.

**Bit 7 – CREM** Card Removal Signal Enable

0 (MASKED): No interrupt is generated when the CREM status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the CREM status rises in SDMMC\_NISTR.

**Bit 6 – CINS** Card Insertion Signal Enable

0 (MASKED): No interrupt is generated when the CINS status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the CINS status rises in SDMMC\_NISTR.

**Bit 5 – BRDRDY** Buffer Read Ready Signal Enable

0 (MASKED): No interrupt is generated when the BRDRDY status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the BRDRDY status rises in SDMMC\_NISTR.

**Bit 4 – BWRRDY** Buffer Write Ready Signal Enable

0 (MASKED): No interrupt is generated when the BWRRDY status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the BWRRDY status rises in SDMMC\_NISTR.

**Bit 3 – DMAINT** DMA Interrupt Signal Enable

0 (MASKED): No interrupt is generated when the DMAINT status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the DMAINT status rises in SDMMC\_NISTR.

**Bit 2 – BLKGE** Block Gap Event Signal Enable

0 (MASKED): No interrupt is generated when the BLKGE status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the BLKGE status rises in SDMMC\_NISTR.

 1 (ENABLED): An interrupt is generated when the BOOTAE status rises in SDMMC\_EISTR.

**Bit 9 – ADMA** ADMA Error Signal Enable  
 0 (MASKED): No interrupt is generated when the ADMA status rises in SDMMC\_EISTR.  
 1 (ENABLED): An interrupt is generated when the ADMA status rises in SDMMC\_EISTR.

**Bit 8 – ACMD** Auto CMD Error Signal Enable  
 0 (MASKED): No interrupt is generated when the ACMD status rises in SDMMC\_EISTR.  
 1 (ENABLED): An interrupt is generated when the ACMD status rises in SDMMC\_EISTR.

**Bit 7 – CURLIM** Current Limit Error Signal Enable  
 0 (MASKED): No interrupt is generated when the CURLIM status rises in SDMMC\_EISTR.  
 1 (ENABLED): An interrupt is generated when the CURLIM status rises in SDMMC\_EISTR.

**Bit 6 – DATEND** Data End Bit Error Signal Enable  
 0 (MASKED): No interrupt is generated when the DATEND status rises in SDMMC\_EISTR.  
 1 (ENABLED): An interrupt is generated when the DATEND status rises in SDMMC\_EISTR.

**Bit 5 – DATCRC** Data CRC Error Signal Enable  
 0 (MASKED): No interrupt is generated when the DATCRC status rises in SDMMC\_EISTR.  
 1 (ENABLED): An interrupt is generated when the DATCRC status rises in SDMMC\_EISTR.

**Bit 4 – DATTEO** Data Timeout Error Signal Enable  
 0 (MASKED): No interrupt is generated when the DATTEO status rises in SDMMC\_EISTR.  
 1 (ENABLED): An interrupt is generated when the DATTEO status rises in SDMMC\_EISTR.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

**Bit 3 – CMDIDX** Command Index Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.

**Bit 2 – CMDEND** Command End Bit Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.

**Bit 1 – CMDCRC** Command CRC Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.

**Bit 0 – CMDTEO** Command Timeout Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

### 50.12.31 SDMMC Auto CMD Error Status Register

**Name:** SDMMC\_ACESR  
**Offset:** 0x3C  
**Reset:** 0x0000  
**Property:** Read-only

|        |     |       |    |    |         |         |         |         |          |
|--------|-----|-------|----|----|---------|---------|---------|---------|----------|
|        | Bit | 15    | 14 | 13 | 12      | 11      | 10      | 9       | 8        |
|        |     |       |    |    |         |         |         |         |          |
| Access |     |       |    |    |         |         |         |         |          |
| Reset  |     |       |    |    |         |         |         |         |          |
|        |     |       |    |    |         |         |         |         |          |
|        | Bit | 7     | 6  | 5  | 4       | 3       | 2       | 1       | 0        |
|        |     | CMDNI |    |    | ACMDIDX | ACMDEND | ACMDCRC | ACMDTEO | ACMD12NE |
| Access |     | R     |    |    | R       | R       | R       | R       | R        |
| Reset  |     | 0     |    |    | 0       | 0       | 0       | 0       | 0        |

**Bit 7 – CMDNI** Command Not Issued by Auto CMD12 Error  
 This bit is set to 1 when CMD\_wo\_DAT is not executed due to an Auto CMD12 error (SDMMC\_ACESR[4:1]). This bit is set to 0 when Auto CMD Error is generated by Auto CMD23.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 4 – ACMDIDX** Auto CMD Index Error  
 This bit is set to 1 when the Command Index error occurs in response to a command.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 3 – ACMDEND** Auto CMD End Bit Error  
 This bit is set to 1 when detecting that the end bit of the command response is 0.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 2 – ACMDCRC** Auto CMD CRC Error  
 This bit is set to 1 when detecting a CRC error in the command response (see [the table above](#) for more details).

**Bit 1 – ACMDTEO** Auto CMD Timeout Error  
 This bit is set to 1 if no response is returned within 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, the other error status bits (SDMMC\_ACESR[4:2]) are meaningless.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

**Table 50-4. Relation between ACMDCRC and ACMDTEO**

| ACMDCRC | ACMDTEO | Types of error         |
|---------|---------|------------------------|
| 0       | 0       | No error               |
| 0       | 1       | Response Timeout error |
| 1       | 0       | Response CRC error     |
| 1       | 1       | CMD line conflict      |

**Bit 0 – ACMD12NE** Auto CMD12 Not Executed

If a memory multiple block data transfer is not started due to a command error, this bit is not set to 1 because it is not necessary to issue Auto CMD12. Setting this bit to 1 means the SDMMC cannot issue Auto CMD12 to stop a memory multiple block data transfer due to some error. If this bit is set to 1, other error status bits (SDMMC\_ACESR[4:1]) are meaningless.

This bit is set to 0 when an Auto CMD error is generated by Auto CMD23.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### 50.12.32 SDMMC Host Control 2 Register (SD\_SDIO)

**Name:** SDMMC\_HC2R (SD\_SDIO)  
**Offset:** 0x3E  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |     |         |         |             |     |        |            |     |     |
|--------|-----|---------|---------|-------------|-----|--------|------------|-----|-----|
|        | Bit | 15      | 14      | 13          | 12  | 11     | 10         | 9   | 8   |
|        |     | PVALEN  | ASINTEN |             |     |        |            |     |     |
| Access |     | R/W     | R/W     |             |     |        |            |     |     |
| Reset  |     | 0       | 0       |             |     |        |            |     |     |
|        |     |         |         |             |     |        |            |     |     |
|        | Bit | 7       | 6       | 5           | 4   | 3      | 2          | 1   | 0   |
|        |     | SCLKSEL | EXTUN   | DRVSEL[1:0] |     | VS18EN | UHSMS[2:0] |     |     |
| Access |     | R/W     | R/W     | R/W         | R/W | R/W    | R/W        | R/W | R/W |
| Reset  |     | 0       | 0       | 0           | 0   | 0      | 0          | 0   | 0   |

#### Bit 15 – PVALEN Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When PVALEN is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC\_PVR.

If this bit is set to 0, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the user.

If this bit is set to 1, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the SDMMC as specified in SDMMC\_PVR.

| Value | Description   |
|-------|---|
| 0     | SDCLK and Driver strength are controlled by the user. |
| 1     | Automatic selection by Preset Value is enabled.       |

#### Bit 14 – ASINTEN Asynchronous Interrupt Enable

This bit can be set to 1 if a card supports asynchronous interrupts and Asynchronous Interrupt Support (ASINTSUP) is set to 1 in SDMMC\_CA0R. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode. If this bit is set to 1, the user can stop the SDCLK during the asynchronous interrupt period to save power. During this period, the SDMMC continues to deliver the Card Interrupt to the host when it is asserted by the card.

| Value | Description |
|-------|-------------|
| 0     | Disabled    |
| 1     | Enabled     |

#### Bit 7 – SCLKSEL Sampling Clock Select

The SDMMC uses this bit to select the sampling clock to receive CMD and DAT.

This bit is set by the tuning procedure and is valid after completion of tuning (when EXTUN is cleared). Setting 1 means that tuning is completed successfully and setting 0 means that tuning has failed.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by writing to 0. This bit can be cleared by setting EXTUN to 1. Once the tuning circuit is reset, it takes time to complete the tuning sequence. Therefore, the user should keep this bit to 1 to perform a retuning sequence to complete a retuning sequence in a short time. Changing this bit is not allowed while the SDMMC is receiving a response or a read data block. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description                             |
|-------|---|
| 0     | The fixed clock is used to sample data. |
| 1     | The tuned clock is used to sample data. |

### Bit 6 – EXTUN Execute Tuning

This bit is set to 1 to start the tuning procedure and is automatically cleared when the tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select (SCLKSEL). The tuning procedure is aborted by writing 0. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description                    |
|-------|--------------------------------|
| 0     | Not tuned or tuning completed. |
| 1     | Execute tuning.                |

### Bits 5:4 – DRVSEL[1:0] Driver Strength Select

The SDMMC output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set according to the Driver Type A, C and D support bits in SDMMC\_CA1R.

This field depends on the setting of Preset Value Enable (PVALEN):

- PVALEN = 0: This field is set by the user.
- PVALEN = 1: This field is automatically set by a value specified in one of the SDMMC\_PVRx.

| Value | Name   | Description                         |
|-------|--------|-------------------------------------|
| 0     | TYPEB  | Driver Type B is selected (Default) |
| 1     | TYPEA  | Driver Type A is selected           |
| 2     | TYPEC  | Driver Type C is selected           |
| 3     | TYPE D | Driver Type D is selected           |

### Bit 3 – VS18EN 1.8V Signaling Enable

This bit controls the SDMMC\_1V8SEL output, which in turn may control an external voltage regulator for the I/O cell and card I/Os. 3.3V or some other fixed voltage is supplied to the card/device regardless of the signaling voltage.

Setting this bit from 0 to 1 starts changing the signal voltage from 3.3V to 1.8V. The 1.8V regulator output must be stable within 5 ms.

Clearing this bit from 1 to 0 starts changing the signal voltage from 1.8V to 3.3V. The 3.3V regulator output must be stable within 5 ms.

The user can set this bit to 1 when the SDMMC supports 1.8V signaling (one of the support bits is set to 1: SDR50SUP, SDR104SUP or DDR50SUP in SDMMC\_CA1R) and the card or device supports UHS-I (S18A = 1. See “Bus Switch Voltage Switch Sequence in the “Physical Layer Simplified Specification V3.01” ).

| Value | Description     |
|-------|-----------------|
| 0     | 3.3V signaling. |
| 1     | 1.8V signaling. |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bits 2:0 – UHSMS[2:0] UHS Mode Select

This field is used to select one of the UHS-I modes and is effective when 1.8V Signal Enable (VS18EN) is set to 1.

This field is effective only if SDMMC\_MC1R.DDR is set to 0.

If Preset Value Enable is set to 1, the SDMMC sets SDCLK Frequency Select (SDCLKFSEL), Clock Generator Select (CLKGSEL) in SDMMC\_CCR and Driver Strength Select (DRVSEL) according to SDMMC\_PVR. In this case, one of the preset value registers is selected by this field. The user needs to reset SD Clock Enable (SDCLKEN) before changing this field to avoid generating a clock glitch. After setting this field, the user sets SDCLKEN to 1 again.

| Value | Name   | Description     |
|-------|--------|-----------------|
| 0     | SDR12  | UHS SDR12 Mode  |
| 1     | SDR25  | UHS SDR25 Mode  |
| 2     | SDR50  | UHS SDR50 Mode  |
| 3     | SDR104 | UHS SDR104 Mode |
| 4     | DDR50  | UHS DDR50 Mode  |

### 50.12.33 SDMMC Host Control 2 Register (e.MMC)

**Name:** SDMMC\_HC2R (e.MMC)  
**Offset:** 0x3E  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |     |         |       |             |     |              |     |     |     |
|--------|-----|---------|-------|-------------|-----|--------------|-----|-----|-----|
|        | Bit | 15      | 14    | 13          | 12  | 11           | 10  | 9   | 8   |
|        |     | PVALEN  |       |             |     |              |     |     |     |
| Access |     | R/W     |       |             |     |              |     |     |     |
| Reset  |     | 0       |       |             |     |              |     |     |     |
|        |     |         |       |             |     |              |     |     |     |
|        | Bit | 7       | 6     | 5           | 4   | 3            | 2   | 1   | 0   |
|        |     | SCLKSEL | EXTUN | DRVSEL[1:0] |     | HS200EN[3:0] |     |     |     |
| Access |     | R/W     | R/W   | R/W         | R/W | R/W          | R/W | R/W | R/W |
| Reset  |     | 0       | 0     | 0           | 0   | 0            | 0   | 0   | 0   |

**Bit 15 – PVALEN** Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When Preset Value Enable (PVALEN) is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC\_PVR.

If this bit is set to 0, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the user.

If this bit is set to 1, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the SDMMC as specified in SDMMC\_PVR.

| Value | Description   |
|-------|---|
| 0     | SDCLK and Driver strength are controlled by the user. |
| 1     | Automatic selection by Preset Value is enabled.       |

**Bit 7 – SCLKSEL** Sampling Clock Select

The SDMMC uses this bit to select the sampling clock to receive CMD and DAT.

This bit is set by the tuning procedure and is valid after completion of tuning (when EXTUN is cleared). Setting 1 means that tuning is completed successfully and setting 0 means that tuning has failed.

Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by writing to 0. This bit can be cleared by setting EXTUN to 1. Once the tuning circuit is reset, it takes time to complete a tuning sequence. Therefore, the user should keep this bit to 1 to perform a retuning sequence to complete a retuning sequence in a short time. Changing this bit is not allowed while the SDMMC is receiving a response or a read data block. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description                             |
|-------|---|
| 0     | The fixed clock is used to sample data. |
| 1     | The tuned clock is used to sample data. |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 6 – EXTUN Execute Tuning

This bit is set to 1 to start the tuning procedure and is automatically cleared when the tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select (SCLKSEL). The tuning procedure is aborted by writing 0. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description                   |
|-------|-------------------------------|
| 0     | Not tuned or tuning completed |
| 1     | Execute tuning                |

### Bits 5:4 – DRVSEL[1:0] Driver Strength Select

The SDMMC output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set according to the Driver Type A, C and D support bits in SDMMC\_CA1R.

This field depends on setting of Preset Value Enable (PVALEN):

- PVALEN = 0: This field is set by the user.
- PVALEN = 1: This field is automatically set by a value specified in one of the SDMMC\_PVRx.

| Value | Name  | Description                         |
|-------|-------|-------------------------------------|
| 0     | TYPEB | Driver Type B is selected (Default) |
| 1     | TYPEA | Driver Type A is selected           |
| 2     | TYPEC | Driver Type C is selected           |
| 3     | TYPED | Driver Type D is selected           |

### Bits 3:0 – HS200EN[3:0] HS200 Mode Enable

This field is used to select the e.MMC HS200 mode. When HS200EN is set to B<sub>(hexa)</sub>, the HS200 mode is enabled. Any other value except 0 is forbidden when interfacing an e.MMC device.

If Preset Value Enable is set to 1, SDMMC sets SDCLK Frequency Select (SDCLKFSEL), Clock Generator Select (CLKGSEL) in SDMMC\_CCR and Driver Strength Select (DRVSEL) according to SDMMC\_PVR. In this case, one of the preset value registers is selected by this field. The user needs to reset SD Clock Enable (SDCLKEN) before changing this field to avoid generating a clock glitch. After setting this field, the user sets SDCLKEN to 1 again.

Note: This field is effective only if DDR in SDMMC\_MC1R is set to 0.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.34 SDMMC Capabilities 0 Register

**Name:** SDMMC\_CA0R  
**Offset:** 0x40  
**Property:** Read/Write

**Reset:** Register reset values depend on the instance of the SDMMC:

| Instance | Reset Value |
|----------|-------------|
| SDMMC0   | 0x27EC0C8C  |
| SDMMC1   | 0x27E80C8C  |

**Note:** The Capabilities 0 Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC\_CACR.

|        |               |         |              |         |          |         |              |         |
|--------|---------------|---------|--------------|---------|----------|---------|--------------|---------|
| Bit    | 31            | 30      | 29           | 28      | 27       | 26      | 25           | 24      |

| Reset  |               |         |              |         |          |         |              |         |

**Bits 31:30 – SLTYPE[1:0] Slot Type**

This field indicates usage of a slot by a specific system. An SDMMC control register set is defined per slot.

Embedded Slot for One Device means that only one nonremovable device is connected to a bus slot.

The Standard Host Driver controls a removable card (SLTYPE = 0) or one embedded device (SLTYPE = 1) connected to an SD bus slot.

| Value | Name                         |
|-------|------------------------------|
| 0     | Removable Card Slot          |
| 1     | Embedded Slot for One Device |
| 2     | Reserved                     |
| 3     | Reserved                     |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 29 – ASINTSUP Asynchronous Interrupt Support

See section “Asynchronous Interrupt” in the “SDIO Simplified Specification V3.00” .

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Asynchronous interrupt not supported. |
| 1     | Asynchronous interrupt supported.     |

### Bit 28 – SB64SUP 64-Bit System Bus Support

Reading this bit to 1 means that the SDMMC supports the 64-bit Address Descriptor mode and is connected to the 64-bit address system bus.

| Value | Description                       |
|-------|-----------------------------------|
| 0     | 64-bit address bus not supported. |
| 1     | 64-bit address bus supported.     |

### Bit 26 – V18VSUP Voltage Support 1.8V

| Value | Description                        |
|-------|------------------------------------|
| 0     | 1.8V Voltage supply not supported. |
| 1     | 1.8V Voltage supply supported.     |

### Bit 25 – V30VSUP Voltage Support 3.0V

| Value | Description                        |
|-------|------------------------------------|
| 0     | 3.0V Voltage supply not supported. |
| 1     | 3.0V Voltage supply supported.     |

### Bit 24 – V33VSUP Voltage Support 3.3V

| Value | Description                        |
|-------|------------------------------------|
| 0     | 3.3V Voltage supply not supported. |
| 1     | 3.3V Voltage supply supported.     |

### Bit 23 – SRSUP Suspend/Resume Support

This bit indicates whether the SDMMC supports the Suspend/Resume functionality. If this bit is set to 0, the user does not issue either Suspend or Resume commands because the Suspend and Resume mechanism (see “Suspend and Resume Mechanism” in the “SD Host Controller Simplified Specification V3.00” ) is not supported.

| Value | Description                   |
|-------|-------------------------------|
| 0     | Suspend/Resume not supported. |
| 1     | Suspend/Resume supported.     |

### Bit 22 – SDMASUP SDMA Support

This bit indicates whether the SDMMC is capable of using SDMA to transfer data between system memory and the SDMMC directly.

| Value | Description         |
|-------|---------------------|
| 0     | SDMA not supported. |
| 1     | SDMA supported.     |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 21 – HSSUP High Speed Support

This bit indicates whether the SDMMC and the system support High Speed mode and they can supply SDCLK frequency from 25 MHz to 50 MHz.

| Value | Description               |
|-------|---------------------------|
| 0     | High Speed not supported. |
| 1     | High Speed supported.     |

### Bit 19 – ADMA2SUP ADMA2 Support

This bit indicates whether the SDMMC is capable of using ADMA2.

| Value | Description          |
|-------|----------------------|
| 0     | ADMA2 not supported. |
| 1     | ADMA2 supported.     |

### Bit 18 – ED8SUP 8-Bit Support for Embedded Device

This bit indicates whether the SDMMC is capable of using the 8-bit Bus Width mode.

| Value | Description                    |
|-------|--------------------------------|
| 0     | 8-bit bus width not supported. |
| 1     | 8-bit bus width supported.     |

### Bits 17:16 – MAXBLKL[1:0] Max Block Length

This field indicates the maximum block size that the user can read and write to the buffer in the SDMMC. Three sizes can be defined, as shown below. It is noted that the transfer block length is always 512 bytes for SD Memory Cards regardless of this field.

| Value | Name | Description |
|-------|------|-------------|
| 0     | 512  | 512 bytes   |
| 1     | 1024 | 1024 bytes  |
| 2     | 2048 | 2048 bytes  |
| 3     | NONE | Reserved    |

### Bits 15:8 – BASECLKF[7:0] Base Clock Frequency

This value indicates the frequency of the base clock (BASECLK). The user uses this value to calculate the clock divider value (see SDCLK Frequency Select (SDCLKFSEL) in SDMMC\_CCR).

If this field is set to 0, the user must get the information via another method.

$$f_{\text{BASECLK}} = \text{BASECLKF}_{\text{MHz}}$$

### Bit 7 – TEOCLKU Timeout Clock Unit

This bit shows the unit of the base clock frequency used to detect Data Timeout Error.

| Value | Description |
|-------|-------------|
| 0     | KHz         |
| 1     | MHz         |

### Bits 5:0 – TEOCLKF[5:0] Timeout Clock Frequency

This bit shows the timeout clock frequency (TEOCLK) used to detect Data Timeout Error.

If this field is set to 0, the user must get the information via another method.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

---

The Timeout Clock Unit (TEOCLKU) defines the unit of this field's value.

– TEOCLKU = 0:  $f_{\text{TEOCLK}} = \text{TEOCLKF}_{\text{KHz}}$

– TEOCLKU = 1:  $f_{\text{TEOCLK}} = \text{TEOCLKF}_{\text{MHz}}$

### 50.12.35 SDMMC Capabilities 1 Register

**Name:** SDMMC\_CA1R  
**Offset:** 0x44  
**Property:** Read/Write

**Note:** The Capabilities 1 Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC\_CACR.

**Note:** Register reset values depend on the instance of the SDMMC:

| Instance | Reset Value |
|----------|-------------|
| SDMMC0   | 0x00200F77  |
| SDMMC1   | 0x00200070  |

**Bits 23:16 – CLKMULT[7:0] Clock Multiplier**

This field indicates the multiplier factor between the Base Clock (BASECLK) used for the Divided Clock Mode and the Multiplied Clock (MULTCLK) used for the Programmable Clock mode (see SDMMC\_CCR).

Reading this field to 0 means that the Programmable Clock mode is not supported.

$$f_{MULTCLK} = f_{BASECLK} \times (CLKMULT + 1)$$

**Bits 15:14 – RTMOD[1:0] Retuning Modes**

This field selects the retuning method and limits the maximum data length.

There are two retuning timings: Retuning Request (RTREQ) controlled by the SDMMC, and expiration of a Retuning timer controlled by the user. By receiving either timing, the user executes the retuning procedure just before a next command issue.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

The maximum data length per read/write command is restricted so that retuning procedures can be inserted during data transfers.

### Retuning Mode 1:

The SDMMC does not have any internal logic to detect when retuning needs to be performed. In this case, the user should maintain all retuning timings by using the Retuning Timer. To enable inserting the retuning procedure during data transfers, the data length per Read/Write command must be limited to 4 Mbytes.

### Retuning Mode 2:

The SDMMC has the capability to indicate the retuning timing by Retuning Request (RTREQ) during data transfers. Then the data length per Read/Write command must be limited to 4 Mbytes.

During nondata transfer, retuning timing is determined by either Retuning Request or Retuning Timer. If Retuning Request is used, Retuning Timer should be disabled.

### Retuning Mode 3:

The SDMMC has the capability to take care of the retuning during data transfer (Auto Retuning). Retuning Request is not generated during data transfers and there is no limitation to data length per Read/Write command.

During nondata transfer, retuning timing is determined either by Retuning Request or Retuning Timer. If Retuning Request is used, Retuning Timer should be disabled.

| Value | Name  | Description   | Data Length    |
|-------|-------|---|----------------|
| 0     | MODE1 | Timer   | 4 Mbytes (Max) |
| 1     | MODE2 | Timer and Retuning Request                              | 4 Mbytes (Max) |
| 2     | MODE3 | Auto Retuning (for transfer) Timer and Retuning Request | Any            |
| 3     | –     | Reserved  | –              |

### Bit 13 – TSDR50 Use Tuning for SDR50

If this bit is set to 1, the SDMMC requires tuning to operate SDR50 (tuning is always required to operate SDR104).

| Value | Description                    |
|-------|--------------------------------|
| 0     | SDR50 does not require tuning. |
| 1     | SDR50 requires tuning.         |

### Bits 11:8 – TCNTRT[3:0] Timer Count For Retuning

This field indicates an initial value of the Retuning Timer for Retuning Mode (RTMOD) 1 to 3. Reading this field at 0 means that the Retuning Timer is disabled. The Retuning Timer initial value ranges from 0 to 1024 seconds.

$$t_{\text{TIMER}} = 2^{(\text{TCNTRT} - 1)} \text{Seconds}$$

### Bit 6 – DRVDSUP Driver Type D Support

| Value | Description                     |
|-------|---------------------------------|
| 0     | Driver type D is not supported. |
| 1     | Driver type D is supported.     |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 5 – DRVCSUP Driver Type C Support

| Value | Description                     |
|-------|---------------------------------|
| 0     | Driver type C is not supported. |
| 1     | Driver type C is supported.     |

### Bit 4 – DRVASUP Driver Type A Support

| Value | Description                     |
|-------|---------------------------------|
| 0     | Driver type A is not supported. |
| 1     | Driver type A is supported.     |

### Bit 2 – DDR50SUP DDR50 Support

| Value | Description                  |
|-------|------------------------------|
| 0     | DDR50 mode is not supported. |
| 1     | DDR50 mode is supported.     |

### Bit 1 – SDR104SUP SDR104 Support

| Value | Description                   |
|-------|-------------------------------|
| 0     | SDR104 mode is not supported. |
| 1     | SDR104 mode is supported.     |

### Bit 0 – SDR50SUP SDR50 Support

| Value | Description                  |
|-------|------------------------------|
| 0     | SDR50 mode is not supported. |
| 1     | SDR50 mode is supported.     |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.36 SDMMC Maximum Current Capabilities Register

**Name:** SDMMC\_MCCAR  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

**Note:** The Maximum Current Capabilities Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC\_CACR.

|        |     |                  |    |    |    |    |    |    |    |
|--------|-----|------------------|----|----|----|----|----|----|----|
|        | Bit | 31               | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |     | [Empty Register] |    |    |    |    |    |    |    |
| Access |     |                  |    |    |    |    |    |    |    |
| Reset  |     |                  |    |    |    |    |    |    |    |
|        |     |                  |    |    |    |    |    |    |    |
|        | Bit | 23               | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Access |     |                  |    |    |    |    |    |    |    |
| Reset  |     | 0                | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |     |                  |    |    |    |    |    |    |    |
|        | Bit | 15               | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        |     | MAXCUR30V[7:0]   |    |    |    |    |    |    |    |
| Access |     |                  |    |    |    |    |    |    |    |
| Reset  |     | 0                | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |     |                  |    |    |    |    |    |    |    |
|        | Bit | 7                | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        |     | MAXCUR33V[7:0]   |    |    |    |    |    |    |    |
| Access |     |                  |    |    |    |    |    |    |    |
| Reset  |     | 0                | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 23:16 – MAXCUR18V[7:0]** Maximum Current for 1.8V  
 This field indicates the maximum current capability for 1.8V voltage. This value is meaningful only if V18VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR18V at 0 means that the user must get information via another method.

$$I_{max_{mA}} = 4 \times MAXCURR18V$$

**Bits 15:8 – MAXCUR30V[7:0]** Maximum Current for 3.0V  
 This field indicates the maximum current capability for 3.0V voltage. This value is meaningful only if V30VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR30V at 0 means that the user must get information via another method.

$$I_{max_{mA}} = 4 \times MAXCURR30V$$

**Bits 7:0 – MAXCUR33V[7:0]** Maximum Current for 3.3V  
 This field indicates the maximum current capability for 3.3V voltage. This value is meaningful only if V33VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR33V at 0 means that the user must get information via another method.

$$I_{max_{mA}} = 4 \times MAXCURR33V$$

**50.12.37 SDMMC Force Event Register for Auto CMD Error Status**

**Name:** SDMMC\_FERACES  
**Offset:** 0x50  
**Reset:** –  
**Property:** Write-only

|        |     |       |    |    |         |         |         |         |          |
|--------|-----|-------|----|----|---------|---------|---------|---------|----------|

| Reset  |     | –     |    |    | –       | –       | –       | –       | –        |

**Bit 7 – CMDNI** Force Event for Command Not Issued by Auto CMD12 Error  
 For test purposes, the user can write this bit to 1 to raise the CMDNI status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**Bit 4 – ACMDIDX** Force Event for Auto CMD Index Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDIDX status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**Bit 3 – ACMDEND** Force Event for Auto CMD End Bit Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDEND status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**Bit 2 – ACMDCRC** Force Event for Auto CMD CRC Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDCRC status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**Bit 1 – ACMDTEO** Force Event for Auto CMD Timeout Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDTEO status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**Bit 0 – ACMD12NE** Force Event for Auto CMD12 Not Executed  
 For test purposes, the user can write this bit to 1 to raise the ACMD12NE status flag in SDMMC\_ACESR.

Writing this bit to 0 has no effect.

**50.12.38 SDMMC Force Event Register for Error Interrupt Status**

**Name:** SDMMC\_FEREIS  
**Offset:** 0x52  
**Reset:** –  
**Property:** Write-only

|        |     |        |        |        |        |        |        |        |        |

|        |     | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access |     | W      | W      | W      | W      | W      | W      | W      | W      |
| Reset  |     | –      | –      | –      | –      | –      | –      | –      | –      |

**Bit 12 – BOOTAE** Force Event for Boot Acknowledge Error  
 For test purposes, the user can write this bit to 1 to raise the BOOTAE status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 9 – ADMA** Force Event for ADMA Error  
 For test purposes, the user can write this bit to 1 to raise the ADMA status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 8 – ACMD** Force Event for Auto CMD Error  
 For test purposes, the user can write this bit to 1 to raise the ACMD status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 7 – CURLIM** Force Event for Current Limit Error  
 For test purposes, the user can write this bit to 1 to raise the CURLIM status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 6 – DATEND** Force Event for Data End Bit Error  
 For test purposes, the user can write this bit to 1 to raise the DATEND status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 5 – DATCRC** Force Event for Data CRC error  
 For test purposes, the user can write this bit to 1 to raise the DATCRC status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 4 – DATTEO** Force Event for Data Timeout error  
 For test purposes, the user can write this bit to 1 to raise the DATTEO status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

**Bit 3 – CMDIDX** Force Event for Command Index Error

For test purposes, the user can write this bit to 1 to raise the CMDIDX status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

**Bit 2 – CMDEND** Force Event for Command End Bit Error

For test purposes, the user can write this bit to 1 to raise the CMDEND status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

**Bit 1 – CMDCRC** Force Event for Command CRC Error

For test purposes, the user can write this bit to 1 to raise the CMDCRC status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

**Bit 0 – CMDTEO** Force Event for Command Timeout Error

For test purposes, the user can write this bit to 1 to raise the CMDTEO status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

### 50.12.39 SDMMC ADMA Error Status Register

**Name:** SDMMC\_AESR  
**Offset:** 0x54  
**Reset:** 0x00  
**Property:** Read-only

|        |   |   |   |   |   |      |            |   |
|--------|---|---|---|---|---|------|------------|---|
|        | 7 | 6 | 5 | 4 | 3 | 2    | 1          | 0 |
|        |   |   |   |   |   | LMIS | ERRST[1:0] |   |
| Access |   |   |   |   |   | R    | R          | R |
| Reset  |   |   |   |   |   | 0    | 0          | 0 |

**Bit 2 – LMIS** ADMA Length Mismatch Error

This error occurs in the following two cases:

- While Block Count Enable (BCEN) is being set, the total data length specified by the Descriptor table is different from that specified by the Block Count (BLKCNT) and Transfer Block Size (BLKSIZE).
- The total data length cannot be divided by the Transfer Block Size (BLKSIZE).

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bits 1:0 – ERRST[1:0]** ADMA Error State

This field indicates the state of ADMA when an error has occurred during an ADMA data transfer. This field never reads 2 because ADMA never stops in this state.

| Value | Name                      | Description   |
|-------|---------------------------|---|
| 0     | ST_STOP (Stop DMA)        | Points to the descriptor following the error descriptor |
| 1     | ST_FDS (Fetch Descriptor) | Points to the error descriptor                          |
| 2     | –                         | (Not used)  |
| 3     | ST_TRF (Transfer Data)    | Points to the descriptor following the error descriptor |

**50.12.40 SDMMC ADMA System Address Register 0**

**Name:** SDMMC\_ASAR0  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |               |     |     |     |     |     |     |     |

| Bit    | 15            | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | ADMASA[15:8]  |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7             | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | ADMASA[7:0]   |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – ADMASA[31:0] ADMA System Address**

This field holds the byte address of the executing command of the descriptor table. The 32-bit address descriptor uses SDMMC\_ASAR. At the start of ADMA, the user must set the start address of the descriptor table. The ADMA increments this register address, which points to the next Descriptor line to be fetched.

When the ADMA Error (ADMA) status flag rises, this field holds a valid descriptor address depending on the ADMA Error State (ERRST). The user must program Descriptor Table on 32-bit boundary and set 32-bit boundary address to this register. ADMA2 ignores the lower 2 bits of this register and assumes it to be 0.

### 50.12.41 SDMMC Preset Value Register

**Name:** SDMMC\_PVRx  
**Offset:** 0x60 + x\*0x02 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

One of the Preset Value Registers is effective based on the selected bus speed mode. The table below defines the conditions to select one of the SDMMC\_PVRs.

**Table 50-5. Preset Value Register Select Condition**

| Selected Bus Speed Mode | VS18EN<br>(SDMMC_HC2R) | HSEN<br>(SDMMC_HC1R) | UHSMS<br>(SDMMC_HC2R) |
|-------------------------|------------------------|----------------------|-----------------------|
| Default Speed           | 0                      | 0                    | don't care            |
| High Speed              | 0                      | 1                    | don't care            |
| SDR12                   | 1                      | don't care           | 0                     |
| SDR25                   | 1                      | don't care           | 1                     |
| SDR50                   | 1                      | don't care           | 2                     |
| SDR104/HS200            | 1                      | don't care           | 3                     |
| DDR50                   | 1                      | don't care           | 4                     |
| Reserved                | 1                      | don't care           | Other values          |

The table below shows the effective Preset Value Register according to the Selected Bus Speed mode.

**Table 50-6. Preset Value Registers**

| SDMMC_PVRx | Selected Bus Speed Mode | Signal Voltage |
|------------|-------------------------|----------------|
| SDMMC_PVR0 | Initialization          | 3.3V or 1.8V   |
| SDMMC_PVR1 | Default Speed           | 3.3V           |
| SDMMC_PVR2 | High Speed              | 3.3V           |
| SDMMC_PVR3 | SDR12                   | 1.8V           |
| SDMMC_PVR4 | SDR25                   | 1.8V           |
| SDMMC_PVR5 | SDR50                   | 1.8V           |
| SDMMC_PVR6 | SDR104/HS200            | 1.8V           |
| SDMMC_PVR7 | DDR50                   | 1.8V           |

When Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, SDCLK Frequency Select (SDCLKFSEL) and Clock Generator Select (CLKGSEL) in SDMMC\_CCR, and Driver Strength Select (DRVSEL) in SDMMC\_HC2R are automatically set based on the Selected Bus Speed mode. This means that the user does not need to set these fields when preset is enabled. A Preset Value Register for Initialization (SDMMC\_PVR0) is not selected by Bus Speed mode. Before starting the initialization

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

sequence, the user needs to set a clock preset value to SDCLKFSEL in SDMMC\_CCR. PVALEN can be set to 1 after the initialization is completed.

|        |                |     |     |     |     |         |                |     |
|--------|----------------|-----|-----|-----|-----|---------|----------------|-----|
| Bit    | 15             | 14  | 13  | 12  | 11  | 10      | 9              | 8   |
|        | DRVSEL[1:0]    |     |     |     |     | CLKGSEL | SDCLKFSEL[9:8] |     |
| Access | R/W            | R/W |     |     |     | R/W     | R/W            | R/W |
| Reset  | 0              | 0   |     |     |     | 0       | 0              | 0   |
|        |                |     |     |     |     |         |                |     |
| Bit    | 7              | 6   | 5   | 4   | 3   | 2       | 1              | 0   |
|        | SDCLKFSEL[7:0] |     |     |     |     |         |                |     |
| Access | R/W            | R/W | R/W | R/W | R/W | R/W     | R/W            | R/W |
| Reset  | 0              | 0   | 0   | 0   | 0   | 0       | 0              | 0   |

**Bits 15:14 – DRVSEL[1:0]** Driver Strength Select  
See DRVSEL in SDMMC\_HC2R.

**Bit 10 – CLKGSEL** Clock Generator Select  
See CLKGSEL in SDMMC\_CCR.

**Bits 9:0 – SDCLKFSEL[9:0]** SDCLK Frequency Select  
See SDCLKFSEL in SDMMC\_CCR.

### 50.12.42 SDMMC Slot Interrupt Status Register

**Name:** SDMMC\_SISR  
**Offset:** 0xFC  
**Reset:** 0x0000  
**Property:** Read-only

**Bits 1:0 – INTSSL[1:0]** Interrupt Signal for Each Slot

These status bits indicate the logical OR of Interrupt Signals and Wakeup Signal for each SDMMC instance in the product (INTSSL[x] corresponds to SDMMCx instance in the product).

### 50.12.43 SDMMC Host Controller Version Register

**Name:** SDMMC\_HCVR  
**Offset:** 0xFE  
**Reset:** 0x1502  
**Property:** Read-only

|        |     |           |    |    |    |    |    |   |   |
|--------|-----|-----------|----|----|----|----|----|---|---|
|        | Bit | 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |     | VVER[7:0] |    |    |    |    |    |   |   |
| Access |     | R         | R  | R  | R  | R  | R  | R | R |
| Reset  |     |           |    |    |    |    |    |   |   |
|        | Bit | 7         | 6  | 5  | 4  | 3  | 2  | 1 | 0 |
|        |     | SVER[7:0] |    |    |    |    |    |   |   |
| Access |     | R         | R  | R  | R  | R  | R  | R | R |
| Reset  |     |           |    |    |    |    |    |   |   |

**Bits 15:8 – VVER[7:0]** Vendor Version Number

Reserved. Value subject to change. No functionality associated. This is the internal version of the module.

**Bits 7:0 – SVER[7:0]** Specification Version Number

This status indicates the SD Host Controller Specification Version.

| Value | Name  |
|-------|---|
| 0     | SD Host Specification Version 1.00  |
| 1     | SD Host Specification Version 2.00, including the feature of the ADMA and Test Register |
| 2     | SD Host Specification Version 3.00  |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.44 SDMMC Additional Present State Register

**Name:** SDMMC\_APSR  
**Offset:** 0x200  
**Reset:** –  
**Property:** Read-only

**Reset:**

Reset value depends on the instance of the SDMMC:

| Instance | Reset Value |
|----------|-------------|
| SDMMC0   | 0x0000000F  |
| SDMMC1   | 0x00000000  |

**Bits 3:0 – HDATLL[3:0] DAT[7:4] High Line Level**

This status is used to check the DAT[7:4] line level to recover from errors, and for debugging.

### 50.12.45 SDMMC e.MMC Control 1 Register

**Name:** SDMMC\_MC1R  
**Offset:** 0x204  
**Reset:** 0x00  
**Property:** Read/Write

|        |     |      |       |     |     |   |             |     |
|--------|-----|------|-------|-----|-----|---|-------------|-----|
| Bit    | 7   | 6    | 5     | 4   | 3   | 2 | 1           | 0   |
|        | FCD | RSTN | BOOTA | OPD | DDR |   | CMDTYP[1:0] |     |
| Access | R/W | R/W  | R/W   | R/W | R/W |   | R/W         | R/W |
| Reset  | 0   | 0    | 0     | 0   | 0   |   | 0           | 0   |

**Bit 7 – FCD** e.MMC Force Card Detect

When using e.MMC, the user can set this bit to 1 to bypass the card detection procedure using the SDMMC\_CD signal.

0 (DISABLED): e.MMC Forced Card Detect is disabled. The SDMMC\_CD signal is used and debounce timing is applied.

1 (ENABLED): e.MMC Forced Card Detect is enabled.

**Bit 6 – RSTN** e.MMC Reset Signal

This bit controls the e.MMC reset signal.

| Value | Description               |
|-------|---------------------------|
| 0     | Reset signal is inactive. |
| 1     | Reset signal is active.   |

**Bit 5 – BOOTA** e.MMC Boot Acknowledge Enable

This bit must be set according to the value of BOOT\_ACK in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”).

When this bit is set to 1, the SDMMC waits for boot acknowledge pattern from the e.MMC before receiving boot data.

If the boot acknowledge pattern is wrong, the BOOTAE status flag rises in SDMMC\_EISTR if BOOTAE is set in SDMMC\_EISTER. An interrupt is generated if BOOTAE is set in SDMMC\_EISIER.

If the no boot acknowledge pattern is received, the DATTEO status flag rises in SDMMC\_EISTR if DATTEO is set in SDMMC\_EISTER. An interrupt is generated if DATTEO is set in SDMMC\_EISIER.

**Bit 4 – OPD** e.MMC Open Drain Mode

This bit sets the command line in open drain.

| Value | Description                        |
|-------|------------------------------------|
| 0     | The command line is in push-pull.  |
| 1     | The command line is in open drain. |

**Bit 3 – DDR** e.MMC HSDDR Mode

This bit selects the High Speed DDR mode.

The clock divider (DIV) in SDMMC\_CCR must be set to a value different from 0 when DDR is 1.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| Value | Description                     |
|-------|---------------------------------|
| 0     | High Speed DDR is not selected. |
| 1     | High Speed DDR is selected.     |

### Bits 1:0 – CMDTYP[1:0] e.MMC Command Type

| Value | Name    | Description  |
|-------|---------|--|
| 0     | NORMAL  | The command is not an e.MMC specific command.  |
| 1     | WAITIRQ | This bit must be set to 1 when the e.MMC is in Interrupt mode (CMD40). See “Interrupt Mode” in the “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” . |
| 2     | STREAM  | This bit must be set to 1 in the case of Stream Read(CMD11) or Stream Write (CMD20). Only effective for e.MMC up to revision 4.41.                               |
| 3     | BOOT    | Starts a Boot Operation mode at the next write to SDMMC_CR. Boot data are read directly from e.MMC device.   |

**50.12.46 SDMMC e.MMC Control 2 Register**

**Name:** SDMMC\_MC2R  
**Offset:** 0x205  
**Reset:** –  
**Property:** Write-only

|        |   |   |   |   |   |   |       |       |
|--------|---|---|---|---|---|---|-------|-------|
|        | 7 | 6 | 5 | 4 | 3 | 2 | 1     | 0     |
|        |   |   |   |   |   |   | ABOOT | SRESP |
| Access |   |   |   |   |   |   | W     | W     |
| Reset  |   |   |   |   |   |   | –     | –     |

**Bit 1 – ABOOT** e.MMC Abort Boot

This bit is used to exit from Boot mode. Writing this bit to 1 exits the Boot Operation mode. Writing 0 is ignored.

**Bit 0 – SRESP** e.MMC Abort Wait IRQ

This bit is used to exit from the Interrupt mode. When this bit is written to 1, the SDMMC sends the CMD40 response automatically. This brings the e.MMC from Interrupt mode to the standard Data Transfer mode. Writing this bit to 0 is ignored.

This bit is only effective when CMD\_TYP in SDMMC\_MC1R is set to WAITIRQ.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.47 SDMMC AHB Control Register

**Name:** SDMMC\_ACR  
**Offset:** 0x208  
**Reset:** 0x00  
**Property:** Read/Write

**Bits 1:0 – BMAX[1:0] AHB Maximum Burst**

This field selects the maximum burst size in case of DMA transfer.

| Value | Name   | Description                          |
|-------|--------|--------------------------------------|
| 0     | INCR16 | The maximum burst size is INCR16.    |
| 1     | INCR8  | The maximum burst size is INCR8.     |
| 2     | INCR4  | The maximum burst size is INCR4.     |
| 3     | SINGLE | Only SINGLE transfers are performed. |

### 50.12.48 SDMMC Clock Control 2 Register

**Name:** SDMMC\_CC2R  
**Offset:** 0x20C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – FSDCLKD** Force SDCLK Disabled

The user can choose to maintain the SDCLK during 8 SDCLK cycles after the end bit of the last data block in case of a read transaction, or after the end bit of the CRC status in case of a write transaction.

| Value | Description  |
|-------|--|
| 0     | The SDCLK is forced and it cannot be stopped immediately after the transaction.  |
| 1     | The SDCLK is not forced and it can be stopped immediately after the transaction. |

**50.12.49 SDMMC Retuning Control 1 Register**

**Name:** SDMMC\_RTC1R  
**Offset:** 0x210  
**Reset:** 0x00  
**Property:** Read/Write

| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0     |
|--------|---|---|---|---|---|---|---|-------|
|        |   |   |   |   |   |   |   | TMREN |
| Access |   |   |   |   |   |   |   | R/W   |
| Reset  |   |   |   |   |   |   |   | 0     |

**Bit 0 – TMREN** Retuning Timer Enable

Enable the retuning timer.

0 (DISABLED): The retuning timer is disabled.

1 (ENABLED): The retuning timer is enabled.

### 50.12.50 SDMMC Retuning Control 2 Register

**Name:** SDMMC\_RTC2R  
**Offset:** 0x211  
**Reset:** –  
**Property:** Write-only

| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0   |
|--------|---|---|---|---|---|---|---|-----|
|        |   |   |   |   |   |   |   | RLD |
| Access |   |   |   |   |   |   |   | W   |
| Reset  |   |   |   |   |   |   |   | –   |

**Bit 0 – RLD** Retuning Timer Reload

This bit is only efficient if the Retuning timer is enabled (SDMMC\_RTC1R.TMREN set to 1). Once the Timer Counter Value (TCVAL) is set to a nonzero value in SDMMC\_RTCVR, setting this bit to 1 starts the timer count. The retuning timer count restarts each time this bit is written to 1.

Writing this bit to 0 has no effect.

### 50.12.51 SDMMC Retuning Counter Value Register

**Name:** SDMMC\_RTCVR  
**Offset:** 0x214  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 3:0 – TCVAL[3:0]** Retuning Timer Counter Value

The TCVAL value is used to define the time before expiration of the retuning timer where:

$$\text{Time} = 2^{\text{TCVAL} - 1} \text{seconds}$$

This value must range between 1 and 11. Any other value results in the retuning timer being disabled.

**50.12.52 SDMMC Retuning Interrupt Status Enable Register**

**Name:** SDMMC\_RTISTR  
**Offset:** 0x218  
**Reset:** 0x00  
**Property:** Read/Write

| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
|--------|---|---|---|---|---|---|---|------|
|        |   |   |   |   |   |   |   | TEVT |
| Access |   |   |   |   |   |   |   | R/W  |
| Reset  |   |   |   |   |   |   |   | 0    |

**Bit 0 – TEVT** Retuning Timer Event

0 (MASKED): The TEVT status flag in SDMMC\_RTISTR is masked.

1 (ENABLED): The TEVT status flag in SDMMC\_RTISTR is enabled.

**50.12.53 SDMMC Retuning Interrupt Signal Enable Register**

**Name:** SDMMC\_RTISIER  
**Offset:** 0x219  
**Reset:** 0x00  
**Property:** Read/Write

|        |   |   |   |   |   |   |   |      |
|--------|---|---|---|---|---|---|---|------|
|        | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
|        |   |   |   |   |   |   |   | TEVT |
| Access |   |   |   |   |   |   |   | R/W  |
| Reset  |   |   |   |   |   |   |   | 0    |

**Bit 0 – TEVT** Retuning Timer Event

0 (MASKED): No interrupt is generated when the TEVT status rises in SDMMC\_RTISTR.

1 (ENABLED): An interrupt is generated when the TEVT status rises in SDMMC\_RTISTR.

### 50.12.54 SDMMC Retuning Interrupt Status Register

**Name:** SDMMC\_RTISTR  
**Offset:** 0x21C  
**Reset:** 0x00  
**Property:** Read/Write

|        |                       |  |   |  |   |  |   |  |   |  |   |  |   |  |      |
|--------|-----------------------|--|---|--|---|--|---|--|---|--|---|--|---|--|------|
|        | 7                     |  | 6 |  | 5 |  | 4 |  | 3 |  | 2 |  | 1 |  | 0    |
|        | [Register Bit Fields] |  |   |  |   |  |   |  |   |  |   |  |   |  | TEVT |
| Access |                       |  |   |  |   |  |   |  |   |  |   |  |   |  | R/W  |
| Reset  |                       |  |   |  |   |  |   |  |   |  |   |  |   |  | 0    |

**Bit 0 – TEVT** Retuning Timer Event

This bit is set to 1 when the retuning timer count is elapsed if SDMMC\_RTISTR.TEVT is set to 1. An interrupt is generated if SDMMC\_RTISTR.TEVT is set to 1.

Writing this bit to 1 clears this bit.

| Value | Description              |
|-------|--------------------------|
| 0     | No retuning timer event. |
| 1     | Retuning timer event.    |

**50.12.55 SDMMC Retuning Status Slots Register**

**Name:** SDMMC\_RTSSR  
**Offset:** 0x21D  
**Reset:** 0x00  
**Property:** Read-only

|        |   |   |   |   |   |   |               |   |
|--------|---|---|---|---|---|---|---------------|---|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1             | 0 |
|        |   |   |   |   |   |   | TEVTSLOT[1:0] |   |
| Access |   |   |   |   |   |   | R             | R |
| Reset  |   |   |   |   |   |   | 0             | 0 |

**Bits 1:0 – TEVTSLOT[1:0]** Retuning Timer Event Slots

Indicates the TEVT status for each SDMMC instance in the product (TEVTSLOT[x] corresponds to SDMMCx instance in the product).

| Bit    | 7           | 6    | 5      | 4       | 3           | 2   | 1   | 0   |
|        |             | BPEN | TUNDIS | ALWYSON | CLKDIV[2:0] |     |     | EN  |
| Access |             | R/W  | R/W    | R/W     | R/W         | R/W | R/W | R/W |
| Reset  |             | 0    | 0      | 0       | 1           | 1   | 1   | 0   |

**Bits 31:28 – CALPBP[3:0]** Calibration P Bypass Value

Calibration code applied for the p-channel transistors when BPEN is set to 1. This field is ignored if BPEN is 0.

**Bits 27:24 – CALP[3:0]** Calibration P Status

Calibration code for the p-channel transistors to match the required output impedance.

**Bits 23:20 – CALNBP[3:0]** Calibration N Bypass Value

Calibration code applied for the n-channel transistors when BPEN is set to 1. This field is ignored if BPEN is 0.

**Bits 19:16 – CALN[3:0]** Calibration N Status

Calibration code for the n-channel transistors to match the required output impedance.

**Bits 15:8 – CNTVAL[7:0]** Calibration Counter Value

Defines the number of XXXX cycles (divided by 4) required to cover the I/O calibration cell startup time.

$$CNTVAL_{\text{Minimum}} = \frac{t_{\text{STARTUP}}}{4 \times t_{\text{HCLOCK}}}$$

$$t_{\text{STARTUP}} = 2 \mu\text{s}$$

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 6 – BPEN Calibration Bypass Enabled

| Value | Description   |
|-------|---|
| 0     | Calibration bypass is not enabled.  |
| 1     | Calibration bypass is enabled. CALPBP and CALNBP codes are applied to the calibration cell. |

### Bit 5 – TUNDIS Calibration During Tuning Disabled

| Value | Description                                 |
|-------|---|
| 0     | Calibration is launched before each tuning. |
| 1     | Calibration is not launched at tuning.      |

### Bit 4 – ALWYSON Calibration Analog Always ON

| Value | Description   |
|-------|---|
| 0     | Calibration analog is shut down after each calibration. |
| 1     | Calibration analog remains powered after calibration.   |

### Bits 3:1 – CLKDIV[2:0] Calibration Clock Division

The clock applied to the calibration cell is divided by  $\text{CLKDIV} + 1$

### Bit 0 – EN PADS Calibration Enable

| Value | Description                     |
|-------|---------------------------------|
| 0     | SDMMC I/O calibration disabled. |
| 1     | SDMMC I/O calibration enabled.  |

## **51. Image Sensor Controller (ISC)**

### **51.1 Description**

The Image Sensor Controller (ISC) system manages incoming data from a parallel sensor. It supports a single active interface. The parallel interface protocol can use a free-running clock or a gated clock strategy. It supports the ITU-R BT 656/1120 422 protocol with a data width of 8 bits or 10 bits and raw Bayer format. The internal image processor includes adjustable white balance, color filter array interpolation, color correction, gamma correction, 12 bits to 10 bits compression, programmable color space conversion, horizontal and vertical chrominance subsampling module. The module also integrates a triple channel direct memory access controller master interface.

### **51.2 Embedded Characteristics**

- Parallel 12-bit Interface for Raw Bayer, YCbCr, Monochrome and JPEG Compressed Sensor Interface
- BT.601/656/1120 Video Interface Supported
- Progressive Systems and Segmented Frame Systems
- Raw Bayer, YCbCr, Luminance (Black and White) Pixel Format Supported
- Resolution up to 2592 x 1944
- Input Pixel Clock up to 96 MHz
- Output Master Clock Generation
- Cropping
- Adjustable White Balance
- Raw Bayer Color Filter Array Interpolation
- Color Correction
- Gamma Correction
- Color Space Conversion
- Contrast and Brightness Control
- 4:4:4 to 4:2:2 Subsamplere
- 4:2:2 to 4:2:0 Subsamplere
- Rounding, Limiting and Packing unit
- Histogram Generation
- System Interface: Direct Memory Access Interface with Packed, Semi Planar and Planar output format
- Output Memory Format: 16 bpp RGB, 32 bpp RGB, 16 bpp, YCbCr 444, YCbCr 422, YCbCr 420, up to 12 bit raw Bayer

## 51.3 Block Diagram and Use Cases

### 51.3.1 Image Sensor Controller Functional Diagrams

**Figure 51-1. ISC Block Diagram**

**Figure 51-2. ISC Raw Bayer Signal Processor**

The ISC video pipeline integrates the following submodules:

- PFE: Parallel Front End to sample the camera sensor input stream
- WB: Programmable white balance in the Bayer domain
- CFA: Color filter array interpolation module
- CC: Programmable color correction
- GAM: Gamma correction
- CSC: Programmable color space conversion
- CBC: Contrast and Brightness control
- SUB: This module performs YCbCr444 to YCbCr420 chrominance subsampling.
- RLP: This module performs rounding, range limiting and packing of the incoming data.

### 51.3.2 Image Sensor Controller Clock Domain Diagram

**Figure 51-3. Clock Domain Hierarchy**

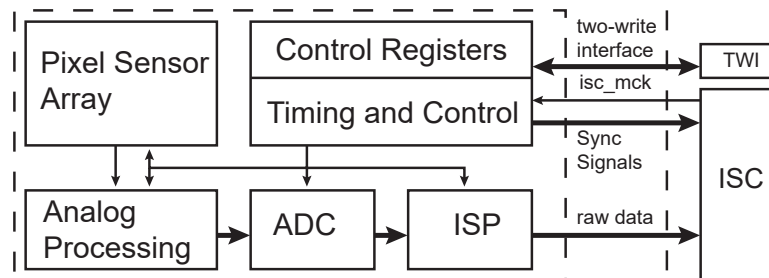

### 51.3.3 Image Sensor Controller Typical Use Cases

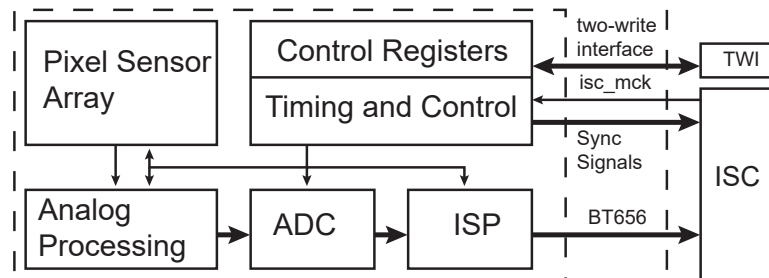

**Figure 51-4. Raw Bayer Sensor**

**Figure 51-5. Raw Bayer Sensor with Embedded Image Processor**

**Figure 51-6. BT656 Video Interface Sensor**

**Figure 51-7. Sensor with JPEG Output**

**Figure 51-8. Serial CMOS Sensor with External Parallel Bridge**

## 51.4 Product Dependencies

### 51.4.1 I/O Lines

The pins used for interfacing the ISC are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the ISC pins to their peripheral function. If I/O lines of the ISC are not used by the application, they can be used for other purposes by the PIO controller.

### 51.4.2 Power Management

The peripheral clock is not continuously provided to the ISC. The programmer must first enable the ISC clock in the Power Management Controller (PMC) before using the ISC.

### 51.4.3 Interrupt Sources

The ISC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the ISC interrupt requires the Interrupt Controller to be programmed first.

## 51.5 Functional Description

### 51.5.1 ISC Clock Management

The ISC module provides the `isc_mck` output clock to the image sensor. The `isc_mck` clock has three selectable clock sources (`ISC_CLKCFG.MCSEL`) and one programmable clock divider (`ISC_CLKCFG.MCDIV`). The clock is enabled using the `ISC_CLKEN.MCEN`. The `isc_mck` is driven by the ISC and is the external reference clock of the CMOS sensor.

**Figure 51-9. Clock Divider Block Diagram**

The ISC digital pipeline requires internally a functional clock named `isc_ispck`. This clock is also fully programmable. This `isc_ispck` is enabled using the `ISC_CLKEN.ICEN`. This clock is mandatory for ISC operation. The ISC module is designed to accept input signals that are asynchronous to the `isc_ispck`. Synchronization is done internally as long as the following relationship holds:

`isc_pck` frequency is less than or equal to `isc_ispck`, and `isc_ispck` is greater than or equal to `HCLOCK`.

**51.5.1.1 Software Requirement**

A software write operation to the `ISC_CLKEN` or `ISC_CLKDIS` register requires double clock domain synchronization and is not permitted when the `ISC_CLKSR.SIP` is asserted.

**51.5.2 Parallel Interface Timing Description**

The parallel interface protocol supports two operating modes.

**Figure 51-10. Free-Running Pixel Clock**

**Figure 51-11. Gated Pixel Clock**

**51.5.3 BT.601/656/1120 Embedded Timing Synchronization Operation**

The ISC module supports embedded synchronization decoding. When the `ISC_PFE_CFG0.CCIR656` is set, the decoder is activated and signals `isc_vsync` `isc_hsync` are not used to decode the valid pixels. If the `CCIR10_8N` is set, the bitstream is 10 bits wide, otherwise it is only 8 bits wide. When the `ISC_PFE_CFG0.CCIR_CRC` is set, the decoder automatically corrects the error.

**Figure 51-12. Field/Segment Timing Relationship for Interlaced and Segmented Frame Systems**

**Figure 51-13. Frame Timing Relationship for Progressive Systems**

#### 51.5.4 Parallel Interface External Sensor Connections

##### 51.5.4.1 YCbCr, 10-bit CCIR656 with Embedded Synchronization

This mode is activated when ISC\_PFE\_CFG0.CCIR656 and ISC\_PFE\_CFG0.CCIR10\_8N are both set.

| Interface Bit     | First Word | Second Word | Third Word | Fourth Word |
|-------------------|------------|-------------|------------|-------------|

### 51.5.5 Parallel Front End (PFE) Module

Figure 51-14. PFE Block Diagram

The Parallel Front End module performs data resampling across clock domain boundary. It includes a CCIR656 decoder used to convert a standard ITU-R BT.656 stream to 24-bit digital video. It also generates pixels, syncs flags and valid signals to the main video pipeline. It outputs field, video and synchronization signals. The PFE can optionally crop and limit the incoming pixel stream to a predefined horizontal and vertical value. By default, the PFE only relies on the cmos sensor horizontal and vertical reference to sample the incoming pixel stream. A pixel is sampled if, and only if, the vertical and horizontal synchronizations are valid and a pixel clock edge is detected. ISC\_PFE\_CFG0.BPS shows the number of bits per sample. The PFE module outputs a 12-bit data on the vp\_data[11:0] bus, and asserts the vp\_valid signal when the data can be sampled.

| PFE VP_DATA Mapping | Raw Bayer 12-bit | Raw Bayer 10-bit | YUV422 8-bit | YUV422 10-bit | Mono 12-bit |
|---------------------|------------------|------------------|--------------|---------------|-------------|
| VP_DATA[11]         | RGGB[11]         | RGGB[9]          | YC422[7]     | YC422[9]      | Y[11]       |
| VP_DATA[10]         | RGGB[10]         | RGGB[8]          | YC422[6]     | YC422[8]      | Y[10]       |
| VP_DATA[9]          | RGGB[9]          | RGGB[7]          | YC422[5]     | YC422[7]      | Y[9]        |
| VP_DATA[8]          | RGGB[8]          | RGGB[6]          | YC422[4]     | YC422[6]      | Y[8]        |
| VP_DATA[7]          | RGGB[7]          | RGGB[5]          | YC422[3]     | YC422[5]      | Y[7]        |
| VP_DATA[6]          | RGGB[6]          | RGGB[4]          | YC422[2]     | YC422[4]      | Y[6]        |
| VP_DATA[5]          | RGGB[5]          | RGGB[3]          | YC422[1]     | YC422[3]      | Y[5]        |

.....continued

| PFE VP_DATA Mapping | Raw Bayer 12-bit | Raw Bayer 10-bit | YUV422 8-bit  | YUV422 10-bit | Mono 12-bit |
|---------------------|------------------|------------------|---------------|---------------|-------------|
| VP_DATA[4]          | RGGB[4]          | RGGB[2]          | YC422[0]      | YC422[2]      | Y[4]        |
| VP_DATA[3]          | RGGB[3]          | RGGB[1]          | YC422[7] or 0 | YC422[1]      | Y[3]        |
| VP_DATA[2]          | RGGB[2]          | RGGB[0]          | YC422[6] or 0 | YC422[0]      | Y[2]        |
| VP_DATA[1]          | RGGB[1]          | RGGB[9] or 0     | YC422[5] or 0 | YC422[9] or 0 | Y[1]        |
| VP_DATA[0]          | RGGB[0]          | RGGB[8] or 0     | YC422[4] or 0 | YC422[8] or 0 | Y[0]        |

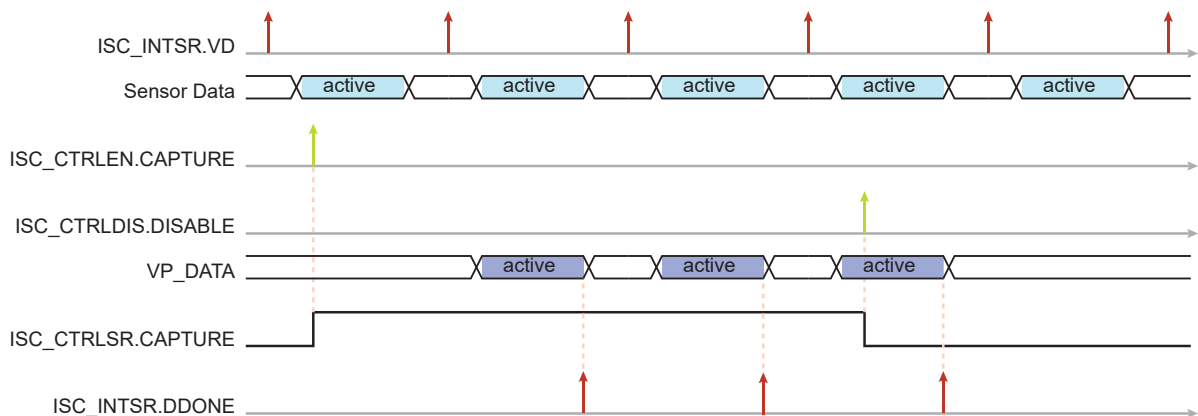

**Note:** When ISC\_PFE\_CFG0.REP is set, missing VP\_DATA LSBs are replaced with replicated LSBs of the incoming stream, otherwise they are forced to zero.

The PFE module also includes logic to synchronize capture request with the incoming pixel stream. Two operating modes are available: Single Shot and Continuous Acquisition. When the ISC\_PFE\_CFG0.CONT is cleared, the ISC transfers a single image to memory,

**Figure 51-15. Single Shot Mode**

**Figure 51-16. Continuous Acquisition Mode**

When Continuous Acquisition mode is activated (ISC\_PFE\_CFG0.CONT is set), the data transfer terminates when either a DMA end of list is reached, a software disable is performed or a software reset is activated. The ISC\_INTSR.DDONE is set at the end of the DMA data transfer.

**Figure 51-17. Continuous Acquisition, DMA Terminated**

The linked list DMA transfer is terminated when an item of the list is programmed with `ISC_DCTRL.DE` cleared or when `ISC_DNDA.NDA` is equal to zero. This configuration also clears `ISC_CTRLISR.CAPTURE` and sets the `ISC_INTSR.LDONE` interrupt flag.

The linked list DMA transfer starts if `ISC_DCTRL.DE` is set and if `ISC_DNDA.NDA` is different from zero.

### 51.5.5.1 Update the ISC Profile

Each ISC register is double-buffered to simplify the software configuration and the synchronization with the associated frame buffer. When the configuration of the ISC is modified, `ISC_CTRLLEN.UPPRO` must be set to transfer the configuration from the input buffer to the ISC video pipeline.

**Figure 51-18. Update Profile Timing Diagram**

### 51.5.5.2 Software Requirements

Writing to the `ISC_CTRLLEN` or `ISC_CTRLDIS` register requires a double domain synchronization, so it is forbidden to write these registers when `ISC_CTRLISR.SIP` is asserted.

### 51.5.6 White Balance (WB) Module

The White Balance (WB) module captures the `vp_data[11:0]` bus from the PFE module when the `vp_valid` signal is asserted, and it generates a `wb_data[11:0]` data along with its validity signal `wb_valid`. When `ISC_WB_CTRL.ENABLE` is set, each Bayer color component (R, Gr, B, Gb) can be manually adjusted using an offset and a gain. The Bayer pattern is adjustable using `ISC_WB_CFG.BAYCFG`.

**Figure 51-19. WB Block Diagram**

There are four {gain, offset} sets for each Bayer component. The output value is clipped.

| ISC_WB_CTRL.ENABLE | WB_DATA Slice              | Value   |
|--------------------|----------------------------|---|
| 0                  | <code>wb_data[11:0]</code> | <code>vp_data[11:0]</code>  |
| 1                  | <code>wb_data[11:0]</code> | $\text{clipped}((\text{vp\_data}[11:0] + \text{offset}) * \text{gain})$ |

### 51.5.7 Color Filter Array (CFA) Interpolation Module

In a single-sensor system, each cell on the sensor has a specific color filter and microlens positioned above it. The raw data obtained from the sensor do not have the full R/G/B information at each cell position. Color interpolation is required to retrieve the missing components. The CFA module samples the `wb_data[11:0]` 12-bit bus when `wb_valid` is asserted and generates a 36-bit width data bus `cfa_data[35:0]` with the validity bit `cfa_valid`.

**Figure 51-20. CFA Block Diagram**

| ISC_CFA_CTRL.ENABLE | CFA_DATA Slice               | Value  |
|---------------------|------------------------------|--|
| 0                   | <code>cfa_data[35:24]</code> | <code>wb_data[11:0]</code>                             |
|                     | <code>cfa_data[23:12]</code> | <code>wb_data[11:0]</code>                             |
|                     | <code>cfa_data[11:0]</code>  | <code>wb_data[11:0]</code>                             |
| 1                   | <code>cfa_data[35:24]</code> | $R = \text{spatial\_filter\_R}(\text{wb\_data}[11:0])$ |
|                     | <code>cfa_data[23:12]</code> | $G = \text{spatial\_filter\_G}(\text{wb\_data}[11:0])$ |
|                     | <code>cfa_data[11:0]</code>  | $B = \text{spatial\_filter\_B}(\text{wb\_data}[11:0])$ |

The filter kernel size is 5, and requires two additional lines to initialize the filter. When `ISC_CFA_CFG.EITPOL` is set, the missing information is interpolated from the nearest neighbor. If `ISC_CFA_CFG.EITPOL` is cleared, only valid pixels are used to initialize the filter kernel, but the output number of lines is less than the input number of lines. In that case, four lines are consumed to fill the kernel.

#### 51.5.7.1 Frame Size Requirement when Edge Interpolation is Off, `ISC_CFA_CFG.EITPOL` Cleared

- Minimum number of rows (in): 5
- Minimum number of columns (in): 5
- Number of rows after CFA: Number of rows (in) - 4

- Number of columns after CFA: Number of columns (in) - 4

### 51.5.7.2 Frame Size Requirement when Edge Interpolation is On, ISC\_CFA\_CFG.EITPOL Set

- Minimum number of rows (in): 3
- Minimum number of columns (in): 3
- Number of rows after CFA: Number of rows (in)
- Number of columns after CFA: Number of columns (in)

### 51.5.7.3 Bayer Mode and Edge Interpolation Description

When Edge Interpolation mode (ISC\_CFA\_CFG.EITPOL) is activated, dummy lines are generated using rows and columns replication.

The CFA module supports four sensor alignments using ISC\_CFA\_CFG.BAYCFG. See the figure below.

**Figure 51-21. Supported Color Filter Array Patterns**

### 51.5.8 Color Correction (CC) Module

RGB color correction is used to compensate for cross color bleeding in the filter used with the image sensor. The module samples the `cfa_data[35:0]` 36-bit bus when `cfa_valid` is asserted and generate a `cc_data[35:0]` 36-bit wide bus and a `cc_valid` signal.

**Figure 51-22. CC Block Diagram**

There are three {gain, offset} sets for color component R, G, B.

| ISC_CC_CTRL.ENABLE | CC_DATA Slice  | Value   |
|--------------------|----------------|---|
| 0                  | cc_data[35:24] | cfa_data[11:0]                                  |
|                    | cc_data[23:12] | cfa_data[11:0]                                  |
|                    | cc_data[11:0]  | cfa_data[11:0]                                  |
| 1                  | cc_data[35:24] | R=clipped(sum(cfa_data_x * gain_Rx) + offset_R) |
|                    | cc_data[23:12] | G=clipped(sum(cfa_data_x * gain_gx) + offset_g) |
|                    | cc_data[11:0]  | B=clipped(sum(cfa_data_x * gain_Bx) + offset_B) |

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} \text{RRGAIN} & \text{RGGAIN} & \text{RBGAIN} \\ \text{GRGAIN} & \text{GGGAIN} & \text{GBGAIN} \\ \text{BRGAIN} & \text{BGGAIN} & \text{BBGAIN} \end{bmatrix} \times \begin{bmatrix} \text{cfa\_data}[35:24] \\ \text{cfa\_data}[23:12] \\ \text{cfa\_data}[11:0] \end{bmatrix} + \begin{bmatrix} \text{ROFST} \\ \text{GOFST} \\ \text{BOFST} \end{bmatrix}$$

### 51.5.9 Gamma Curve (GAM) Module

The GAM module samples the cc\_data[35:0] bus when cc\_valid is asserted, and generates gam\_data[29:0] 30-bit width data along with the validity signal gam\_valid. Imaging devices have non-linear characteristics, but the transfer function is approximated by a power function. The intensity of each of the linear RGB components is transformed to a non-linear signal through the use of the gamma correction submodule. The power function is linearly interpolated using 64 breakpoints. This also performs a 12-bit to 10-bit compression. The polynomial for the linear interpolation between breakpoints is  $i$  and  $i + 1$ . Consequently, for each breakpoint, two values are required: constant and slope. The table values are programmable through the user interface when the gamma correction module is disabled (ISC\_GAM\_CTRL.ENABLE is cleared). ISC\_GAM\_RENTRY is used for Red gamma correction. ISC\_GAM\_GENTRY is used for Green gamma correction. ISC\_GAM\_BENTRY is used for Blue gamma correction. Each table entry is composed of a 10-bit (signed) slope and a 10-bit constant.

**Figure 51-23. GAM Block Diagram**

| ISC_GAM_CTRL.ENABLE | ISC_GAM_CTRL.XLUT | GAM_DATA Slice  | Value                               |
|---------------------|-------------------|-----------------|-------------------------------------|
| 0                   | 0                 | gam_data[29:0]  | cc_data[29:0]                       |
| 1                   | 0                 | gam_data[29:20] | cc_data[35:26]                      |
|                     |                   | gam_data[19:10] | cc_data[23:14]                      |
|                     |                   | gam_data[9:0]   | cc_data[11:2]                       |
| 1                   | 1                 | gam_data[29:20] | R=piecewise_itpol(cc_data_r[35:24]) |
|                     |                   | gam_data[19:10] | G=piecewise_itpol(cc_data_r[23:12]) |
|                     |                   | gam_data[9:0]   | B=piecewise_itpol(cc_data_r[11:0])  |

**Figure 51-24. Piecewise Linear Interpolation Block Diagram**

The interpolation consists of three tables that store the function values GAM\_XENTRY[0:63] where X stands for R, G and B. The input of the table has six bits. It outputs a slope and a constant. The slope is later multiplied by the data lsb (6-bit) and added to a constant. The final value is the gamma-corrected value of the input. This module performs a 12-to-10 compression.

**51.5.10 Color Space Conversion (CSC) Module**

By converting an image from RGB to YCbCr color space, it is possible to separate Y, Cb and Cr information. The CSC samples the gam\_data[29:0] 30-bit data bus, extracts YCbCr information from the sampled data, and then generates the color-converted data csc\_data[29:0] and the validity signal csc\_valid.

**Figure 51-25. CSC Block Diagram**

| ISC_CSC_CTRL.ENABLE | CSC_DATA Slice  | Value   |
|---------------------|-----------------|---|
| 0                   | csc_data[29:0]  | gam_data[29:0]  |
| 1                   | csc_data[29:20] | $Y = \text{clipped}(\text{sum}(\text{gam\_data\_x} * \text{gain\_Yx}) + \text{offset\_y} \ll 2)$    |
|                     | csc_data[19:10] | $Cb = \text{clipped}(\text{sum}(\text{gam\_data\_x} * \text{gain\_Cbx}) + \text{offset\_cb} \ll 2)$ |
|                     | csc_data[9:0]   | $Cr = \text{clipped}(\text{sum}(\text{gam\_data\_x} * \text{gain\_Crx}) + \text{offset\_cr} \ll 2)$ |

$$\begin{bmatrix} Y \\ CB \\ CR \end{bmatrix} = \begin{bmatrix} YR & YG & YB \\ CBR & CBG & CBB \\ CRR & CRG & CRB \end{bmatrix} \times \begin{bmatrix} \text{gam\_data}[29:20] \\ \text{gam\_data}[19:10] \\ \text{gam\_data}[9:0] \end{bmatrix} + \begin{bmatrix} \text{YOFST} \\ \text{CBOFST} \\ \text{CROFST} \end{bmatrix}$$

**51.5.11 Contrast and Brightness**

Luminance is adjusted through the use of Brightness Offset and Contrast Gain. Chrominance is left unchanged. The CBC samples the csc\_data[29:0] 30-bit bus when csc\_valid is asserted and generates cbc\_data[29:0] with the validity signal cbc\_valid.

**Figure 51-26. CBC Block Diagram**

| ISC_CBC_CTRL.ENABLE | ISC_CBC_CFG.CCIR | CBC_DATA Slice  | Value   |
|---------------------|------------------|-----------------|---|
| 0                   | 0                | cbc_data[29:0]  | csc_data[29:0]  |
| 1                   | 0                | cbc_data[29:20] | $Y = \text{clipped}((\text{csc\_data}[29:20] + \text{offset}) * \text{gain})$ |
|                     |                  | cbc_data[19:10] | $C_b = \text{csc\_data}[19:10]$   |
|                     |                  | cbc_data[9:0]   | $C_r = \text{csc\_data}[9:0]$   |

### 51.5.12 4:4:4 To 4:2:2 Chrominance Horizontal Subampler (SUB422) Module

The color space conversion output stream is a full-bandwidth YCbCr 4:4:4 signal. The chrominance subsampling divides the horizontal chrominance sampling rate by two. A horizontal low pass filter is applied to avoid aliasing effect. The SUB422 module samples 444 full scale YCbCr cbc\_data[29:0] 30-bit data, performs horizontal subsampling and generates the sub422\_data[39:0] 40-bit data bus with its validity signal sub422\_valid.

**Figure 51-27. SUB422 Block Diagram**

| ISC_SUB422_CTRL.ENABLE | ISC_SUB422_CFG.CCIR | SUB422_DATA Slice  | Value   |
|------------------------|---------------------|--------------------|---|
| 0                      | 0                   | sub422_data[29:0]  | cbc_data[29:0]                                      |
| 1                      | 0                   | sub422_data[39:30] | $Y_1 = \text{cbc\_data}[29:20]$                     |
|                        |                     | sub422_data[29:20] | $Y_0 = \text{cbc\_data}[29:20]$                     |
|                        |                     | sub422_data[19:10] | $C_b = \text{filter\_hor}(\text{cbc\_data}[19:10])$ |
|                        |                     | sub422_data[9:0]   | $C_r = \text{filter\_hor}(\text{cbc\_data}[9:0])$   |

.....continued

| ISC_SUB422_CTRL.ENABLE | ISC_SUB422_CFG.CCIR | SUB422_DATA Slice  | Value              |
|------------------------|---------------------|--------------------|--------------------|
| 1                      | 1                   | sub422_data[39:30] | Y1 = cbc_data[9:0] |
|                        |                     | sub422_data[29:20] | Y0 = cbc_data[9:0] |
|                        |                     | sub422_data[19:10] | Cb = cbc_data[9:0] |
|                        |                     | sub422_data[9:0]   | Cr = cbc_data[9:0] |

The filter\_hor function included in the sub422 module is the chrominance horizontal filter.

| sub422 data slice  | YCbCr mapping    |
|--------------------|------------------|
| sub422_data[39:30] | Y1 (sample n)    |
| sub422_data[29:20] | Y0 (sample n-1)  |
| sub422_data[19:10] | Cb (from filter) |
| sub422_data[9:0]   | Cr (from filter) |

The filter chrominance position is selectable through the use of ISC\_SUB422\_CFG.FILTER.

**Figure 51-28. Cosited Filter Configuration**

**Figure 51-29. Centered Filter Configuration**

The SUB422 module performs luminance and chrominance packing. When the line length is odd, the missing luminance is a copy of the last but one luminance. It also means that the final dma stream written to memory is equal to the original horizontal size plus one when the line length is odd.

| SUB422_DATA Slice  | Line Length Even | Line Length Odd |
|--------------------|------------------|-----------------|
| sub422_data[39:30] | Y(n)             | Y(n-1)          |
| sub422_data[29:20] | Y(n-1)           | Y(n-1)          |
| sub422_data[19:10] | Cb (filtered)    | Cb (filtered)   |
| sub422_data[9:0]   | Cr (filtered)    | Cr (filtered)   |

### 51.5.13 4:2:2 To 4:2:0 Chrominance Vertical Subampler (SUB420) Module

The chrominance subsampling divides the vertical chrominance sampling rate by two. A vertical low pass filter is applied to avoid aliasing effect. Two different filters are used when the source frame is interlaced, and the filter configuration depends on the field value (the field is propagated in the video pipeline).

**Figure 51-30. SUB420 Block Diagram**

The SUB420 module samples the sub422\_data[39:0] 40-bit data when sub422\_valid is asserted, then it performs a vertical subsampling and generates a valid sub420\_data[39:0] 40-bit word and the corresponding sub420\_valid signal.

| ISC_CFA_CTRL.ENABLE | SUB420_DATA Slice  | Value                          |
|---------------------|--------------------|--------------------------------|
| 0                   | sub420_data[39:0]  | sub422_data[39:0]              |
| 1                   | sub420_data[39:30] | Y1 = sub422_data[39:30]        |
|                     | sub420_data[29:20] | Y0 = sub422_data[29:20]        |
|                     | sub420_data[19:10] | Cb = filter_ver(sub422[19:10]) |
|                     | sub420_data[9:0]   | Cr = filter_ver(sub422[9:0])   |

The vertical filter is a two-tap filter; for progressive content the coefficient  $i$  {1, 1}. When an interlaced field is downsampled, the coefficients are different between the top and the bottom fields.

**Figure 51-31. Vertical Chrominance Filter for Progressive Content (Cosited Chrominance Example)**

**Figure 51-32. Field-dependent Chrominance Filter for Interlaced Content (Cosited Chrominance Example)**

**Table 51-1. Filter Configuration**

| ISC_SUB420_CTRL.FILTER | Field       | Filter Configuration |
|------------------------|-------------|----------------------|
| 0                      | progressive | {1, 1}               |
| 1                      | 0 (TOP)     | {3, 1}               |
|                        | 1 (BOTTOM)  | {1, 3}               |

**Table 51-2. Output Line Length Configuration**

| SUB420 Input Number of Rows | SUB420 Luminance Rows | SUB420 Chrominance Rows |
|-----------------------------|-----------------------|-------------------------|
| M rows, M odd               | M rows                | (M+1)/2 rows            |
| M rows, M even              | M rows                | M/2 rows                |

### 51.5.14 Rounding, Limiting and Packing (RLP) Module

This module is used to round, limit and pack in the incoming pixel stream before the DMA master module. The RLP samples the sub420\_data[39:0] 40-bit data bus and generates rlp\_data[31:0] 32-bit data words with the associated validity signal rlp\_valid.

**Figure 51-33. RLP Block Diagram**

| ISC_RLP_CFG | RLP_DATA Slice  | Value             |
|-------------|-----------------|-------------------|
| DAT8        | rlp_data[31:8]  | 0                 |

### 51.5.15 DMA Interface

The descriptor-based DMA interface supports multiple buffers. A DMA stride value shows the offset between two consecutive lines (in bytes). If the stride is set to zero, the frame buffer is contiguous. When ISC\_DCTRL.WB is set (Write Back), the DMA interface performs a single write operation to the ISC\_DCTRL register, and sets ISC\_DCTRL[7] to one and ISC\_DCTRL[6] to the value of the frame field when interlaced content is being used. That means that interlaced fields are tagged with their relevant field values. The Write Back operation is always performed when the whole frame has been transferred to memory.

**Figure 51-34. DMA Engine Block Diagram**

| ISC_DCFG.IMODE | DMA Engine Input Data |
|----------------|-----------------------|
| PACKED8        | rlp_data[7:0]         |
| PACKED16       | rlp_data[15:0]        |
| PACKED32       | rlp_data[31:0]        |
| YC422SP        | rlp_data[31:0]        |
| YC422P         | rlp_data[31:0]        |
| YC420SP        | rlp_data[31:0]        |
| YC420P         | rlp_data[31:0]        |

When a bus error is detected, an interrupt flag is set. If the error occurs on a write operation, ISC\_INTSR.WERR is asserted. If the error occurs on a read operation, ISC\_INTSR.RERR is asserted. ISC\_INTSR.WERRID gives details on the first error channel identifier.

### 51.5.15.1 Descriptor Memory Address Mapping

### 51.5.16 Histogram Module

For each possible pixel value, the histogram counts the number of times the value was encountered in the current image. RGGG Bayer, RAW data or luminance histogram are available. There are 512 entries

in the histogram entries, and each histogram bin can count up to  $2^{20}$  data. As the table entries are limited, each bin is actually a range, i.e., least significant bits are ignored. A write to `ISC_CTRLLEN.HISREQ` initiates a new histogram. The counting operation ends when `ISC_INTSR.HISDONE` is set. At that time, a software or hardware dma transfer copies the table from the interface to the internal or external memory. To clear the table content (for a new operation), use `ISC_CTRLLEN.HISCLR`. An automatic clear (reset after read) is available when `ISC_HIS_CFG.RAR` is set. In that case, as soon as the data is read from the table, the table entry is cleared.

### 51.6.1 ISC Control Enable Register 0

**Name:** ISC\_CTRLLEN  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding command.

|        |    |    |    |    |        |        |        |         |
|--------|----|----|----|----|--------|--------|--------|---------|
| Bit    | 31 | 30 | 29 | 28 | 27     | 26     | 25     | 24      |
|        |    |    |    |    |        |        |        |         |
| Access |    |    |    |    |        |        |        |         |
| Reset  |    |    |    |    |        |        |        |         |
|        |    |    |    |    |        |        |        |         |
| Bit    | 23 | 22 | 21 | 20 | 19     | 18     | 17     | 16      |

| Reset  |    |    |    |    | –      | –      | –      | –       |

**Bit 9 – FUPPRO** Force Update Color Profile

**Bit 3 – HISCLR** Histogram Clear

**Bit 2 – HISREQ** Histogram Request

**Bit 1 – UPPRO** Update Profile

**Bit 0 – CAPTURE** Capture Input Stream Command

### 51.6.2 ISC Control Disable Register 0

**Name:** ISC\_CTRLDIS  
**Offset:** 0x04  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Performs the corresponding command.

|        |     |    |    |    |    |    |    |    |         |
|--------|-----|----|----|----|----|----|----|----|---------|
|        | Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24      |
|        |     |    |    |    |    |    |    |    |         |
| Access |     |    |    |    |    |    |    |    |         |
| Reset  |     |    |    |    |    |    |    |    |         |
|        |     |    |    |    |    |    |    |    |         |
|        | Bit | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16      |
|        |     |    |    |    |    |    |    |    |         |
| Access |     |    |    |    |    |    |    |    |         |

| Access |     |    |    |       |    |        |       |         |   |
| Reset  |     |    |    |       |    |        |       |         |   |
|        |     |    |    |       |    |        |       |         |   |
| Bit    | 7   | 6  | 5  | 4     | 3  | 2      | 1     | 0       |   |
|        |     |    |    | FIELD |    | HISREQ | UPPRO | CAPTURE |   |
| Access |     |    |    | R     |    |        | R     | R       | R |
| Reset  |     |    |    | 0     |    |        | 0     | 0       | 0 |

#### Bit 31 – SIP Synchronization In Progress

| Value | Description                                       |
|-------|---|
| 0     | The double domain synchronization is terminated.  |
| 1     | The double domain synchronization is in progress. |

#### Bit 4 – FIELD Field Status (only relevant when the video stream is interlaced)

| Value | Description                                  |
|-------|--|
| 0     | The current field/segment is a top field     |
| 1     | The current field/segment is a bottom field. |

#### Bit 2 – HISREQ Histogram Request Pending

| Value | Description  |
|-------|--|
| 0     | There is no histogram pending request.                 |
| 1     | Indicates that the histogram request is still pending. |

#### Bit 1 – UPPRO Profile Update Pending

| Value | Description   |
|-------|---|
| 0     | There is no profile update pending request.                 |
| 1     | Indicates that the profile update request is still pending. |

**Bit 0 – CAPTURE** Capture pending

| Value | Description               |
|-------|---------------------------|
| 0     | Capture mode is disabled. |
| 1     | Capture is pending.       |

### 51.6.4 ISC Parallel Front End Configuration 0 Register

**Name:** ISC\_PFE\_CFG0  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |           |       |       |           |          |         |       |
|--------|--------------|-----------|-------|-------|-----------|----------|---------|-------|
| Bit    | 31           | 30        | 29    | 28    | 27        | 26       | 25      | 24    |

|        |              |           |       |       |           |          |         |       |
| Bit    | 7            | 6         | 5     | 4     | 3         | 2        | 1       | 0     |
|        | CONT         | MODE[2:0] |       |       | FPOL      | PPOL     | VPOL    | HPOL  |
| Access | R/W          | R/W       | R/W   | R/W   | R/W       | R/W      | R/W     | R/W   |
| Reset  | 0            | 0         | 0     | 0     | 0         | 0        | 0       | 0     |

#### Bit 31 – REP Up Multiply with Replication

| Value | Description                      |
|-------|----------------------------------|
| 0     | Unused bits are stuck at 0.      |
| 1     | Unused bits are copied from MSB. |

#### Bits 30:28 – BPS[2:0] Bits Per Sample

| Value | Name   | Description  |
|-------|--------|--------------|
| 0     | TWELVE | 12-bit input |
| 1     | ELEVEN | 11-bit input |
| 2     | TEN    | 10-bit input |
| 3     | NINE   | 9-bit input  |
| 4     | EIGHT  | 8-bit input  |

#### Bit 27 – CCIR\_REP CCIR Replication

| Value | Description                      |
|-------|----------------------------------|
| 0     | Unused bits are stuck at 0.      |
| 1     | Unused bits are copied from MSB. |

#### Bits 23:16 – SKIPCNT[7:0] Frame Skipping Counter

**Bit 13 – ROWEN** Row Cropping Enable

| Value | Description               |
|-------|---------------------------|
| 0     | Row Cropping is disabled. |
| 1     | Row Cropping is enabled.  |

**Bit 12 – COLEN** Column Cropping Enable

| Value | Description                  |
|-------|------------------------------|
| 0     | Column Cropping is disabled. |
| 1     | Column Cropping is enabled.  |

**Bit 11 – CCIR10\_8N** CCIR 10 bits or 8 bits

| Value | Description  |
|-------|--------------|
| 0     | 8-bit mode.  |
| 1     | 10-bit mode. |

**Bit 10 – CCIR\_CRC** CCIR656 CRC Decoder

| Value | Description                |
|-------|----------------------------|
| 0     | Embedded CRC is discarded. |
| 1     | Embedded CRC is decoded.   |

**Bit 9 – CCIR656** CCIR656 input mode

| Value | Description   |
|-------|---|
| 0     | HSYNC and VSYNC signals are used to synchronize the input stream. |
| 1     | Embedded synchronization is used.                                 |

**Bit 8 – GATED** Gated input clock

| Value | Description                               |
|-------|---|
| 0     | The external pixel clock is free running. |
| 1     | The external pixel clock is gated.        |

**Bit 7 – CONT** Continuous Acquisition

| Value | Description       |
|-------|-------------------|
| 0     | Single Shot mode. |
| 1     | Video mode.       |

**Bits 6:4 – MODE[2:0]** Parallel Front End Mode

| Value | Name         | Description   |
|-------|--------------|---|
| 0     | PROGRESSIVE  | Video source is progressive.  |
| 1     | DF_TOP       | Video source is interlaced, two fields are captured starting with top field.    |
| 2     | DF_BOTTOM    | Video source is interlaced, two fields are captured starting with bottom field. |
| 3     | DF_IMMEDIATE | Video source is interlaced, two fields are captured immediately.                |
| 4     | SF_TOP       | Video source is interlaced, one field is captured starting with the top field.  |

# SAMA5D2 Series

## Image Sensor Controller (ISC)

| Value | Name         | Description   |
|-------|--------------|---|
| 5     | SF_BOTTOM    | Video source is interlaced, one field is captured starting with the bottom field. |
| 6     | SF_IMMEDIATE | Video source is interlaced, one field is captured starting immediately.           |

### Bit 3 – FPOL Field Polarity

| Value | Description  |
|-------|--|
| 0     | Top field is sampled when F value is 0; Bottom field is sampled when F value is 1. |
| 1     | Top field is sampled when F value is 1; Bottom field is sampled when F value is 0. |

### Bit 2 – PPOL Pixel Clock Polarity

| Value | Description   |
|-------|---|
| 0     | The pixel stream is sampled on the rising edge of the pixel clock.  |
| 1     | The pixel stream is sampled on the falling edge of the pixel clock. |

### Bit 1 – VPOL Vertical Synchronization Polarity

| Value | Description   |
|-------|---|
| 0     | VSYNC signal is active high, i.e. valid pixels are sampled when VSYNC is asserted.  |
| 1     | VSYNC signal is active low, i.e. valid pixels are sampled when VSYNC is deasserted. |

### Bit 0 – HPOL Horizontal Synchronization Polarity

| Value | Description   |
|-------|---|
| 0     | HSYNC signal is active high, i.e. valid pixels are sampled when HSYNC is asserted.  |
| 1     | HSYNC signal is active low, i.e. valid pixels are sampled when HSYNC is deasserted. |

### 51.6.5 ISC Parallel Front End Configuration 1 Register

**Bits 31:16 – ROWMAX[15:0]** Row Maximum Limit  
 Vertical ending position of the cropping area.

**Bits 15:0 – ROWMIN[15:0]** Row Minimum Limit  
 Vertical starting position of the cropping area.

### 51.6.7 ISC Clock Enable Register

**Name:** ISC\_CLKEN  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

#### Bit 1 – MCEN Master Clock Enable

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Enables the master clock. |

#### Bit 0 – ICEN ISP Clock Enable

| Value | Description            |
|-------|------------------------|
| 0     | No effect.             |
| 1     | Enables the ISP clock. |

### 51.6.8 ISC Clock Disable Register

**Name:** ISC\_CLKDIS  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Performs the corresponding command.

|        |    |    |    |    |    |    |         |         |
|--------|----|----|----|----|----|----|---------|---------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25      | 24      |
|        |    |    |    |    |    |    |         |         |
| Access |    |    |    |    |    |    |         |         |

|        |     |    |    |    |    |    |      |      |
| Access |     |    |    |    |    |    |      |      |
| Reset  |     |    |    |    |    |    |      |      |
|        |     |    |    |    |    |    |      |      |
| Bit    | 15  | 14 | 13 | 12 | 11 | 10 | 9    | 8    |
|        |     |    |    |    |    |    |      |      |
| Access |     |    |    |    |    |    |      |      |
| Reset  |     |    |    |    |    |    |      |      |
|        |     |    |    |    |    |    |      |      |
| Bit    | 7   | 6  | 5  | 4  | 3  | 2  | 1    | 0    |
|        |     |    |    |    |    |    | MCSR | ICSR |
| Access |     |    |    |    |    |    | R    | R    |
| Reset  |     |    |    |    |    |    | 0    | 0    |

#### Bit 31 – SIP Synchronization In Progress

| Value | Description   |
|-------|---|
| 0     | The double domain synchronization operation is over.        |
| 1     | The double domain synchronization operation is in progress. |

#### Bit 1 – MCSR Master Clock Status Register

| Value | Description                   |
|-------|-------------------------------|
| 0     | The master clock is disabled. |
| 1     | The master clock is enabled.  |

#### Bit 0 – ICSR ISP Clock Status Register

| Value | Description                |
|-------|----------------------------|
| 0     | The ISP clock is disabled. |
| 1     | The ISP clock is enabled.  |

### 51.6.10 ISC Clock Configuration Register

**Name:** ISC\_CLKCFG  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |            |     |     |     |     |     |            |       |  |

| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0          | 0     |  |

#### Bits 25:24 – MCSEL[1:0] Master Clock Reference Clock Selection

| Value | Description         |
|-------|---------------------|
| 0     | HCLOCK is selected. |
| 1     | ISCCLK is selected. |
| 2     | GCK is selected.    |

#### Bits 23:16 – MCDIV[7:0] Master Clock Divider

$$f_{mc} = \frac{f_{mcref}}{MCDIV + 1}$$

#### Bit 8 – ICSEL ISP Clock Selection

| Value | Description         |
|-------|---------------------|
| 0     | HCLOCK is selected. |
| 1     | ISCCLK is selected. |

#### Bits 7:0 – ICDIV[7:0] ISP Clock Divider

$$f_{cc} = \frac{f_{ccref}}{ICDIV + 1}$$

### 51.6.11 ISC Interrupt Enable Register

**Name:** ISC\_INTEN  
**Offset:** 0x28  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the interrupt.

|        |     |    |    |        |         |      |      |       |       |
|--------|-----|----|----|--------|---------|------|------|-------|-------|

| Access |     |    |    | W      | W       |      |      | W     | W     |
| Reset  |     |    |    | –      | –       |      |      | –     | –     |

**Bit 28 – CCIRERR** CCIR Decoder Error Interrupt Enable

**Bit 27 – HDTO** Horizontal Synchronization Timeout Interrupt Enable

**Bit 26 – VDTO** Vertical Synchronization Timeout Interrupt Enable

**Bit 25 – DAOV** Data Overflow Interrupt Enable

**Bit 24 – VFPOV** Vertical Front Porch Overflow Interrupt Enable

**Bit 20 – RERR** Read Channel Error Interrupt Enable

**Bit 16 – WERR** Write Channel Error Interrupt Enable

**Bit 13 – HISCLR** Histogram Clear Interrupt Enable

**Bit 12 – HISDONE** Histogram Completed Interrupt Enable

**Bit 9 – LDONE** DMA List Done Interrupt Enable

**Bit 8 – DDONE** DMA Done Interrupt Enable

**Bit 5 – DIS** Disable Completed Interrupt Enable

**Bit 4 – SWRST** Software Reset Completed Interrupt Enable

**Bit 1 – HD** Horizontal Synchronization Detection Interrupt Enable

**Bit 0 – VD** Vertical Synchronization Detection Interrupt Enable

### 51.6.12 ISC Interrupt Disable Register

**Name:** ISC\_INTDIS  
**Offset:** 0x2C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the interrupt.

|        |     |    |    |        |         |      |      |       |       |
|--------|-----|----|----|--------|---------|------|------|-------|-------|

**Bit 28 – CCIRERR** CCIR Decoder Error Interrupt Disable

**Bit 27 – HDTO** Horizontal Synchronization Timeout Interrupt Disable

**Bit 26 – VDTO** Vertical Synchronization Timeout Interrupt Disable

**Bit 25 – DAOV** Data Overflow Interrupt Disable

**Bit 24 – VFPOV** Vertical Front Porch Overflow Interrupt Disable

**Bit 20 – RERR** Read Channel Error Interrupt Disable

**Bit 16 – WERR** Write Channel Error Interrupt Disable

**Bit 13 – HISCLR** Histogram Clear Interrupt Disable

**Bit 12 – HISDONE** Histogram Completed Interrupt Disable

**Bit 9 – LDONE** DMA List Done Interrupt Disable

**Bit 8 – DDONE** DMA Done Interrupt Disable

**Bit 5 – DIS** Disable Completed Interrupt Disable

**Bit 4 – SWRST** Software Reset Completed Interrupt Disable

**Bit 1 – HD** Horizontal Synchronization Detection Interrupt Disable

**Bit 0 – VD** Vertical Synchronization Detection Interrupt Disable

### 51.6.13 ISC Interrupt Mask Register

**Name:** ISC\_INTMASK  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The interrupt is disabled.

1: The interrupt is enabled.

|        |     |    |    |        |         |      |      |       |       |
|--------|-----|----|----|--------|---------|------|------|-------|-------|
|        | Bit | 31 | 30 | 29     | 28      | 27   | 26   | 25    | 24    |

| Access |    |    | R      | R       |      |             | R     | R     |
| Reset  |    |    | 0      | 0       |      |             | 0     | 0     |
|        |    |    |        |         |      |             |       |       |
| Bit    | 7  | 6  | 5      | 4       | 3    | 2           | 1     | 0     |
|        |    |    | DIS    | SWRST   |      |             | HD    | VD    |
| Access |    |    | R      | R       |      |             | R     | R     |
| Reset  |    |    | 0      | 0       |      |             | 0     | 0     |

**Bit 28 – CCIRERR** CCIR Decoder Error Interrupt (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No CCIR CRC error detected since the last read of the Interrupt Status register. |
| 1     | A CCIR CRC error has been detected.  |

**Bit 27 – HDTO** Horizontal Synchronization Timeout Interrupt (cleared on read)

| Value | Description                                |
|-------|--|
| 0     | A horizontal synchronization is detected.  |
| 1     | No horizontal synchronization is detected. |

**Bit 26 – VDTO** Vertical Synchronization Timeout Interrupt (cleared on read)

| Value | Description                              |
|-------|--|
| 0     | A vertical synchronization is detected.  |
| 1     | No vertical synchronization is detected. |

**Bit 25 – DAOV** Data Overflow Interrupt (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No data overflow error occurred since the last reset of the Interrupt Status register. |
| 1     | A data overflow occurred.  |

**Bit 24 – VFPOV** Vertical Front Porch Overflow Interrupt (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No vertical front porch error occurred since the last read of the Interrupt Status register. |
| 1     | The vertical synchronization has been detected but the DMA channel is still busy.            |

**Bit 20 – RERR** Read Channel Error Interrupt (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No read channel error since the last read of the Interrupt Status register. |
| 1     | A read channel error occurred when the ISC read the descriptor.             |

**Bits 18:17 – WERRID[1:0]** Write Channel Error Identifier (cleared on read)

| Value | Name | Description                                 |
|-------|------|---|
| 0     | CH0  | An error occurred for Channel 0 (RAW/RGB/Y) |
| 1     | CH1  | An error occurred for Channel 1 (CbCr/Cb)   |
| 2     | CH2  | An error occurred for Channel 2 (Cr)        |
| 3     | WB   | Write back channel error                    |

**Bit 16 – WERR** Write Channel Error Interrupt (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No write channel error since the last read of the Interrupt Status register. |
| 1     | A write channel error occurred.  |

**Bit 13 – HISCLR** Histogram Clear Interrupt (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No Histogram Clear Interrupt has been raised since the last read of the Interrupt Status register. |
| 1     | The Histogram Clear Interrupt has occurred.  |

**Bit 12 – HISDONE** Histogram Completed Interrupt (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No Histogram Completed Interrupt has been raised since the last read of the Interrupt Status register. |
| 1     | The Histogram Completed Interrupt has occurred.  |

**Bit 9 – LDONE** DMA List Done Interrupt (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No DMA List Done Interrupt has occurred since the last read of the Interrupt Status register. |
| 1     | The DMA List Done Interrupt has occurred.   |

**Bit 8 – DDONE** DMA Done Interrupt (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No DMA Transfer Done Interrupt has occurred since the last read of the Interrupt Status register. |
| 1     | The DMA Transfer Done Interrupt has occurred.   |

**Bit 5 – DIS** Disable Completed Interrupt (cleared on read)

| Value | Description  |
|-------|--|
| 0     | The disable has not occurred since the last read of the Interrupt Status register. |
| 1     | The disable has completed.   |

**Bit 4 – SWRST** Software Reset Completed Interrupt (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No software reset completion since the last read of the Interrupt Status register. |
| 1     | The software reset has completed.  |

**Bit 1 – HD** Horizontal Synchronization Detected Interrupt (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No horizontal synchronization detection since the last read of the Interrupt Status register. |
| 1     | A horizontal synchronization has been detected.   |

**Bit 0 – VD** Vertical Synchronization Detected Interrupt (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No vertical synchronization detection since the last read of the Interrupt Status register. |
| 1     | A vertical synchronization has been detected.   |

### 51.6.15 ISC White Balance Control Register

**Name:** ISC\_WB\_CTRL  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 0 – ENABLE White Balance Enable

| Value | Description                    |
|-------|--------------------------------|
| 0     | The white balance is disabled. |
| 1     | The white balance is enabled.  |

### 51.6.16 ISC White Balance Configuration Register

**Name:** ISC\_WB\_CFG  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 1:0 – BAYCFG[1:0] White Balance Bayer Configuration (Pixel Color Pattern)

| Value | Name | Description                                       |
|-------|------|---|
| 0     | GRGR | Starting Row configuration is G R G R (Red Row).  |
| 1     | RGRG | Starting Row configuration is R G R G (Red Row).  |
| 2     | GBGB | Starting Row configuration is G B G B (Blue Row). |
| 3     | BGBG | Starting Row configuration is B G B G (Blue Row). |

### 51.6.17 ISC White Balance Offset for R, GR Register

**Name:** ISC\_WB\_O\_RGR  
**Offset:** 0x60  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |             |     |     |              |     |     |     |     |
|--------|-------------|-----|-----|--------------|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28           | 27  | 26  | 25  | 24  |
|        |             |     |     | GROFST[12:8] |     |     |     |     |
| Access |             |     |     | R/W          | R/W | R/W | R/W | R/W |
| Reset  |             |     |     | 0            | 0   | 0   | 0   | 0   |
|        |             |     |     |              |     |     |     |     |
| Bit    | 23          | 22  | 21  | 20           | 19  | 18  | 17  | 16  |
|        | GROFST[7:0] |     |     |              |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W          | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0            | 0   | 0   | 0   | 0   |
|        |             |     |     |              |     |     |     |     |
| Bit    | 15          | 14  | 13  | 12           | 11  | 10  | 9   | 8   |
|        |             |     |     | ROFST[12:8]  |     |     |     |     |
| Access |             |     |     | R/W          | R/W | R/W | R/W | R/W |
| Reset  |             |     |     | 0            | 0   | 0   | 0   | 0   |
|        |             |     |     |              |     |     |     |     |
| Bit    | 7           | 6   | 5   | 4            | 3   | 2   | 1   | 0   |
|        | ROFST[7:0]  |     |     |              |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W          | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0            | 0   | 0   | 0   | 0   |

**Bits 28:16 – GROFST[12:0]** Offset Green Component for Red Row (signed 13 bits 1:12:0)

**Bits 12:0 – ROFST[12:0]** Offset Red Component (signed 13 bits 1:12:0)

### 51.6.18 ISC White Balance Offset for B and GB Register

**Name:** ISC\_WB\_O\_BGB  
**Offset:** 0x64  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |             |     |     |              |     |     |     |     |
|--------|-------------|-----|-----|--------------|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28           | 27  | 26  | 25  | 24  |
|        |             |     |     | GBOFST[12:8] |     |     |     |     |
| Access |             |     |     | R/W          | R/W | R/W | R/W | R/W |
| Reset  |             |     |     | 0            | 0   | 0   | 0   | 0   |

**Bits 12:0 – BGAIN[12:0]** Blue Component Gain (unsigned 13 bits, 0:4:9)

### 51.6.21 ISC Color Filter Array Control Register

**Name:** ISC\_CFA\_CTRL  
**Offset:** 0x70  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – ENABLE** Color Filter Array Interpolation Enable

| Value | Description                                   |
|-------|---|
| 0     | Color Filter Array Interpolation is disabled. |
| 1     | Color Filter Array Interpolation is enabled.  |

### 51.6.22 ISC Color Filter Array Configuration Register

**Name:** ISC\_CFA\_CFG  
**Offset:** 0x74  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 4 – EITPOL Edge Interpolation

| Value | Description                      |
|-------|----------------------------------|
| 0     | Edges are not interpolated.      |
| 1     | Edge interpolation is performed. |

#### Bits 1:0 – BAYCFG[1:0] Color Filter Array Pattern

| Value | Name | Description                                       |
|-------|------|---|
| 0     | GRGR | Starting row configuration is G R G R (red row).  |
| 1     | RGRG | Starting row configuration is R G R G (red row).  |
| 2     | GBGB | Starting row configuration is G B G B (blue row). |
| 3     | BGBG | Starting row configuration is B G B G (blue row). |

### 51.6.23 ISC Color Correction Control Register

**Name:** ISC\_CC\_CTRL  
**Offset:** 0x78  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – ENABLE** Color Correction Enable

| Value | Description                   |
|-------|-------------------------------|
| 0     | Color correction is disabled. |
| 1     | Color correction is enabled.  |

### 51.6.24 ISC Color Correction RR RG Register

**Name:** ISC\_CC\_RR\_RG  
**Offset:** 0x7C  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |     |     |     |     |     |     |     |

### 51.6.30 ISC Gamma Correction Control Register

**Name:** ISC\_GAM\_CTRL  
**Offset:** 0x94  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 4 – BIPART Bipartite Table Configuration

| Value | Description  |
|-------|--|
| 0     | Bipartite table is disabled. There are 64 points of interpolation from 0 to 4095.  |
| 1     | Bipartite table is enabled. There are 32 points of interpolation (spacing is 8) from 0 to 255, then there are 30 points of interpolation from 256 to 4095. |

#### Bit 3 – RENABLE Gamma Correction Enable for R Channel

| Value | Description  |
|-------|--|
| 0     | 12-bit to 10-bit compression is performed skipping two bits.                                 |
| 1     | Piecewise interpolation is used to perform 12-bit to 10-bit compression for the red channel. |

#### Bit 2 – GENABLE Gamma Correction Enable for G Channel

| Value | Description  |
|-------|--|
| 0     | 12-bit to 10-bit compression is performed skipping two bits.                                   |
| 1     | Piecewise interpolation is used to perform 12-bit to 10-bit compression for the green channel. |

#### Bit 1 – BENABLE Gamma Correction Enable for B Channel

# SAMA5D2 Series

## Image Sensor Controller (ISC)

---

---

| Value | Description   |
|-------|---|
| 0     | 12-bit to 10-bit compression is performed skipping two bits.                                  |
| 1     | Piecewise interpolation is used to perform 12-bit to 10-bit compression for the blue channel. |

**Bit 0 – ENABLE** Gamma Correction Enable

| Value | Description                   |
|-------|-------------------------------|
| 0     | Gamma correction is disabled. |
| 1     | Gamma correction is enabled.  |

### 51.6.31 ISC Gamma Correction Blue Entry Register x [x=0..63]

**Bits 11:0 – CRBGAIN[11:0]** Blue Gain for Red Chrominance (signed 12 bits 1:3:8)

### 51.6.41 ISC Contrast And Brightness Control Register

**Name:** ISC\_CBC\_CTRL  
**Offset:** 0x3B4  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – ENABLE** Contrast and Brightness Control Enable

| Value | Description                                   |
|-------|---|
| 0     | Contrast and brightness control are disabled. |
| 1     | Contrast and brightness control are enabled.  |

### 51.6.42 ISC Contrast And Brightness Configuration Register

**Name:** ISC\_CBC\_CFG  
**Offset:** 0x3B8  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 2:1 – CCIRMODE[1:0] CCIR656 Byte Ordering

| Value | Name | Description                    |
|-------|------|--------------------------------|
| 0     | CBY  | Byte ordering Cb0, Y0, Cr0, Y1 |
| 1     | CRY  | Byte ordering Cr0, Y0, Cb0, Y1 |
| 2     | YCB  | Byte ordering Y0, Cb0, Y1, Cr0 |
| 3     | YCR  | Byte ordering Y0, Cr0, Y1, Cb0 |

#### Bit 0 – CCIR CCIR656 Stream Enable

| Value | Description     |
|-------|-----------------|
| 0     | Raw mode.       |
| 1     | CCIR656 stream. |

### 51.6.43 ISC Contrast And Brightness, Brightness Register

|        | CONTRAST[7:0] |     |     |     |                |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W            | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0              | 0   | 0   | 0   |

**Bits 11:0 – CONTRAST[11:0]** Contrast (unsigned 12 bits 0:4:8)  
 Adjusts the image contrast by multiplying with YCbCr data.

### 51.6.45 ISC Subsampling 4:4:4 to 4:2:2 Control Register

**Name:** ISC\_SUB422\_CTRL  
**Offset:** 0x3C4  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – ENABLE** 4:4:4 to 4:2:2 Chrominance Horizontal Subsampling Filter Enable

| Value | Description             |
|-------|-------------------------|
| 0     | Subsampler is disabled. |
| 1     | Subsampler is enabled.  |

### 51.6.46 ISC Subsampling 4:4:4 to 4:2:2 Configuration Register

**Name:** ISC\_SUB422\_CFG  
**Offset:** 0x3C8  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 5:4 – FILTER[1:0] Low Pass Filter Selection

| Value | Name    | Description           |
|-------|---------|-----------------------|
| 0     | FILT0CO | Cosited, {1}          |
| 1     | FILT1CE | Centered {1, 1}       |
| 2     | FILT2CO | Cosited {1,2,1}       |
| 3     | FILT3CE | Centered {1, 3, 3, 1} |

#### Bits 2:1 – CCIRMODE[1:0] CCIR656 Byte Ordering

| Value | Name | Description                    |
|-------|------|--------------------------------|
| 0     | CBY  | Byte ordering Cb0, Y0, Cr0, Y1 |
| 1     | CRY  | Byte ordering Cr0, Y0, Cb0, Y1 |
| 2     | YCB  | Byte ordering Y0, Cb0, Y1, Cr0 |
| 3     | YCR  | Byte ordering Y0, Cr0, Y1, Cb0 |

#### Bit 0 – CCIR CCIR656 Input Stream

| Value | Description |
|-------|-------------|
| 0     | Raw mode.   |
| 1     | CCIR mode.  |

### 51.6.47 ISC Subsampling 4:2:2 to 4:2:0 Control Register

**Name:** ISC\_SUB420\_CTRL  
**Offset:** 0x3CC  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 4 – FILTER** Interlaced or Progressive Chrominance Filter

| Value | Description  |
|-------|--|
| 0     | Progressive filter {0.5, 0.5}.   |
| 1     | Field-dependent filter, top field filter is {0.75, 0.25}, bottom field filter is {0.25, 0.75}. |

**Bit 0 – ENABLE** 4:2:2 to 4:2:0 Vertical Subsampling Filter Enable (Center Aligned)

| Value | Description          |
|-------|----------------------|
| 0     | Subsampler disabled. |
| 1     | Subsampler enabled.  |

### 51.6.48 ISC Rounding, Limiting and Packing Configuration Register

**Name:** ISC\_RLP\_CFG  
**Offset:** 0x3D0  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 15:8 – ALPHA[7:0]** Alpha Value for Alpha-enabled RGB Mode

**Bits 3:0 – MODE[3:0]** Rounding, Limiting and Packing Mode

| Value | Name         | Description                      |
|-------|--------------|----------------------------------|
| 0     | DAT8         | 8-bit data                       |
| 1     | DAT9         | 9-bit data                       |
| 2     | DAT10        | 10-bit data                      |
| 3     | DAT11        | 11-bit data                      |
| 4     | DAT12        | 12-bit data                      |
| 5     | DATY8        | 8-bit luminance only             |
| 6     | DATY10       | 10-bit luminance only            |
| 7     | ARGB444      | 12-bit RGB+4-bit Alpha (MSB)     |
| 8     | ARGB555      | 15-bit RGB+1-bit Alpha (MSB)     |
| 9     | RGB565       | 16-bit RGB                       |
| 10    | ARGB32       | 24-bits RGB mode+8-bit Alpha     |
| 11    | YYCC         | YCbCr mode (full range, [0–255]) |
| 12    | YYCC_LIMITED | YCbCr mode (limited range)       |

### 51.6.49 ISC Histogram Control Register

**Name:** ISC\_HIS\_CTRL  
**Offset:** 0x3D4  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – ENABLE** Histogram Sub Module Enable

| Value | Description         |
|-------|---------------------|
| 0     | Histogram disabled. |
| 1     | Histogram enabled.  |

### 51.6.50 ISC Histogram Configuration Register

**Name:** ISC\_HIS\_CFG  
**Offset:** 0x3D8  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |                         |    |             |     |                       |    |           |     |

|        |      |       |     |     |    |            |     |     |
| Bit    | 7    | 6     | 5   | 4   | 3  | 2          | 1   | 0   |
|        | DONE | FIELD | WB  | IE  |    | DVIEW[1:0] |     | DE  |
| Access | R/W  | R/W   | R/W | R/W |    | R/W        | R/W | R/W |
| Reset  | 0    | 0     | 0   | 0   |    | 0          | 0   | 0   |

**Bit 7 – DONE** Descriptor Processing Status

This bit appears only in the descriptor located in memory and can be used only if WB (Write Back) is set.

| Value | Description                   |
|-------|-------------------------------|
| 0     | Descriptor not processed yet. |
| 1     | Descriptor processed.         |

**Bit 6 – FIELD** Value of Captured Frame Field Signal

This bit is only relevant for interlaced content. It appears only in the descriptor located in memory and can be used only if WB (Write Back) is set.

| Value | Description       |
|-------|-------------------|
| 0     | Field value is 0. |
| 1     | Field value is 1. |

**Bit 5 – WB** Write Back Operation Enable

| Value | Description                        |
|-------|------------------------------------|
| 0     | Write Back operation is skipped.   |
| 1     | Write Back operation is performed. |

**Bit 4 – IE** Interrupt Enable

# SAMA5D2 Series

## Image Sensor Controller (ISC)

| Value | Description                      |
|-------|----------------------------------|
| 0     | DMA Done interrupt is generated. |
| 1     | DMA Done interrupt is not set.   |

### Bits 2:1 – DVIEW[1:0] Descriptor View

| Value | Name       | Description                                |
|-------|------------|--|
| 0     | PACKED     | Address {0} Stride {0} are updated         |
| 1     | SEMIPLANAR | Address {0,1} Stride {0,1} are updated     |
| 2     | PLANAR     | Address {0,1,2} Stride {0,1,2} are updated |

### Bit 0 – DE Descriptor Enable

| Value | Description          |
|-------|----------------------|
| 0     | Descriptor disabled. |
| 1     | Descriptor enabled.  |

### 51.6.53 ISC DMA Descriptor Address Register

## 52. Controller Area Network (MCAN)

### 52.1 Description

The Controller Area Network (MCAN) performs communication according to CAN Protocol Version 2.0 Part A,B and Bosch CAN FD Specification V1.0 (Non-ISO). Additional transceiver hardware is required for connection to the physical layer.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN core to the Message RAM, as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN core, as well as providing transmit status information.

Acceptance filtering is implemented by a combination of up to 128 filter elements, where each element can be configured as a range, as a bit mask, or as a dedicated ID filter.

MCAN implements the non-ISO CAN FD frame format and therefore does not pass the CAN FD Conformance Test according to ISO 16845-1:2016.

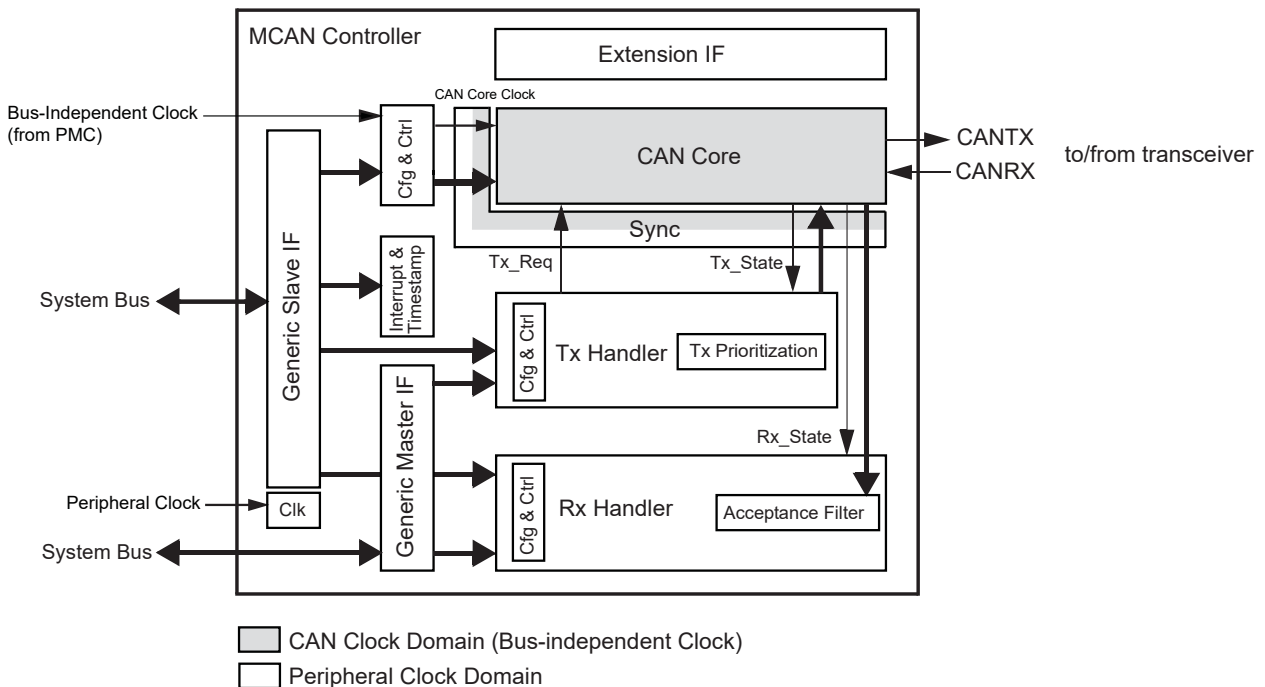

---

### 52.2 Embedded Characteristics

- Classic CAN (2.0 A,B) in Conformance with ISO11898-1:2015 and ISO16845-1:2016
- CAN FD Frame Format according to Bosch CAN FD Specification V1.0 (Non-ISO)
- CAN-FD with up to 64 Data Bytes Supported
- CAN Error Logging
- AUTOSAR Optimized
- SAE J1939 Optimized
- Improved Acceptance Filtering
- Two Configurable Receive FIFOs
- Separate Signalling on Reception of High Priority Messages
- Up to 64 Dedicated Receive Buffers
- Up to 32 Dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM Access for Processor
- Multiple MCANs May Share the Same Message RAM
- Programmable Loop-back Test Mode
- Maskable Module Interrupts
- Support for Asynchronous CAN and System Bus Clocks
- Power-down Support
- Debug on CAN Support

## 52.3 Block Diagram

Figure 52-1. MCAN Block Diagram

**Note:** Refer to section “Power Management Controller (PMC)” for details about the bus-independent clock (GCLK).

## 52.4 Product Dependencies

### 52.4.1 I/O Lines

The pins used to interface to the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the CAN pins to their peripheral functions.

### 52.4.2 Power Management

The MCAN can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the MCAN clock.

In order to achieve a stable function of the MCAN, the system bus clock must always be faster than or equal to the CAN clock.

It is recommended to use the CAN clock at frequencies of 20, 40 or 80 MHz. To achieve these frequencies, PMC GCLK must select the UPLLCK (480 MHz) as source clock and divide by 24, 12, or 6. GCLK allows the system bus and processor clock to be modified without affecting the bit rate communication.

### 52.4.3 Interrupt Sources

The two MCAN interrupt lines (MCAN\_INT0, MCAN\_INT1) are connected on internal sources of the Interrupt Controller.

Using the MCAN interrupts requires the Interrupt Controller to be programmed first.

Interrupt sources can be routed either to MCAN\_INT0 or to MCAN\_INT1. By default, all interrupt sources are routed to interrupt line MCAN\_INT0/1. By programming MCAN\_ILE.EINT0 and MCAN\_ILE.EINT1, the interrupt sources can be enabled or disabled separately.

### 52.4.4 Address Configuration

The LSBs [bits 15:2] for each section of the CAN Message RAM are configured in the respective buffer configuration registers as detailed in [Message RAM](#).

The MSBs [bits 31:16] of the CAN Message RAM for CAN0 and CAN1 are configured in 0x00200000.

## 52.5 Functional Description

### 52.5.1 Operating Modes

#### 52.5.1.1 Software Initialization

Software initialization is started by setting bit MCAN\_CCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus\_Off. While MCAN\_CCCR.INIT is set, message transfer from and to the CAN bus is stopped and the status of the CAN bus output CANTX is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MCAN\_CCCR.INIT does not change any configuration register. Resetting MCAN\_CCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits ( $\equiv$  Bus\_Idle) before it can take part in bus activities and start the message transfer.

Access to the MCAN configuration registers is only enabled when both bits MCAN\_CCCR.INIT and MCAN\_CCCR.CCE are set (protected write).

MCAN\_CCCR.CCE can only be configured when MCAN\_CCCR.INIT = '1'. MCAN\_CCCR.CCE is automatically cleared when MCAN\_CCCR.INIT = '0'.

The following registers are cleared when MCAN\_CCCR.CCE = '1':

- High Priority Message Status (MCAN\_HPMS)
- Receive FIFO 0 Status (MCAN\_RXF0S)
- Receive FIFO 1 Status (MCAN\_RXF1S)
- Transmit FIFO/Queue Status (MCAN\_TXFQS)
- Transmit Buffer Request Pending (MCAN\_TXBRP)
- Transmit Buffer Transmission Occurred (MCAN\_TXBTO)
- Transmit Buffer Cancellation Finished (MCAN\_TXBCF)
- Transmit Event FIFO Status (MCAN\_TXEFS)

The Timeout Counter value MCAN\_TOCV.TOC is loaded with the value configured by MCAN\_TOCC.TOP when MCAN\_CCCR.CCE = '1'.

In addition, the state machines of the Tx Handler and Rx Handler are held in idle state while MCAN\_CCCR.CCE = '1'.

The following registers are only writeable while MCAN\_CCCR.CCE = '0'

- Transmit Buffer Add Request (MCAN\_TXBAR)
- Transmit Buffer Cancellation Request (MCAN\_TXBCR)

MCAN\_CCCR.TEST and MCAN\_CCCR.MON can only be set when MCAN\_CCCR.INIT = '1' and MCAN\_CCCR.CCE = '1'. Both bits may be cleared at any time. MCAN\_CCCR.DAR can only be configured when MCAN\_CCCR.INIT = '1' and MCAN\_CCCR.CCE = '1'.

### 52.5.1.2 Normal Operation

Once the MCAN is initialized and MCAN\_CCCR.INIT is cleared, the MCAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted, dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

### 52.5.1.3 CAN FD Operation

There are two variants in the CAN FD frame format, first the CAN FD frame without bit rate switching where the data field of a CAN frame may be longer than 8 bytes. The second variant is the CAN FD frame where control field, data field, and CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame.

The previously reserved bit in CAN frames with 11-bit identifiers and the first previously reserved bit in CAN frames with 29-bit identifiers will now be decoded as FDF bit. FDF = recessive signifies a CAN FD frame, FDF = dominant signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF, res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. The coding of res = recessive is reserved for future expansion of the protocol. In case the MCAN receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting bit MCAN\_PSR.PXE. When Protocol Exception Handling is enabled (MCAN\_CCCR.PXHD = 0), this causes the operation state to change from Receiver (MCAN\_PSR.ACT = 2) to Integrating (MCAN\_PSR.ACT = 00) at the next sample point. In case Protocol Exception Handling is disabled (MCAN\_CCCR.PXHD = 1), the MCAN will treat a recessive res bit as an form error and will respond with an error frame.

CAN FD operation is enabled by programming CCCR.FDOE. In case CCCR.FDOE = '1', transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via bit FDF in the respective Tx Buffer element. With CCCR.FDOE = '0', received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if bit FDF of a Tx Buffer element is set. CCCR.FDOE and CCCR.BRSE can only be changed while CCCR.INIT and CCCR.CCE are both set.

With MCAN\_CCCR.FDOE = 0, the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format. With MCAN\_CCCR.FDOE = 1 and MCAN\_CCCR.BRSE = 0, only bit FDF of a Tx Buffer element is evaluated. With MCAN\_CCCR.FDOE = 1 and MCAN\_CCCR.BRSE = 1, transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching.

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting according to ISO11898-1 until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- Wake-up messages in CAN Partial Networking have to be transmitted in Classic CAN format.

- End-of-line programming in case not all nodes are CAN FD-capable. Non-CAN FD nodes are held in Silent mode until programming has completed. Then all nodes revert to Classic CAN communication.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to the table below.

**Table 52-1. Coding of DLC in CAN FD**

| DLC                  | 9  | 10 | 11 | 12 | 13 | 14 | 15 |
|----------------------|----|----|----|----|----|----|----|
| Number of Data Bytes | 12 | 16 | 20 | 24 | 32 | 48 | 64 |

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal CAN bit timing is used as defined by the Nominal Bit Timing and Prescaler register (MCAN\_NBTP). In the following CAN FD data phase, the data phase CAN bit timing is used as defined by the FastData Bit Timing and Prescaler register (MCAN\_DBTP). The bit timing reverts back from the data phase timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN core clock frequency. Example: with a CAN clock frequency of 20 MHz and the shortest configurable bit time of  $4 t_q$ , the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD and CAN FD with bit rate switching, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

#### 52.5.1.4 Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin CANTX the protocol controller receives the transmitted data from its local CAN transceiver via pin CANRX. The received data is delayed by the transmitter delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transmitter delay, the delay compensation is introduced. Without delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the delay.

##### 52.5.1.4.1 Description

The MCAN protocol unit has implemented a delay compensation mechanism to compensate the delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver.

To check for bit errors during the data phase, the delayed transmit data is compared against the received data at the secondary sample point. If a bit error is detected, the transmitter will react to this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

The transmitter delay compensation enables configurations where the data bit time is shorter than the transmitter delay, it is described in detail in the new ISO11898-1. It is enabled by setting bit MCAN\_DBTP.TDC.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the MCAN's transmit output CANTX through the transceiver to the receive input CANRX plus the transmitter delay compensation offset as configured by

MCAN\_TDCR.TDCO. The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (e.g. half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of CAN core clock periods.

MCAN\_PSR.TDCV shows the actual transmitter delay compensation value. MCAN\_PSR.TDCV is cleared when MCAN\_CCCR.INIT is set and is updated at each transmission of an FD frame while MCAN\_DBTP.TDC is set.

The following boundary conditions have to be considered for the delay compensation implemented in the MCAN:

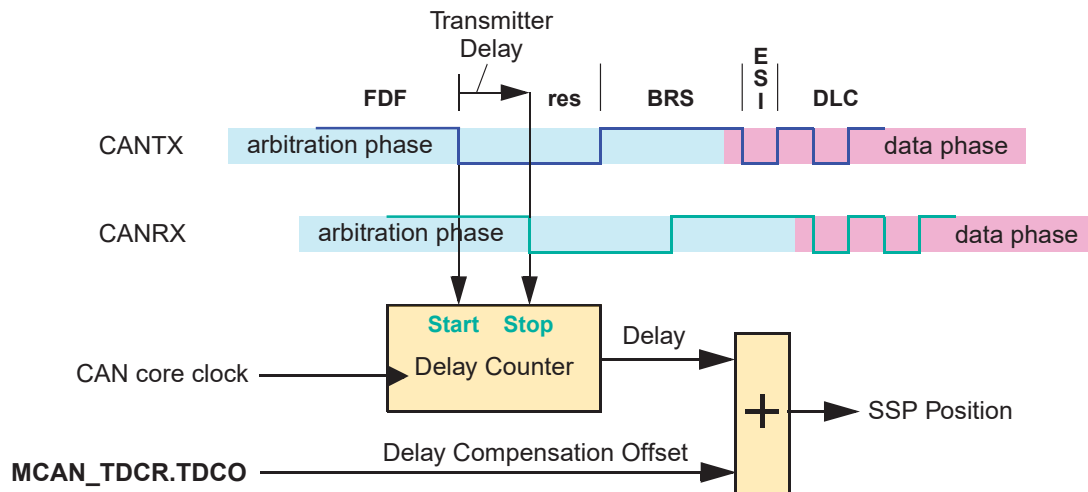

- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN\_TDCR.TDCO has to be less than 6 bit times in the data phase.
- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN\_TDCR.TDCO has to be less or equal 127 CAN core clock periods. In case this sum exceeds 127 CAN core clock periods, the maximum value of 127 CAN core clock periods is used for delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs.

### 52.5.1.4.2 Transmitter Delay Measurement

If transmitter delay compensation is enabled by programming MCAN\_DBTP.TDC = '1', the measurement is started within each transmitted CAN FD frame at the falling edge of bit FDF to bit res. The measurement is stopped when this edge is seen at the receive input CANRX of the transmitter.

The resolution of this measurement is one mtq.

**Figure 52-2. Transmitter Delay Measurement**

To avoid that a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in a too early SSP position, the use of a transmitter delay compensation filter window can be enabled by programming MCAN\_TDCR.TDCF.

This defines a minimum value for the SSP position. Dominant edges on CANRX, that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MCAN\_TDCR.TDCF AND CANRX is low.

### 52.5.1.5 Restricted Operation Mode

In Restricted Operation mode, the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or

overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters are not incremented. The processor can set the MCAN into Restricted Operation mode by setting bit MCAN\_CCCR.ASM. The bit can only be set by the processor when both MCAN\_CCCR.CCE and MCAN\_CCCR.INIT are set to '1'. The bit can be reset by the processor at any time.

Restricted Operation mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation mode, the processor has to reset MCAN\_CCCR.ASM.

The Restricted Operation mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation mode after it has received a valid frame.

**Note:** The Restricted Operation Mode must not be combined with the Loop Back mode (internal or external).

### 52.5.1.6 Bus Monitoring Mode

The MCAN is set in Bus Monitoring mode by setting MCAN\_CCCR.MON. In Bus Monitoring mode (see ISO11898-1, 10.12 Bus monitoring), the MCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus. If the MCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the MCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring mode, the Tx Buffer Request Pending register (MCAN\_TXBRP) is held in reset state.

The Bus Monitoring mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. The figure below shows the connection of signals CANTX and CANRX to the MCAN in Bus Monitoring mode.

**Figure 52-3. Pin Control in Bus Monitoring Mode**

### 52.5.1.7 Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1, 6.3.3 Recovery Management), the MCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MCAN\_CCCR.DAR.

### 52.5.1.7.1 Frame Transmission in DAR Mode

In DAR mode, all transmissions are automatically cancelled after they start on the CAN bus. A Tx Buffer's Tx Request Pending bit TXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx set  
Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx not set
- Successful transmission in spite of cancellation:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx set  
Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx set
- Arbitration lost or frame transmission disturbed:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx not set  
Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = "10" (transmission in spite of cancellation).

### 52.5.1.8 Power-down (Sleep Mode)

The MCAN can be set into Power-down mode via bit MCAN\_CCCR.CSR.

When all pending transmission requests have completed, the MCAN waits until bus idle state is detected. Then the MCAN sets MCAN\_CCCR.INIT to prevent any further CAN transfers. Now the MCAN acknowledges that it is ready for power down by setting to one the bit MCAN\_CCCR.CSA. In this state, before the clocks are switched off, further register accesses can be made. A write access to MCAN\_CCCR.INIT will have no effect. Now the bus clock (peripheral clock) and the CAN core clock may be switched off.

To leave Power-down mode, the application has to turn on the MCAN clocks before clearing CC Control Register flag MCAN\_CCCR.CSR. The MCAN will acknowledge this by clearing MCAN\_CCCR.CSA. The application can then restart CAN communication by clearing the bit CCCR.INIT.

### 52.5.1.9 Test Modes

To enable write access to the MCAN Test register (MCAN\_TEST) (see Section 7.6), bit MCAN\_CCCR.TEST must be set. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin CANTX by programming MCAN\_TEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the MCAN's bit timing and it can drive constant dominant or recessive values. The actual value at pin CANRX can be read from MCAN\_TEST.RX. Both functions can be used to check the CAN bus' physical layer.

Due to the synchronization mechanism between CAN clock and system bus clock domain, there may be a delay of several system bus clock periods between writing to MCAN\_TEST.TX until the new configuration is visible at output pin CANTX. This applies also when reading input pin CANRX via MCAN\_TEST.RX.

**Note:** Test modes should be used for production tests or self-test only. The software control for pin CANTX interferes with all CAN protocol functions. It is not recommended to use test modes for application.

### 52.5.1.9.1 External Loop Back Mode

The MCAN can be set in External Loop Back mode by setting the bit MCAN\_TEST.LBCK. In Loop Back mode, the MCAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into an Rx Buffer or an Rx FIFO. The figure below shows the connection of signals CANTX and CANRX to the MCAN in External Loop Back mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the MCAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back mode. In this mode, the MCAN performs an internal feedback from its Tx output to its Rx input. The actual value of the CANRX input pin is disregarded by the MCAN. The transmitted messages can be monitored at the CANTX pin.

### 52.5.1.9.2 Internal Loop Back Mode

Internal Loop Back mode is entered by setting bits MCAN\_TEST.LBCK and MCAN\_CCCR.MON. This mode can be used for a “Hot Selftest”, meaning the MCAN can be tested without affecting a running CAN system connected to the pins CANTX and CANRX. In this mode, pin CANRX is disconnected from the MCAN, and pin CANTX is held recessive. The figure below shows the connection of CANTX and CANRX to the MCAN when Internal Loop Back mode is enabled.

**Figure 52-4. Pin Control in Loop Back Modes**

### 52.5.2 Timestamp Generation

For timestamp generation, the MCAN supplies a 16-bit wrap-around counter. A prescaler TSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1...16). The counter is readable via MCAN\_TSCV.TSC. A write access to the Timestamp Counter Value register (MCAN\_TSCV) resets the counter to zero. When the timestamp counter wraps around, the interrupt flag MCAN\_IR.TSW is set.

On start of frame reception / transmission, the counter value is captured and stored into the timestamp section of an Rx Buffer / Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

By programming bit MCAN\_TSCC.TSS, an external 16-bit timestamp can be used.

### 52.5.3 Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO, the MCAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by TSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via the Timeout Counter Configuration register (MCAN\_TOCC). The actual counter value can be read from MCAN\_TOCV.TOC. The Timeout Counter can only be started while MCAN\_CCCR.INIT = '0'. It is stopped when MCAN\_CCCR.INIT = '1', e.g. when the MCAN enters Bus\_Off state.

The operating mode is selected by MCAN\_TOCC.TOS. When operating in Continuous mode, the counter starts when MCAN\_CCCR.INIT is reset. A write to MCAN\_TOCV presets the counter to the value configured by MCAN\_TOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN\_TOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MCAN\_TOCV has no effect.

When the counter reaches zero, interrupt flag MCAN\_IR.TOO is set. In Continuous mode, the counter is immediately restarted at MCAN\_TOCC.TOP.

**Note:** The clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the bit rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

### 52.5.4 Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

#### 52.5.4.1 Acceptance Filtering

The MCAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration (MCAN\_GFC)
- Standard ID Filter Configuration (MCAN\_SIDFC)
- Extended ID Filter Configuration (MCAN\_XIDFC)
- Extended ID and Mask (MCAN\_XIDAM)

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag (MCAN\_IR.HPM)

- Set High Priority Message interrupt flag (MCAN\_IR.HPM) and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the effected Rx Buffer or Rx FIFO:

- Rx Buffer  
New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type, see MCAN\_PSR.LEC and MCAN\_PSR.DLEC.
- Rx FIFO  
Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type, see MCAN\_PSR.LEC and MCAN\_PSR.DLEC. In case the matching Rx FIFO is operated in Overwrite mode, the boundary conditions described in [Rx FIFO Overwrite Mode](#) have to be considered.  
**Note:** When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

#### 52.5.4.1.1 Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

- EFT = "00": The Message ID of received frames is ANDed with MCAN\_XIDAM before the range filter is applied.
- EFT = "11": MCAN\_XIDAM is not used for range filtering.

#### 52.5.4.1.2 Filter for Specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

#### 52.5.4.1.3 Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

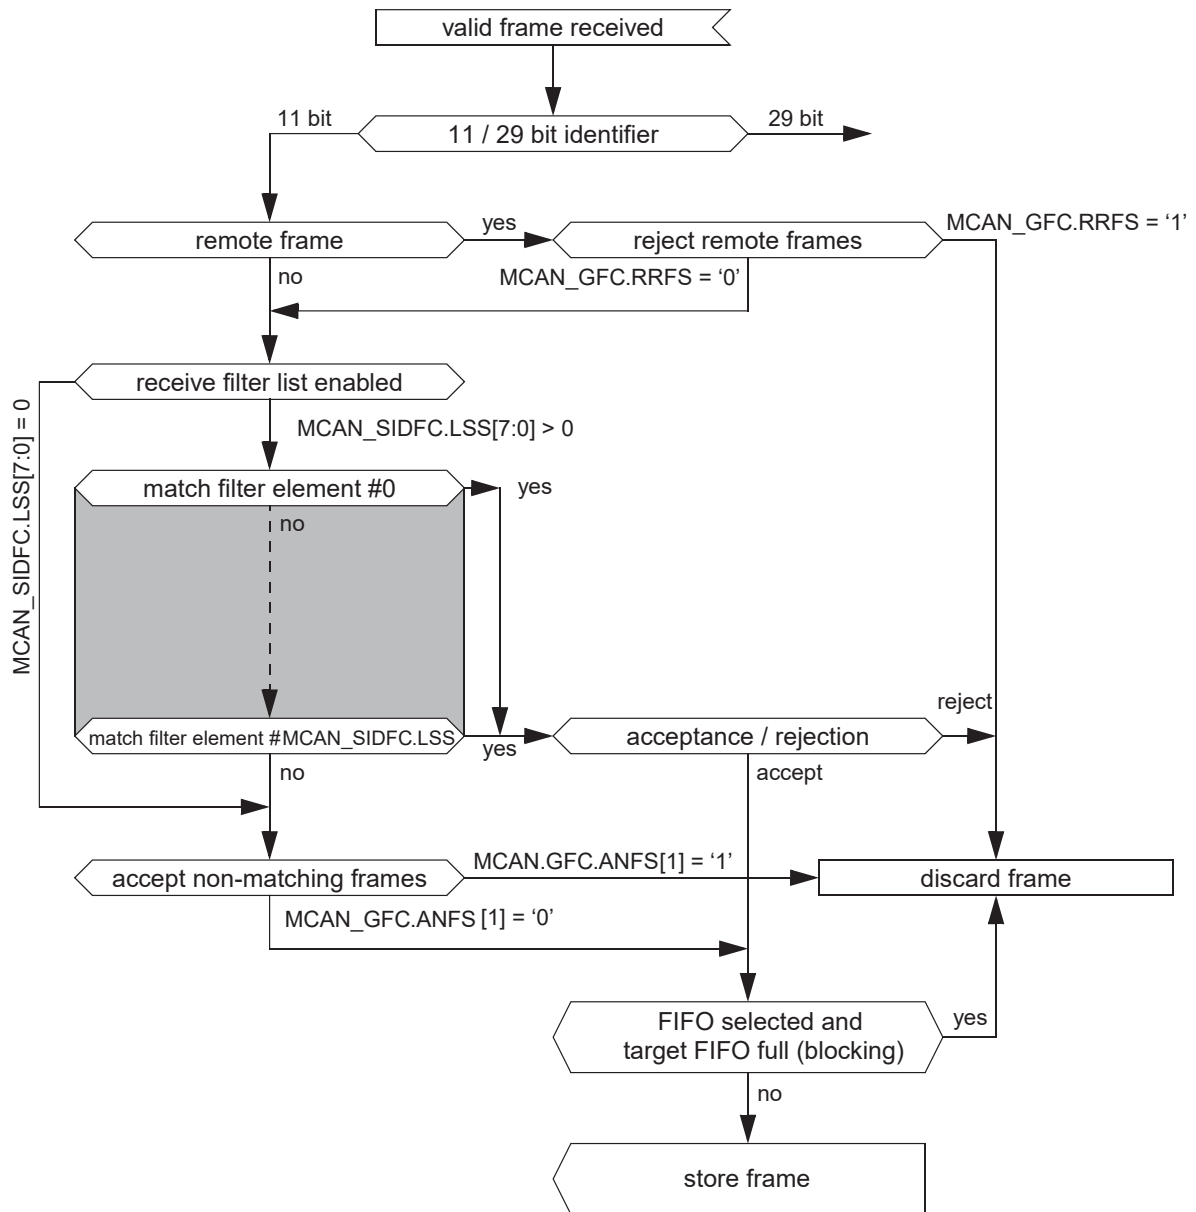

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

#### 52.5.4.1.4 Standard Message ID Filtering

The figure below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in [52.5.7.5 Standard Message ID Filter Element](#).

Controlled by MCAN\_GFC and MCAN\_SIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

**Figure 52-5. Standard Message ID Filter Path**

**Extended Message ID Filtering**

The figure below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in [52.5.7.6 Extended Message ID Filter Element](#).

Controlled by MCAN\_GFC and MCAN\_XIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

MCAN\_XIDAM is ANDed with the received identifier before the filter list is executed.

**Figure 52-6. Extended Message ID Filter Path**

#### 52.5.4.2 Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via the Rx FIFO 0 Configuration register (MCAN\_RXF0C) and the Rx FIFO 1 Configuration register (MCAN\_RXF1C).

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1, see [Acceptance Filtering](#). The Rx FIFO element is described in [Rx Buffer and FIFO Element](#).

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by MCAN\_RXFnC.FnWM, interrupt flag MCAN\_IR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index, an Rx FIFO Full condition is signalled by MCAN\_RXFnS.FnF. In addition, the interrupt flag MCAN\_IR.RFnF is set.

**Figure 52-7. Rx FIFO Status**

When reading from an Rx FIFO, Rx FIFO Get Index `MCAN_RXFnS.FnGI` × FIFO Element Size has to be added to the corresponding Rx FIFO start address `MCAN_RXFnC.FnSA`.

**Table 52-2. Rx Buffer / FIFO Element Size**

| <code>MCAN_RXESC.RBDS[2:0]</code><br><code>MCAN_RXESC.FnDS[2:0]</code> | Data Field<br>[bytes] | FIFO Element Size<br>[RAM words] |
|--|-----------------------|----------------------------------|
| 0  | 8                     | 4                                |
| 1  | 12                    | 5                                |
| 2  | 16                    | 6                                |
| 3  | 20                    | 7                                |
| 4  | 24                    | 8                                |
| 5  | 32                    | 10                               |
| 6  | 48                    | 14                               |
| 7  | 64                    | 18                               |

**52.5.4.2.1 Rx FIFO Blocking Mode**

The Rx FIFO Blocking mode is configured by `MCAN_RXFnC.FnOM = '0'`. This is the default operating mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (`MCAN_RXFnS.FnPI = MCAN_RXFnS.FnGI`), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by `MCAN_RXFnS.FnF = '1'`. In addition, the interrupt flag `MCAN_IR.RFnF` is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by `MCAN_RXFnS.RFnL = '1'`. In addition, the interrupt flag `MCAN_IR.RFnL` is set.

**52.5.4.2.2 Rx FIFO Overwrite Mode**

The Rx FIFO Overwrite mode is configured by `MCAN_RXFnC.FnOM = '1'`.

When an Rx FIFO full condition (MCAN\_RXFnS.FnPI = MCAN\_RXFnS.FnGI) is signalled by MCAN\_RXFnS.FnF = '1', the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in Overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the processor is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the processor accesses the Rx FIFO. The figure below shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

**Figure 52-8. Rx FIFO Overflow Handling**

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index MCAN\_RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (MCAN\_RXFnS.FnF = '0').

### 52.5.4.3 Dedicated Rx Buffers

The MCAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MCAN\_RXBC.RBSA.

For each Rx Buffer, a Standard or Extended Message ID Filter Element with SFEC / EFEC = 7 and SFID2 / EFID2[10:9] = 0 has to be configured.

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition, the flag MCAN\_IR.DRX (Message stored in dedicated Rx Buffer) in MCAN\_IR is set.

**Table 52-3. Example Filter Configuration for Rx Buffers**

| Filter Element | SFID1[10:0]<br>EFID1[28:0] | SFID2[10:9]<br>EFID2[10:9] | SFID2[5:0]<br>EFID2[5:0] |
|----------------|----------------------------|----------------------------|--------------------------|
| 0              | ID message 1               | 0                          | 0                        |

| .....continued |                            |                            |                          |
|----------------|----------------------------|----------------------------|--------------------------|
| Filter Element | SFID1[10:0]<br>EFID1[28:0] | SFID2[10:9]<br>EFID2[10:9] | SFID2[5:0]<br>EFID2[5:0] |
| 1              | ID message 2               | 0                          | 1                        |
| 2              | ID message 3               | 0                          | 2                        |

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in the New Data 1 register (MCAN\_NDAT1) and New Data 2 register (MCAN\_NDAT2) is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the processor by writing a '1' to the respective bit position.

While an Rx Buffer's New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

#### 52.5.4.3.1 Rx Buffer Handling

- Reset interrupt flag IR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

#### 52.5.4.4 Debug on CAN Support

Debug messages are stored into Rx Buffers. For debug handling three consecutive Rx buffers (e.g. #61, #62, #63) have to be used for storage of debug messages A, B, and C. The format is the same as for an Rx Buffer or an Rx FIFO element (see [Rx Buffer and FIFO Element](#)).

Advantage: Fixed start address for the DMA transfers (relative to MCAN\_RXBC.RBSA), no additional configuration required.

For filtering of debug messages Standard / Extended Filter Elements with SFEC / EFEC = '111' have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by SFID2 / EFID2[5:0].

After message C has been stored, the DMA request output m\_can\_dma\_req is activated and the three messages can be read from the Message RAM under DMA control. The RAM words holding the debug messages will not be changed by the MCAN while m\_can\_dma\_req is activated. The behavior is similar to that of an Rx Buffer with its New Data flag set.

After the DMA has completed, the MCAN is prepared to receive the next set of debug messages.

##### 52.5.4.4.1 Filtering for Debug Messages

Filtering for debug messages is done by configuring one Standard / Extended Message ID Filter Element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC / EFEC has to be programmed to "111". In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning. While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New Data flag nor MCAN\_IR.DRX are set. The reception of debug messages can be monitored via RXF1S.DMS.

**Table 52-4. Example Filter Configuration for Debug Messages**

| Filter Element | SFID1[10:0]<br>EFID1[28:0] | SFID2[10:9]<br>EFID2[10:9] | SFID2[5:0]<br>EFID2[5:0] |
|----------------|----------------------------|----------------------------|--------------------------|
| 0              | ID debug message A         | 1                          | 11 1101                  |
| 1              | ID debug message B         | 2                          | 11 1110                  |
| 2              | ID debug message C         | 3                          | 11 1111                  |

#### 52.5.4.4.2 Debug Message Handling

The debug message handling state machine ensures that debug messages are stored to three consecutive Rx Buffers in the correct order. If some messages are missing, the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in the correct order.

The status of the debug message handling state machine is signalled via MCAN\_RXF1S.DMS.

**Figure 52-9. Debug Message Handling State Machine**

- T0: reset m\_can\_dma\_req output, enable reception of debug messages A, B, and C
- T1: reception of debug message A
- T2: reception of debug message A
- T3: reception of debug message C
- T4: reception of debug message B
- T5: reception of debug messages A, B
- T6: reception of debug message C
- T7: DMA transfer completed
- T8: reception of debug message A,B,C (message rejected)

#### 52.5.5 Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The CAN mode for transmission (Classic CAN or CAN FD) can be configured separately for each Tx Buffer element. The Tx

Buffer element is described in [Tx Buffer Element](#). The table below describes the possible configurations for frame transmission.

**Table 52-5. Possible Configurations for Frame Transmission**

| MCAN_CCCR |      | Tx Buffer Element |         | Frame Transmission            |
|-----------|------|-------------------|---------|-------------------------------|
| BRSE      | FDOE | FDF               | BRS     |                               |
| ignored   | 0    | ignored           | ignored | Classic CAN                   |
| 0         | 1    | 0                 | ignored | Classic CAN                   |
| 0         | 1    | 1                 | ignored | FD without bit rate switching |
| 1         | 1    | 0                 | ignored | Classic CAN                   |
| 1         | 1    | 1                 | 0       | FD without bit rate switching |
| 1         | 1    | 1                 | 1       | FD with bit rate switching    |

**Note:** AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation.

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when MCAN\_TXBRP is updated, or when a transmission has been started.

### 52.5.5.1 Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MCAN\_CCCR.TXP. If the bit is set, the MCAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MCAN\_CCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against “babbling idiot” scenarios where the application program erroneously requests too many transmissions.

### 52.5.5.2 Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the processor. Each dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an Add Request via MCAN\_TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see the table below). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0...31) × Element Size to the Tx Buffer Start Address TXBC.TBSA.

**Table 52-6. Tx Buffer / FIFO / Queue Element Size**

| TXESC.TBDS[2:0] | Data Field [bytes] | Element Size [RAM words] |
|-----------------|--------------------|--------------------------|
| 0               | 8                  | 4                        |
| 1               | 12                 | 5                        |
| 2               | 16                 | 6                        |
| 3               | 20                 | 7                        |
| 4               | 24                 | 8                        |
| 5               | 32                 | 10                       |
| 6               | 48                 | 14                       |
| 7               | 64                 | 18                       |

### 52.5.5.3 Tx FIFO

Tx FIFO operation is configured by programming MCAN\_TXBC.TFQM to '0'. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MCAN\_TXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The MCAN calculates the Tx FIFO Free Level MCAN\_TXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCAN\_TXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MCAN\_TXFQS.TFQF = '1') is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a '1' to the TXBAR bit related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MCAN\_TXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see the table [Table 52-6](#)). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/ Queue Put Index MCAN\_TXFQS.TFQPI (0...31) × Element Size to the Tx Buffer Start Address MCAN\_TXBC.TBSA.

### 52.5.5.4 Tx Queue

Tx Queue operation is configured by programming MCAN\_TXBC.TFQM to '1'. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx Buffer referenced by the Put Index MCAN\_TXFQS.TFQPI. An Add Request cyclically increments the Put Index to the next free Tx Buffer. In case that the Tx Queue is full (MCAN\_TXFQS.TFQF = '1'), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register MCAN\_TXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see the table [Tx Buffer / FIFO / Queue Element Size](#)). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN\_TXFQS.TFQPI (0...31) × Element Size to the Tx Buffer Start Address MCAN\_TXBC.TBSA.

### 52.5.5.5 Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx FIFO. The number of dedicated Tx Buffers is configured by MCAN\_TXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MCAN\_TXBC.TFQS. In case MCAN\_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

**Figure 52-10. Example of Mixed Configuration Dedicated Tx Buffers / Tx FIFO**

Tx prioritization:

- Scan dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by MCAN\_TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

### 52.5.5.6 Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx Queue. The number of dedicated Tx Buffers is configured by MCAN\_TXBC.NDTB. The number of Tx Queue Buffers is configured by MCAN\_TXBC.TFQS. In case MCAN\_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

**Figure 52-11. Example of Mixed Configuration Dedicated Tx Buffers / Tx Queue**

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

### 52.5.5.7 Transmit Cancellation

The MCAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR-based applications. To cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer, the processor has to write a '1' to the corresponding bit position (=number of Tx Buffer) of register MCAN\_TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MCAN\_TXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding TXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCAN\_TXBTO and MCAN\_TXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MCAN\_TXBCF bit is set.

**Note:** In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

### 52.5.5.8 Tx Event Handling

To support Tx event handling the MCAN has implemented a Tx Event FIFO. After the MCAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in [Debug on CAN Support](#).

When a Tx Event FIFO full condition is signalled by IR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MCAN\_IR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MCAN\_TXEFC.EFWM, interrupt flag MCAN\_IR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCAN\_TXEFS.EFGI has to be added to the Tx Event FIFO start address MCAN\_TXEFC.EFSA.

### 52.5.6 FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index in the registers MCAN\_RXF0A, MCAN\_RXF1A and MCAN\_TXEFA. Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the processor has free access to the MCAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

**Note:** The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The MCAN does not check for erroneous values.

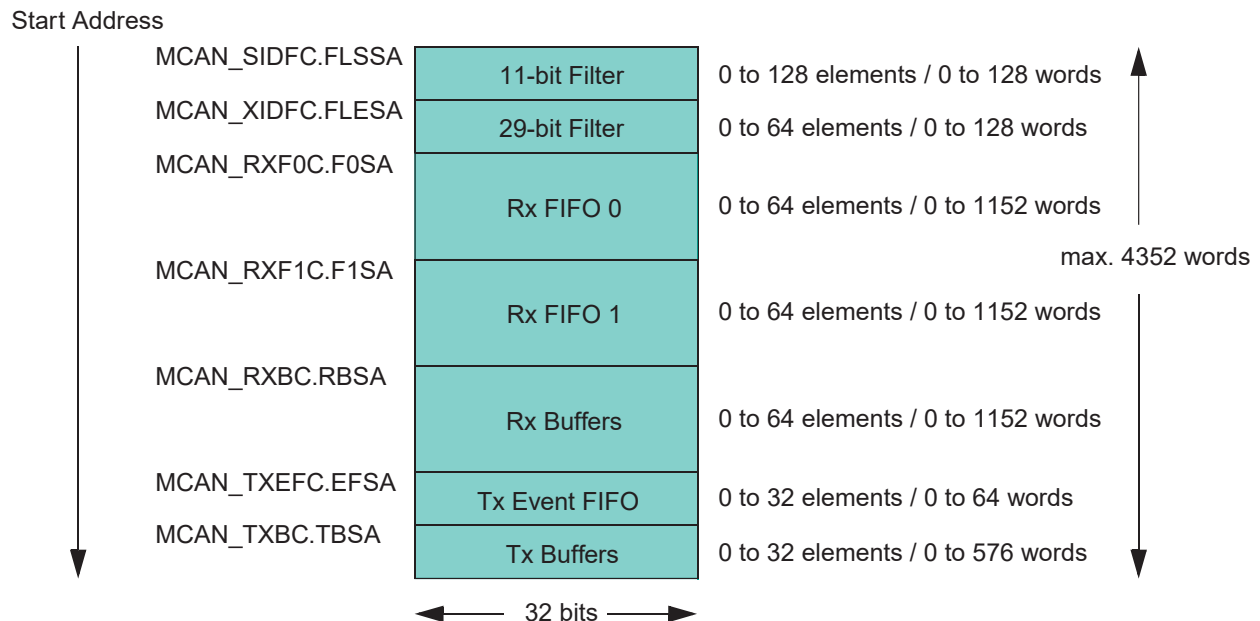

### 52.5.7 Message RAM

#### 52.5.7.1 Message RAM Configuration

The Message RAM has a width of 32 bits. The MCAN module can be configured to allocate up to 4352 words in the Message RAM. It is not necessary to configure each of the sections listed in the figure below, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode, the required Message RAM size depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MCAN\_RXESC.F0DS, MCAN\_RXESC.F1DS, MCAN\_RXESC.RBDS, and MCAN\_TXESC.TBDS.

**Figure 52-12. Message RAM Configuration**

When the MCAN addresses the Message RAM, it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses; i.e., only bits 15 to 2 are evaluated, the two least significant bits are ignored.

**Note:** The MCAN does not check for erroneous configuration of the Message RAM. The configuration of the start addresses of the different sections and the number of elements of each section must be checked carefully to avoid falsification or loss of data.

### 52.5.7.2 Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in the table below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MCAN\_RXESC.

**Table 52-7. Rx Buffer and FIFO Element**

|     |          |           |     |          |            |    |     |     |            |  |  |    |            |  |  |   |   |  |  |   |
|-----|----------|-----------|-----|----------|------------|----|-----|-----|------------|--|--|----|------------|--|--|---|---|--|--|---|
|     | 31       |           |     |          | 24         | 23 |     |     |            |  |  | 16 | 15         |  |  | 8 | 7 |  |  | 0 |
| R0  | ESI      | XTD       | RTR | ID[28:0] |            |    |     |     |            |  |  |    |            |  |  |   |   |  |  |   |
| R1  | ANMF     | FIDX[6:0] |     |          |            | –  | FDX | BRS | DLC[3:0]   |  |  |    | RXTS[15:0] |  |  |   |   |  |  |   |
| R2  | DB3[7:0] |           |     |          | DB2[7:0]   |    |     |     | DB1[7:0]   |  |  |    | DB0[7:0]   |  |  |   |   |  |  |   |
| R3  | DB7[7:0] |           |     |          | DB6[7:0]   |    |     |     | DB5[7:0]   |  |  |    | DB4[7:0]   |  |  |   |   |  |  |   |
| ... | ...      |           |     |          | ...        |    |     |     | ...        |  |  |    | ...        |  |  |   |   |  |  |   |
| Rn  | DBm[7:0] |           |     |          | DBm-1[7:0] |    |     |     | DBm-2[7:0] |  |  |    | DBm-3[7:0] |  |  |   |   |  |  |   |

- R0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active.

1: Transmitting node is error passive.

- R0 Bit 30 XTD: Extended Identifier

Signals to the processor whether the received frame has a standard or extended identifier.

0: 11-bit standard identifier.

1: 29-bit extended identifier.

- R0 Bit 29 RTR: Remote Transmission Request

Signals to the processor whether the received frame is a data frame or a remote frame.

0: Received frame is a data frame.

1: Received frame is a remote frame.

**Note:** There are no remote frames in CAN FD format. In case a CAN FD frame was received (FDX = 1), bit RTR reflects the state of the reserved bit r1.

- R0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

- R1 Bit 31 ANMF: Accepted Non-matching Frame

Acceptance of non-matching frames may be enabled via MCAN\_GFC.ANFS and MCAN\_GFC.ANFE.

0: Received frame matching filter index FIDX.

1: Received frame did not match any Rx filter element.

- R1 Bits 30:24 FIDX[6:0]: Filter Index

0-127: Index of matching Rx acceptance filter element (invalid if ANMF = '1').  
Range is 0 to MCAN\_SIDFC.LSS - 1 resp. MCAN\_XIDFC.LSE - 1.

- R1 Bit 21 FDF: FD Format

0: Standard frame format.

1: CAN FD frame format (new DLC-coding and CRC).

- R1 Bit 20 BRS: Bit Rate Switch

0: Frame received without bit rate switching.

1: Frame received with bit rate switching.

**Note:**

Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN\_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN\_CCCR.BRSE = 1.

- R1 Bits 19:16 DLC[3:0]: Data Length Code

0-8: CAN + CAN FD: received frame has 0-8 data bytes.

9-15: CAN: received frame has 8 data bytes.

9-15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes.

- R1 Bits 15:0 RXTS[15:0]: Rx Timestamp

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN\_TSCC.TCP.

- R2 Bits 31:24 DB3[7:0]: Data Byte 3

- R2 Bits 23:16 DB2[7:0]: Data Byte 2

- R2 Bits 15:8 DB1[7:0]: Data Byte 1

- R2 Bits 7:0 DB0[7:0]: Data Byte 0

- R3 Bits 31:24 DB7[7:0]: Data Byte 7

- R3 Bits 23:16 DB6[7:0]: Data Byte 6

- R3 Bits 15:8 DB5[7:0]: Data Byte 5

- R3 Bits 7:0 DB4[7:0]: Data Byte 4

... ..

- Rn Bits 31:24 DBm[7:0]: Data Byte m

- Rn Bits 23:16 DBm-1[7:0]: Data Byte m-1

- Rn Bits 15:8 DBm-2[7:0]: Data Byte m-2

- Rn Bits 7:0 DBm-3[7:0]: Data Byte m-3

**Note:** Depending on the configuration of the element size (MCAN\_RXESC), between two and sixteen 32-bit words (Rn = 3 .. 17) are used for storage of a CAN message's data field.

### 52.5.7.3 Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration TXBC.TFQS and TXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register TXESC.

**Table 52-8. Tx Buffer Element**

|     |          |     |     |          |            |          |     |     |          |  |    |            |  |  |  |            |   |  |  |  |  |   |
|-----|----------|-----|-----|----------|------------|----------|-----|-----|----------|--|----|------------|--|--|--|------------|---|--|--|--|--|---|
|     | 31       |     |     | 24       | 23         |          |     |     |          |  | 16 | 15         |  |  |  | 8          | 7 |  |  |  |  | 0 |
| T0  | ESI      | XTD | RTR | ID[28:0] |            |          |     |     |          |  |    |            |  |  |  |            |   |  |  |  |  |   |
| T1  | MM[7:0]  |     |     |          | EFC        | reserved | fdf | BRS | DLC[3:0] |  |    | reserved   |  |  |  |            |   |  |  |  |  |   |
| T2  | DB3[7:0] |     |     |          | DB2[7:0]   |          |     |     |          |  |    | DB1[7:0]   |  |  |  | DB0[7:0]   |   |  |  |  |  |   |
| T3  | DB7[7:0] |     |     |          | DB6[7:0]   |          |     |     |          |  |    | DB5[7:0]   |  |  |  | DB4[7:0]   |   |  |  |  |  |   |
| ... | ...      |     |     |          | ...        |          |     |     |          |  |    | ...        |  |  |  | ...        |   |  |  |  |  |   |
| Tn  | DBm[7:0] |     |     |          | DBm-1[7:0] |          |     |     |          |  |    | DBm-2[7:0] |  |  |  | DBm-3[7:0] |   |  |  |  |  |   |

- T0 Bit 30 ESI: Error State Indicator

T0 Bit 31 ESI: Error State Indicator

0: ESI bit in CAN FD format depends only on error passive flag

1: ESI bit in CAN FD format transmitted recessive

**Note:** The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive. This feature can be used in gateway applications when a message from an error passive node is routed to another CAN network.

- T0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier.

1: 29-bit extended identifier.

- T0 Bit 29 RTR: Remote Transmission Request

0: Transmit data frame.

1: Transmit remote frame.

**Note:** When RTR = 1, the MCAN transmits a remote frame according to ISO11898-1, even if MCAN\_CCCR.FDOE enables the transmission in CAN FD format.

- T0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

- T1 Bits 31:24 MM[7:0]: Message Marker

Written by processor during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

- T1 Bit 23 EFC: Event FIFO Control

0: Do not store Tx events.

1: Store Tx events.

- T1 Bit 21 FDF: FD Format

0: Frame transmitted in Classic CAN format

1: Frame transmitted in CAN FD format

- T1 Bit 20 BRS: Bit Rate Switching

0: CAN FD frames transmitted without bit rate switching

1: CAN FD frames transmitted with bit rate switching

**Note:**

Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN\_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN\_CCCR.BRSE = 1.

- T1 Bits 19:16 DLC[3:0]: Data Length Code

0-8: CAN + CAN FD: transmit frame has 0-8 data bytes.

9-15: CAN: transmit frame has 8 data bytes.

9-15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes.

- T2 Bits 31:24 DB3[7:0]: Data Byte 3

- T2 Bits 23:16 DB2[7:0]: Data Byte 2

- T2 Bits 15:8 DB1[7:0]: Data Byte 1

- T2 Bits 7:0 DB0[7:0]: Data Byte 0

- T3 Bits 31:24 DB7[7:0]: Data Byte 7

- T3 Bits 23:16 DB6[7:0]: Data Byte 6

- T3 Bits 15:8 DB5[7:0]: Data Byte 5

- T3 Bits 7:0 DB4[7:0]: Data Byte 4

... ..

- Tn Bits 31:24 DBm[7:0]: Data Byte m

- Tn Bits 23:16 DBm-1[7:0]: Data Byte m-1

- Tn Bits 15:8 DBm-2[7:0]: Data Byte m-2

- Tn Bits 7:0 DBm-3[7:0]: Data Byte m-3

**Note:** Depending on the configuration of the element size (MCAN\_TXESC), between two and sixteen 32-bit words (Tn = 3 ..17) are used for storage of a CAN message's data field.

#### 52.5.7.4 Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the processor gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register TXEFS.

**Table 52-9. Tx Event FIFO Element**

|    |         |     |     |          |    |             |     |     |          |            |    |    |   |   |   |
|----|---------|-----|-----|----------|----|-------------|-----|-----|----------|------------|----|----|---|---|---|
|    | 31      |     |     |          | 24 | 23          |     |     |          |            | 16 | 15 | 8 | 7 | 0 |
| E0 | ESI     | XTD | RTR | ID[28:0] |    |             |     |     |          |            |    |    |   |   |   |
| E1 | MM[7:0] |     |     |          |    | ET<br>[1:0] | FDF | BRS | DLC[3:0] | TXTS[15:0] |    |    |   |   |   |

- E0 Bit 31 ESI: Error State Indicator  
0: Transmitting node is error active.  
1: Transmitting node is error passive.
- E0 Bit 30 XTD: Extended Identifier  
0: 11-bit standard identifier.  
1: 29-bit extended identifier.
- E0 Bit 29 RTR: Remote Transmission Request  
0: Data frame transmitted.  
1: Remote frame transmitted.
- E0 Bits 28:0 ID[28:0]: Identifier  
Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].
- E1 Bits 31:24 MM[7:0]: Message Marker  
Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.
- E1 Bit 23:22 ET[1:0]: Event Type  
0: Reserved  
1: Tx event  
2: Transmission in spite of cancellation (always set for transmissions in DAR mode)  
3: Reserved
- E1 Bit 21 FDF: FD Format  
0: Standard frame format.  
1: CAN FD frame format (new DLC-coding and CRC).
- E1 Bit 20 BRS: Bit Rate Switch  
0: Frame transmitted without bit rate switching.  
1: Frame transmitted with bit rate switching.
- E1 Bits 19:16 DLC[3:0]: Data Length Code  
0-8: CAN + CAN FD: frame with 0-8 data bytes transmitted.  
9-15: CAN: frame with 8 data bytes transmitted.  
9-15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted
- E1 Bits 15:0 TXTS[15:0]: Tx Timestamp

Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN\_TSCC.TCP.

### 52.5.7.5 Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MCAN\_SIDFC.FLSSA plus the index of the filter element (0...127).

**Table 52-10. Standard Message ID Filter Element**

|    |          |  |            |  |             |    |    |    |             |   |   |   |
|----|----------|--|------------|--|-------------|----|----|----|-------------|---|---|---|
|    | 31       |  |            |  |             | 24 | 23 | 16 | 15          | 8 | 7 | 0 |
| S0 | SFT[1:0] |  | SFEC [2:0] |  | SFID1[10:0] |    |    | –  | SFID2[10:0] |   |   |   |

- Bits 31:30 SFT[1:0]: Standard Filter Type
  - 0: Range filter from SF1ID to SF2ID (SF2ID ≥ SF1ID)
  - 1: Dual ID filter for SF1ID or SF2ID
  - 2: Classic filter: SF1ID = filter, SF2ID = mask
  - 3: Reserved
- Bit 29:27 SFEC[2:0]: Standard Filter Element Configuration

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MCAN\_IR.HPM and, if enabled, an interrupt is generated. In this case register HPMS is updated with the status of the priority match.

- 0: Disable filter element
- 1: Store in Rx FIFO 0 if filter matches
- 2: Store in Rx FIFO 1 if filter matches
- 3: Reject ID if filter matches
- 4: Set priority if filter matches
- 5: Set priority and store in FIFO 0 if filter matches
- 6: Set priority and store in FIFO 1 if filter matches
- 7: Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored

- Bits 26:16 SFID1[10:0]: Standard Filter ID 1
- First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

- Bits 10:0 SFID2[10:0]: Standard Filter ID 2

This field has a different meaning depending on the configuration of SFEC:

- SFEC = “001”...“110”–Second ID of standard ID filter element
- SFEC = “111”–Filter for Rx Buffers or for debug messages

SFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

- 0: Store message in a Rx buffer
- 1: Debug Message A
- 2: Debug Message B
- 3: Debug Message C

SFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

### 52.5.7.6 Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MCAN\_XIDFC.FLESA plus two times the index of the filter element (0...63).

**Table 52-11. Extended Message ID Filter Element**

|    | 31         |  |   | 24          | 23 | 16 | 15 | 8 | 7 | 0 |
|----|------------|--|---|-------------|----|----|----|---|---|---|
| F0 | EFEC [2:0] |  |   | EFID1[28:0] |    |    |    |   |   |   |
| F1 | EFT[1:0]   |  | – | EFID2[28:0] |    |    |    |   |   |   |

- F0 Bit 31:29 EFEC[2:0]: Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = “100”, “101”, or “110”, a match sets the interrupt flag MCAN\_IR.HPM and, if enabled, an interrupt is generated. In this case, register MCAN\_HPMS is updated with the status of the priority match.

- 0: Disable filter element
- 1: Store in Rx FIFO 0 if filter matches
- 2: Store in Rx FIFO 1 if filter matches
- 3: Reject ID if filter matches
- 4: Set priority if filter matches
- 5: Set priority and store in FIFO 0 if filter matches
- 6: Set priority and store in FIFO 1 if filter matches
- 7: Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored

- F0 Bits 28:0 EFID1[28:0]: Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MCAN\_XIDAM masking mechanism (see [Extended Message ID Filtering](#)) is used.

- F1 Bits 31:30 EFT[1:0]: Extended Filter Type
- 0: Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID)

1: Dual ID filter for EF1ID or EF2ID

2: Classic filter: EF1ID = filter, EF2ID = mask

3: Range filter from EF1ID to EF2ID ( $EF2ID \geq EF1ID$ ), MCAN\_XIDAM mask not applied

- F1 Bits 28:0 EFID2[28:0]: Extended Filter ID 2

This field has a different meaning depending on the configuration of EFEC:

- EFEC = “001”...“110”–Second ID of extended ID filter element

- EFEC = “111”–Filter for Rx Buffers or for debug messages

EFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

0: Store message in an Rx buffer

1: Debug Message A

2: Debug Message B

3: Debug Message C

EFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

#### **52.5.8 Hardware Reset Description**

After hardware reset, the registers of the MCAN hold the reset values listed in the register descriptions. Additionally the Bus\_Off state is reset and the output CANTX is set to recessive (HIGH). The value 0x0001 (MCAN\_CCCR.INIT = ‘1’) in the CC Control register enables software initialization. The MCAN does not influence the CAN bus until the processor resets MCAN\_CCCR.INIT to ‘0’.

#### **52.5.9 Access to Reserved Register Addresses**

In case the application software accesses one of the reserved addresses in the MCAN register map (read or write access), interrupt flag MCAN\_IR.ARA is set and, if enabled, the selected interrupt line is risen.

## 52.6 Register Summary

| Offset | Name      | Bit Pos. |             |           |      |      |           |     |      |           |          |
|--------|-----------|----------|-------------|-----------|------|------|-----------|-----|------|-----------|----------|
| 0x04   | MCAN_ENDN | 7:0      | ETV[7:0]    |           |      |      |           |     |      |           |          |
|        |           | 15:8     | ETV[15:8]   |           |      |      |           |     |      |           |          |
|        |           | 23:16    | ETV[23:16]  |           |      |      |           |     |      |           |          |
|        |           | 31:24    | ETV[31:24]  |           |      |      |           |     |      |           |          |
| 0x08   | MCAN_CUST | 7:0      | CSV[7:0]    |           |      |      |           |     |      |           |          |
|        |           | 15:8     | CSV[15:8]   |           |      |      |           |     |      |           |          |
|        |           | 23:16    | CSV[23:16]  |           |      |      |           |     |      |           |          |
|        |           | 31:24    | CSV[31:24]  |           |      |      |           |     |      |           |          |
| 0x0C   | MCAN_DBTP | 7:0      | DTSEG2[3:0] |           |      |      | DSJW[2:0] |     |      |           |          |
|        |           | 15:8     | DTSEG1[4:0] |           |      |      |           |     |      |           |          |
|        |           | 23:16    | TDC         | DBRP[4:0] |      |      |           |     |      |           |          |
|        |           | 31:24    |             |           |      |      |           |     |      |           |          |

 Customer-specific value.

### 52.6.3 MCAN Data Bit Timing and Prescaler Register

**Name:** MCAN\_DBTP  
**Offset:** 0x0C  
**Reset:** 0x00000A33  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

The CAN bit time may be programmed in the range of 4 to 25 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 CAN core clock periods.  $t_q = (\text{DBRP} + 1)$  CAN core clock periods.

DTSEG1 is the sum of Prop\_Seg and Phase\_Seg1. DTSEG2 is Phase\_Seg2.

Therefore the length of the bit time is (programmed values)  $[\text{DTSEG1} + \text{DTSEG2} + 3] t_q$   
 or (functional values)  $[\text{Sync\_Seg} + \text{Prop\_Seg} + \text{Phase\_Seg1} + \text{Phase\_Seg2}] t_q$ .

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x00000A33 configures the MCAN for a fast bit rate of 500 kbit/s.

The bit rate configured for the CAN FD data phase via MCAN\_DBTP must be higher than or equal to the bit rate configured for the arbitration phase via MCAN\_NBTP.

**Bit 23 – TDC** Transmitter Delay Compensation  
 0 (DISABLED): Transmitter Delay Compensation disabled.  
 1 (ENABLED): Transmitter Delay Compensation enabled.

**Bits 20:16 – DBRP[4:0]** Data Bit Rate Prescaler

The value by which the peripheral clock is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

**Bits 12:8 – DTSEG1[4:0]** Data Time Segment Before Sample Point

0: Forbidden.

1 to 31: The duration of time segment is  $t_q \times (DTSEG1 + 1)$ .

**Bits 7:4 – DTSEG2[3:0]** Data Time Segment After Sample Point

The duration of time segment is  $t_q \times (DTSEG2 + 1)$ .

**Bits 2:0 – DSJW[2:0]** Data (Re) Synchronization Jump Width

The duration of a synchronization jump is  $t_q \times (DSJW + 1)$ .

### 52.6.4 MCAN Test Register

**Name:** MCAN\_TEST  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

Write access to the Test Register has to be enabled by setting bit MCAN\_CCCR.TEST to '1'.

All MCAN Test Register functions are set to their reset values when bit MCAN\_CCCR.TEST is cleared.

Loop Back mode and software control of pin CANTX are hardware test modes. Programming of TX ≠ 0 disturbs the message transfer on the CAN bus.

The reset value for MCAN\_TEST.RX is undefined.

**Bit 7 – RX** Receive Pin (read-only)  
Monitors the actual value of pin CANRX.

The reset value for this bit is undefined.

| Value | Description                             |
|-------|---|
| 0     | The CAN bus is dominant (CANRX = '0').  |
| 1     | The CAN bus is recessive (CANRX = '1'). |

**Bits 6:5 – TX[1:0]** Control of Transmit Pin (read/write)

| Value | Name                    | Description  |
|-------|-------------------------|--|
| 0     | RESET                   | Reset value, CANTX controlled by the CAN Core, updated at the end of the CAN bit time. |
| 1     | SAMPLE_POINT_MONITORING | Sample Point can be monitored at pin CANTX.  |
| 2     | DOMINANT                | Dominant ('0') level at pin CANTX.   |

# SAMA5D2 Series

## Controller Area Network (MCAN)

---

---

| Value | Name      | Description                   |
|-------|-----------|-------------------------------|
| 3     | RECESSIVE | Recessive ('1') at pin CANTX. |

**Bit 4 – LBCK** Loop Back Mode (read/write)

0 (DISABLED): Reset value. Loop Back mode is disabled.

1 (ENABLED): Loop Back mode is enabled (see [Test Modes](#)).

### 52.6.5 MCAN RAM Watchdog Register

**Name:** MCAN\_RWD  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

The RAM Watchdog monitors the Message RAM response time. A Message RAM access via the MCAN's Generic Master Interface starts the Message RAM Watchdog Counter with the value configured by MCAN\_RWD.WDC. The counter is reloaded with MCAN\_RWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MCAN\_IR.WDI is set. The RAM Watchdog Counter is clocked by the system bus clock (peripheral clock).

|        |      |     |      |      |     |     |      |      |
| Bit    | 7    | 6   | 5    | 4    | 3   | 2   | 1    | 0    |
|        | TEST | DAR | MON  | CSR  | CSA | ASM | CCE  | INIT |
| Access | R/W  | R/W | R/W  | R/W  | R   | R/W | R/W  | R/W  |
| Reset  | 0    | 0   | 0    | 0    | 0   | 0   | 0    | 1    |

**Bit 14 – TXP** Transmit Pause (read/write, write protection)

If this bit is set, the MCAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see [Tx Handling](#)).

| Value | Description              |
|-------|--------------------------|
| 0     | Transmit pause disabled. |
| 1     | Transmit pause enabled.  |

**Bit 13 – EFBI** Edge Filtering during Bus Integration (read/write, write protection)

| Value | Description   |
|-------|---|
| 0     | Edge filtering is disabled.   |
| 1     | Edge filtering is enabled. Two consecutive dominant tq required to detect an edge for hard synchronization. |

**Bit 12 – PXHD** Protocol Exception Event Handling (read/write, write protection)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Protocol exception handling enabled.  |
| 1     | Protocol exception handling disabled. |

**Bit 9 – BRSE** Bit Rate Switching Enable (read/write, write protection)

0 (DISABLED): Bit rate switching for transmissions disabled.

1 (ENABLED): Bit rate switching for transmissions enabled.

**Bit 8 – FDOE** CAN FD Operation Enable (read/write, write protection)

0 (DISABLED): FD operation disabled.

1 (ENABLED): FD operation enabled.

**Bit 7 – TEST** Test Mode Enable (read/write, write protection against '1')

0 (DISABLED): Normal operation, MCAN\_TEST register holds reset values.

1 (ENABLED): Test mode, write access to MCAN\_TEST register enabled.

**Bit 6 – DAR** Disable Automatic Retransmission (read/write, write protection)

0 (AUTO\_RETX): Automatic retransmission of messages not transmitted successfully enabled.

1 (NO\_AUTO\_RETX): Automatic retransmission disabled.

**Bit 5 – MON** Bus Monitoring Mode (read/write, write protection against '1')

0 (DISABLED): Bus Monitoring mode is disabled.

1 (ENABLED): Bus Monitoring mode is enabled.

**Bit 4 – CSR** Clock Stop Request (read/write)

0 (NO\_CLOCK\_STOP): No clock stop is requested.

1 (CLOCK\_STOP): Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.

**Bit 3 – CSA** Clock Stop Acknowledge (read-only)

| Value | Description  |
|-------|--|
| 0     | No clock stop acknowledged.  |
| 1     | MCAN may be set in power down by stopping the peripheral clock and the CAN core clock. |

**Bit 2 – ASM** Restricted Operation Mode (read/write, write protection against '1')

For a description of the Restricted Operation mode see [Restricted Operation Mode](#).

0 (NORMAL): Normal CAN operation.

1 (RESTRICTED): Restricted Operation mode active.

**Bit 1 – CCE** Configuration Change Enable (read/write, write protection)

0 (PROTECTED): The processor has no write access to the protected configuration registers.

1 (CONFIGURABLE): The processor has write access to the protected configuration registers (while MCAN\_CCCR.INIT = '1').

**Bit 0 – INIT** Initialization (read/write)

Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to ensure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

0 (DISABLED): Normal operation.

1 (ENABLED): Initialization is started.

### 52.6.7 MCAN Nominal Bit Timing and Prescaler Register

**Name:** MCAN\_NBTP  
**Offset:** 0x1C  
**Reset:** 0x06000A03  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN\_CCCR.

The CAN bit time may be programmed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 CAN core clock periods.  $t_q = t_{\text{core clock}} \times (\text{NBRP} + 1)$ .

NTSEG1 is the sum of Prop\_Seg and Phase\_Seg1. NTSEG2 is Phase\_Seg2.

Therefore the length of the bit time is (programmed values)  $[\text{NTSEG1} + \text{NTSEG2} + 3] t_q$   
 or (functional values)  $[\text{Sync\_Seg} + \text{Prop\_Seg} + \text{Phase\_Seg1} + \text{Phase\_Seg2}] t_q$ .

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x06000A03 configures the MCAN for a bit rate of 500 kbit/s.

|        |             |             |     |     |     |     |     |           |
|--------|-------------|-------------|-----|-----|-----|-----|-----|-----------|
| Bit    | 31          | 30          | 29  | 28  | 27  | 26  | 25  | 24        |
|        | NSJW[6:0]   |             |     |     |     |     |     | NBRP[8:8] |
| Access | R/W         | R/W         | R/W | R/W | R/W | R/W | R/W | R/W       |
| Reset  | 0           | 0           | 0   | 0   | 0   | 1   | 1   | 0         |
|        |             |             |     |     |     |     |     |           |
| Bit    | 23          | 22          | 21  | 20  | 19  | 18  | 17  | 16        |
|        | NBRP[7:0]   |             |     |     |     |     |     |           |
| Access | R/W         | R/W         | R/W | R/W | R/W | R/W | R/W | R/W       |

| Access | R/W         | R/W         | R/W | R/W | R/W | R/W | R/W | R/W       |
| Reset  | 0           | 0           | 0   | 0   | 1   | 0   | 1   | 0         |
|        |             |             |     |     |     |     |     |           |
| Bit    | 7           | 6           | 5   | 4   | 3   | 2   | 1   | 0         |
|        |             | NTSEG2[6:0] |     |     |     |     |     |           |
| Access |             | R/W         | R/W | R/W | R/W | R/W | R/W | R/W       |
| Reset  |             | 0           | 0   | 0   | 0   | 0   | 1   | 1         |

**Bits 31:25 – NSJW[6:0]** Nominal (Re) Synchronization Jump Width  
 0 to 127: The duration of a synchronization jump is  $t_q \times (\text{NSJW} + 1)$ .

**Bits 24:16 – NBRP[8:0]** Nominal Bit Rate Prescaler  
 0 to 511: The value by which the oscillator frequency is divided for generating the CAN time quanta. The CAN time is built up from a multiple of this quanta. CAN time quantum ( $t_q$ ) =  $t_{\text{core clock}} \times (\text{NBRP} + 1)$

**Bits 15:8 – NTSEG1[7:0]** Nominal Time Segment Before Sample Point

# SAMA5D2 Series

## Controller Area Network (MCAN)

| Value    | Description  |
|----------|--|
| 0        | Reserved; do not use.  |
| 1 to 255 | The duration of time segment is $t_q \times (\text{NTSEG1} + 1)$ . |

### Bits 6:0 – NTSEG2[6:0] Nominal Time Segment After Sample Point

| Value    | Description  |
|----------|--|
| 0        | Reserved; do not use.  |
| 1 to 127 | The duration of time segment is $t_q \times (\text{NTSEG2} + 1)$ . |

### 52.6.8 MCAN Timestamp Counter Configuration Register

**Name:** MCAN\_TSCC  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

For a description of the Timestamp Counter see [Timestamp Generation](#).

With CAN FD, an external counter is required for timestamp generation (TSS = 2).

**Bits 19:16 – TCP[3:0]** Timestamp Counter Prescaler

Configures the timestamp and timeout counters time unit in multiples of CAN bit times [ 1...16 ]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

**Bits 1:0 – TSS[1:0]** Timestamp Select

| Value | Name          | Description  |
|-------|---------------|--|
| 0     | ALWAYS_0      | Timestamp counter value always 0x0000                |
| 1     | TCP_INC       | Timestamp counter value incremented according to TCP |
| 2     | EXT_TIMESTAMP | External timestamp counter value used                |
| 3     | ALWAYS_0      | Timestamp counter value always 0x0000                |

### 52.6.9 MCAN Timestamp Counter Value Register

**Name:** MCAN\_TSCV  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 15:0 – TSC[15:0]** Timestamp Counter (cleared on write)

The internal/external Timestamp Counter value is captured on start of frame (both Receive and Transmit). When MCAN\_TSCC.TSS = 1, the Timestamp Counter is incremented in multiples of CAN bit times [ 1... 16 ] depending on the configuration of MCAN\_TSCC.TCP. A wrap around sets interrupt flag MCAN\_IR.TSW. Write access resets the counter to zero.

When MCAN\_TSCC.TSS = 2, TSC reflects the external Timestamp Counter value. Thus a write access has no impact.

**Note:** A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MCAN\_TSCV.

### 52.6.10 MCAN Timeout Counter Configuration Register

**Name:** MCAN\_TOCC  
**Offset:** 0x28  
**Reset:** 0xFFFF0000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

For a description of the Timeout Counter, see [Timeout Counter](#).

|        |           |     |     |     |     |          |     |      |  |
|--------|-----------|-----|-----|-----|-----|----------|-----|------|--|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26       | 25  | 24   |  |
|        | TOP[15:8] |     |     |     |     |          |     |      |  |

|        |           |     |     |     |     |          |     |      |  |
| Bit    | 23        | 22  | 21  | 20  | 19  | 18       | 17  | 16   |  |
|        | TOP[7:0]  |     |     |     |     |          |     |      |  |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W      | R/W | R/W  |  |
| Reset  | 1         | 1   | 1   | 1   | 1   | 1        | 1   | 1    |  |
|        |           |     |     |     |     |          |     |      |  |
| Bit    | 15        | 14  | 13  | 12  | 11  | 10       | 9   | 8    |  |
|        |           |     |     |     |     |          |     |      |  |
| Access |           |     |     |     |     |          |     |      |  |
| Reset  |           |     |     |     |     |          |     |      |  |
|        |           |     |     |     |     |          |     |      |  |
| Bit    | 7         | 6   | 5   | 4   | 3   | 2        | 1   | 0    |  |
|        |           |     |     |     |     | TOS[1:0] |     | ETOC |  |
| Access |           |     |     |     |     | R/W      | R/W | R/W  |  |
| Reset  |           |     |     |     |     | 0        | 0   | 0    |  |

**Bits 31:16 – TOP[15:0]** Timeout Period

Start value of the Timeout Counter (down-counter). Configures the Timeout Period.

**Bits 2:1 – TOS[1:0]** Timeout Select

When operating in Continuous mode, a write to MCAN\_TOCV presets the counter to the value configured by MCAN\_TOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN\_TOCC.TOP. Down-counting is started when the first FIFO element is stored.

| Value | Name           | Description                           |
|-------|----------------|---------------------------------------|
| 0     | CONTINUOUS     | Continuous operation.                 |
| 1     | TX_EV_TIMEOUT  | Timeout controlled by Tx Event FIFO.  |
| 2     | RX0_EV_TIMEOUT | Timeout controlled by Receive FIFO 0. |
| 3     | RX1_EV_TIMEOUT | Timeout controlled by Receive FIFO 1. |

**Bit 0 – ETOC** Enable Timeout Counter

0 (NO\_TIMEOUT): Timeout Counter disabled.

1 (TOS\_CONTROLLED): Timeout Counter enabled.

# SAMA5D2 Series

## Controller Area Network (MCAN)

---

---

For use of timeout function with CAN FD, see [Timeout Counter](#).

### 52.6.11 MCAN Timeout Counter Value Register

**Name:** MCAN\_TOCV  
**Offset:** 0x2C  
**Reset:** 0x0000FFFF  
**Property:** Read/Write

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |           |     |     |     |     |     |     |     |
| Access |           |     |     |     |     |     |     |     |
| Reset  |           |     |     |     |     |     |     |     |
|        |           |     |     |     |     |     |     |     |
| Bit    | 23        | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        |           |     |     |     |     |     |     |     |
| Access |           |     |     |     |     |     |     |     |
| Reset  |           |     |     |     |     |     |     |     |
|        |           |     |     |     |     |     |     |     |
| Bit    | 15        | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | TOC[15:8] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 1         | 1   | 1   | 1   | 1   | 1   | 1   | 1   |
|        |           |     |     |     |     |     |     |     |
| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | TOC[7:0]  |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 1         | 1   | 1   | 1   | 1   | 1   | 1   | 1   |

**Bits 15:0 – TOC[15:0]** Timeout Counter (cleared on write)  
 The Timeout Counter is decremented in multiples of CAN bit times [ 1...16 ] depending on the configuration of MCAN\_TSCC.TCP. When decremented to zero, interrupt flag MCAN\_IR.TOO is set and the Timeout Counter is stopped. Start and reset/restart conditions are configured via MCAN\_TOCC.TOS.

### 52.6.12 MCAN Error Counter Register

**Name:** MCAN\_ECR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read-only

When MCAN\_CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented.

|        |          |          |    |    |    |    |    |    |
|--------|----------|----------|----|----|----|----|----|----|
| Bit    | 31       | 30       | 29 | 28 | 27 | 26 | 25 | 24 |
|        |          |          |    |    |    |    |    |    |

| Reset  | 0        | 0        | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 23:16 – CEL[7:0]** CAN Error Logging (cleared on read)

The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at 0xFF; the next increment of TEC or REC sets interrupt flag IR.ELO.

**Bit 15 – RP** Receive Error Passive

| Value | Description   |
|-------|---|
| 0     | The Receive Error Counter is below the error passive level of 128.    |
| 1     | The Receive Error Counter has reached the error passive level of 128. |

**Bits 14:8 – REC[6:0]** Receive Error Counter

Actual state of the Receive Error Counter, values between 0 and 127.

**Bits 7:0 – TEC[7:0]** Transmit Error Counter

Actual state of the Transmit Error Counter, values between 0 and 255.

### 52.6.13 MCAN Protocol Status Register

**Name:** MCAN\_PSR  
**Offset:** 0x44  
**Reset:** 0x00000707  
**Property:** Read-only

|        |              |    |      |          |      |           |    |    |

| Access | R            | R  | R    | R        | R    |           |    |    |
| Reset  | 0            | 0  | 0    | 0        | 0    | 1         | 1  | 1  |

**Bits 22:16 – TDCV[6:0]** Transmitter Delay Compensation Value  
 0 to 127: Position of the secondary sample point, in CAN core clock periods, defined by the sum of the measured delay from CANTX to CANRX and MCAN\_TDCR.TDCO.

**Bit 14 – PXE** Protocol Exception Event (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No protocol exception event occurred since last read access |
| 1     | Protocol exception event occurred                           |

**Bit 13 – RFDF** Received a CAN FD Message (cleared on read)  
 This bit is set independently from acceptance filtering.

| Value | Description  |
|-------|--|
| 0     | Since this bit was reset by the CPU, no CAN FD message has been received |
| 1     | Message in CAN FD format with FDF flag set has been received             |

**Bit 12 – RBRS** BRS Flag of Last Received CAN FD Message (cleared on read)  
 This bit is set together with RFDF, independently from acceptance filtering.

| Value | Description   |
|-------|---|
| 0     | Last received CAN FD message did not have its BRS flag set. |

# SAMA5D2 Series

## Controller Area Network (MCAN)

| Value | Description  |
|-------|--|
| 1     | Last received CAN FD message had its BRS flag set. |

**Bit 11 – RESI** ESI Flag of Last Received CAN FD Message (cleared on read)  
This bit is set together with RFDF, independently from acceptance filtering.

| Value | Description   |
|-------|---|
| 0     | Last received CAN FD message did not have its ESI flag set. |
| 1     | Last received CAN FD message had its ESI flag set.          |

**Bits 10:8 – DLEC[2:0]** Data Phase Last Error Code (set to 111 on read)  
Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.

**Bit 7 – BO** Bus\_Off Status

| Value | Description                   |
|-------|-------------------------------|
| 0     | The MCAN is not Bus_Off.      |
| 1     | The MCAN is in Bus_Off state. |

**Bit 6 – EW** Warning Status

| Value | Description  |
|-------|--|
| 0     | Both error counters are below the Error_Warning limit of 96.             |
| 1     | At least one of error counter has reached the Error_Warning limit of 96. |

**Bit 5 – EP** Error Passive

| Value | Description  |
|-------|--|
| 0     | The MCAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected. |
| 1     | The MCAN is in the Error_Passive state.  |

**Bits 4:3 – ACT[1:0]** Activity  
Monitors the CAN communication state of the CAN module.

| Value | Name          | Description                                |
|-------|---------------|--|
| 0     | SYNCHRONIZING | Node is synchronizing on CAN communication |
| 1     | IDLE          | Node is neither receiver nor transmitter   |
| 2     | RECEIVER      | Node is operating as receiver              |
| 3     | TRANSMITTER   | Node is operating as transmitter           |

**Bits 2:0 – LEC[2:0]** Last Error Code (set to 111 on read)  
The LEC indicates the type of the last error to occur on the CAN bus. This field is cleared when a message has been transferred (reception or transmission) without error.

| Value | Name        | Description   |
|-------|-------------|---|
| 0     | NO_ERROR    | No error occurred since LEC has been reset by successful reception or transmission.                           |
| 1     | STUFF_ERROR | More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed. |

# SAMA5D2 Series

## Controller Area Network (MCAN)

| Value | Name       | Description  |
|-------|------------|--|
| 2     | FORM_ERROR | A fixed format part of a received frame has the wrong format.  |
| 3     | ACK_ERROR  | The message transmitted by the MCAN was not acknowledged by another node.  |
| 4     | BIT1_ERROR | During transmission of a message (with the exception of the arbitration field), the device tried to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.   |
| 5     | BIT0_ERROR | During transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device tried to send a dominant level (data or identifier bit logical value '0'), but the monitored bus value was recessive. During Bus_Off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the processor to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). |
| 6     | CRC_ERROR  | The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match the CRC calculated from the received data.  |
| 7     | NO_CHANGE  | Any read access to the Protocol Status Register re-initializes the LEC to '7'. When the LEC shows value '7', no CAN bus event was detected since the last processor read access to the Protocol Status Register.   |

**52.6.14 MCAN Transmitter Delay Compensation Register**

**Name:** MCAN\_TDCR  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 14:8 – TDCO[6:0]** Transmitter Delay Compensation Offset  
 0 to 127: Offset value, in CAN core clock periods, defining the distance between the measured delay from CANTX to CANRX and the secondary sample point.

**Bits 6:0 – TDCF[6:0]** Transmitter Delay Compensation Filter  
 0 to 127: defines the minimum value for the SSP position, in CAN core clock periods. Dominant edges on CANRX that would result in an earlier SSP position are ignored for transmitter delay measurement. The feature is enabled when TDCF is configured to a value greater than TDCO.

### 52.6.15 MCAN Interrupt Register

**Name:** MCAN\_IR  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read/Write

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of IE controls whether an interrupt is generated. The configuration of ILS controls on which interrupt line an interrupt is signalled.

|        |     |      |      |      |      |      |      |      |      |
|--------|-----|------|------|------|------|------|------|------|------|

| Access |     | R/W  | R/W  |      |      | R/W  | R/W  | R/W  | R/W  |
| Reset  |     | 0    | 0    |      |      | 0    | 0    | 0    | 0    |
|        |     |      |      |      |      |      |      |      |      |
|        | Bit | 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    |
|        |     | TEFL | TEFF | TEFW | TEFN | TFE  | TCF  | TC   | HPM  |
| Access |     | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  |
| Reset  |     | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |
|        |     |      |      |      |      |      |      |      |      |
|        | Bit | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
|        |     | RF1L | RF1F | RF1W | RF1N | RF0L | RF0F | RF0W | RF0N |
| Access |     | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  | R/W  |
| Reset  |     | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

#### Bit 29 – ARA Access to Reserved Address

| Value | Description                            |
|-------|--|
| 0     | No access to reserved address occurred |
| 1     | Access to reserved address occurred    |

#### Bit 28 – PED Protocol Error in Data Phase

| Value | Description   |
|-------|---|
| 0     | No protocol error in data phase   |
| 1     | Protocol error in data phase detected (MCAN_PSR.DLEC differs from 0 or 7) |

#### Bit 27 – PEA Protocol Error in Arbitration Phase

| Value | Description   |
|-------|---|
| 0     | No protocol error in arbitration phase  |
| 1     | Protocol error in arbitration phase detected (MCAN_PSR.LEC differs from 0 or 7) |

**Bit 26 – WDI** Watchdog Interrupt

| Value | Description                                      |
|-------|--|
| 0     | No Message RAM Watchdog event occurred.          |
| 1     | Message RAM Watchdog event due to missing READY. |

**Bit 25 – BO** Bus\_Off Status

| Value | Description               |
|-------|---------------------------|
| 0     | Bus_Off status unchanged. |
| 1     | Bus_Off status changed.   |

**Bit 24 – EW** Warning Status

| Value | Description                     |
|-------|---------------------------------|
| 0     | Error_Warning status unchanged. |
| 1     | Error_Warning status changed.   |

**Bit 23 – EP** Error Passive

| Value | Description                     |
|-------|---------------------------------|
| 0     | Error_Passive status unchanged. |
| 1     | Error_Passive status changed.   |

**Bit 22 – ELO** Error Logging Overflow

| Value | Description                                     |
|-------|---|
| 0     | CAN Error Logging Counter did not overflow.     |
| 1     | Overflow of CAN Error Logging Counter occurred. |

**Bit 19 – DRX** Message stored to Dedicated Receive Buffer

The flag is set whenever a received message has been stored into a dedicated Receive Buffer.

| Value | Description   |
|-------|---|
| 0     | No Receive Buffer updated.                                  |
| 1     | At least one received message stored into a Receive Buffer. |

**Bit 18 – TOO** Timeout Occurred

| Value | Description      |
|-------|------------------|
| 0     | No timeout.      |
| 1     | Timeout reached. |

**Bit 17 – MRAF** Message RAM Access Failure

The flag is set, when the Rx Handler

- has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message.
- was not able to write a message to the Message RAM. In this case message storage is aborted.

In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Receive Buffer is not set, a partly stored message is overwritten when the next message is stored to this location.

The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the MCAN is switched into Restricted Operation mode (see [Restricted Operation Mode](#)). To leave Restricted Operation mode, the processor has to reset MCAN\_CCCR.ASM.

| Value | Description                             |
|-------|---|
| 0     | No Message RAM access failure occurred. |
| 1     | Message RAM access failure occurred.    |

### Bit 16 – TSW Timestamp Wraparound

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No timestamp counter wrap-around. |
| 1     | Timestamp counter wrapped around. |

### Bit 15 – TEFL Tx Event FIFO Element Lost

| Value | Description   |
|-------|---|
| 0     | No Tx Event FIFO element lost.  |
| 1     | Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero. |

### Bit 14 – TEFF Tx Event FIFO Full

| Value | Description             |
|-------|-------------------------|
| 0     | Tx Event FIFO not full. |
| 1     | Tx Event FIFO full.     |

### Bit 13 – TEFW Tx Event FIFO Watermark Reached

| Value | Description                                 |
|-------|---|
| 0     | Tx Event FIFO fill level below watermark.   |
| 1     | Tx Event FIFO fill level reached watermark. |

### Bit 12 – TEFN Tx Event FIFO New Entry

| Value | Description                             |
|-------|---|
| 0     | Tx Event FIFO unchanged.                |
| 1     | Tx Handler wrote Tx Event FIFO element. |

### Bit 11 – TFE Tx FIFO Empty

| Value | Description        |
|-------|--------------------|
| 0     | Tx FIFO non-empty. |
| 1     | Tx FIFO empty.     |

### Bit 10 – TCF Transmission Cancellation Finished

| Value | Description                            |
|-------|--|
| 0     | No transmission cancellation finished. |
| 1     | Transmission cancellation finished.    |

### Bit 9 – TC Transmission Completed

| Value | Description                |
|-------|----------------------------|
| 0     | No transmission completed. |
| 1     | Transmission completed.    |

**Bit 8 – HPM** High Priority Message

| Value | Description                        |
|-------|------------------------------------|
| 0     | No high priority message received. |
| 1     | High priority message received.    |

**Bit 7 – RF1L** Receive FIFO 1 Message Lost

| Value | Description   |
|-------|---|
| 0     | No Receive FIFO 1 message lost.   |
| 1     | Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero. |

**Bit 6 – RF1F** Receive FIFO 1 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 1 not full. |
| 1     | Receive FIFO 1 full.     |

**Bit 5 – RF1W** Receive FIFO 1 Watermark Reached

| Value | Description                                  |
|-------|--|
| 0     | Receive FIFO 1 fill level below watermark.   |
| 1     | Receive FIFO 1 fill level reached watermark. |

**Bit 4 – RF1N** Receive FIFO 1 New Message

| Value | Description                               |
|-------|---|
| 0     | No new message written to Receive FIFO 1. |
| 1     | New message written to Receive FIFO 1.    |

**Bit 3 – RF0L** Receive FIFO 0 Message Lost

| Value | Description   |
|-------|---|
| 0     | No Receive FIFO 0 message lost.   |
| 1     | Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero. |

**Bit 2 – RF0F** Receive FIFO 0 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 0 not full. |
| 1     | Receive FIFO 0 full.     |

**Bit 1 – RF0W** Receive FIFO 0 Watermark Reached

| Value | Description                                  |
|-------|--|
| 0     | Receive FIFO 0 fill level below watermark.   |
| 1     | Receive FIFO 0 fill level reached watermark. |

**Bit 0 – RF0N** Receive FIFO 0 New Message

| <b>Value</b> | <b>Description</b>                        |
|--------------|---|
| 0            | No new message written to Receive FIFO 0. |
| 1            | New message written to Receive FIFO 0.    |

### 52.6.16 MCAN Interrupt Enable Register

**Name:** MCAN\_IE  
**Offset:** 0x54  
**Reset:** 0x00000000  
**Property:** Read/Write

The following configuration values are valid for all listed bit names of this register:

0: Disables the corresponding interrupt.

1: Enables the corresponding interrupt.

|        |       |       |       |       |       |       |       |       |
|--------|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit    | 31    | 30    | 29    | 28    | 27    | 26    | 25    | 24    |
|        |       |       | ARAE  | PEDE  | PEAE  | WDIE  | BOE   | EWE   |
| Access |       |       | R/W   | R/W   | R/W   | R/W   | R/W   | R/W   |
| Reset  |       |       | 0     | 0     | 0     | 0     | 0     | 0     |
|        |       |       |       |       |       |       |       |       |
| Bit    | 23    | 22    | 21    | 20    | 19    | 18    | 17    | 16    |
|        | EPE   | ELOE  |       |       | DRXE  | TOOE  | MRAFE | TSWE  |
| Access | R/W   | R/W   |       |       | R/W   | R/W   | R/W   | R/W   |
| Reset  | 0     | 0     |       |       | 0     | 0     | 0     | 0     |

- Bit 1 – RF0WE** Receive FIFO 0 Watermark Reached Interrupt Enable
- Bit 0 – RF0NE** Receive FIFO 0 New Message Interrupt Enable

### 52.6.17 MCAN Interrupt Line Select Register

**Name:** MCAN\_ILS  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines.

0: Interrupt assigned to interrupt line MCAN\_INT0.

1: Interrupt assigned to interrupt line MCAN\_INT1.

|        |       |       |       |       |       |       |       |       |

- Bit 1 – RF0WL** Receive FIFO 0 Watermark Reached Interrupt Line
- Bit 0 – RF0NL** Receive FIFO 0 New Message Interrupt Line

### 52.6.18 MCAN Interrupt Line Enable

**Name:** MCAN\_ILE  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

Each of the two interrupt lines to the processor can be enabled/disabled separately by programming bits EINT0 and EINT1.

#### Bit 1 – EINT1 Enable Interrupt Line 1

| Value | Description                        |
|-------|------------------------------------|
| 0     | Interrupt line MCAN_INT1 disabled. |
| 1     | Interrupt line MCAN_INT1 enabled.  |

#### Bit 0 – EINT0 Enable Interrupt Line 0

| Value | Description                        |
|-------|------------------------------------|
| 0     | Interrupt line MCAN_INT0 disabled. |
| 1     | Interrupt line MCAN_INT0 enabled.  |

### 52.6.19 MCAN Global Filter Configuration

**Name:** MCAN\_GFC  
**Offset:** 0x80  
**Reset:** 0x00000000  
**Property:** Read/Write

Global settings for Message ID filtering. The Global Filter Configuration controls the filter path for standard and extended messages as illustrated in [Standard Message ID Filter Path](#) and [Extended Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

**Bits 5:4 – ANFS[1:0]** Accept Non-matching Frames Standard

Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated.

| Value | Name      | Description         |
|-------|-----------|---------------------|
| 0     | RX_FIFO_0 | Accept in Rx FIFO 0 |
| 1     | RX_FIFO_1 | Accept in Rx FIFO 1 |
| 2-3   | REJECTED  | Message rejected    |

**Bits 3:2 – ANFE[1:0]** Accept Non-matching Frames Extended

Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated.

| Value | Name      | Description         |
|-------|-----------|---------------------|
| 0     | RX_FIFO_0 | Accept in Rx FIFO 0 |
| 1     | RX_FIFO_1 | Accept in Rx FIFO 1 |
| 2-3   | REJECTED  | Message rejected    |

**Bit 1 – RRFS** Reject Remote Frames Standard

0 (FILTER): Filter remote frames with 11-bit standard IDs.

1 (REJECT): Reject all remote frames with 11-bit standard IDs.

**Bit 0 – RRFE** Reject Remote Frames Extended

0 (FILTER): Filter remote frames with 29-bit extended IDs.

1 (REJECT): Reject all remote frames with 29-bit extended IDs.

### 52.6.20 MCAN Standard ID Filter Configuration

**Name:** MCAN\_SIDFC  
**Offset:** 0x84  
**Reset:** 0x00000000  
**Property:** Read/Write

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as illustrated in [Standard Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |             |     |     |     |     |     |     |     |
| Access |             |     |     |     |     |     |     |     |
| Reset  |             |     |     |     |     |     |     |     |
|        |             |     |     |     |     |     |     |     |
| Bit    | 23          | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | LSS[7:0]    |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |             |     |     |     |     |     |     |     |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | FLSSA[13:6] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |             |     |     |     |     |     |     |     |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | FLSSA[5:0]  |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W |     |     |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   |     |     |

**Bits 23:16 – LSS[7:0]** List Size Standard  
 >128: Values greater than 128 are interpreted as 128.

| Value | Description                                    |
|-------|--|
| 0     | No standard Message ID filter.                 |
| 1-128 | Number of standard Message ID filter elements. |

**Bits 15:2 – FLSSA[13:0]** Filter List Standard Start Address  
 Start address of standard Message ID filter list (32-bit word address, see [Message RAM Configuration](#)).

Write FLSSA with the bits [15:2] of the 32-bit address.

### 52.6.21 MCAN Extended ID Filter Configuration

**Name:** MCAN\_XIDFC  
**Offset:** 0x88  
**Reset:** 0x00000000  
**Property:** Read/Write

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages as described in [Extended Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |             |     |          |     |     |     |     |     |  |
|--------|-------------|-----|----------|-----|-----|-----|-----|-----|--|
| Bit    | 31          | 30  | 29       | 28  | 27  | 26  | 25  | 24  |  |
|        |             |     |          |     |     |     |     |     |  |
| Access |             |     |          |     |     |     |     |     |  |
| Reset  |             |     |          |     |     |     |     |     |  |
|        |             |     |          |     |     |     |     |     |  |
| Bit    | 23          | 22  | 21       | 20  | 19  | 18  | 17  | 16  |  |
|        |             |     | LSE[6:0] |     |     |     |     |     |  |
| Access |             | R/W | R/W      | R/W | R/W | R/W | R/W | R/W |  |
| Reset  |             | 0   | 0        | 0   | 0   | 0   | 0   | 0   |  |
|        |             |     |          |     |     |     |     |     |  |
| Bit    | 15          | 14  | 13       | 12  | 11  | 10  | 9   | 8   |  |
|        | FLESA[13:6] |     |          |     |     |     |     |     |  |
| Access | R/W         | R/W | R/W      | R/W | R/W | R/W | R/W | R/W |  |
| Reset  | 0           | 0   | 0        | 0   | 0   | 0   | 0   | 0   |  |
|        |             |     |          |     |     |     |     |     |  |
| Bit    | 7           | 6   | 5        | 4   | 3   | 2   | 1   | 0   |  |
|        | FLESA[5:0]  |     |          |     |     |     |     |     |  |
| Access | R/W         | R/W | R/W      | R/W | R/W | R/W |     |     |  |
| Reset  | 0           | 0   | 0        | 0   | 0   | 0   |     |     |  |

#### Bits 22:16 – LSE[6:0] List Size Extended

| Value | Description                                    |
|-------|--|
| 0     | No extended Message ID filter.                 |
| 1–64  | Number of extended Message ID filter elements. |
| >64   | Values greater than 64 are interpreted as 64.  |

#### Bits 15:2 – FLESA[13:0] Filter List Extended Start Address

Start address of extended Message ID filter list (32-bit word address, see [Message RAM Configuration](#)).

Write FLESA with the bits [15:2] of the 32-bit address.

### 52.6.22 MCAN Extended ID AND Mask

**Name:** MCAN\_XIDAM  
**Offset:** 0x90  
**Reset:** 0x1FFFFFFF  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | EIDM[28:24] |     |     |     |     |     |     |     |
| Access |             |     |     | R/W | R/W | R/W | R/W | R/W |
| Reset  |             |     |     | 1   | 1   | 1   | 1   | 1   |
|        |             |     |     |     |     |     |     |     |

| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 1           | 1   | 1   | 1   | 1   | 1   | 1   | 1   |
|        |             |     |     |     |     |     |     |     |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | EIDM[15:8]  |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 1           | 1   | 1   | 1   | 1   | 1   | 1   | 1   |
|        |             |     |     |     |     |     |     |     |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | EIDM[7:0]   |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 1           | 1   | 1   | 1   | 1   | 1   | 1   | 1   |

#### Bits 28:0 – EIDM[28:0] Extended ID Mask

For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

### 52.6.23 MCAN High Priority Message Status

**Name:** MCAN\_HPMS  
**Offset:** 0x94  
**Reset:** 0x00000000  
**Property:** Read-only

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

**Bit 15 – FLST** Filter List  
Indicates the filter list of the matching filter element.

| Value | Description          |
|-------|----------------------|
| 0     | Standard filter list |
| 1     | Extended filter list |

**Bits 14:8 – FIDX[6:0]** Filter Index  
Index of matching filter element. Range is 0 to MCAN\_SIDFC.LSS - 1 resp. MCAN\_XIDFC.LSE - 1.

**Bits 7:6 – MSI[1:0]** Message Storage Indicator

| Value | Name        | Description               |
|-------|-------------|---------------------------|
| 0     | NO_FIFO_SEL | No FIFO selected.         |
| 1     | LOST        | FIFO message lost.        |
| 2     | FIFO_0      | Message stored in FIFO 0. |
| 3     | FIFO_1      | Message stored in FIFO 1. |

**Bits 5:0 – BIDX[5:0]** Buffer Index

Index of Receive FIFO element to which the message was stored. Only valid when MSI[1] = '1'.

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – NDx New Data**

The register holds the New Data flags of Receive Buffers 0 to 31. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

| Value | Description                             |
|-------|---|
| 0     | Receive Buffer not updated              |
| 1     | Receive Buffer updated from new message |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – NDx New Data**

The register holds the New Data flags of Receive Buffers 32 to 63. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

| Value | Description                              |
|-------|--|
| 0     | Receive Buffer not updated.              |
| 1     | Receive Buffer updated from new message. |

### 52.6.26 MCAN Receive FIFO 0 Configuration

**Name:** MCAN\_RXF0C  
**Offset:** 0xA0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |            |     |           |     |     |     |     |     |  |

| Reset  | 0          | 0   | 0         | 0   | 0   | 0   |     |     |  |

#### Bit 31 – F0OM FIFO 0 Operation Mode

FIFO 0 can be operated in Blocking or in Overwrite mode (see [Rx FIFOs](#)).

| Value | Description            |
|-------|------------------------|
| 0     | FIFO 0 Blocking mode.  |
| 1     | FIFO 0 Overwrite mode. |

#### Bits 30:24 – F0WM[6:0] Receive FIFO 0 Watermark

| Value | Description  |
|-------|--|
| 0     | Watermark interrupt disabled.                                |
| 1–64  | Level for Receive FIFO 0 watermark interrupt (MCAN_IR.RF0W). |
| >64   | Watermark interrupt disabled.                                |

#### Bits 22:16 – F0S[6:0] Receive FIFO 0 Size

The Receive FIFO 0 elements are indexed from 0 to F0S-1.

| Value | Description                                   |
|-------|---|
| 0     | No Receive FIFO 0                             |
| 1–64  | Number of Receive FIFO 0 elements.            |
| >64   | Values greater than 64 are interpreted as 64. |

**Bits 15:2 – F0SA[13:0]** Receive FIFO 0 Start Address

Start address of Receive FIFO 0 in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write F0SA with the bits [15:2] of the 32-bit address.

### 52.6.27 MCAN Receive FIFO 0 Status

**Name:** MCAN\_RXF0S  
**Offset:** 0xA4  
**Reset:** 0x00000000  
**Property:** Read-only

| Reset  |           | 0  | 0         | 0  | 0  | 0  | 0    | 0   |  |

**Bit 25 – RF0L** Receive FIFO 0 Message Lost

This bit is a copy of interrupt flag MCAN\_IR.RF0L. When MCAN\_IR.RF0L is reset, this bit is also reset.

Overwriting the oldest message when MCAN\_RXF0C.F0OM = '1' will not set this flag.

| Value | Description  |
|-------|--|
| 0     | No Receive FIFO 0 message lost   |
| 1     | Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero |

**Bit 24 – F0F** Receive FIFO 0 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 0 not full. |
| 1     | Receive FIFO 0 full.     |

**Bits 21:16 – F0PI[5:0]** Receive FIFO 0 Put Index

Receive FIFO 0 write index pointer, range 0 to 63.

**Bits 13:8 – F0GI[5:0]** Receive FIFO 0 Get Index

Receive FIFO 0 read index pointer, range 0 to 63.

**Bits 6:0 – F0FL[6:0]** Receive FIFO 0 Fill Level

Number of elements stored in Receive FIFO 0, range 0 to 64.

### 52.6.28 MCAN Receive FIFO 0 Acknowledge

**Name:** MCAN\_RXF0A  
**Offset:** 0xA8  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 5:0 – F0AI[5:0]** Receive FIFO 0 Acknowledge Index

After the processor has read a message or a sequence of messages from Receive FIFO 0 it has to write the buffer index of the last element read from Receive FIFO 0 to F0AI. This will set the Receive FIFO 0 Get Index MCAN\_RXF0S.F0GI to F0AI + 1 and update the FIFO 0 Fill Level MCAN\_RXF0S.F0FL.

**52.6.29 MCAN Receive Buffer Configuration**

**Name:** MCAN\_RXBC  
**Offset:** 0xAC  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 15:2 – RBSA[13:0]** Receive Buffer Start Address  
 Configures the start address of the Receive Buffers section in the Message RAM (32-bit word address, see [Message RAM Configuration](#)). Also used to reference debug messages A,B,C.  
 Write RBSA with the bits [15:2] of the 32-bit address.

### 52.6.30 MCAN Receive FIFO 1 Configuration

**Name:** MCAN\_RXF1C  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |            |     |     |     |     |     |     |     |           |

| Reset  | 0          | 0   | 0   | 0   | 0   | 0   |     |     |           |

#### Bit 31 – F1OM FIFO 1 Operation Mode

FIFO 1 can be operated in Blocking or in Overwrite mode (see [Rx FIFOs](#)).

| Value | Description            |
|-------|------------------------|
| 0     | FIFO 1 Blocking mode.  |
| 1     | FIFO 1 Overwrite mode. |

#### Bits 30:24 – F1WM[6:0] Receive FIFO 1 Watermark

| Value | Description  |
|-------|--|
| 0     | Watermark interrupt disabled                                 |
| 1–64  | Level for Receive FIFO 1 watermark interrupt (MCAN_IR.RF1W). |
| >64   | Watermark interrupt disabled.                                |

#### Bits 22:16 – F1S[6:0] Receive FIFO 1 Size

The elements in Receive FIFO 1 are indexed from 0 to F1S - 1.

| Value | Description                                   |
|-------|---|
| 0     | No Receive FIFO 1                             |
| 1–64  | Number of elements in Receive FIFO 1.         |
| >64   | Values greater than 64 are interpreted as 64. |

**Bits 15:2 – F1SA[13:0]** Receive FIFO 1 Start Address

Start address of Receive FIFO 1 in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write F1SA with the bits [15:2] of the 32-bit address.

### 52.6.31 MCAN Receive FIFO 1 Status

**Name:** MCAN\_RXF1S  
**Offset:** 0xB4  
**Reset:** 0x00000000  
**Property:** Read-only

|        |          |           |           |    |    |    |      |     |  |
|--------|----------|-----------|-----------|----|----|----|------|-----|--|
| Bit    | 31       | 30        | 29        | 28 | 27 | 26 | 25   | 24  |  |

|        |          |           | F1PI[5:0] |    |    |    |      |     |  |
| Access |          |           | R         | R  | R  | R  | R    | R   |  |
| Reset  |          |           | 0         | 0  | 0  | 0  | 0    | 0   |  |
|        |          |           |           |    |    |    |      |     |  |
| Bit    | 15       | 14        | 13        | 12 | 11 | 10 | 9    | 8   |  |
|        |          |           | F1GI[5:0] |    |    |    |      |     |  |
| Access |          |           | R         | R  | R  | R  | R    | R   |  |
| Reset  |          |           | 0         | 0  | 0  | 0  | 0    | 0   |  |
|        |          |           |           |    |    |    |      |     |  |
| Bit    | 7        | 6         | 5         | 4  | 3  | 2  | 1    | 0   |  |
|        |          | F1FL[6:0] |           |    |    |    |      |     |  |
| Access |          | R         | R         | R  | R  | R  | R    | R   |  |
| Reset  |          | 0         | 0         | 0  | 0  | 0  | 0    | 0   |  |

#### Bits 31:30 – DMS[1:0] Debug Message Status

| Value | Name    | Description   |
|-------|---------|---|
| 0     | IDLE    | Idle state, wait for reception of debug messages, DMA request is cleared. |
| 1     | MSG_A   | Debug message A received.   |
| 2     | MSG_AB  | Debug messages A, B received.   |
| 3     | MSG_ABC | Debug messages A, B, C received, DMA request is set.                      |

#### Bit 25 – RF1L Receive FIFO 1 Message Lost

This bit is a copy of interrupt flag IR.RF1L. When IR.RF1L is reset, this bit is also reset.

Overwriting the oldest message when MCAN\_RXF1C.F1OM = '1' will not set this flag.

| Value | Description   |
|-------|---|
| 0     | No Receive FIFO 1 message lost.   |
| 1     | Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero. |

#### Bit 24 – F1F Receive FIFO 1 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 1 not full. |
| 1     | Receive FIFO 1 full.     |

**Bits 21:16 – F1PI[5:0]** Receive FIFO 1 Put Index  
Receive FIFO 1 write index pointer, range 0 to 63.

**Bits 13:8 – F1GI[5:0]** Receive FIFO 1 Get Index  
Receive FIFO 1 read index pointer, range 0 to 63.

**Bits 6:0 – F1FL[6:0]** Receive FIFO 1 Fill Level  
Number of elements stored in Receive FIFO 1, range 0 to 64.

### 52.6.32 MCAN Receive FIFO 1 Acknowledge

**Name:** MCAN\_RXF1A  
**Offset:** 0xB8  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 5:0 – F1AI[5:0]** Receive FIFO 1 Acknowledge Index

After the processor has read a message or a sequence of messages from Receive FIFO 1 it has to write the buffer index of the last element read from Receive FIFO 1 to F1AI. This will set the Receive FIFO 1 Get Index MCAN\_RXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MCAN\_RXF1S.F1FL.

### 52.6.33 MCAN Receive Buffer / FIFO Element Size Configuration

**Name:** MCAN\_RXESC  
**Offset:** 0xBC  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Configures the number of data bytes belonging to a Receive Buffer / Receive FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Receive Buffer or Receive FIFO, only the number of bytes as configured by MCAN\_RXESC are stored to the Receive Buffer resp. Receive FIFO element. The rest of the frame's data field is ignored.

#### Bits 10:8 – RBDS[2:0] Receive Buffer Data Field Size

| Value | Name    | Description        |
|-------|---------|--------------------|
| 0     | 8_BYTE  | 8-byte data field  |
| 1     | 12_BYTE | 12-byte data field |
| 2     | 16_BYTE | 16-byte data field |
| 3     | 20_BYTE | 20-byte data field |
| 4     | 24_BYTE | 24-byte data field |
| 5     | 32_BYTE | 32-byte data field |
| 6     | 48_BYTE | 48-byte data field |
| 7     | 64_BYTE | 64-byte data field |

#### Bits 6:4 – F1DS[2:0] Receive FIFO 1 Data Field Size

# SAMA5D2 Series

## Controller Area Network (MCAN)

| Value | Name    | Description        |
|-------|---------|--------------------|
| 0     | 8_BYTE  | 8-byte data field  |
| 1     | 12_BYTE | 12-byte data field |
| 2     | 16_BYTE | 16-byte data field |
| 3     | 20_BYTE | 20-byte data field |
| 4     | 24_BYTE | 24-byte data field |
| 5     | 32_BYTE | 32-byte data field |
| 6     | 48_BYTE | 48-byte data field |
| 7     | 64_BYTE | 64-byte data field |

### Bits 2:0 – F0DS[2:0] Receive FIFO 0 Data Field Size

| Value | Name    | Description        |
|-------|---------|--------------------|
| 0     | 8_BYTE  | 8-byte data field  |
| 1     | 12_BYTE | 12-byte data field |
| 2     | 16_BYTE | 16-byte data field |
| 3     | 20_BYTE | 20-byte data field |
| 4     | 24_BYTE | 24-byte data field |
| 5     | 32_BYTE | 32-byte data field |
| 6     | 48_BYTE | 48-byte data field |
| 7     | 64_BYTE | 64-byte data field |

### 52.6.34 MCAN Tx Buffer Configuration

**Name:** MCAN\_TXBC  
**Offset:** 0xC0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

The sum of TFQS and NDTB may not exceed 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

|        |     |            |      |           |     |     |     |     |     |
|--------|-----|------------|------|-----------|-----|-----|-----|-----|-----|
|        | Bit | 31         | 30   | 29        | 28  | 27  | 26  | 25  | 24  |
|        |     |            | TFQM | TFQS[5:0] |     |     |     |     |     |

| Reset  |     |            | 0    | 0         | 0   | 0   | 0   | 0   | 0   |
|        | Bit | 23         | 22   | 21        | 20  | 19  | 18  | 17  | 16  |
|        |     |            |      | NDTB[5:0] |     |     |     |     |     |
| Access |     |            |      | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  |     |            |      | 0         | 0   | 0   | 0   | 0   | 0   |
|        | Bit | 15         | 14   | 13        | 12  | 11  | 10  | 9   | 8   |
|        |     | TBSA[13:6] |      |           |     |     |     |     |     |
| Access |     | R/W        | R/W  | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  |     | 0          | 0    | 0         | 0   | 0   | 0   | 0   | 0   |
|        | Bit | 7          | 6    | 5         | 4   | 3   | 2   | 1   | 0   |
|        |     | TBSA[5:0]  |      |           |     |     |     |     |     |
| Access |     | R/W        | R/W  | R/W       | R/W | R/W | R/W |     |     |
| Reset  |     | 0          | 0    | 0         | 0   | 0   | 0   |     |     |

#### Bit 30 – TFQM Tx FIFO/Queue Mode

| Value | Description         |
|-------|---------------------|
| 0     | Tx FIFO operation.  |
| 1     | Tx Queue operation. |

#### Bits 29:24 – TFQS[5:0] Transmit FIFO/Queue Size

| Value | Description                                   |
|-------|---|
| 0     | No Tx FIFO/Queue.                             |
| 1–32  | Number of Tx Buffers used for Tx FIFO/Queue.  |
| >32   | Values greater than 32 are interpreted as 32. |

#### Bits 21:16 – NDTB[5:0] Number of Dedicated Transmit Buffers

| Value | Description                                   |
|-------|---|
| 0     | No dedicated Tx Buffers.                      |
| 1–32  | Number of dedicated Tx Buffers.               |
| >32   | Values greater than 32 are interpreted as 32. |

**Bits 15:2 – TBSA[13:0]** Tx Buffers Start Address

Start address of Tx Buffers section in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write TBSA with the bits [15:2] of the 32-bit address.

### 52.6.35 MCAN Tx FIFO/Queue Status

**Name:** MCAN\_TXFQS  
**Offset:** 0xC4  
**Reset:** 0x00000000  
**Property:** Read-only

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MCAN\_TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MCAN\_TXBRP not yet updated).

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers. Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

|        |     |    |    |           |            |    |    |    |    |  |
|--------|-----|----|----|-----------|------------|----|----|----|----|--|
|        | Bit | 31 | 30 | 29        | 28         | 27 | 26 | 25 | 24 |  |

#### Bit 21 – TFQF Tx FIFO/Queue Full

| Value | Description             |
|-------|-------------------------|
| 0     | Tx FIFO/Queue not full. |
| 1     | Tx FIFO/Queue full.     |

#### Bits 20:16 – TFQPI[4:0] Tx FIFO/Queue Put Index

Tx FIFO/Queue write index pointer, range 0 to 31.

#### Bits 12:8 – TFGI[4:0] Tx FIFO Get Index

Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MCAN\_TXBC.TFQM = '1').

**Bits 5:0 – TFFL[5:0]** Tx FIFO Free Level

Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (MCAN\_TXBC.TFQM = '1').

### 52.6.36 MCAN Tx Buffer Element Size Configuration

**Name:** MCAN\_TXESC  
**Offset:** 0xC8  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size MCAN\_TXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as "0xCC" (padding bytes).

#### Bits 2:0 – TBDS[2:0] Tx Buffer Data Field Size

| Value | Name    | Description         |
|-------|---------|---------------------|
| 0     | 8_BYTE  | 8-byte data field   |
| 1     | 12_BYTE | 12-byte data field  |
| 2     | 16_BYTE | 16-byte data field  |
| 3     | 20_BYTE | 20-byte data field  |
| 4     | 24_BYTE | 24-byte data field  |
| 5     | 32_BYTE | 32-byte data field  |
| 6     | 48_BYTE | 48- byte data field |
| 7     | 64_BYTE | 64-byte data field  |

### 52.6.37 MCAN Transmit Buffer Request Pending

**Name:** MCAN\_TXBRP  
**Offset:** 0xCC  
**Reset:** 0x00000000  
**Property:** Read-only

MCAN\_TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MCAN\_TXBRP bit is reset.

| Bit    | 31    | 30    | 29    | 28    | 27    | 26    | 25    | 24    |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – TRPx** Transmission Request Pending for Buffer x

Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MCAN\_TXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MCAN\_TXBCR.

TXBRP bits are set only for those Tx Buffers configured via MCAN\_TXBC. After a MCAN\_TXBRP bit has been set, a Tx scan (see [Tx Handling](#)) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).

A cancellation request resets the corresponding transmission request pending bit of register MCAN\_TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding TXBRP bit has been reset.

After a cancellation has been requested, a finished cancellation is signalled via MCAN\_TXBCF.

- after successful transmission together with the corresponding MCAN\_TXBTO bit.
- when the transmission has not yet been started at the point of cancellation.

# SAMA5D2 Series

## Controller Area Network (MCAN)

---

---

- when the transmission has been aborted due to lost arbitration.
- when an error occurred during frame transmission.

In DAR mode, all transmissions are automatically cancelled if they are not successful. The corresponding MCAN\_TXBCF bit is set for all unsuccessful transmissions.

| Value | Description                     |
|-------|---------------------------------|
| 0     | No transmission request pending |
| 1     | Transmission request pending    |

### 52.6.38 MCAN Transmit Buffer Add Request

**Name:** MCAN\_TXBAR  
**Offset:** 0xD0  
**Reset:** 0x00000000  
**Property:** Read/Write

If an add request is applied for a Transmit Buffer with pending transmission request (corresponding MCAN\_TXBRP bit already set), this Add Request is ignored.

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – ARx Add Request for Transmit Buffer x**

Each Transmit Buffer has its own Add Request bit. Writing a '1' will set the corresponding Add Request bit; writing a '0' has no impact. This enables the processor to set transmission requests for multiple Transmit Buffers with one write to MCAN\_TXBAR. MCAN\_TXBAR bits are set only for those Transmit Buffers configured via TXBC. When no Transmit scan is running, the bits are reset immediately, else the bits remain set until the Transmit scan process has completed.

| Value | Description                    |
|-------|--------------------------------|
| 0     | No transmission request added. |
| 1     | Transmission requested added.  |

### 52.6.39 MCAN Transmit Buffer Cancellation Request

| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – CF<sub>x</sub> Cancellation Finished for Transmit Buffer x**

Each Transmit Buffer has its own Cancellation Finished bit. The bits are set when the corresponding MCAN\_TXBRP bit is cleared after a cancellation was requested via MCAN\_TXBCR. In case the corresponding MCAN\_TXBRP bit was not set at the point of cancellation, CF is set immediately. The bits are reset when a new transmission is requested by writing a '1' to the corresponding bit of register MCAN\_TXBAR.

| Value | Description                            |
|-------|--|
| 0     | No transmit buffer cancellation.       |
| 1     | Transmit buffer cancellation finished. |

#### Bits 29:24 – EFWM[5:0] Event FIFO Watermark

| Value | Description   |
|-------|---|
| 0     | Watermark interrupt disabled.                               |
| 1–32  | Level for Tx Event FIFO watermark interrupt (MCAN_IR.TEFW). |
| >32   | Watermark interrupt disabled.                               |

#### Bits 21:16 – EFS[5:0] Event FIFO Size

The Tx Event FIFO elements are indexed from 0 to EFS - 1.

| Value | Description                                   |
|-------|---|
| 0     | Tx Event FIFO disabled.                       |
| 1–32  | Number of Tx Event FIFO elements.             |
| >32   | Values greater than 32 are interpreted as 32. |

#### Bits 15:2 – EFSA[13:0] Event FIFO Start Address

Start address of Tx Event FIFO in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write EFSA with the bits [15:2] of the 32-bit address.

### 52.6.45 MCAN Tx Event FIFO Status

|        |    |    |           |           |    |    |      |     |
| Bit    | 7  | 6  | 5         | 4         | 3  | 2  | 1    | 0   |
|        |    |    | EFFL[5:0] |           |    |    |      |     |
| Access |    |    | R         | R         | R  | R  | R    | R   |
| Reset  |    |    | 0         | 0         | 0  | 0  | 0    | 0   |

**Bit 25 – TEFL** Tx Event FIFO Element Lost

This bit is a copy of interrupt flag MCAN\_IR.TEFL. When MCAN\_IR.TEFL is reset, this bit is also reset.

| Value | Description   |
|-------|---|
| 0     | No Tx Event FIFO element lost.  |
| 1     | Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero. |

**Bit 24 – EFF** Event FIFO Full

| Value | Description             |
|-------|-------------------------|
| 0     | Tx Event FIFO not full. |
| 1     | Tx Event FIFO full.     |

**Bits 20:16 – EFPI[4:0]** Event FIFO Put Index

Tx Event FIFO write index pointer, range 0 to 31.

**Bits 12:8 – EFGI[4:0]** Event FIFO Get Index

Tx Event FIFO read index pointer, range 0 to 31.

**Bits 5:0 – EFFL[5:0]** Event FIFO Fill Level

Number of elements stored in Tx Event FIFO, range 0 to 32.

**52.6.46 MCAN Tx Event FIFO Acknowledge**

**Name:** MCAN\_TXEFA  
**Offset:** 0xF8  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 4:0 – EFAI[4:0] Event FIFO Acknowledge Index**

After the processor has read an element or a sequence of elements from the Tx Event FIFO, it has to write the index of the last element read from Tx Event FIFO to EFAI. This will set the Tx Event FIFO Get Index MCAN\_TXEFS.EFGI to EFAI + 1 and update the FIFO 0 Fill Level MCAN\_TXEFS.EFFL.

## **53. Timer Counter (TC)**

### **53.1 Description**

A Timer Counter (TC) module includes three identical TC channels. The number of implemented TC modules is device-specific.

Each TC channel can be independently programmed to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation.

Each channel has three external clock inputs, five internal clock inputs and two multipurpose input/output signals which can be configured by the user. Each channel drives an internal interrupt signal which can be programmed to generate processor interrupts.

The TC embeds a quadrature decoder (QDEC) connected in front of the timers and driven by TIOA0, TIOB0 and TIOB1 inputs. When enabled, the QDEC performs the input lines filtering, decoding of quadrature signals and connects to the timers/counters in order to read the position and speed of the motor through the user interface.

The TC block has two global registers which act upon all TC channels:

- Block Control register (TC\_BCR)—allows channels to be started simultaneously with the same instruction
- Block Mode register (TC\_BMR)—defines the external clock inputs for each channel, allowing them to be chained

### **53.2 Embedded Characteristics**

- Total of 6 Channels
- 32-bit Channel Size
- Wide Range of Functions Including:
  - Frequency measurement
  - Event counting
  - Interval measurement
  - Pulse generation
  - Delay timing
  - Pulse Width Modulation
  - Up/down capabilities
  - Quadrature decoder
  - 2-bit Gray up/down count for stepper motor
- Each Channel is User-Configurable and Contains:
  - Three external clock inputs
  - Five Internal clock inputs
  - Two multipurpose input/output signals acting as trigger event
  - Trigger/capture events can be directly synchronized by PWM signals
- Internal Interrupt Signal

- Read of the Capture Registers by the DMAC
- Compare Event Fault Generation for PWM
- Register Write Protection

### 53.3 Block Diagram

**Table 53-1. Timer Counter Clock Assignment**

| Name                     | Definition                      |
|--------------------------|---------------------------------|
| TIMER_CLOCK1             | GCLK[35], GCLK[36]              |
| TIMER_CLOCK2             | System bus clock divided by 8   |
| TIMER_CLOCK3             | System bus clock divided by 32  |
| TIMER_CLOCK4             | System bus clock divided by 128 |
| TIMER_CLOCK5 (See Notes) | slow_clock                      |

**Note:**

1. The GCLK frequency must be at least three times lower than peripheral clock frequency.

**Figure 53-1. Timer Counter Block Diagram**

**Note:**

The QDEC connections are detailed in [Figure 53-17](#).

**Table 53-2. Channel Signal Description**

| Signal Name   | Description  |
|---------------|--|
| XC0, XC1, XC2 | External Clock Inputs  |
| TIOAx         | Capture Mode: Timer Counter Input<br>Waveform Mode: Timer Counter Output       |
| TIOBx         | Capture Mode: Timer Counter Input<br>Waveform Mode: Timer Counter Input/Output |
| INT           | Interrupt Signal Output (internal signal)                                      |
| SYNC          | Synchronization Input Signal (from configuration register)                     |

## 53.4 Pin List

**Table 53-3. Pin List**

| Pin Name    | Description          | Type  |
|-------------|----------------------|-------|
| TCLK0–TCLK2 | External Clock Input | Input |
| TIOA0–TIOA2 | I/O Line A           | I/O   |
| TIOB0–TIOB2 | I/O Line B           | I/O   |

## 53.5 Product Dependencies

### 53.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the TC pins to their peripheral functions.

### 53.5.2 Power Management

The TC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the Timer Counter clock.

### 53.5.3 Interrupt Sources

The TC has an interrupt line connected to the interrupt controller. Handling the TC interrupt requires programming the interrupt controller before configuring the TC.

### 53.5.4 Synchronization Inputs from PWM

The TC has trigger/capture inputs internally connected to the PWM. Refer to [“Synchronization with PWM”](#) and to the implementation of the Pulse Width Modulation (PWM) in this product.

### 53.5.5 Fault Output

The TC has the FAULT output internally connected to the fault input of PWM. Refer to [“Fault Mode”](#) and to the implementation of the Pulse Width Modulation (PWM) in this product.

### 53.6 Functional Description

#### 53.6.1 Description

All channels of the Timer Counter are independent and identical in operation except when the QDEC is enabled. The registers for channel programming are listed in [53.7 Register Summary](#).

#### 53.6.2 32-bit Counter

Each 32-bit channel is organized around a 32-bit counter. The value of the counter is incremented at each positive edge of the selected clock. When the counter has reached the value  $2^{32}-1$  and passes to zero, an overflow occurs and the COVFS bit in the Interrupt Status register (TC\_SR) is set.

The current value of the counter is accessible in real time by reading the Counter Value register (TC\_CV). The counter can be reset by a trigger. In this case, the counter value passes to zero on the next valid edge of the selected clock.

#### 53.6.3 Clock Selection

At block level, input clock signals of each channel can be connected either to the external inputs TCLKx, or to the internal I/O signals TIOAx for chaining<sup>(1)</sup> by programming the Block Mode register (TC\_BMR). See [Clock Chaining Selection](#).

Each channel can independently select an internal or external clock source for its counter<sup>(2)</sup>:

- External clock signals: XC0, XC1 or XC2
- Internal clock signals: GCLK[35], GCLK[36], System bus clock divided by 8, System bus clock divided by 32, System bus clock divided by 128, slow\_clock

This selection is made by the TCCLKS bits in the Channel Mode register (TC\_CMRx).

The selected clock can be inverted with TC\_CMRx.CLKI. This allows counting on the opposite edges of the clock.

The burst function allows the clock to be validated when an external signal is high. The BURST parameter in the TC\_CMRx defines this signal (none, XC0, XC1, XC2). See [Clock Selection](#).

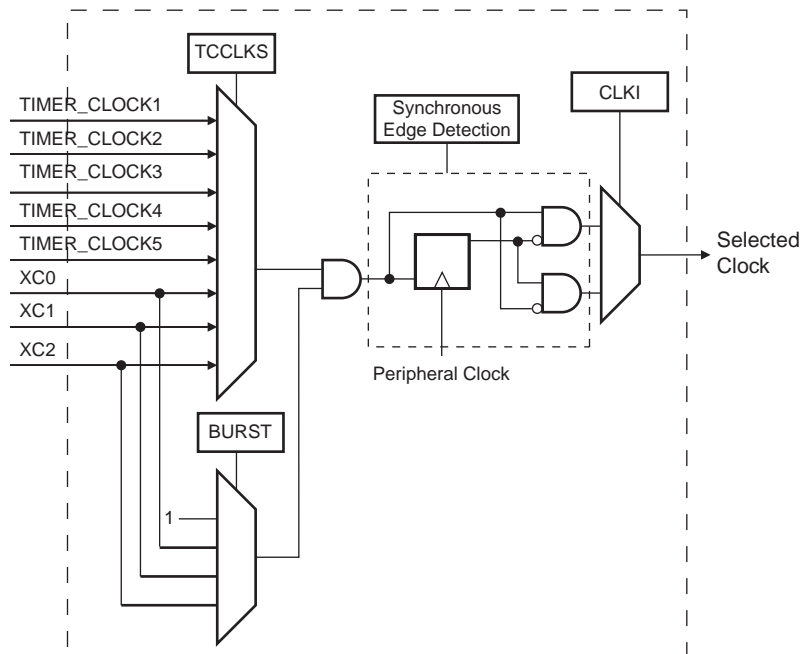

#### Note:

1. In Waveform mode, to chain two timers, it is mandatory to initialize some parameters:
  - Configure TIOx outputs to 1 or 0 by writing the required value to TC\_CMRx.ASWTRG.
  - Bit TC\_BCR.SYNC must be written to 1 to start the channels at the same time.
2. In all cases, if an external clock or asynchronous internal clock GCLK is used, the duration of each of its levels must be longer than the peripheral clock period, so the clock frequency will be at least 2.5 times lower than the peripheral clock.

**Figure 53-2. Clock Chaining Selection**

**Figure 53-3. Clock Selection**

### 53.6.4 Clock Control

The clock of each counter can be controlled in two different ways: it can be enabled/disabled and started/stopped, as shown in the following figure.

- The clock can be enabled or disabled by the user with the CLKEN and the CLKDIS commands in the Channel Control register (TC\_CCR). In Capture mode it can be disabled by an RB load event if TC\_CMRx.LDBDIS is set to '1'. In Waveform mode, it can be disabled by an RC Compare event if TC\_CMRx.CPCDIS is set to '1'. When disabled, the start or the stop actions have no effect: only a CLKEN command in the TC\_CCR can reenale the clock. When the clock is enabled, TC\_SR.CLKSTA is set.
- The clock can also be started or stopped: a trigger (software, synchro, external or compare) always starts the clock. The clock can be stopped by an RB load event in Capture mode (TC\_CMRx.LDBSTOP = 1) or an RC compare event in Waveform mode (TC\_CMRx.CPCSTOP = 1). The start and the stop commands are effective only if the clock is enabled.

**Figure 53-4. Clock Control**

### 53.6.5 Operating Modes

Each channel can operate independently in two different modes:

- Capture mode provides measurement on signals.
- Waveform mode provides wave generation.

The TC operating mode is programmed with TC\_CMRx.WAVE.

In Capture mode, TIOAx and TIOBx are configured as inputs.

In Waveform mode, TIOAx is always configured to be an output and TIOBx is an output if it is not selected to be the external trigger.

### 53.6.6 Trigger

A trigger resets the counter and starts the counter clock. Three types of triggers are common to both modes, and a fourth external trigger is available to each mode.

Regardless of the trigger used, it will be taken into account at the following active edge of the selected clock. This means that the counter value can be read differently from zero just after a trigger, especially when a low frequency signal is selected as the clock.

The following triggers are common to both modes:

- Software Trigger: Each channel has a software trigger, available by setting TC\_CCR.SWTRG.
- SYNC: Each channel has a synchronization signal SYNC. When asserted, this signal has the same effect as a software trigger. The SYNC signals of all channels are asserted simultaneously by writing TC\_BCR with SYNC set.
- Compare RC Trigger: RC is implemented in each channel and can provide a trigger when the counter value matches the RC value if TC\_CMRx.CPCTRG is set .

The channel can also be configured to have an external trigger. In Capture mode, the external trigger signal can be selected between TIOAx and TIOBx. In Waveform mode, an external event can be programmed on one of the following signals: TIOBx, XC0, XC1 or XC2. This external event can then be programmed to perform a trigger by setting TC\_CMRx.ENETRIG.

If an external trigger is used, the duration of the pulses must be longer than the peripheral clock period in order to be detected.

### 53.6.7 Capture Mode

Capture mode is entered by clearing TC\_CMRx.WAVE.

Capture mode allows the TC channel to perform measurements such as pulse timing, frequency, period, duty cycle and phase on TIOAx and TIOBx signals which are considered as inputs.

Figure 53-6 shows the configuration of the TC channel when programmed in Capture mode.

### 53.6.8 Capture Registers A and B

Registers A and B (TC\_RA and TC\_RB) are used as capture registers. They can be loaded with the counter value when a programmable event occurs on the signal TIOAx.

TC\_CMRx.LDRA defines the TIOAx selected edge for the loading of TC\_RA, and TC\_CMRx.LDRB defines the TIOAx selected edge for the loading of TC\_RB.

The subsampling ratio defined by TC\_CMRx.SBSMPLR is applied to these selected edges, so that the loading of Register A and Register B occurs once every 1, 2, 4, 8 or 16 selected edges.

TC\_RA is loaded only if it has not been loaded since the last trigger or if TC\_RB has been loaded since the last loading of TC\_RA.

TC\_RB is loaded only if TC\_RA has been loaded since the last trigger or the last loading of TC\_RB.

Loading TC\_RA or TC\_RB before the read of the last value loaded sets TC\_SR.LOVRS. In this case, the old value is overwritten.

When DMA is used, the Register AB (TC\_RAB) address must be configured as source address of the transfer. TC\_RAB provides the next unread value from TC\_RA and TC\_RB. It may be read by the DMA after a request has been triggered upon loading TC\_RA or TC\_RB.

### 53.6.9 Transfer with DMAC in Capture Mode

The DMAC can perform access from the TC to system memory in Capture mode only.

The following figure illustrates how TC\_RA and TC\_RB can be loaded in the system memory without processor intervention.

**Figure 53-5. Example of Transfer with DMAC in Capture Mode**

ETRGEDG = 1, LDRA = 1, LDRB = 2, ABETRG = 0

T1,T2,T3,T4 = System Bus load dependent ( $t_{min} = 8$  Peripheral Clocks)

ETRGEDG = 3, LDRA = 3, LDRB = 0, ABETRG = 0

T1,T2,T3,T4 = System Bus load dependent ( $t_{min} = 8$  Peripheral Clocks)

### 53.6.10 Trigger Conditions

In addition to the SYNC signal, the software trigger and the RC compare trigger, an external trigger can be defined.

The ABETRG bit in the TC\_CMCR selects TIOAx or TIOBx input signal as an external trigger or the trigger signal from the output comparator of the PWM module. The External Trigger Edge Selection parameter (ETRGEDG field in TC\_CMCR) defines the edge (rising, falling, or both) detected to generate an external trigger. If ETRGEDG = 0 (none), the external trigger is disabled.

**Figure 53-6. Capture Mode**

### 53.6.11 Waveform Mode

Waveform mode is entered by setting the TC\_CMRx.WAVE bit.

In Waveform mode, the TC channel generates one or two PWM signals with the same frequency and independently programmable duty cycles, or generates different types of one-shot or repetitive pulses.

In this mode, TIOAx is configured as an output and TIOBx is defined as an output if it is not used as an external event (EEVT parameter in TC\_CMR).

[Waveform Mode](#) shows the configuration of the TC channel when programmed in Waveform operating mode.

### 53.6.12 Waveform Selection

Depending on the WAVSEL parameter in TC\_CMR, the behavior of TC\_CV varies.

With any selection, TC\_RA, TC\_RB and TC\_RC can all be used as compare registers.

RA Compare is used to control the TIOAx output, RB Compare is used to control the TIOBx output (if correctly configured) and RC Compare is used to control TIOAx and/or TIOBx outputs.

**Figure 53-7. Waveform Mode**

### 53.6.12.1 WAVSEL = 00

When WAVSEL = 00, the value of TC\_CV is incremented from 0 to  $2^{32}-1$ . Once  $2^{32}-1$  has been reached, the value of TC\_CV is reset. Incrementation of TC\_CV starts again and the cycle continues.

An external event trigger or a software trigger can reset the value of TC\_CV. It is important to note that the trigger may occur at any time.

Refer to the figures below.

RC Compare cannot be programmed to generate a trigger in this configuration. At the same time, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

**Figure 53-8. WAVSEL = 00 without Trigger**

**Figure 53-9. WAVSEL = 00 with Trigger**

### 53.6.12.2 WAVSEL = 10

When WAVSEL = 10, the value of TC\_CV is incremented from 0 to the value of RC, then automatically reset on a RC Compare. Once the value of TC\_CV has been reset, it is then incremented and so on.

It is important to note that TC\_CV can be reset at any time by an external event or a software trigger if both are programmed correctly.

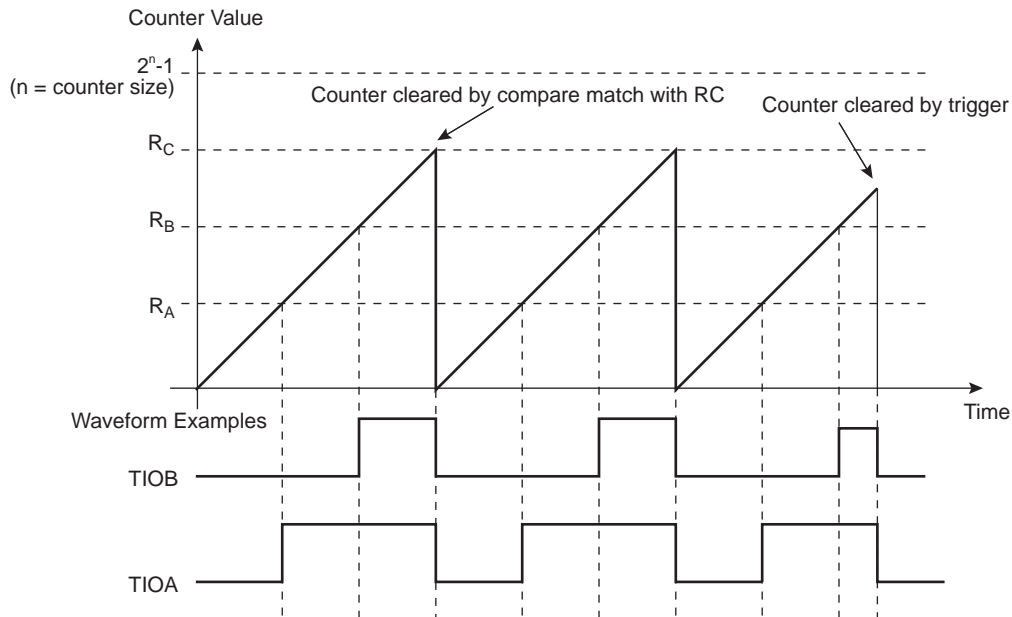

Refer to the figures below.

In addition, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

**Figure 53-10. WAVSEL = 10 without Trigger**

**Figure 53-11. WAVSEL = 10 with Trigger**

**53.6.12.3 WAVSEL = 01**

When WAVSEL = 01, the value of TC\_CV is incremented from 0 to  $2^{32}-1$ . Once  $2^{32}-1$  is reached, the value of TC\_CV is decremented to 0, then reincremented to  $2^{32}-1$  and so on.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments.

Refer to the figures below.

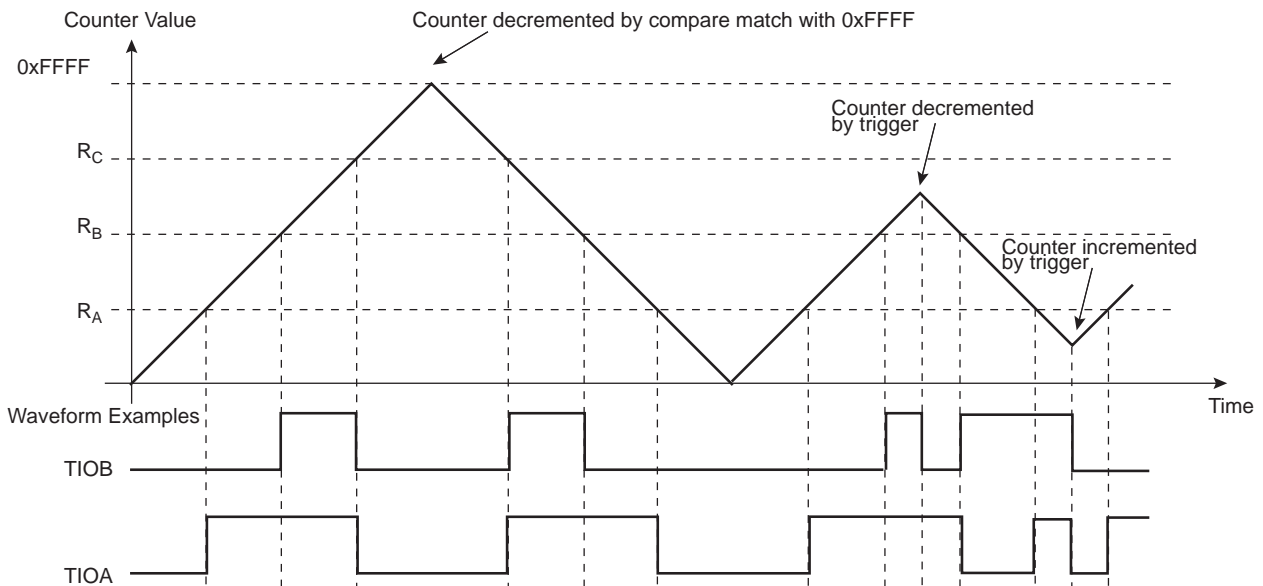

RC Compare cannot be programmed to generate a trigger in this configuration.

At the same time, RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 53-12. WAVSEL = 01 without Trigger**

**Figure 53-13. WAVSEL = 01 with Trigger**

### 53.6.12.4 WAVSEL = 11

When WAVSEL = 11, the value of TC\_CV is incremented from 0 to RC. Once RC is reached, the value of TC\_CV is decremented to 0, then reincremented to RC and so on.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments.

Refer to the figures below.

RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 53-14. WAVSEL = 11 without Trigger**

**Figure 53-15. WAVSEL = 11 with Trigger**

### 53.6.13 External Event/Trigger Conditions

An external event can be programmed to be detected on one of the clock sources (XC0, XC1, XC2) or TIOBx. The external event selected can then be used as a trigger.

The event trigger is selected using TC\_CMRE.EEVT. The trigger edge (rising, falling or both) for each of the possible external triggers is defined in TC\_CMRE.EEVTEDG. If EEVTEDG is cleared (none), no external event is defined.

If TIOBx is defined as an external event signal (EEVT = 0), TIOBx is no longer used as an output and the compare register B is not used to generate waveforms and subsequently no IRQs. In this case, the TC channel can only generate a waveform on TIOAx.

When an external event is defined, it can be used as a trigger by setting TC\_CMRE.ENETRGE.

As in Capture mode, the SYNC signal and the software trigger are also available as triggers. RC Compare can also be used as a trigger depending on the parameter WAVSEL.

### 53.6.14 Synchronization with PWM

The inputs TIOAx/TIOBx can be bypassed, and thus channel trigger/capture events can be directly driven by the independent PWM module.

PWM comparator outputs (internal signals without dead-time insertion - OCx), respectively source of the PWMH/L[2:0] outputs, are routed to the internal TC inputs. These specific TC inputs are multiplexed with TIOA/B input signal to drive the internal trigger/capture events.

The selection is made in the Extended Mode register (TC\_EMR) fields TRIGSRCA and TRIGSRCB (see [“TC Extended Mode Register”](#)).

Each channel of the TC module can be synchronized by a different PWM channel as described in the following figure.

**Figure 53-16. Synchronization with PWM**

### 53.6.15 Output Controller

The output controller defines the output level changes on TIOAx and TIOBx following an event. TIOBx control is used only if TIOBx is defined as output (not as an external event).

The following events control TIOAx and TIOBx:

- Software trigger

- External event
- RC compare

RA Compare controls TIOAx, and RB Compare controls TIOBx. Each of these events can be programmed to set, clear or toggle the output as defined in the corresponding parameter in TC\_CMx.

### 53.6.16 Quadrature Decoder

#### 53.6.16.1 Description

The quadrature decoder (QDEC) is driven by TIOA0, TIOB0 and TIOB1 input pins and drives the timer counter of channel 0 and 1. Channel 2 can be used as a time base in case of speed measurement requirements (refer to [Predefined Connection of the Quadrature Decoder with Timer Counters](#)).

When writing a '0' to TC\_BMR.QDEN, the QDEC is bypassed and the IO pins are directly routed to the timer counter function.

TIOA0 and TIOB0 are to be driven by the two dedicated quadrature signals from a rotary sensor mounted on the shaft of the off-chip motor.

A third signal from the rotary sensor can be processed through pin TIOB1 and is typically dedicated to be driven by an index signal if it is provided by the sensor. This signal is not required to decode the quadrature signals PHA, PHB.

TC\_CMx.TCCLKS must be configured to select XC0 input (i.e., 0x101). Field TC0XC0S has no effect as soon as the QDEC is enabled.

Either speed or position/revolution can be measured. Position channel 0 accumulates the edges of PHA, PHB input signals giving a high accuracy on motor position whereas channel 1 accumulates the index pulses of the sensor, therefore the number of rotations. Concatenation of both values provides a high level of precision on motion system position.

In Speed mode, position cannot be measured but revolution can be measured.

Inputs from the rotary sensor can be filtered prior to downstream processing. Accommodation of input polarity, phase definition and other factors are configurable.

Interruptions can be generated on different events.

A compare function (using TC\_RC) is available on channel 0 (speed/position) or channel 1 (rotation) and can generate an interrupt by means of TC\_SRx.CPCS.

**Figure 53-17. Predefined Connection of the Quadrature Decoder with Timer Counters**

### 53.6.16.2 Input Preprocessing

Input preprocessing consists of capabilities to take into account rotary sensor factors such as polarities and phase definition followed by configurable digital filtering.

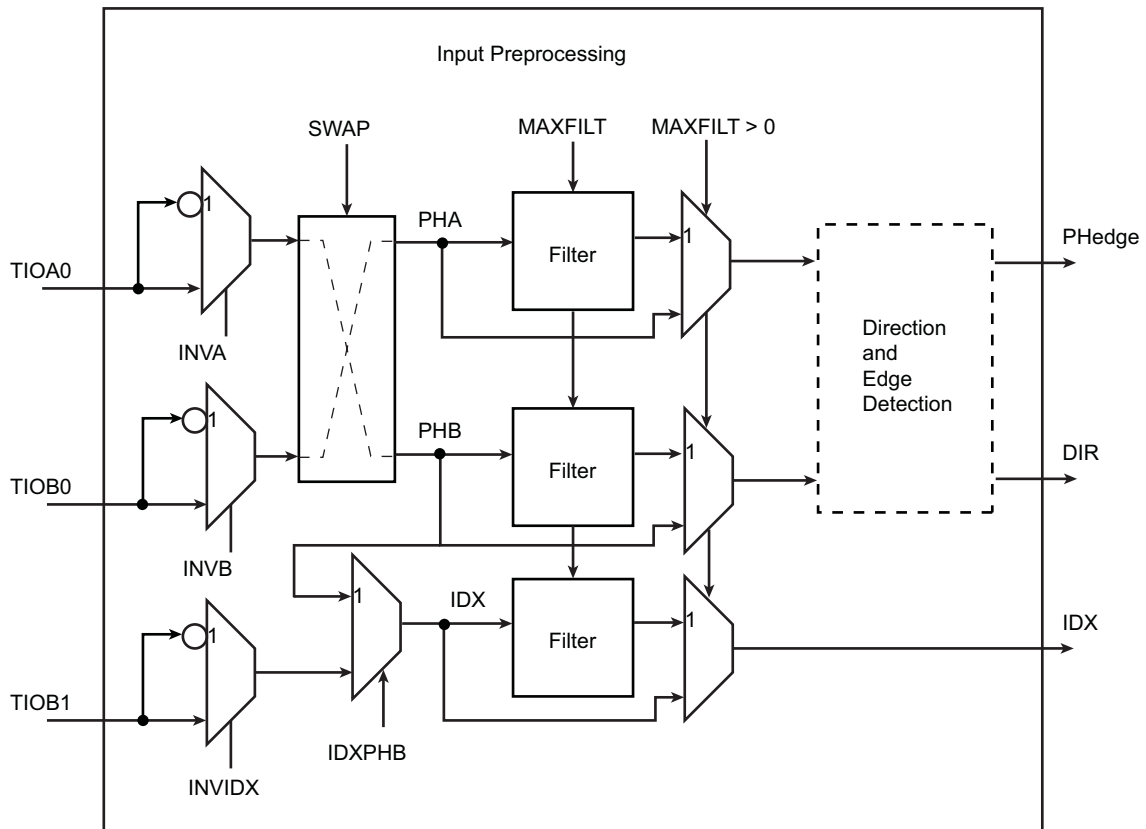

Each input can be negated and swapping PHA, PHB is also configurable.

TC\_BMR.MAXFILT is used to configure a minimum duration for which the pulse is stated as valid. When the filter is active, pulses with a duration lower than  $(MAXFILT + 1) \times t_{\text{peripheral clock}}$  are not passed to downstream logic.

The value of  $(MAXFILT + 1) \times t_{\text{peripheral clock}}$  must not be greater than 10% of the minimum pulse on PHA, PHB or index when the rotary encoder speed is at its maximum. This speed depends on the application.

**Figure 53-18. Input Stage**

Input filtering can efficiently remove spurious pulses that might be generated by the presence of particulate contamination on the optical or magnetic disk of the rotary sensor.

Spurious pulses can also occur in environments with high levels of electromagnetic interference. Or, simply if vibration occurs even when rotation is fully stopped and the shaft of the motor is in such a position that the beginning of one of the reflective or magnetic bars on the rotary sensor disk is aligned with the light or magnetic (Hall) receiver cell of the rotary sensor. Any vibration can make the PHA, PHB signals toggle for a short duration.

**Figure 53-19. Filtering Examples**

**53.6.16.3 Direction Status and Change Detection**

After filtering, the quadrature signals are analyzed to extract the rotation direction and edges of the two quadrature signals detected in order to be counted by TC logic downstream.

The direction status can be directly read at anytime in the TC\_QISR. The polarity of the direction flag status depends on the configuration written in TC\_BMR. INVA, INV B, INVIDX, SWAP modify the polarity of DIR flag.

Any change in rotation direction is reported in the TC\_QISR and can generate an interrupt.

The direction change condition is reported as soon as two consecutive edges on a phase signal have sampled the same value on the other phase signal and there is an edge on the other signal. The two consecutive edges of one phase signal sampling the same value on other phase signal is not sufficient to declare a direction change, as particulate contamination may mask one or more reflective bars on the optical or magnetic disk of the sensor. Refer to the following figure for waveforms.

**Figure 53-20. Rotation Change Detection**

The direction change detection is disabled when TC\_BMR.QDTRANS is set. In this case, the DIR flag report must not be used.

A quadrature error is also reported by the QDEC via TC\_QISR.QERR. This error is reported if the time difference between two edges on PHA, PHB is lower than a predefined value. This predefined value is configurable and corresponds to  $(TC\_BMR.MAXFILT + 1) \times t_{\text{peripheral clock}}$  ns. After being filtered, there is no reason to have two edges closer than  $(TC\_BMR.MAXFILT + 1) \times t_{\text{peripheral clock}}$  ns under normal mode of operation.

**Figure 53-21. Quadrature Error Detection**

MAXFILT must be tuned according to several factors such as the peripheral clock frequency, type of rotary sensor and rotation speed to be achieved.

#### 53.6.16.4 Position and Rotation Measurement

When TC\_BMR.POSEN is set, the motor axis position is processed on channel 0 (by means of the PHA, PHB edge detections) and the number of motor revolutions are recorded on channel 1 if the IDX signal is provided on the TIOB1 input. If no IDX signal is available, the internal counter can be cleared for each revolution if the number of counts per revolution is configured in TC\_RC0.RC and the TC\_CMR.CPCTRG bit is written to '1'. The position measurement can be read in the TC\_CV0 register and the rotation measurement can be read in the TC\_CV1 register.

Channel 0 and 1 must be configured in Capture mode (TC\_CMR0.WAVE = 0). 'Rising edge' must be selected as the External Trigger Edge (TC\_CMR.ETRGEDG = 0x01) and 'TIOAx' must be selected as the External Trigger (TC\_CMR.ABETRG = 0x1). The process must be started by configuring TC\_CCR.CLKEN and TC\_CCR.SWTRG.

In parallel, the number of edges are accumulated on TC channel 0 and can be read on the TC\_CV0 register.

Therefore, the accurate position can be read on both TC\_CV registers and concatenated to form a 32-bit word.

The TC channel 0 is cleared for each increment of IDX count value.

Depending on the quadrature signals, the direction is decoded and allows to count up or down in TC channels 0 and 1. The direction status is reported on TC\_QISR.

### 53.6.16.5 Speed Measurement

When TC\_BMR.SPEEDEN is set, the speed measure is enabled on channel 0.

A time base must be defined on channel 2 by writing the TC\_RC2 period register. Channel 2 must be configured in Waveform mode (WAVE bit set) in TC\_CMR2. The WAVSEL field must be defined with 0x10 to clear the counter by comparison and matching with TC\_RC value. Field ACPC must be defined at 0x11 to toggle TIOAx output.

This time base is automatically fed back to TIOAx of channel 0 when QDEN and SPEEDEN are set.

Channel 0 must be configured in Capture mode (WAVE = 0 in TC\_CMR0). TC\_CMR0.ABETRG must be configured at 1 to select TIOAx as a trigger for this channel.

EDGTRG must be set to 0x01, to clear the counter on a rising edge of the TIOAx signal and field LDRA must be set accordingly to 0x01, to load TC\_RA0 at the same time as the counter is cleared (LDRB must be set to 0x01). As a consequence, at the end of each time base period the differentiation required for the speed calculation is performed.

The process must be started by configuring bits CLKEN and SWTRG in the TC\_CCR.

The speed can be read on field RA in TC\_RA0.

Channel 1 can still be used to count the number of revolutions of the motor.

### 53.6.16.6 Detecting a Missing Index Pulse

To detect a missing index pulse due contamination, dust, etc., the TC\_SR0.CPCS flag can be used. It is also possible to assert the interrupt line if the TC\_SR0.CPCS flag is enabled as a source of the interrupt by writing a '1' to TC\_IER0.CPCS.

The TC\_RC0.RC field must be written with the nominal number of counts per revolution provided by the rotary encoder, plus a margin to eliminate potential noise (e.g., if nominal count per revolution is 1024, then TC\_RC0.RC=1026).

If the index pulse is missing, the timer value is not cleared and the nominal value is exceeded, then the comparator on the RC triggers an event, TC\_SR0.CPCS=1, and the interrupt line is asserted if TC\_IER0.CPCS=1.

The missing index pulse detection is only valid if the bit TC\_QISR.DIRCHG=0.

### 53.6.16.7 Detecting Contamination/Dust at Rotary Encoder Low Speed

The contamination/dust that can be filtered when the rotary encoder speed is high may not be filtered at low speed, thus creating unsolicited direction change, etc.

At low speed, even a minor contamination may appear as a long pulse, and thus not filtered and processed as a standard quadrature encoder pulse.

This contamination can be detected by using the similar method as the missing index detection.

A contamination exists on a phase line if TC\_SR.CPCS = 1 and TC\_QISR.DIRCHG = 1 when there is no solicited change of direction.

### 53.6.16.8 Missing Pulse Detection and Autocorrection

The QDEC is equipped with a circuitry which detects and corrects some errors that may result from contamination on optical disks or other materials producing the quadrature phase signals.

The detection and autocorrection only works if the Count mode is configured for both phases (EDGPHA = 1 in TC\_BMR) and is enabled (AUTOC = 1 in TC\_BMR).

If a pulse is missing on a phase signal, it is automatically detected and the pulse count reported in the CV field of the TC\_CV0/1 is automatically corrected.

There is no detection if both phase signals are affected at the same location on the device providing the quadrature signals because the detection requires a valid phase signal to detect the contamination on the other phase signal.

**Figure 53-22. Detection and Autocorrection of Missing Pulses**

If a quadrature device is undamaged, the number of pulses counted for a predefined period of time must be the same with or without detection and autocorrection feature.

Therefore, if the measurement results differ, a contamination exists on the device producing the quadrature signals.

This does not substitute the measurements of the number of pulses between two index pulses (if available) but provides a complementary method to detect damaged quadrature devices.

When the device providing quadrature signals is severely damaged, potentially leading to a number of consecutive missing pulses greater than 1, the downstream processing may be affected. It is possible to define the maximum admissible number of consecutive missing pulses before issuing a Missing Pulse Error flag (MPE in TC\_QISR). The threshold triggering an MPE flag report can be configured in TC\_BMR.MAXCMP. If the field MAXCMP is cleared, MPE never rises. The flag MAXCMP can trigger an interrupt while the QDEC is operating, thus providing a real time report of a potential problem on the quadrature device.

### 53.6.17 2-bit Gray Up/Down Counter for Stepper Motor

Each channel can be independently configured to generate a 2-bit Gray count waveform on corresponding TIOAx, TIOBx outputs by means of TC\_SMMRx.GCEN.

Up or Down count can be defined by writing TC\_SMMRx.DOWN.

It is mandatory to configure the channel in Waveform mode in the TC\_CMR.

The period of the counters can be programmed in TC\_RCx.

**Figure 53-23. 2-bit Gray Up/Down Counter**

**53.6.18 Fault Mode**

At any time, the TC\_RCx registers can be used to perform a comparison on the respective current channel counter value (TC\_CVx) with the value of TC\_RCx register.

The CPCSx flags can be set accordingly and an interrupt can be generated.

This interrupt is processed but requires an unpredictable amount of time to be achieved the required action.

It is possible to trigger the FAULT output of the TIMER1 with CPCS from TC\_SR0 and/or CPCS from TC\_SR1. Each source can be independently enabled/disabled in the TC\_FMR.

This can be useful to detect an overflow on speed and/or position when QDEC is processed and to act immediately by using the FAULT output.

**Figure 53-24. Fault Output Generation**

**53.6.19 Register Write Protection**

To prevent any single software error from corrupting TC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [TC Write Protection Mode Register \(TC\\_WPMR\)](#).

The Timer Counter clock of the first channel must be enabled to access TC\_WPMR.

The following registers can be write-protected when WPEN is set:

- [TC Block Mode Register](#)
- [TC Channel Mode Register Capture Mode](#)
- [TC Channel Mode Register Waveform Mode](#)
- [TC Fault Mode Register](#)
- [TC Stepper Motor Mode Register](#)
- [TC Register A](#)
- [TC Register B](#)
- [TC Register C](#)
- [TC Extended Mode Register](#)

### 53.7 Register Summary

**Note:** The register TC\_CMCR has two modes, Capture Mode and Waveform Mode. In this register summary, both modes are displayed

| Offset | Name     | Bit Pos. |             |              |            |        |           |              |              |        |  |
|--------|----------|----------|-------------|--------------|------------|--------|-----------|--------------|--------------|--------|--|
| 0x00   | TC_CCR0  | 7:0      |             |              |            |        |           | SWTRG        | CLKDIS       | CLKEN  |  |
|        |          | 15:8     |             |              |            |        |           |              |              |        |  |
|        |          | 23:16    |             |              |            |        |           |              |              |        |  |
|        |          | 31:24    |             |              |            |        |           |              |              |        |  |
| 0x04   | TC_CMCR0 | 7:0      | LDBDIS      | LDBSTOP      | BURST[1:0] | CLKI   |           | TCCLKS[2:0]  |              |        |  |
|        |          | 15:8     | WAVE        | CPCTRG       |            |        | ABETRG    | ETRGEDG[1:0] |              |        |  |
|        |          | 23:16    |             | SBSMPLR[2:0] |            |        | LDRB[1:0] | LDRA[1:0]    |              |        |  |

### 53.7.1 TC Channel Control Register

**Name:** TC\_CCRx  
**Offset:** 0x00 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

#### Bit 2 – SWTRG Software Trigger Command

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | A software trigger is performed: the counter is reset and the clock is started. |

#### Bit 1 – CLKDIS Counter Clock Disable Command

| Value | Description         |
|-------|---------------------|
| 0     | No effect.          |
| 1     | Disables the clock. |

#### Bit 0 – CLKEN Counter Clock Enable Command

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Enables the clock if CLKDIS is not 1. |

### 53.7.2 TC Channel Mode Register: Capture Mode

**Name:** TC\_CM Rx  
**Offset:** 0x04 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can be written only if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |                       |         |            |           |      |             |              |     |

| Reset  | 0                     | 0       | 0          | 0         | 0    | 0           | 0            | 0   |

#### Bits 22:20 – SBSMPLR[2:0] Loading Edge Subsampling Ratio

| Value | Name      | Description                                      |
|-------|-----------|--|
| 0     | ONE       | Load a Capture register each selected edge.      |
| 1     | HALF      | Load a Capture register every 2 selected edges.  |
| 2     | FOURTH    | Load a Capture register every 4 selected edges.  |
| 3     | EIGHTH    | Load a Capture register every 8 selected edges.  |
| 4     | SIXTEENTH | Load a Capture register every 16 selected edges. |

#### Bits 19:18 – LDRB[1:0] RB Loading Edge Selection

| Value | Name    | Description           |
|-------|---------|-----------------------|
| 0     | NONE    | None                  |
| 1     | RISING  | Rising edge of TIOAx  |
| 2     | FALLING | Falling edge of TIOAx |
| 3     | EDGE    | Each edge of TIOAx    |

#### Bits 17:16 – LDRA[1:0] RA Loading Edge Selection

| Value | Name | Description |
|-------|------|-------------|
| 0     | NONE | None        |

| Value | Name    | Description           |
|-------|---------|-----------------------|
| 1     | RISING  | Rising edge of TIOAx  |
| 2     | FALLING | Falling edge of TIOAx |
| 3     | EDGE    | Each edge of TIOAx    |

**Bit 15 – WAVE** Waveform Mode

| Value | Description  |
|-------|--|
| 0     | Capture mode is enabled.                             |
| 1     | Capture mode is disabled (Waveform mode is enabled). |

**Bit 14 – CPCTRG** RC Compare Trigger Enable

| Value | Description   |
|-------|---|
| 0     | RC Compare has no effect on the counter and its clock.      |
| 1     | RC Compare resets the counter and starts the counter clock. |

**Bit 10 – ABETRG** TIOAx or TIOBx External Trigger Selection

| Value | Description                           |
|-------|---------------------------------------|
| 0     | TIOBx is used as an external trigger. |
| 1     | TIOAx is used as an external trigger. |

**Bits 9:8 – ETRGEDG[1:0]** External Trigger Edge Selection

| Value | Name    | Description                                   |
|-------|---------|---|
| 0     | NONE    | The clock is not gated by an external signal. |
| 1     | RISING  | Rising edge                                   |
| 2     | FALLING | Falling edge                                  |
| 3     | EDGE    | Each edge                                     |

**Bit 7 – LBDIS** Counter Clock Disable with RB Loading

| Value | Description   |
|-------|---|
| 0     | Counter clock is not disabled when RB loading occurs. |
| 1     | Counter clock is disabled when RB loading occurs.     |

**Bit 6 – LDBSTOP** Counter Clock Stopped with RB Loading

| Value | Description  |
|-------|--|
| 0     | Counter clock is not stopped when RB loading occurs. |
| 1     | Counter clock is stopped when RB loading occurs.     |

**Bits 5:4 – BURST[1:0]** Burst Signal Selection

| Value | Name | Description                                   |
|-------|------|---|
| 0     | NONE | The clock is not gated by an external signal. |
| 1     | XC0  | XC0 is ANDed with the selected clock.         |
| 2     | XC1  | XC1 is ANDed with the selected clock.         |
| 3     | XC2  | XC2 is ANDed with the selected clock.         |

**Bit 3 – CLKI** Clock Invert

# SAMA5D2 Series

## Timer Counter (TC)

| Value | Description  |
|-------|--|
| 0     | Counter is incremented on rising edge of the clock.  |
| 1     | Counter is incremented on falling edge of the clock. |

### Bits 2:0 – TCCLKS[2:0] Clock Selection

To operate at maximum peripheral clock frequency, refer to [“TC Extended Mode Register”](#).

| Value | Name         | Description  |
|-------|--------------|--|
| 0     | TIMER_CLOCK1 | Clock selected: internal GCLK[35], GCLK[36] clock signal (from PMC)              |
| 1     | TIMER_CLOCK2 | Clock selected: internal System bus clock divided by 8 clock signal (from PMC)   |
| 2     | TIMER_CLOCK3 | Clock selected: internal System bus clock divided by 32 clock signal (from PMC)  |
| 3     | TIMER_CLOCK4 | Clock selected: internal System bus clock divided by 128 clock signal (from PMC) |
| 4     | TIMER_CLOCK5 | Clock selected: internal slow_clock clock signal (from PMC)                      |
| 5     | XC0          | Clock selected: XC0  |
| 6     | XC1          | Clock selected: XC1  |
| 7     | XC2          | Clock selected: XC2  |

### 53.7.3 TC Channel Mode Register: Waveform Mode

**Name:** TC\_CMRx  
**Offset:** 0x04 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |             |             |            |        |           |             |              |     |

#### Bits 31:30 – BSWTRG[1:0] Software Trigger Effect on TIOBx

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

#### Bits 29:28 – BEEVT[1:0] External Event Effect on TIOBx

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

#### Bits 27:26 – BCPC[1:0] RC Compare Effect on TIOBx

| Value | Name | Description |
|-------|------|-------------|
| 0     | NONE | None        |
| 1     | SET  | Set         |

# SAMA5D2 Series

## Timer Counter (TC)

| Value | Name   | Description |
|-------|--------|-------------|
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

### Bits 25:24 – BCPB[1:0] RB Compare Effect on TIOBx

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

### Bits 23:22 – ASWTRG[1:0] Software Trigger Effect on TIOAx

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

### Bits 21:20 – AEEVT[1:0] External Event Effect on TIOAx

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

### Bits 19:18 – ACPC[1:0] RC Compare Effect on TIOAx

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

### Bits 17:16 – ACPA[1:0] RA Compare Effect on TIOAx

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NONE   | None        |
| 1     | SET    | Set         |
| 2     | CLEAR  | Clear       |
| 3     | TOGGLE | Toggle      |

### Bit 15 – WAVE Waveform Mode

| Value | Description  |
|-------|--|
| 0     | Waveform mode is disabled (Capture mode is enabled). |
| 1     | Waveform mode is enabled.                            |

### Bits 14:13 – WAVSEL[1:0] Waveform Selection

| Value | Name      | Description   |
|-------|-----------|---|
| 0     | UP        | UP mode without automatic trigger on RC Compare     |
| 1     | UPDOWN    | UPDOWN mode without automatic trigger on RC Compare |
| 2     | UP_RC     | UP mode with automatic trigger on RC Compare        |
| 3     | UPDOWN_RC | UPDOWN mode with automatic trigger on RC Compare    |

**Bit 12 – ENETRГ** External Event Trigger Enable

Whatever the value programmed in ENETRГ, the selected external event only controls the TIOAx output and TIOBx if not used as input (trigger event input or other input used).

| Value | Description   |
|-------|---|
| 0     | The external event has no effect on the counter and its clock.      |
| 1     | The external event resets the counter and starts the counter clock. |

**Bits 11:10 – EEVT[1:0]** External Event Selection

Signal selected as external event.

| Value | Name | Description | TIOB Direction |
|-------|------|-------------|----------------|
| 0     | TIOB | TIOB        | Input          |
| 1     | XC0  | XC0         | Output         |
| 2     | XC1  | XC1         | Output         |
| 3     | XC2  | XC2         | Output         |

**Note:** If TIOB is chosen as the external event signal, it is configured as an input and no longer generates waveforms and subsequently no IRQs.

**Bits 9:8 – EEVTEDG[1:0]** External Event Edge Selection

| Value | Name    | Description  |
|-------|---------|--------------|
| 0     | NONE    | None         |
| 1     | RISING  | Rising edge  |
| 2     | FALLING | Falling edge |
| 3     | EDGE    | Each edge    |

**Bit 7 – CPCDIS** Counter Clock Disable with RC Compare

| Value | Description  |
|-------|--|
| 0     | Counter clock is not disabled when counter reaches RC. |
| 1     | Counter clock is disabled when counter reaches RC.     |

**Bit 6 – CPCSTOP** Counter Clock Stopped with RC Compare

| Value | Description   |
|-------|---|
| 0     | Counter clock is not stopped when counter reaches RC. |
| 1     | Counter clock is stopped when counter reaches RC.     |

**Bits 5:4 – BURST[1:0]** Burst Signal Selection

# SAMA5D2 Series

## Timer Counter (TC)

| Value | Name | Description                                   |
|-------|------|---|
| 0     | NONE | The clock is not gated by an external signal. |
| 1     | XC0  | XC0 is ANDed with the selected clock.         |
| 2     | XC1  | XC1 is ANDed with the selected clock.         |
| 3     | XC2  | XC2 is ANDed with the selected clock.         |

### Bit 3 – CLKI Clock Invert

| Value | Description  |
|-------|--|
| 0     | Counter is incremented on rising edge of the clock.  |
| 1     | Counter is incremented on falling edge of the clock. |

### Bits 2:0 – TCCLKS[2:0] Clock Selection

To operate at maximum peripheral clock frequency, refer to [“TC Extended Mode Register”](#).

| Value | Name         | Description  |
|-------|--------------|--|
| 0     | TIMER_CLOCK1 | Clock selected: internal GCLK[35], GCLK[36] clock signal (from PMC)              |
| 1     | TIMER_CLOCK2 | Clock selected: internal System bus clock divided by 8 clock signal (from PMC)   |
| 2     | TIMER_CLOCK3 | Clock selected: internal System bus clock divided by 32 clock signal (from PMC)  |
| 3     | TIMER_CLOCK4 | Clock selected: internal System bus clock divided by 128 clock signal (from PMC) |
| 4     | TIMER_CLOCK5 | Clock selected: internal slow_clock clock signal (from PMC)                      |
| 5     | XC0          | Clock selected: XC0  |
| 6     | XC1          | Clock selected: XC1  |
| 7     | XC2          | Clock selected: XC2  |

### 53.7.4 TC Stepper Motor Mode Register

**Name:** TC\_SMMRx  
**Offset:** 0x08 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

#### Bit 1 – DOWN Down Count

| Value | Description   |
|-------|---------------|
| 0     | Up counter.   |
| 1     | Down counter. |

#### Bit 0 – GCEN Gray Count Enable

| Value | Description  |
|-------|--|
| 0     | TIOAx [x=0..2] and TIOBx [x=0..2] are driven by internal counter of channel x. |
| 1     | TIOAx [x=0..2] and TIOBx [x=0..2] are driven by a 2-bit Gray counter.          |

### 53.7.5 TC Register AB

**Name:** TC\_RABx  
**Offset:** 0x0C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

|        |     |            |    |    |    |    |    |    |    |
|--------|-----|------------|----|----|----|----|----|----|----|
|        | Bit | 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |     | RAB[31:24] |    |    |    |    |    |    |    |
| Access |     | R          | R  | R  | R  | R  | R  | R  | R  |
| Reset  |     | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |     |            |    |    |    |    |    |    |    |
|        | Bit | 23         | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |     | RAB[23:16] |    |    |    |    |    |    |    |
| Access |     | R          | R  | R  | R  | R  | R  | R  | R  |
| Reset  |     | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |     |            |    |    |    |    |    |    |    |
|        | Bit | 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        |     | RAB[15:8]  |    |    |    |    |    |    |    |
| Access |     | R          | R  | R  | R  | R  | R  | R  | R  |
| Reset  |     | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |     |            |    |    |    |    |    |    |    |
|        | Bit | 7          | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        |     | RAB[7:0]   |    |    |    |    |    |    |    |
| Access |     | R          | R  | R  | R  | R  | R  | R  | R  |
| Reset  |     | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 31:0 – RAB[31:0]** Register A or Register B

RAB contains the next unread capture Register A or Register B value in real time. It is usually read by the DMA after a request due to a valid load edge on TIOAx.

When DMA is used, the RAB register address must be configured as source address of the transfer.

### 53.7.6 TC Counter Value Register

**Name:** TC\_CVx  
**Offset:** 0x10 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

|        |     |           |    |    |    |    |    |    |    |
|--------|-----|-----------|----|----|----|----|----|----|----|
|        | Bit | 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |     | CV[31:24] |    |    |    |    |    |    |    |
| Access |     | R         | R  | R  | R  | R  | R  | R  | R  |
| Reset  |     | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |     |           |    |    |    |    |    |    |    |
|        | Bit | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |     | CV[23:16] |    |    |    |    |    |    |    |
| Access |     | R         | R  | R  | R  | R  | R  | R  | R  |
| Reset  |     | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |     |           |    |    |    |    |    |    |    |
|        | Bit | 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        |     | CV[15:8]  |    |    |    |    |    |    |    |
| Access |     | R         | R  | R  | R  | R  | R  | R  | R  |
| Reset  |     | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |     |           |    |    |    |    |    |    |    |
|        | Bit | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        |     | CV[7:0]   |    |    |    |    |    |    |    |
| Access |     | R         | R  | R  | R  | R  | R  | R  | R  |
| Reset  |     | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 31:0 – CV[31:0]** Counter Value  
 CV contains the counter value in real time.

**Important:**

### 53.7.7 TC Register A

**Name:** TC\_RA<sub>x</sub>  
**Offset:** 0x14 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register has access Read-only if TC\_CMRA<sub>x</sub>.WAVE = 0, Read/Write if TC\_CMRA<sub>x</sub>.WAVE = 1.  
 This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |           |     |     |     |     |     |     |     |

| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | RA[7:0]   |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – RA[31:0] Register A**  
 RA contains the Register A value in real time.

**Important:**

### 53.7.8 TC Register B

**Name:** TC\_RBx  
**Offset:** 0x18 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register has access Read-only if TC\_CMRx.WAVE = 0, Read/Write if TC\_CMRx.WAVE = 1.  
 This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | RB[31:24] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – RC[31:0] Register C**  
 RC contains the Register C value in real time.

**Important:**

### 53.7.10 TC Interrupt Status Register

**Name:** TC\_SRx  
**Offset:** 0x20 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

|        |                         |       |       |      |      |       |       |        |  |
|--------|-------------------------|-------|-------|------|------|-------|-------|--------|--|
| Bit    | 31                      | 30    | 29    | 28   | 27   | 26    | 25    | 24     |  |
|        | [Greyed out bits 31-24] |       |       |      |      |       |       |        |  |
| Access |                         |       |       |      |      |       |       |        |  |

| Bit    | 7                       | 6     | 5     | 4    | 3    | 2     | 1     | 0      |  |
|        | ETRGS                   | LDRBS | LDRAS | CPCS | CPBS | CPAS  | LOVRS | COVFS  |  |
| Access | R                       | R     | R     | R    | R    | R     | R     | R      |  |
| Reset  | 0                       | 0     | 0     | 0    | 0    | 0     | 0     | 0      |  |

#### Bit 18 – MTIOB TIOBx Mirror

| Value | Description   |
|-------|---|
| 0     | TIOBx is low. If TC_CMRx.WAVE = 0, TIOBx pin is low. If TC_CMRx.WAVE = 1, TIOBx is driven low.    |
| 1     | TIOBx is high. If TC_CMRx.WAVE = 0, TIOBx pin is high. If TC_CMRx.WAVE = 1, TIOBx is driven high. |

#### Bit 17 – MTIOA TIOAx Mirror

| Value | Description   |
|-------|---|
| 0     | TIOAx is low. If TC_CMRx.WAVE = 0, TIOAx pin is low. If TC_CMRx.WAVE = 1, TIOAx is driven low.    |
| 1     | TIOAx is high. If TC_CMRx.WAVE = 0, TIOAx pin is high. If TC_CMRx.WAVE = 1, TIOAx is driven high. |

#### Bit 16 – CLKSTA Clock Enabling Status

| Value | Description        |
|-------|--------------------|
| 0     | Clock is disabled. |
| 1     | Clock is enabled.  |

**Bit 7 – ETRGS** External Trigger Status (cleared on read)

| Value | Description   |
|-------|---|
| 0     | External trigger has not occurred since the last read of the Status Register. |
| 1     | External trigger has occurred since the last read of the Status Register.     |

**Bit 6 – LDRBS** RB Loading Status (cleared on read)

| Value | Description   |
|-------|---|
| 0     | RB Load has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1. |
| 1     | RB Load has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 0.    |

**Bit 5 – LDRAS** RA Loading Status (cleared on read)

| Value | Description   |
|-------|---|
| 0     | RA Load has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1. |
| 1     | RA Load has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 0.    |

**Bit 4 – CPCS** RC Compare Status (cleared on read)

| Value | Description   |
|-------|---|
| 0     | RC Compare has not occurred since the last read of the Status Register. |
| 1     | RC Compare has occurred since the last read of the Status Register.     |

**Bit 3 – CPBS** RB Compare Status (cleared on read)

| Value | Description  |
|-------|--|
| 0     | RB Compare has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 0. |
| 1     | RB Compare has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 1.    |

**Bit 2 – CPAS** RA Compare Status (cleared on read)

| Value | Description  |
|-------|--|
| 0     | RA Compare has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 0. |
| 1     | RA Compare has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 1.    |

**Bit 1 – LOVRS** Load Overrun Status (cleared on read)

| Value | Description   |
|-------|---|
| 0     | Load overrun has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1.  |
| 1     | RA or RB have been loaded at least twice without any read of the corresponding register since the last read of the Status Register, if TC_CM Rx.WAVE = 0. |

**Bit 0 – COVFS** Counter Overflow Status (cleared on read)

# SAMA5D2 Series

## Timer Counter (TC)

| Value | Description  |
|-------|--|
| 0     | No counter overflow has occurred since the last read of the Status Register. |
| 1     | A counter overflow has occurred since the last read of the Status Register.  |

### 53.7.11 TC Interrupt Enable Register

**Name:** TC\_IERx  
**Offset:** 0x24 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |     |       |       |       |      |      |      |       |       |
|--------|-----|-------|-------|-------|------|------|------|-------|-------|
|        | Bit | 31    | 30    | 29    | 28   | 27   | 26   | 25    | 24    |
|        |     |       |       |       |      |      |      |       |       |
| Access |     |       |       |       |      |      |      |       |       |
| Reset  |     |       |       |       |      |      |      |       |       |
|        |     |       |       |       |      |      |      |       |       |
|        | Bit | 23    | 22    | 21    | 20   | 19   | 18   | 17    | 16    |
|        |     |       |       |       |      |      |      |       |       |
| Access |     |       |       |       |      |      |      |       |       |
| Reset  |     |       |       |       |      |      |      |       |       |
|        |     |       |       |       |      |      |      |       |       |
|        | Bit | 15    | 14    | 13    | 12   | 11   | 10   | 9     | 8     |
|        |     |       |       |       |      |      |      |       |       |
| Access |     |       |       |       |      |      |      |       |       |
| Reset  |     |       |       |       |      |      |      |       |       |
|        |     |       |       |       |      |      |      |       |       |
|        | Bit | 7     | 6     | 5     | 4    | 3    | 2    | 1     | 0     |
|        |     | ETRGS | LDRBS | LDRAS | CPCS | CPBS | CPAS | LOVRS | COVFS |
| Access |     | W     | W     | W     | W    | W    | W    | W     | W     |
| Reset  |     | –     | –     | –     | –    | –    | –    | –     | –     |

**Bit 7 – ETRGS** External Trigger

**Bit 6 – LDRBS** RB Loading

**Bit 5 – LDRAS** RA Loading

**Bit 4 – CPCS** RC Compare

**Bit 3 – CPBS** RB Compare

**Bit 2 – CPAS** RA Compare

**Bit 1 – LOVRS** Load Overrun

**Bit 0 – COVFS** Counter Overflow

### 53.7.12 TC Interrupt Disable Register

**Name:** TC\_IDRx  
**Offset:** 0x28 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |       |       |       |      |      |      |       |       |
|--------|-------|-------|-------|------|------|------|-------|-------|
| Bit    | 31    | 30    | 29    | 28   | 27   | 26   | 25    | 24    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
|        |       |       |       |      |      |      |       |       |
| Bit    | 23    | 22    | 21    | 20   | 19   | 18   | 17    | 16    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
|        |       |       |       |      |      |      |       |       |
| Bit    | 15    | 14    | 13    | 12   | 11   | 10   | 9     | 8     |

**Bit 1 – LOVRS** Load Overrun

**Bit 0 – COVFS** Counter Overflow

### 53.7.14 TC Extended Mode Register

**Name:** TC\_EMRx  
**Offset:** 0x30 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

#### Bit 8 – NODIVCLK No Divided Clock

| Value | Description  |
|-------|--|
| 0     | The selected clock is defined by field TCCLKS in TC_CMRx.                        |
| 1     | The selected clock is peripheral clock and TCCLKS field (TC_CMRx) has no effect. |

#### Bits 5:4 – TRIGSRCB[1:0] Trigger Source for Input B

| Value | Name           | Description  |
|-------|----------------|--|
| 0     | EXTERNAL_TIOBx | The trigger/capture input B is driven by external pin TIOBx  |
| 1     | PWMx           | For TC0 to TC10: The trigger/capture input B is driven internally by the comparator output (see <a href="#">Synchronization with PWM</a> ) of the PWMx.<br>For TC11: The trigger/capture input B is driven internally by the GTSUCOMP signal of the Ethernet MAC (GMAC). |

#### Bits 1:0 – TRIGSRCA[1:0] Trigger Source for Input A

| Value | Name           | Description   |
|-------|----------------|---|
| 0     | EXTERNAL_TIOAx | The trigger/capture input A is driven by external pin TIOAx |
| 1     | PWMx           | The trigger/capture input A is driven internally by PWMx    |

### 53.7.15 TC Block Control Register

**Name:** TC\_BCR  
**Offset:** 0xC0  
**Reset:** –  
**Property:** Write-only

#### Bit 0 – SYNC Synchro Command

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | Asserts the SYNC signal which generates a software trigger simultaneously for each of the channels. |

### 53.7.16 TC Block Mode Register

**Name:** TC\_BMR  
**Offset:** 0xC4  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |              |      |              |             |              |         |              |      |
|--------|--------------|------|--------------|-------------|--------------|---------|--------------|------|

| Access |              |      | R/W          | R/W         | R/W          | R/W     | R/W          | R/W  |
| Reset  |              |      | 0            | 0           | 0            | 0       | 0            | 0    |

#### Bits 29:26 – MAXCMP[3:0] Maximum Consecutive Missing Pulses

| Value | Description  |
|-------|--|
| 0     | The flag MPE in TC_QISR never rises.                                   |
| 1–15  | Defines the number of consecutive missing pulses before a flag report. |

#### Bits 25:20 – MAXFILT[5:0] Maximum Filter

Pulses with a period shorter than MAXFILT+1 peripheral clock cycles are discarded. For more details on MAXFILT constraints, see [“Input Preprocessing”](#)

| Value | Description                         |
|-------|-------------------------------------|
| 1–63  | Defines the filtering capabilities. |

#### Bit 18 – AUTO AutoCorrection of missing pulses

0 (DISABLED): The detection and autocorrection function is disabled.

1 (ENABLED): The detection and autocorrection function is enabled.

#### Bit 17 – IDXP Index Pin is PHB Pin

| Value | Description                                    |
|-------|--|
| 0     | IDX pin of the rotary sensor must drive TIOA1. |

| Value | Description                                    |
|-------|--|
| 1     | IDX pin of the rotary sensor must drive TIOB0. |

**Bit 16 – SWAP** Swap PHA and PHB

| Value | Description   |
|-------|---|
| 0     | No swap between PHA and PHB.                            |
| 1     | Swap PHA and PHB internally, prior to driving the QDEC. |

**Bit 15 – INVIDX** Inverted Index

| Value | Description                               |
|-------|---|
| 0     | IDX (TIOA1) is directly driving the QDEC. |
| 1     | IDX is inverted before driving the QDEC.  |

**Bit 14 – INVB** Inverted PHB

| Value | Description                               |
|-------|---|
| 0     | PHB (TIOB0) is directly driving the QDEC. |
| 1     | PHB is inverted before driving the QDEC.  |

**Bit 13 – INVA** Inverted PHA

| Value | Description                               |
|-------|---|
| 0     | PHA (TIOA0) is directly driving the QDEC. |
| 1     | PHA is inverted before driving the QDEC.  |

**Bit 12 – EDGPHA** Edge on PHA Count Mode

| Value | Description                             |
|-------|---|
| 0     | Edges are detected on PHA only.         |
| 1     | Edges are detected on both PHA and PHB. |

**Bit 11 – QDTRANS** Quadrature Decoding Transparent

| Value | Description   |
|-------|---|
| 0     | Full quadrature decoding logic is active (direction change detected).   |
| 1     | Quadrature decoding logic is inactive (direction change inactive) but input filtering and edge detection are performed. |

**Bit 10 – SPEEDEN** Speed Enabled

| Value | Description  |
|-------|--|
| 0     | Disabled.  |
| 1     | Enables the speed measure on channel 0, the time base being provided by channel 2. |

**Bit 9 – POSEN** Position Enabled

| Value | Description                                      |
|-------|--|
| 0     | Disable position.                                |
| 1     | Enables the position measure on channel 0 and 1. |

**Bit 8 – QDEN** Quadrature Decoder Enabled

Quadrature decoding (direction change) can be disabled using QDTRANS bit.

One of the POSEN or SPEEDEN bits must be also enabled.

| Value | Description  |
|-------|--|
| 0     | Disabled.  |
| 1     | Enables the QDEC (filter, edge detection and quadrature decoding). |

**Bits 5:4 – TC2XC2S[1:0]** External Clock Signal 2 Selection

| Value | Name  | Description                    |
|-------|-------|--------------------------------|
| 0     | TCLK2 | Signal connected to XC2: TCLK2 |
| 1     | –     | Reserved                       |
| 2     | TIOA0 | Signal connected to XC2: TIOA0 |
| 3     | TIOA1 | Signal connected to XC2: TIOA1 |

**Bits 3:2 – TC1XC1S[1:0]** External Clock Signal 1 Selection

| Value | Name  | Description                    |
|-------|-------|--------------------------------|
| 0     | TCLK1 | Signal connected to XC1: TCLK1 |
| 1     | –     | Reserved                       |
| 2     | TIOA0 | Signal connected to XC1: TIOA0 |
| 3     | TIOA2 | Signal connected to XC1: TIOA2 |

**Bits 1:0 – TC0XC0S[1:0]** External Clock Signal 0 Selection

| Value | Name  | Description                    |
|-------|-------|--------------------------------|
| 0     | TCLK0 | Signal connected to XC0: TCLK0 |
| 1     | –     | Reserved                       |
| 2     | TIOA1 | Signal connected to XC0: TIOA1 |
| 3     | TIOA2 | Signal connected to XC0: TIOA2 |

### 53.7.17 TC QDEC Interrupt Enable Register

**Name:** TC\_QIER  
**Offset:** 0xC8  
**Reset:** –  
**Property:** Write-only

#### Bit 3 – MPE Consecutive Missing Pulse Error

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Enables the interrupt when an occurrence of MAXCMP consecutive missing pulses is detected. |

#### Bit 2 – QERR Quadrature Error

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | Enables the interrupt when a quadrature error occurs on PHA, PHB. |

#### Bit 1 – DIRCHG Direction Change

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Enables the interrupt when a change on rotation direction is detected. |

#### Bit 0 – IDX Index

| Value | Description |
|-------|-------------|
| 0     | No effect.  |

# SAMA5D2 Series

## Timer Counter (TC)

---

---

| Value | Description   |
|-------|---|
| 1     | Enables the interrupt when a rising edge occurs on IDX input. |

### 53.7.18 TC QDEC Interrupt Disable Register

**Name:** TC\_QIDR  
**Offset:** 0xCC  
**Reset:** –  
**Property:** Write-only

#### Bit 3 – MPE Consecutive Missing Pulse Error

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | Disables the interrupt when an occurrence of MAXCMP consecutive missing pulses has been detected. |

#### Bit 2 – QERR Quadrature Error

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Disables the interrupt when a quadrature error occurs on PHA, PHB. |

#### Bit 1 – DIRCHG Direction Change

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | Disables the interrupt when a change on rotation direction is detected. |

#### Bit 0 – IDX Index

| Value | Description |
|-------|-------------|
| 0     | No effect.  |

# SAMA5D2 Series

## Timer Counter (TC)

---

---

| Value | Description  |
|-------|--|
| 1     | Disables the interrupt when a rising edge occurs on IDX input. |

### 53.7.19 TC QDEC Interrupt Mask Register

**Name:** TC\_QIMR  
**Offset:** 0xD0  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 3 – MPE Consecutive Missing Pulse Error

| Value | Description  |
|-------|--|
| 0     | The interrupt on the maximum number of consecutive missing pulses specified in MAXCMP is disabled. |
| 1     | The interrupt on the maximum number of consecutive missing pulses specified in MAXCMP is enabled.  |

#### Bit 2 – QERR Quadrature Error

| Value | Description                                    |
|-------|--|
| 0     | The interrupt on quadrature error is disabled. |
| 1     | The interrupt on quadrature error is enabled.  |

#### Bit 1 – DIRCHG Direction Change

| Value | Description   |
|-------|---|
| 0     | The interrupt on rotation direction change is disabled. |
| 1     | The interrupt on rotation direction change is enabled.  |

#### Bit 0 – IDX Index

# SAMA5D2 Series

## Timer Counter (TC)

| Value | Description                             |
|-------|---|
| 0     | The interrupt on IDX input is disabled. |
| 1     | The interrupt on IDX input is enabled.  |

### 53.7.20 TC QDEC Interrupt Status Register

**Name:** TC\_QISR  
**Offset:** 0xD4  
**Reset:** 0x00000000  
**Property:** Read-only

|        |                         |    |    |     |    |      |        |     |

| Bit    | 31                      | 30 | 29 | 28  | 27 | 26   | 25     | 24  |
|        | [Greyed out bits 31-24] |    |    |     |    |      |        |     |
| Access |                         |    |    |     |    |      |        |     |
| Reset  |                         |    |    |     |    |      |        |     |
| Bit    | 23                      | 22 | 21 | 20  | 19 | 18   | 17     | 16  |
|        | [Greyed out bits 23-16] |    |    |     |    |      |        |     |
| Access |                         |    |    |     |    |      |        |     |
| Reset  |                         |    |    |     |    |      |        |     |
| Bit    | 15                      | 14 | 13 | 12  | 11 | 10   | 9      | 8   |
|        | [Greyed out bits 15-9]  |    |    |     |    |      |        | DIR |
| Access |                         |    |    |     |    |      |        | R   |
| Reset  |                         |    |    |     |    |      |        | 0   |
| Bit    | 7                       | 6  | 5  | 4   | 3  | 2    | 1      | 0   |
|        | [Greyed out bits 7-5]   |    |    | MPE |    | QERR | DIRCHG | IDX |
| Access |                         |    |    | R   | R  | R    | R      |     |
| Reset  |                         |    |    | 0   | 0  | 0    | 0      |     |

**Bit 8 – DIR** Direction  
 Returns an image of the current rotation direction.

**Bit 3 – MPE** Consecutive Missing Pulse Error

| Value | Description  |
|-------|--|
| 0     | The number of consecutive missing pulses has not reached the maximum value specified in MAXCMP since the last read of TC_QISR. |
| 1     | An occurrence of MAXCMP consecutive missing pulses has been detected since the last read of TC_QISR.                           |

**Bit 2 – QERR** Quadrature Error

| Value | Description   |
|-------|---|
| 0     | No quadrature error since the last read of TC_QISR.         |
| 1     | A quadrature error occurred since the last read of TC_QISR. |

**Bit 1 – DIRCHG** Direction Change

| Value | Description   |
|-------|---|
| 0     | No change on rotation direction since the last read of TC_QISR. |
| 1     | The rotation direction changed since the last read of TC_QISR.  |

---

---

**Bit 0 – IDX** Index

| Value | Description   |
|-------|---|
| 0     | No Index input change since the last read of TC_QISR.     |
| 1     | The IDX input has changed since the last read of TC_QISR. |

### 53.7.21 TC Fault Mode Register

**Name:** TC\_FMR  
**Offset:** 0xD8  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

#### Bit 1 – ENCF1 Enable Compare Fault Channel 1

| Value | Description  |
|-------|--|
| 0     | Disables the FAULT output source (CPCS flag) from channel 1. |
| 1     | Enables the FAULT output source (CPCS flag) from channel 1.  |

#### Bit 0 – ENCF0 Enable Compare Fault Channel 0

| Value | Description  |
|-------|--|
| 0     | Disables the FAULT output source (CPCS flag) from channel 0. |
| 1     | Enables the FAULT output source (CPCS flag) from channel 0.  |

### 53.7.22 TC Write Protection Mode Register

**Name:** TC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |              |    |    |    |    |    |    |      |
|--------|--------------|----|----|----|----|----|----|------|
| Bit    | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        | WPKEY[23:16] |    |    |    |    |    |    |      |
| Access | W            | W  | W  | W  | W  | W  | W  | W    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        | WPKEY[15:8]  |    |    |    |    |    |    |      |
| Access | W            | W  | W  | W  | W  | W  | W  | W    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPKEY[7:0]   |    |    |    |    |    |    |      |
| Access | W            | W  | W  | W  | W  | W  | W  | W    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |              |    |    |    |    |    |    | WPEN |
| Access |              |    |    |    |    |    |    | R/W  |
| Reset  |              |    |    |    |    |    |    | 0    |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description   |
|----------|--------|---|
| 0x54494D | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. |
| D        |        | Always reads as 0.  |

#### Bit 0 – WPEN Write Protection Enable

The Timer Counter clock of the first channel must be enabled to access this register.

See [“Register Write Protection”](#) for a list of registers that can be write-protected and Timer Counter clock conditions.

| Value | Description  |
|-------|--|
| 0     | Disables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII).  |

## 54. Pulse Density Modulation Interface Controller (PDMIC)

### 54.1 Description

The Pulse Density Modulation Interface Controller (PDMIC) is a PDM interface controller and decoder that support mono PDM format. It integrates a clock generator driving the PDM microphone and embeds filters which decimate the incoming bitstream to obtain most common audio rates.

### 54.2 Embedded Characteristics

- 16-bit Resolution
- DMA Controller Support
- Up to 4 Conversions Stored
- PDM Clock Source can be Independent from Core Clock
- Register Write Protection

### 54.3 Block Diagram

Figure 54-1. PDMIC Block Diagram

### 54.4 Signal Description

Table 54-1. PDMIC Pin Description

| Pin Name  | Description                                       | Type   |
|-----------|---|--------|
| PDMIC_CLK | Pulse Density Modulation Bitstream Sampling Clock | Output |
| PDMIC_DAT | Pulse Density Modulation Data                     | Input  |

## 54.5 Product Dependencies

### 54.5.1 I/O Lines

The pins used for interfacing the PDMIC are multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the peripheral functions to PDMIC pins.

### 54.5.2 Power Management

The PDMIC is not continuously clocked. The user must first enable the PDMIC peripheral clocks (PDMIC Channel 0 and PDMIC Channel 1) and the PDMIC Generic Clock in the Power Management Controller (PMC) before using the controller.

### 54.5.3 Interrupt Sources

The PDMIC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PDMIC interrupt requires the Interrupt Controller to be programmed first.

## 54.6 Functional Description

### 54.6.1 PDM Interface

#### 54.6.1.1 Description

The PDM clock (PDMIC\_CLK) is used to sample the PDM bitstream.

The PDMIC\_CLK frequency range is between peripheral clock/2 and peripheral clock/256 or between GCLK clock/2 and GCLK clock/256, depending on the selected clock source.

The GCLK clock frequency must always be at least three times lower than the peripheral clock frequency.

The field PRESCAL in the Mode Register (PDMIC\_MR) must be programmed in order to provide a PDMIC\_CLK frequency compliant with the microphone parameters.

#### 54.6.1.2 Start-up Sequence

To start processing the bitstream coming from the PDM interface, follow the steps below:

1. Clear all bits in the Control Register (PDMIC\_CR) or compute a soft reset using the SWRST bit of PDMIC\_CR.
2. Configure the PRESCAL field in PDMIC\_MR according to the microphone specifications.
3. Enable the PDM mode and start the conversions using the ENPDM bit in PDMIC\_CR.

### 54.6.2 Digital Signal Processing (Digital Filter)

#### 54.6.2.1 Description

The PDMIC includes a DSP section containing a decimation filter, a droop compensation filter, a sixth-order low pass filter, a first-order high pass filter and an offset and gain compensation stage. A block diagram of the DSP section is represented in [Figure 54-2](#).

Data processed by the filtering section are two's complement signals defined on 24 bits.

The filtering of the decimation stage is performed by a fourth-order sinc-based filter whose zeros are placed in order to minimize aliasing effects of the decimation. The decimation ratio of this filter is either 32 or 64. The droop induced by this filter can be compensated by the droop compensation stage.

The sixth-order low pass filter is used to decimate the sinc filter output by a ratio of 2.

An optional first-order high pass filter is implemented in order to eliminate the DC component of the incoming signal.

The overall decimation ratio of this DSP section is either 64 or 128. This fits an audio sampling rate of 48 kHz with a PDM microphone sampling frequency of either 3.072 or 6.144 MHz. The frequency response of the filters optimizes the gain flatness between 0 and 20 kHz (when the droop compensation filter is implemented and the high pass filter is bypassed) and highly reduces the aliasing effects of the decimation.

**Figure 54-2. DSP Block Diagram**

### 54.6.2.2 Decimation Filter

The sigma-delta architecture of the PDM microphone implies a filtering and a decimation of the bitstream at the output of the microphone bitstream. The decimation filter decimates the bitstream by either 32 or 64. To perform this operation, a fourth-order sinc filter with an Over-Sampling Ratio (OSR) of 32 or 64 is implemented with the following transfer function:

$$H(z) = \frac{1}{OSR^4} \left( \sum_{i=0}^{OSR-1} z^{-i} \right)^4$$

The DC gain of this filter is unity and does not depend on its OSR. However, as it generates a fourth-order zero at  $F_s/OSR$  frequency multiples ( $F_s$  being the sampling frequency of the microphone), the frequency response of the decimation filter depends on the OSR parameter. See [54.6.2.3 Droop Compensation](#) for frequency plots.

Its non-flat frequency response can be compensated over the 0 to 20 kHz band by using the droop compensation filter when the decimated frequency is set to 48 kHz. See [54.6.2.3 Droop Compensation](#).

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

In [Figure 54-3](#) and [Figure 54-4](#),  $F_s$  is the sampling rate of the PDM microphone.

**Figure 54-3. Spectral mask of an OSR = 32,  $F_s = 6.144$  MHz, Fourth-Order Sinc Filter: Overall Response (continuous line) and 0 to 20 kHz Bandwidth Response (dashed line)**

The zeros of this filter are located at multiples of  $F_s/32$

**Figure 54-4. Spectral Mask of an OSR = 64,  $F_s = 3.072$  MHz, Fourth-order Sinc Filter: Overall Response (continuous line) and 0 to 20 kHz Bandwidth Response (dashed line)**

The zeros of this filter are located at multiples of  $F_s/64$ .

### 54.6.2.3 Droop Compensation

The droop effect introduced by the sinc filter can be compensated in the 0 to 20 kHz by the droop compensation filter (see [Figure 54-5](#)). This is a second-order IIR filter which is applied on the signal output by the sinc. The default coefficients of the droop compensation filter are computed to optimize the droop of the sinc filter with the decimated frequency equal to 48 kHz.

This filter compensates the droop of the sinc filter regardless of the OSR value.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

This filter can be bypassed by setting the SINBYP bit in the [PDMIC DSP Configuration Register 0](#) (PDMIC\_DSPR0).

**Figure 54-5. Droop Compensation Filter Overall Frequency Response**

**Figure 54-6. Droop Compensation Filter 0 to 20 kHz Band Flatness**

#### 54.6.2.4 Low Pass Filter

The PDMIC includes a sixth-order IIR filter that performs a low pass transfer function and decimates by 2 the output of the sinc filter. The coefficients are computed for a decimated sampling rate of 48 kHz and optimize the 0 to 20 kHz band flatness while rejecting the aliasing of the PDM microphone by at least 60 dB in the 28 to 48 kHz band.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

Figure 54-7 and Figure 54-8 are drawn for an output sampling frequency of 48 kHz.

**Figure 54-7. Low Pass Filter Spectral Mask**

**Figure 54-8. Low Pass Filter Ripple in the 0 to 20 kHz Band**

#### 54.6.2.5 High Pass Filter

The PDMIC includes an optional first-order IIR filter performing a high pass transfer function after the low pass filter and before the decimation. The coefficients are computed for a decimated sampling rate of 48 kHz to obtain a -3dB cutoff frequency at 15 Hz.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

This filter can be bypassed by setting the HPFBYP bit in PDMIC\_DSPR0 (see 54.7.8 PDMIC\_DSPR0).

Figure 54-9 is drawn for an output sampling frequency of 48 kHz.

**Figure 54-9. High Pass Filter Spectral Mask in the 0 to 100 Hz Band**

#### 54.6.2.6 Gain and Offset Compensation

An offset, a gain, a scaling factor and a shift can be applied to a converted PDM microphone value using the following operation:

$$\text{data} = \frac{(\text{data}_0 + \text{offset} \times 2^8) \times \text{dgain}}{2^{\text{scale} + \text{shift} + 8}}$$

where:

- $\text{data}_0$  is a signed integer defined on 24 bits. It is the output of the filtering channel.
- $\text{offset}$  is a signed integer defined on 16 bits (see [PDMIC DSP Configuration Register 1](#)). It is multiplied by  $2^8$  to have the same weight as  $\text{data}_0$ .
- $\text{dgain}$  is an unsigned integer defined on 15 bits (see [PDMIC DSP Configuration Register 1](#)). Only the 32 MSBs of the multiplication operation are used for scaling and shifting operations.  $\text{dgain}$  defaults to 0 after reset, which forces CDR to 0. It must be programmed to a non-zero value to read non-zero data into the PDMIC\_CDR register.
- $\text{scale}$  is an unsigned integer defined on 4 bits (see [PDMIC DSP Configuration Register 0](#)). It shifts the multiplication operation result by  $\text{scale}$  bits to the right. Maximum allowed value is 15.
- $\text{shift}$  is an unsigned integer defined on 4 bits (see [PDMIC DSP Configuration Register 0](#)). It shifts the multiplication operation result by  $\text{shift}$  bits to the right. Maximum allowed value is 15.

If the data transfer is configured in 32-bit mode (see [PDMIC DSP Configuration Register 0](#)), the  $2^{\text{shift}}$  division is not performed and the 32-bit result of the remaining operation is sent.

If the data transfer is configured in 16-bit mode, the  $2^{\text{shift}}$  division is performed. The result is then saturated to be within  $\pm(2^{15}-1)$  and the 16 LSBs of this saturation operation are sent to the controller as the result of the PDM microphone conversion.

Default parameters are defined to output a 16-bit result whatever the data transfer configuration may be.

#### 54.6.3 Conversion Results

When a conversion is completed, the resulting 16-bit digital value is stored in the PDMIC Converted Data Register (PDMIC\_CDR).

The DRDY bit in the Interrupt Status Register (PDMIC\_ISR) is set. In the case of a connected DMA Controller channel, DRDY rising triggers a data transfer request. In any case, DRDY can trigger an interrupt.

Reading PDMIC\_CDR clears the DRDY flag.

**Figure 54-10. DRDY Flag Behavior**

If PDMIC\_CDR is not read before further incoming data is converted, the Overrun Error (OVRE) flag is set in PDMIC\_ISR. Likewise, new data converted when DRDY is high sets the OVRE bit (Overrun Error) in PDMIC\_ISR. In case of overrun, the newly converted data is lost.

The OVRE flag is automatically cleared when PDMIC\_ISR is read.

#### 54.6.4 Register Write Protection

To prevent any single software error from corrupting PDMIC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [PDMIC Write Protection Mode Register](#) (PDMIC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [PDMIC Write Protection Status Register](#) (PDMIC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading PDMIC\_WPSR.

The following registers can be write-protected:

- [PDMIC Mode Register](#)
- [PDMIC DSP Configuration Register 0](#)
- [PDMIC DSP Configuration Register 1](#)

### 54.7.1 PDMIC Control Register

**Name:** PDMIC\_CR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 4 – ENPDM Enable PDM

| Value | Description                                 |
|-------|---|
| 0     | Disables the PDM and stops the conversions. |
| 1     | Enables the PDM and starts the conversions. |

#### Bit 0 – SWRST Software Reset

Warning: The read value of this bit is always 0.

| Value | Description                                    |
|-------|--|
| 0     | No effect.                                     |
| 1     | Resets the PDMIC, simulating a hardware reset. |

### 54.7.2 PDMIC Mode Register

**Name:** PDMIC\_MR  
**Offset:** 0x04  
**Reset:** 0x00F00000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PDMIC Write Protection Mode Register](#).

|        |              |     |     |      |              |     |     |     |

| Access |              |     |     | R/W  |              |     |     |     |
| Reset  |              |     |     | 0    |              |     |     |     |

#### Bits 14:8 – PRESCAL[6:0] Prescaler Rate Selection

PRESCAL determines the frequency of the PDM bitstream sampling clock (PDMIC\_CLK):

$$\text{PRESCAL} = \frac{\text{SELCK}}{2 \times f_{\text{PDMIC\_CLK}}} - 1$$

where SELCK is either  $f_{\text{peripheral clock}}$  or  $f_{\text{GCLK clock}}$  depending on the value of bit CLKS ( $f_{\text{peripheral clock}}$  or  $f_{\text{GCLK clock}}$  is the clock frequency in Hz).

#### Bit 4 – CLKS Clock Source Selection

| Value | Description  |
|-------|--|
| 0     | Peripheral clock selected  |
| 1     | GCLK clock selected (This clock source can be independent of the processor clock.) |

### 54.7.3 PDMIC Converted Data Register

**Name:** PDMIC\_CDR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read-only

|        |             |    |    |    |    |    |    |    |
|--------|-------------|----|----|----|----|----|----|----|
| Bit    | 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | DATA[31:24] |    |    |    |    |    |    |    |

| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | DATA[7:0]   |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – DATA[31:0] Data Converted

The filtered output data is placed into this register at the end of a conversion and remains until it is read.

### 54.7.4 PDMIC Interrupt Enable Register

**Name:** PDMIC\_IER  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |    |    |    |    |    |    |      |      |
|--------|----|----|----|----|----|----|------|------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25   | 24   |
|        |    |    |    |    |    |    | OVRE | DRDY |
| Access |    |    |    |    |    |    | W    | W    |
| Reset  |    |    |    |    |    |    | –    | –    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |

| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |   |   |   |   |
|--------|---|---|---|---|---|---|---|---|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Access |   |   |   |   |   |   |   |   |
| Reset  |   |   |   |   |   |   |   |   |

**Bit 25 – OVRE** Overrun Error Interrupt Enable

**Bit 24 – DRDY** Data Ready Interrupt Enable

### 54.7.5 PDMIC Interrupt Disable Register

**Name:** PDMIC\_IDR  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25   | 24   |
|--------|----|----|----|----|----|----|------|------|
|        |    |    |    |    |    |    | OVRE | DRDY |
| Access |    |    |    |    |    |    | W    | W    |
| Reset  |    |    |    |    |    |    | –    | –    |

| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|--------|----|----|----|----|----|----|----|----|
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|--------|----|----|----|----|----|----|---|---|
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------|---|---|---|---|---|---|---|---|
|        |   |   |   |   |   |   |   |   |
| Access |   |   |   |   |   |   |   |   |
| Reset  |   |   |   |   |   |   |   |   |

**Bit 25 – OVRE** General Overrun Error Interrupt Disable

**Bit 24 – DRDY** Data Ready Interrupt Disable

### 54.7.6 PDMIC Interrupt Mask Register

**Name:** PDMIC\_IMR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25   | 24   |
|--------|----|----|----|----|----|----|------|------|
|        |    |    |    |    |    |    | OVRE | DRDY |
| Access |    |    |    |    |    |    | R    | R    |
| Reset  |    |    |    |    |    |    | 0    | 0    |

| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|--------|----|----|----|----|----|----|----|----|
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|--------|----|----|----|----|----|----|---|---|
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|--------|---|---|---|---|---|---|---|---|
|        |   |   |   |   |   |   |   |   |
| Access |   |   |   |   |   |   |   |   |
| Reset  |   |   |   |   |   |   |   |   |

**Bit 25 – OVRE** General Overrun Error Interrupt Mask

**Bit 24 – DRDY** Data Ready Interrupt Mask

### 54.7.7 PDMIC Interrupt Status Register

**Name:** PDMIC\_ISR  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read-only

|        |              |    |    |    |    |    |      |      |
|--------|--------------|----|----|----|----|----|------|------|
| Bit    | 31           | 30 | 29 | 28 | 27 | 26 | 25   | 24   |
|        |              |    |    |    |    |    | OVRE | DRDY |
| Access |              |    |    |    |    |    | R    | R    |
| Reset  |              |    |    |    |    |    | 0    | 0    |
| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17   | 16   |
|        | FIFOCNT[7:0] |    |    |    |    |    |      |      |
| Access | R            | R  | R  | R  | R  | R  | R    | R    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0    | 0    |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9    | 8    |
| Access |              |    |    |    |    |    |      |      |
| Reset  |              |    |    |    |    |    |      |      |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1    | 0    |
| Access |              |    |    |    |    |    |      |      |
| Reset  |              |    |    |    |    |    |      |      |

**Bit 25 – OVRE** Overrun Error (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No overrun error has occurred since the last read of PDMIC_ISR.           |
| 1     | At least one overrun error has occurred since the last read of PDMIC_ISR. |

**Bit 24 – DRDY** Data Ready (cleared by reading PDMIC\_CDR)

| Value | Description   |
|-------|---|
| 0     | No data has been converted since the last read of PDMIC_CDR.        |
| 1     | At least one data has been converted and is available in PDMIC_CDR. |

**Bits 23:16 – FIFOCNT[7:0]** FIFO Count

Number of conversions available in the FIFO (not a source of interrupt).

### 54.7.8 PDMIC DSP Configuration Register 0

**Name:** PDMIC\_DSPR0  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PDMIC Write Protection Mode Register](#).

|        |            |          |    |    |            |        |        |    |
|--------|------------|----------|----|----|------------|--------|--------|----|
| Bit    | 31         | 30       | 29 | 28 | 27         | 26     | 25     | 24 |
| Access |            |          |    |    |            |        |        |    |
| Reset  |            |          |    |    |            |        |        |    |
| Bit    | 23         | 22       | 21 | 20 | 19         | 18     | 17     | 16 |
| Access |            |          |    |    |            |        |        |    |
| Reset  |            |          |    |    |            |        |        |    |
| Bit    | 15         | 14       | 13 | 12 | 11         | 10     | 9      | 8  |
| Access | SHIFT[3:0] |          |    |    | SCALE[3:0] |        |        |    |
| Reset  | 0          | 0        | 0  | 0  | 0          | 0      | 0      | 0  |
| Bit    | 7          | 6        | 5  | 4  | 3          | 2      | 1      | 0  |
| Access |            | OSR[2:0] |    |    | SIZE       | SINBYP | HPFBYP |    |
| Reset  |            | 0        | 0  | 0  | 0          | 0      | 0      |    |

**Bits 15:12 – SHIFT[3:0]** Data Shift  
 Shifts the scaled result by SHIFT bits to the right.

**Bits 11:8 – SCALE[3:0]** Data Scale  
 Shifts the multiplication operation result by SCALE bits to the right.

**Bits 6:4 – OSR[2:0]** Global Oversampling Ratio  
 Values not listed are reserved.

| Value | Name | Description   |
|-------|------|---|
| 0     | 128  | Global Oversampling ratio is 128 (SINC filter oversampling ratio is 64) |
| 1     | 64   | Global Oversampling ratio is 64 (SINC filter oversampling ratio is 32)  |

**Bit 3 – SIZE** Data Size

| Value | Description                     |
|-------|---------------------------------|
| 0     | Converted data size is 16 bits. |
| 1     | Converted data size is 32 bits. |

**Bit 2 – SINBYP** SINCC Filter Bypass

---

---

| Value | Description                             |
|-------|---|
| 0     | Droop compensation filter enabled.      |
| 1     | Bypasses the droop compensation filter. |

**Bit 1 – HPFBYP** High-Pass Filter Bypass

| Value | Description                    |
|-------|--------------------------------|
| 0     | High-pass filter enabled.      |
| 1     | Bypasses the high-pass filter. |

### 54.7.9 PDMIC DSP Configuration Register 1

**Name:** PDMIC\_DSPR1  
**Offset:** 0x5C  
**Reset:** 0x00000001  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PDMIC Write Protection Mode Register](#).

DGAIN and OFFSET values can be determined using the formula in [54.6.2.6 Gain and Offset Compensation](#).

|        |              |             |     |     |     |     |     |     |
|--------|--------------|-------------|-----|-----|-----|-----|-----|-----|
| Bit    | 31           | 30          | 29  | 28  | 27  | 26  | 25  | 24  |
|        | OFFSET[15:8] |             |     |     |     |     |     |     |
| Access | R/W          | R/W         | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0            | 0           | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23           | 22          | 21  | 20  | 19  | 18  | 17  | 16  |
|        | OFFSET[7:0]  |             |     |     |     |     |     |     |
| Access | R/W          | R/W         | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0            | 0           | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15           | 14          | 13  | 12  | 11  | 10  | 9   | 8   |
|        |              | DGAIN[14:8] |     |     |     |     |     |     |
| Access |              | R/W         | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |              | 0           | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7            | 6           | 5   | 4   | 3   | 2   | 1   | 0   |
|        | DGAIN[7:0]   |             |     |     |     |     |     |     |
| Access | R/W          | R/W         | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0            | 0           | 0   | 0   | 0   | 0   | 0   | 1   |

**Bits 31:16 – OFFSET[15:0]** Offset Correction  
 Offset correction to apply to the final result.

**Bits 14:0 – DGAIN[14:0]** Gain Correction  
 Gain correction to apply to the final result.

## 54.7.10 PDMIC Write Protection Mode Register

**Name:** PDMIC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000

| Reset  |             |    |    |    |    |    |    | 0    |

#### Bits 23:8 – WPVSR[15:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protection Violation Status

| Value | Description   |
|-------|---|
| 0     | No write protection violation has occurred since the last read of PDMIC_WPSR.   |
| 1     | A write protection violation has occurred since the last read of PDMIC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## **55. Pulse Width Modulation Controller (PWM)**

### **55.1 Description**

The Pulse Width Modulation Controller (PWM) generates output pulses on 4 channels independently according to parameters defined per channel. Each channel controls two complementary square output waveforms. Characteristics of the output waveforms such as period, duty-cycle, polarity and dead-times (also called dead-bands or non-overlapping times) are configured through the user interface. Each channel selects and uses one of the clocks provided by the clock generator. The clock generator provides several clocks resulting from the division of the PWM peripheral clock. External triggers can be managed to allow output pulses to be modified in real time.

All accesses to the PWM are made through registers mapped on the peripheral bus. All channels integrate a double buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum, the duty-cycle or the dead-times.

Channels can be linked together as synchronous channels to be able to update their duty-cycle or dead-times at the same time.

The update of duty-cycles of synchronous channels can be performed by the DMA Controller channel which offers buffer transfer without processor Intervention.

The PWM includes a spread-spectrum counter to allow a constantly varying period (only for Channel 0). This counter may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

The PWM provides 1 independent comparison units capable of comparing a programmed value to the counter of the synchronous channels (counter of channel 0). These comparisons are intended to generate software interrupts, to trigger pulses on the 2 independent event lines (in order to synchronize ADC conversions with a lot of flexibility independently of the PWM outputs) and to trigger DMA Controller transfer requests.

PWM outputs can be overridden synchronously or asynchronously to their channel counter.

The PWM provides a fault protection mechanism with 6 fault inputs, capable to detect a fault condition and to override the PWM outputs asynchronously (outputs forced to '0', '1' or Hi-Z).

For safety usage, some configuration registers are write-protected.

### **55.2 Embedded Characteristics**

- 4 Channels
- Common Clock Generator Providing Thirteen Different Clocks
  - A Modulo n Counter Providing Eleven Clocks
  - Two Independent Linear Dividers Working on Modulo n Counter Outputs
- Independent Channels
  - Independent 16-bit Counter for Each Channel
  - Independent Complementary Outputs with 16-bit Dead-Time Generator (Also Called Dead-Band or Non-Overlapping Time) for Each Channel
  - Independent Push-Pull Mode for Each Channel
  - Independent Enable Disable Command for Each Channel

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

- Independent Clock Selection for Each Channel
- Independent Period, Duty-Cycle and Dead-Time for Each Channel
- Independent Double Buffering of Period, Duty-Cycle and Dead-Times for Each Channel
- Independent Programmable Selection of The Output Waveform Polarity for Each Channel, with Double Buffering
- Independent Programmable Center- or Left-aligned Output Waveform for Each Channel
- Independent Output Override for Each Channel
- Independent Interrupt for Each Channel, at Each Period for Left-Aligned or Center-Aligned Configuration
- Independent Update Time Selection of Double Buffering Registers (Polarity, Duty Cycle) for Each Channel, at Each Period for Left-Aligned or Center-Aligned Configuration
- External Trigger Input Management (e.g., for DC/DC or Lighting Control)
  - External PWM Reset Mode
  - External PWM Start Mode
  - Cycle-By-Cycle Duty Cycle Mode
  - Leading-Edge Blanking
- Two 2-bit Gray Up/Down Channels for Stepper Motor Control
- Spread Spectrum Counter to Allow a Constantly Varying Duty Cycle (only for Channel 0)
- Synchronous Channel Mode
  - Synchronous Channels Share the Same Counter
  - Mode to Update the Synchronous Channels Registers after a Programmable Number of Periods
  - Synchronous Channels Supports Connection of one DMA Controller Channel Which Offers Buffer Transfer Without Processor Intervention To Update Duty-Cycle Registers
- 2 Independent Events Lines Intended to Synchronize ADC Conversions
  - Programmable delay for Events Lines to delay ADC measurements
- 1 Comparison Units Intended to Generate Interrupts, Pulses on Event Lines and DMA Controller Transfer Requests
- 6 Programmable Fault Inputs Providing an Asynchronous Protection of PWM Outputs
  - 2 User Driven through PIO Inputs
  - PMC Driven when Crystal Oscillator Clock Fails
  - ADC Controller Driven through Configurable Comparison Function
  - Timer/Counter Driven through Configurable Comparison Function
- Register Write Protection

### 55.3 Block Diagram

Figure 55-1. Pulse Width Modulation Controller Block Diagram

**Note:** For a more detailed illustration of the fault protection circuitry, refer to [55.6.2.7 Fault Protection](#).

### 55.4 I/O Lines Description

Each channel outputs two complementary external I/O lines.

**Table 55-1. I/O Line Description**

| Name      | Description                            | Type   |
|-----------|--|--------|
| PWMHx     | PWM Waveform Output High for channel x | Output |
| PWMLx     | PWM Waveform Output Low for channel x  | Output |
| PWMFlx    | PWM Fault Input x                      | Input  |
| PWMEXTRGy | PWM Trigger Input y                    | Input  |

## 55.5 Product Dependencies

### 55.5.1 I/O Lines

The pins used for interfacing the PWM are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the desired PWM pins to their peripheral function. If I/O lines of the PWM are not used by the application, they can be used for other purposes by the PIO controller.

All of the PWM outputs may or may not be enabled. If an application requires only four channels, then only four PIO lines are assigned to PWM outputs.

### 55.5.2 Power Management

The PWM is not continuously clocked. The programmer must first enable the PWM clock in the Power Management Controller (PMC) before using the PWM. However, if the application does not require PWM operations, the PWM clock can be stopped when not needed and be restarted later. In this case, the PWM will resume its operations where it left off.

### 55.5.3 Interrupt Sources

The PWM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PWM interrupt requires the Interrupt Controller to be programmed first.

### 55.5.4 Fault Inputs

The PWM has the fault inputs connected to the different modules. Refer to the implementation of these modules within the product for detailed information about the fault generation procedure. The PWM receives faults from:

- PIO inputs
- the PMC
- the ADC controller
- Timer/Counters

**Table 55-2. Fault Inputs**

| Fault Generator | External PWM Fault Input Number | Polarity Level <sup>(1)</sup> | Fault Input ID |
|-----------------|---------------------------------|-------------------------------|----------------|
| PB2             | PWMFI0                          | User-defined                  | 0              |
| PB9             | PWMFI1                          | User-defined                  | 1              |
| PMC             | –                               | To be configured to 1         | 2              |

.....continued

| Fault Generator | External PWM Fault Input Number | Polarity Level <sup>(1)</sup> | Fault Input ID |
|-----------------|---------------------------------|-------------------------------|----------------|
| ADC             | –                               | To be configured to 1         | 3              |
| Timer0          | –                               | To be configured to 1         | 4              |
| Timer1          | –                               | To be configured to 1         | 5              |

**Note:**

1. FPOL field in PWMC\_FMR.

### 55.6 Functional Description

The PWM controller is primarily composed of a clock generator module and 4 channels.

- Clocked by the peripheral clock, the clock generator module provides 13 clocks.
- Each channel can independently choose one of the clock generator outputs.
- Each channel generates an output waveform with attributes that can be defined independently for each channel through the user interface registers.

#### 55.6.1 PWM Clock Generator

**Figure 55-2. Functional View of the Clock Generator Block Diagram**

The PWM peripheral clock is divided in the clock generator module to provide different clocks available for all channels. Each channel can independently select one of the divided clocks.

The clock generator is divided into different blocks:

- a modulo n counter which provides 11 clocks:
  - $f_{\text{peripheral clock}}$
  - $f_{\text{peripheral clock}}/2$
  - $f_{\text{peripheral clock}}/4$
  - $f_{\text{peripheral clock}}/8$
  - $f_{\text{peripheral clock}}/16$
  - $f_{\text{peripheral clock}}/32$
  - $f_{\text{peripheral clock}}/64$
  - $f_{\text{peripheral clock}}/128$
  - $f_{\text{peripheral clock}}/256$
  - $f_{\text{peripheral clock}}/512$
  - $f_{\text{peripheral clock}}/1024$
- two linear dividers (1, 1/2, 1/3, ... 1/255) that provide two separate clocks: clkA and clkB

Each linear divider can independently divide one of the clocks of the modulo n counter. The selection of the clock to be divided is made according to the PREA (PREB) field of the PWM Clock register (PWM\_CLK). The resulting clock clkA (clkB) is the clock selected divided by DIVA (DIVB) field value.

After a reset of the PWM controller, DIVA (DIVB) and PREA (PREB) are set to '0'. This implies that after reset clkA (clkB) are turned off.

At reset, all clocks provided by the modulo n counter are turned off except the peripheral clock. This situation is also true when the PWM peripheral clock is turned off through the Power Management Controller.

Before using the PWM controller, the programmer must first enable the peripheral clock in the Power Management Controller (PMC).

---

### 55.6.2 PWM Channel

#### 55.6.2.1 Channel Block Diagram

**Figure 55-3. Functional View of the Channel Block Diagram**

Each of the 4 channels is composed of six blocks:

- A clock selector which selects one of the clocks provided by the clock generator (described in [PWM Clock Generator](#)).
- A counter clocked by the output of the clock selector. This counter is incremented or decremented according to the channel configuration and comparators matches. The size of the counter is 16 bits.
- A comparator used to compute the OCx output waveform according to the counter value and the configuration. The counter value can be the one of the channel counter or the one of the channel 0 counter according to SYNCx bit in the [PWM Sync Channels Mode Register](#) (PWM\_SCM).
- A 2-bit configurable Gray counter enables the stepper motor driver. One Gray counter drives 2 channels.
- A dead-time generator providing two complementary outputs (DTHx/DTOLx) which allows to drive external power control switches safely.
- An output override block that can force the two complementary outputs to a programmed value (OOHx/OOLx).
- An asynchronous fault protection mechanism that has the highest priority to override the two complementary outputs (PWHx/PWLx) in case of fault detection (outputs forced to '0', '1' or Hi-Z).

#### 55.6.2.2 Comparator

The comparator continuously compares its counter value with the channel period defined by CPRD in the [PWM Channel Period Register](#) (PWM\_CPRDx) and the duty-cycle defined by CDTY in the [PWM Channel Duty Cycle Register](#) (PWM\_CDTYx) to generate an output signal OCx accordingly.

The different properties of the waveform of the output OCx are:

- the clock selection. The channel counter is clocked by one of the clocks provided by the clock generator described in the previous section. This channel parameter is defined in the CPRE field of the [PWM Channel Mode Register](#) (PWM\_CMRx). This field is reset at '0'.

- the waveform period. This channel parameter is defined in the CPRD field of the PWM\_CPRDx register.

If the waveform is left-aligned, then the output waveform period depends on the counter source clock and can be calculated:

By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the counter source clock and can be calculated:

By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or}$$

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

- the waveform duty-cycle. This channel parameter is defined in the CDTY field of the PWM\_CDTYx register.

If the waveform is left-aligned, then:

$$\text{duty cycle} = \frac{(\text{period} - 1/f_{\text{channel}_x\text{ clock}} \times \text{CDTY})}{\text{period}}$$

If the waveform is center-aligned, then:

$$\text{duty cycle} = \frac{((\text{period}/2) - 1/f_{\text{channel}_x\text{ clock}} \times \text{CDTY})}{(\text{period}/2)}$$

- the waveform polarity. At the beginning of the period, the signal can be at high or low level. This property is defined in the CPOL bit of PWM\_CMRx. By default, the signal starts by a low level. The DPOLI bit in PWM\_CMRx defines the PWM polarity when the channel is disabled (CHIDx = 0 in PWM\_SR). For more details, see the figure *Waveform Properties*.
  - DPOLI = 0: PWM polarity when the channel is disabled is the same as the one defined for the beginning of the PWM period.

- DPOLI = 1: PWM polarity when the channel is disabled is inverted compared to the one defined for the beginning of the PWM period.
- the waveform alignment. The output waveform can be left- or center-aligned. Center-aligned waveforms can be used to generate non-overlapped waveforms. This property is defined in the CALG bit of PWM\_CMRx. The default mode is left-aligned.

**Figure 55-4. Non-Overlapped Center-Aligned Waveforms**

**Note:** See the figure [Figure 55-5](#) for a detailed description of center-aligned waveforms.

When center-aligned, the channel counter increases up to CPRD and decreases down to 0. This ends the period.

When left-aligned, the channel counter increases up to CPRD and is reset. This ends the period.

Thus, for the same CPRD value, the period for a center-aligned channel is twice the period for a left-aligned channel.

Waveforms are fixed at 0 when:

- CDTY = CPRD and CPOL = 0 (Note that if TRGMODE = MODE3, the PWM waveform switches to 1 at the external trigger event (see [Cycle-By-Cycle Duty Mode](#))).
- CDTY = 0 and CPOL = 1

Waveforms are fixed at 1 (once the channel is enabled) when:

- CDTY = 0 and CPOL = 0
- CDTY = CPRD and CPOL = 1 (Note that if TRGMODE = MODE3, the PWM waveform switches to 0 at the external trigger event (see [Cycle-By-Cycle Duty Mode](#))).

The waveform polarity must be set before enabling the channel. This immediately affects the channel output level.

Modifying CPOL in [PWM Channel Mode Register](#) while the channel is enabled can lead to an unexpected behavior of the device being driven by PWM.

In addition to generating the output signals OCx, the comparator generates interrupts depending on the counter value. When the output waveform is left-aligned, the interrupt occurs at the end of the counter period. When the output waveform is center-aligned, the bit CES of PWM\_CMRx defines when the channel counter interrupt occurs. If CES is set to '0', the interrupt occurs at the end of the counter period. If CES is set to '1', the interrupt occurs at the end of the counter period and at half of the counter period.

The figure below illustrates the counter interrupts depending on the configuration.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

**Figure 55-5. Waveform Properties**

### 55.6.2.3 Trigger Selection for Timer Counter

The PWM controller can be used as a trigger source for the Timer Counter (TC) to achieve the two application examples described below.

#### 55.6.2.3.1 Delay Measurement

To measure the delay between the channel x comparator output (OCx) and the feedback from the bridge driver of the MOSFETs (see the figure below), the bit TCTS in the [PWM Channel Mode Register](#) must be at 0. This defines the comparator output of the channel x as the TC trigger source. The TIOB trigger (TC internal input) is used to start the TC; the TIOA input (from PAD) is used to capture the delay.

**Figure 55-6. Triggering the TC: Delay Measurement**

#### 55.6.2.3.2 Cumulated ON Time Measurement

To measure the cumulated “ON” time of MOSFETs (see the figure below), the bit TCTS of the [PWM Channel Mode Register](#) must be set to 1 to define the counter event (see the figure *Waveform Properties*) as the Timer Counter trigger source.

**Figure 55-7. Triggering the TC: Cumulated “ON” Time Measurement**

### 55.6.2.4 2-bit Gray Up/Down Counter for Stepper Motor

A pair of channels may provide a 2-bit Gray count waveform on two outputs. Dead-time generator and other downstream logic can be configured on these channels.

Up or Down Count mode can be configured on-the-fly by means of PWM\_SMMR configuration registers.

When GCEN0 is set to '1', channels 0 and 1 outputs are driven with a Gray counter.

**Figure 55-8. 2-bit Gray Up/Down Counter**

#### 55.6.2.5 Dead-Time Generator

The dead-time generator uses the comparator output OCx to provide the two complementary outputs DTOHx and DTOLx, which allows the PWM macrocell to drive external power control switches safely. When the dead-time generator is enabled by setting the bit DTE to 1 or 0 in the [PWM Channel Mode Register](#) (PWM\_CMRx), dead-times (also called dead-bands or non-overlapping times) are inserted between the edges of the two complementary outputs DTOHx and DTOLx. Note that enabling or disabling the dead-time generator is allowed only if the channel is disabled.

The dead-time is adjustable by the [PWM Channel Dead Time Register](#) (PWM\_DT<sub>x</sub>). Each output of the dead-time generator can be adjusted separately by DTH and DTL. The dead-time values can be updated synchronously to the PWM period by using the [PWM Channel Dead Time Update Register](#) (PWM\_DTUPD<sub>x</sub>).

The dead-time is based on a specific counter which uses the same selected clock that feeds the channel counter of the comparator. Depending on the edge and the configuration of the dead-time, DTOHx and DTOLx are delayed until the counter has reached the value defined by DTH or DTL. An inverted configuration bit (DTHI and DTLI bit in PWM\_CMRx) is provided for each output to invert the dead-time outputs. The following figure shows the waveform of the dead-time generator.

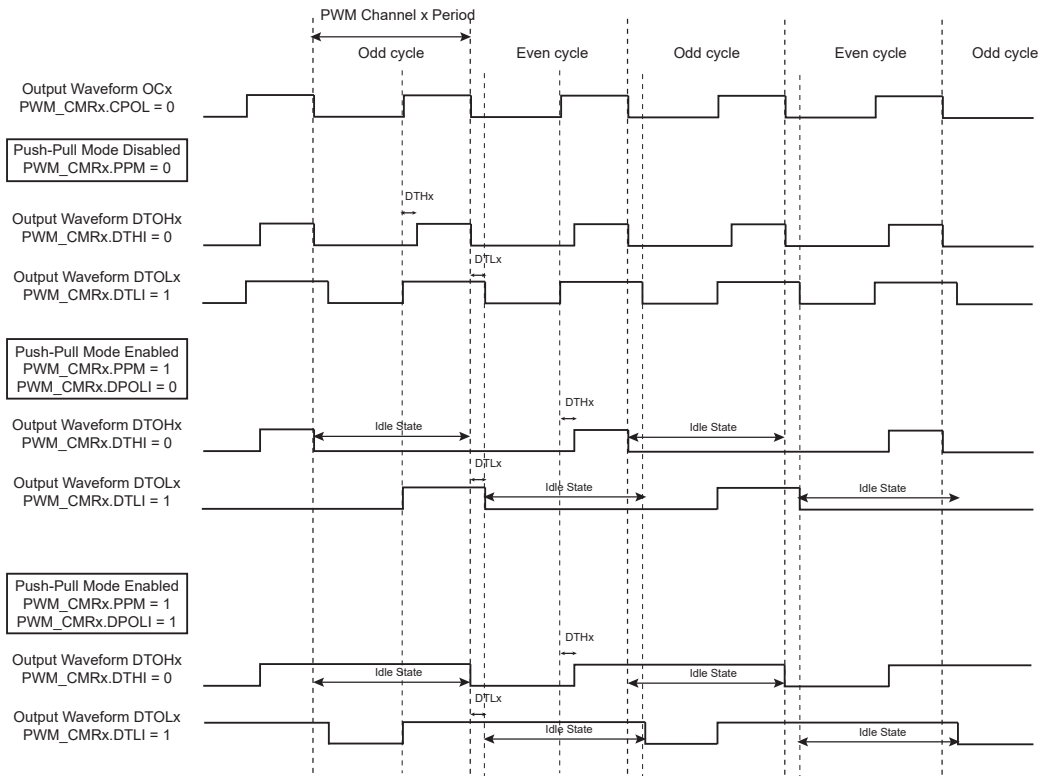

**Figure 55-9. Complementary Output Waveforms**

### 55.6.2.5.1 PWM Push-Pull Mode

When a PWM channel is configured in Push-Pull mode, the dead-time generator output is managed alternately on each PWM cycle. The polarity of the PWM line during the idle state of the Push-Pull mode is defined by the DPOLI bit in the [PWM Channel Mode Register \(PWM\\_CMRx\)](#). The Push-Pull mode can be enabled separately on each channel by writing a one to bit PPM in the [PWM Channel Mode Register](#).

**Figure 55-10. PWM Push-Pull Mode**

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

**Figure 55-11. PWM Push-Pull Waveforms: Left-Aligned Mode**

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

**Figure 55-12. PWM Push-Pull Waveforms: Center-Aligned Mode**

The PWM Push-Pull mode can be useful in transformer-based power converters, such as a half-bridge converter. The Push-Pull mode prevents the transformer core from being saturated by any direct current.

# SAMA5D2 Series

### 55.6.2.6 Output Override

The two complementary outputs DTOHx and DTOLx of the dead-time generator can be forced to a value defined by the software.

**Figure 55-15. Override Output Selection**

The fields OSHx and OSLx in the [PWM Output Selection Register \(PWM\\_OS\)](#) allow the outputs of the dead-time generator DTOHx and DTOLx to be overridden by the value defined in the fields OOVHx and OOVLx in the [PWM Output Override Value Register \(PWM\\_OOV\)](#).

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

The set registers [PWM Output Selection Set Register \(PWM\\_OSS\)](#) and [PWM Output Selection Set Update Register \(PWM\\_OSSUPD\)](#) enable the override of the outputs of a channel regardless of other channels. In the same way, the clear registers [PWM Output Selection Clear Register \(PWM\\_OSC\)](#) and [PWM Output Selection Clear Update Register \(PWM\\_OSCUPD\)](#) disable the override of the outputs of a channel regardless of other channels.

By using buffer registers PWM\_OSSUPD and PWM\_OSCUPD, the output selection of PWM outputs is done synchronously to the channel counter, at the beginning of the next PWM period.

By using registers PWM\_OSS and PWM\_OSC, the output selection of PWM outputs is done asynchronously to the channel counter, as soon as the register is written.

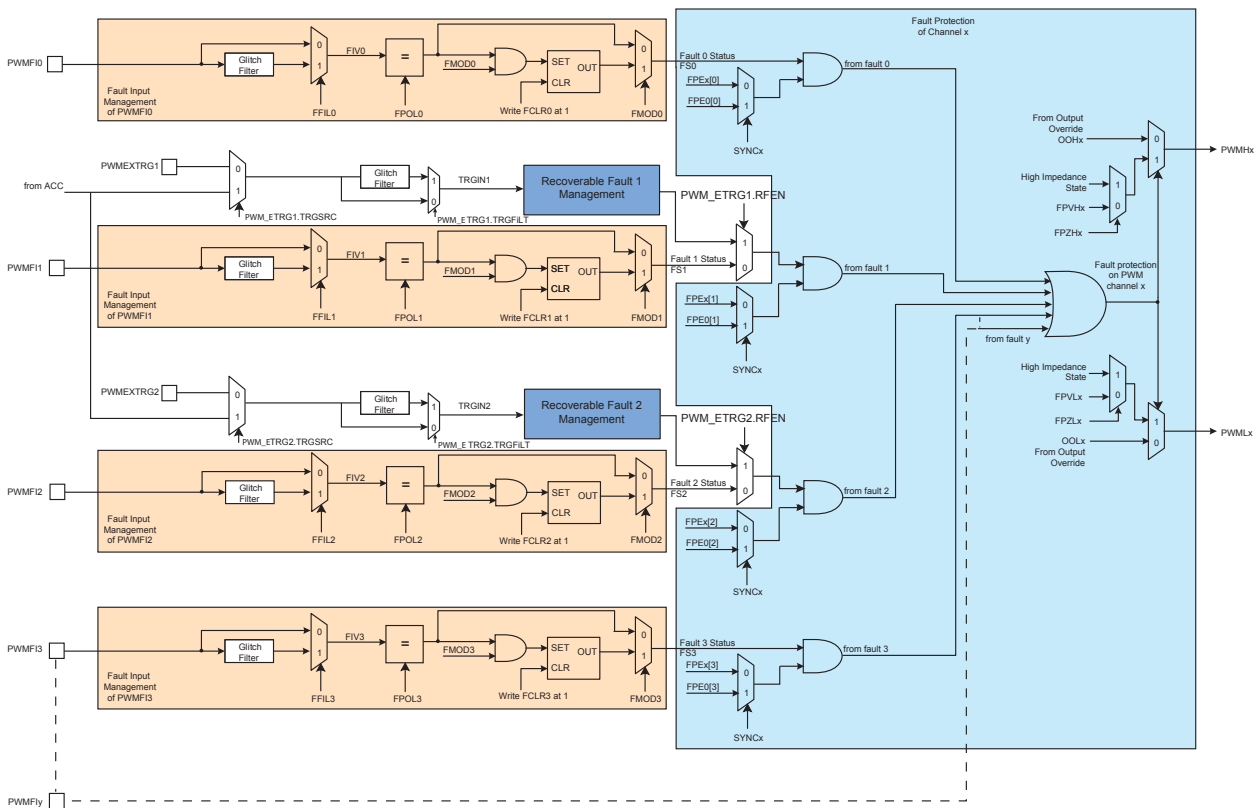

The value of the current output selection can be read in PWM\_OS.

While overriding PWM outputs, the channel counters continue to run, only the PWM outputs are forced to user defined values.

### 55.6.2.7 Fault Protection

6 inputs provide fault protection which can force any of the PWM output pairs to a programmable value. This mechanism has priority over output overriding.

**Figure 55-16. Fault Protection**

The polarity level of the fault inputs is configured by the FPOL field in the [PWM Fault Mode Register \(PWM\\_FMR\)](#). For fault inputs coming from internal peripherals such as ADC or Timer Counter, the polarity level must be FPOL = 1. For fault inputs coming from external GPIO pins the polarity level depends on the user's implementation.

The configuration of the Fault Activation mode (FMOD field in PWM\_C\_FMR) depends on the peripheral generating the fault. If the corresponding peripheral does not have "Fault Clear" management, then the

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

FMOD configuration to use must be FMOD = 1, to avoid spurious fault detection. Refer to the corresponding peripheral documentation for details on handling fault generation.

Fault inputs may or may not be glitch-filtered depending on the FFIL field in PWM\_FMR. When the filter is activated, glitches on fault inputs with a width inferior to the PWM peripheral clock period are rejected.

A fault becomes active as soon as its corresponding fault input has a transition to the programmed polarity level. If the corresponding bit FMOD is set to '0' in PWM\_FMR, the fault remains active as long as the fault input is at this polarity level. If the corresponding FMOD field is set to '1', the fault remains active until the fault input is no longer at this polarity level and until it is cleared by writing the corresponding bit FCLR in the [PWM Fault Clear Register](#) (PWM\_FCR). In the [PWM Fault Status Register](#) (PWM\_FSR), the field FIV indicates the current level of the fault inputs and the field FIS indicates whether a fault is currently active.

Each fault can be taken into account or not by the fault protection mechanism in each channel. To be taken into account in the channel x, the fault y must be enabled by the bit FPEx[y] in the PWM Fault Protection Enable registers (PWM\_FPE1). However, synchronous channels (see [Synchronous Channels](#)) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[y]).

The fault protection on a channel is triggered when this channel is enabled and when any one of the faults that are enabled for this channel is active. It can be triggered even if the PWM peripheral clock is not running but only by a fault input that is not glitch-filtered.

When the fault protection is triggered on a channel, the fault protection mechanism resets the counter of this channel and forces the channel outputs to the values defined by the fields FPVHx and FPVLx in the [PWM Fault Protection Value Register 1](#) (PWM\_FPV) and fields FPZHx/FPZLx in the [PWM Fault Protection Value Register 2](#), as shown in the table below. The output forcing is made asynchronously to the channel counter.

**Table 55-3. Forcing Values of PWM Outputs by Fault Protection**

| FPZH/Lx | FPVH/Lx | Forcing Value of PWMH/Lx    |
|---------|---------|-----------------------------|
| 0       | 0       | 0                           |
| 0       | 1       | 1                           |
| 1       | –       | High impedance state (Hi-Z) |

**⚠ CAUTION**

- To prevent any unexpected activation of the status flag FSy in PWM\_FSR, the FMODy bit can be set to '1' only if the FPOLy bit has been previously configured to its final value.
- To prevent any unexpected activation of the Fault Protection on the channel x, the bit FPEx[y] can be set to '1' only if the FPOLy bit has been previously configured to its final value.

If a comparison unit is enabled (see [PWM Comparison Units](#)) and if a fault is triggered in the channel 0, then the comparison cannot match.

As soon as the fault protection is triggered on a channel, an interrupt (different from the interrupt generated at the end of the PWM period) can be generated but only if it is enabled and not masked. The interrupt is reset by reading the interrupt status register, even if the fault which has caused the trigger of the fault protection is kept active.

### 55.6.2.7.1 Recoverable Fault

The PWM provides a Recoverable Fault mode on fault 1 and 2 (see figure *Fault Protection*).

The recoverable fault signal is an internal signal generated as soon as an external trigger event occurs (see [PWM External Trigger Mode](#)).

When the fault 1 or 2 is defined as a recoverable fault, the corresponding fault input pin is ignored and bits FFIL1/2, FMOD1/2 and FFIL1/2 are not taken into account.

The fault 1 is managed as a recoverable fault by the PWMEXTRG1 input trigger when PWM\_ETRG1.RFEN = 1, PWM\_ENA.CHID1 = 1, and PWM\_ETRG1.TRGMODE ≠ 0.

The fault 2 is managed as a recoverable fault by the PWMEXTRG2 input trigger when PWM\_ETRG2.RFEN = 1, PWM\_ENA.CHID2 = 1, and PWM\_ETRG2.TRGMODE ≠ 0.

Recoverable fault 1 and 2 can be taken into account by all channels by enabling the bit FPEX[1/2] in the PWM Fault Protection Enable registers (PWM\_FPEX). However the synchronous channels (see [Synchronous Channels](#)) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[1/2]).

When a recoverable fault is triggered (according to the PWM\_ETRGx.TRGMODE setting), the PWM counter of the affected channels is not cleared (unlike in the classic fault protection mechanism) but the channel outputs are forced to the values defined by the fields FPVHx and FPVLx in the [PWM Fault Protection Value Register 1](#) (PWM\_FPV), as per table *Forcing Values of PWM Outputs by Fault Protection*. The output forcing is made asynchronously to the channel counter and lasts from the recoverable fault occurrence to the end of the next PWM cycle (if the recoverable fault is no longer present) (see the figure below).

The recoverable fault does not trigger an interrupt. The Fault Status FSy (with y = 1 or 2) is not reported in the [PWM Fault Status Register](#) when the fault y is a recoverable fault.

**Figure 55-17. Recoverable Fault Management**

### 55.6.2.8 Spread Spectrum Counter

The PWM macrocell includes a spread spectrum counter allowing the generation of a constantly varying duty cycle on the output PWM waveform (only for the channel 0). This feature may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

This is achieved by varying the effective period in a range defined by a spread spectrum value which is programmed by the field SPRD in the [PWM Spread Spectrum Register](#) (PWM\_SSPR). The effective

period of the output waveform is the value of the spread spectrum counter added to the programmed waveform period CPRD in the [PWM Channel Period Register](#) (PWM\_CPRD0).

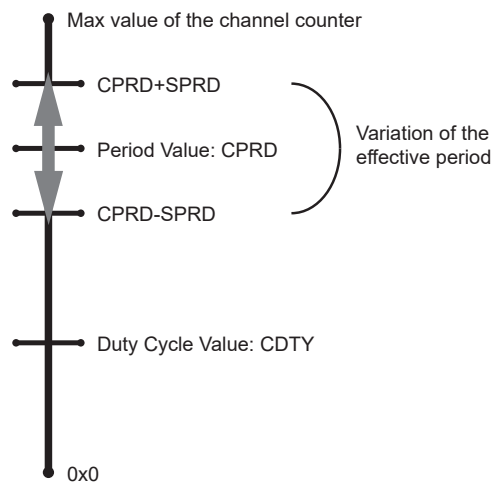

It will cause the effective period to vary from  $CPRD - SPRD$  to  $CPRD + SPRD$ . This leads to a constantly varying duty cycle on the PWM output waveform because the duty cycle value programmed is unchanged.

The value of the spread spectrum counter can change in two ways depending on the bit SPRDM in PWM\_SSPR.

If  $SPRDM = 0$ , the Triangular mode is selected. The spread spectrum counter starts to count from  $-SPRD$  when the channel 0 is enabled or after reset and counts upwards at each period of the channel counter. When it reaches  $SPRD$ , it restarts to count from  $-SPRD$  again.

If  $SPRDM = 1$ , the Random mode is selected. A new random value is assigned to the spread spectrum counter at each period of the channel counter. This random value is between  $-SPRD$  and  $+SPRD$  and is uniformly distributed.

**Figure 55-18. Spread Spectrum Counter**

### 55.6.2.9 Synchronous Channels

Some channels can be linked together as synchronous channels. They have the same source clock, the same period, the same alignment and are started together. In this way, their counters are synchronized together.

The synchronous channels are defined by the SYNCx bits in the [PWM Sync Channels Mode Register](#) (PWM\_SCM). Only one group of synchronous channels is allowed.

When a channel is defined as a synchronous channel, the channel 0 is also automatically defined as a synchronous channel. This is because the channel 0 counter configuration is used by all the synchronous channels.

If a channel x is defined as a synchronous channel, the fields/bits for the channel 0 are used instead of those of channel x:

- CPRE in PWM\_CMRO instead of CPRE in PWM\_CMRx (same source clock)
- CPRD in PWM\_CPRD0 instead of CPRD in PWM\_CPRDx (same period)
- CALG in PWM\_CMRO instead of CALG in PWM\_CMRx (same alignment)

Modifying the fields CPRE, CPRD and CALG of for channels with index greater than 0 has no effect on output waveforms.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

Because counters of synchronous channels must start at the same time, they are all enabled together by enabling the channel 0 (by the CHID0 bit in PWM\_ENA register). In the same way, they are all disabled together by disabling channel 0 (by the CHID0 bit in PWM\_DIS register). However, a synchronous channel x different from channel 0 can be enabled or disabled independently from others (by the CHIDx bit in PWM\_ENA and PWM\_DIS registers).

Defining a channel as a synchronous channel while it is an asynchronous channel (by writing the bit SYNCx to '1' while it was at '0') is allowed only if the channel is disabled at this time (CHIDx = 0 in PWM\_SR). In the same way, defining a channel as an asynchronous channel while it is a synchronous channel (by writing the SYNCx bit to '0' while it was '1') is allowed only if the channel is disabled at this time.

The UPDM field (Update Mode) in the PWM\_SCM register selects one of the three methods to update the registers of the synchronous channels:

- Method 1 (UPDM = 0): The period value, the duty-cycle values and the dead-time values must be written by the processor in their respective update registers (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx). The update is triggered at the next PWM period as soon as the bit UPDULOCK in the [PWM Sync Channels Update Control Register](#) (PWM\_SCUC) is set to '1'.
- Method 2 (UPDM = 1): The period value, the duty-cycle values, the dead-time values and the update period value must be written by the processor in their respective update registers (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPD). The update of the period value and of the dead-time values is triggered at the next PWM period as soon as the bit UPDULOCK in the PWM\_SCUC register is set to '1'. The update of the duty-cycle values and the update period value is triggered automatically after an update period defined by the field UPR in the [PWM Sync Channels Update Period Register](#) (PWM\_SCUP).
- Method 3 (UPDM = 2): Same as Method 2 apart from the fact that the duty-cycle values of ALL synchronous channels are written by the DMA Controller. The user can choose to synchronize the DMA Controller transfer request with a comparison match (see [Section 7.3 "PWM Comparison Units"](#)), by the fields PTRM and PTRCS in the PWM\_SCM register. The DMA destination address must be configured to access only the [PWM DMA Register](#) (PWM\_DMAR). The DMA buffer data structure must consist of sequentially repeated duty cycles. The number of duty cycles in each sequence corresponds to the number of synchronized channels. Duty cycles in each sequence must be ordered from the lowest to the highest channel index. The size of the duty cycle is 16 bits.

**Table 55-4. Summary of the Update of Registers of Synchronous Channels**

| Register                         | UPDM = 0   | UPDM = 1 | UPDM = 2 |
|----------------------------------|--|----------|----------|
| Period Value<br>(PWM_CPRDUPDx)   | Write by the processor   |          |          |
|                                  | Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1' |          |          |
| Dead-Time Values<br>(PWM_DTUPDx) | Write by the processor   |          |          |
|                                  | Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1' |          |          |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| .....continued                       |  |   |                                |
|--------------------------------------|--|---|--------------------------------|
| Register                             | UPDM = 0   | UPDM = 1  | UPDM = 2                       |

|                                      | Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1' | Update is triggered at the next PWM period as soon as the update period counter has reached the value UPR |                                |
| Update Period Value<br>(PWM_SCUPUPD) | Not applicable   | Write by the processor  |                                |
|                                      | Not applicable   | Update is triggered at the next PWM period as soon as the update period counter has reached the value UPR |                                |

### 55.6.2.9.1 Method 1: Manual write of duty-cycle values and manual trigger of the update

In this mode, the update of the period value, the duty-cycle values and the dead-time values must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx).

To trigger the update, the user must use the bit UPDULOCK in the PWM\_SCUC register which allows to update synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

Sequence for Method 1:

1. Select the manual write of duty-cycle values and the manual update by setting the UPDM field to '0' in the PWM\_SCM register.
2. Define the synchronous channels by the SYNCx bits in the PWM\_SCM register.
3. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
4. If an update of the period value and/or the duty-cycle values and/or the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx).
5. Set UPDULOCK to '1' in PWM\_SCUC.
6. The update of the registers will occur at the beginning of the next PWM period. When the UPDULOCK bit is reset, go to [Step 4.](#) for new values.

**Figure 55-19. Method 1 (UPDM = 0)**

### 55.6.2.9.2 Method 2: Manual write of duty-cycle values and automatic trigger of the update

In this mode, the update of the period value, the duty-cycle values, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx, PWM\_DTUPDx and PWM\_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK in the PWM\_SCUC register, which updates synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the update period by the UPR field in the PWM\_SCUP register. The PWM controller waits UPR+1 period of synchronous channels before updating automatically the duty values and the update period value.

The status of the duty-cycle value write is reported in the [PWM Interrupt Status Register 2 \(PWM\\_ISR2\)](#) by the following flags:

- **WRDY:** this flag is set to '1' when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to '0' when the PWM\_ISR2 register is read.

Depending on the interrupt mask in the [PWM Interrupt Mask Register 2 \(PWM\\_IMR2\)](#), an interrupt can be generated by these flags.

Sequence for Method 2:

1. Select the manual write of duty-cycle values and the automatic update by setting the field UPDM to '1' in the PWM\_SCM register
2. Define the synchronous channels by the bits SYNCx in the PWM\_SCM register.
3. Define the update period by the field UPR in the PWM\_SCUP register.
4. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
5. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_DTUPDx), else go to [Step 8](#).
6. Set UPDULOCK to '1' in PWM\_SCUC.

7. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDULOCK is reset, go to [Step 5](#). for new values.
8. If an update of the duty-cycle values and/or the update period is required, check first that write of new update values is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM\_ISR2.
9. Write registers that need to be updated (PWM\_CDTYUPDx, PWM\_SCUPUPD).
10. The update of these registers will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to [Step 8](#). for new values.

**Figure 55-20. Method 2 (UPDM = 1)**

### 55.6.2.9.3 Method 3: Automatic write of duty-cycle values and automatic trigger of the update

In this mode, the update of the duty cycle values is made automatically by the DMA Controller. The update of the period value, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_DTUPDx and PWM\_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK which allows to update synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period value is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the Update Period by the field UPR in the PWM\_SCUP register. The PWM controller waits UPR+1 periods of synchronous channels before updating automatically the duty values and the update period value.

Using the DMA Controller removes processor overhead by reducing its intervention during the transfer. This significantly reduces the number of clock cycles required for a data transfer, which improves microcontroller performance.

The DMA Controller must write the duty-cycle values in the synchronous channels index order. For example if the channels 0, 1 and 3 are synchronous channels, the DMA Controller must write the duty-

cycle of the channel 0 first, then the duty-cycle of the channel 1, and finally the duty-cycle of the channel 3.

The status of the DMA Controller transfer is reported in PWM\_ISR2 by the following flags:

- **WRDY:** this flag is set to '1' when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to '0' when PWM\_ISR2 is read. The user can choose to synchronize the WRDY flag and the DMA Controller transfer request with a comparison match (see [PWM Comparison Units](#)), by the fields PTRM and PTRCS in the PWM\_SCM register.
- **UNRE:** this flag is set to '1' when the update period defined by the UPR field has elapsed while the whole data has not been written by the Peripheral DMA Controller. It is reset to '0' when PWM\_ISR2 is read.

Depending on the interrupt mask in PWM\_IMR2, an interrupt can be generated by these flags.

Sequence for Method 3:

1. Select the automatic write of duty-cycle values and automatic update by setting the field UPDM to 2 in the PWM\_SCM register.
2. Define the synchronous channels by the bits SYNCx in the PWM\_SCM register.
3. Define the update period by the field UPR in the PWM\_SCUP register.
4. Define when the WRDY flag and the corresponding DMA Controller transfer request must be set in the update period by the PTRM bit and the PTRCS field in the PWM\_SCM register (at the end of the update period or when a comparison matches).
5. Define the DMA Controller transfer settings for the duty-cycle values and enable it in the DMA Controller registers
6. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
7. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_DTUPDx), else go to [Step 10](#).
8. Set UPDULOCK to '1' in PWM\_SCUC.
9. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDULOCK is reset, go to [Step 7](#) for new values.
10. If an update of the update period value is required, check first that write of a new update value is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM\_ISR2, else go to [Step 14](#).
11. Write the register that needs to be updated (PWM\_SCUPUPD).
12. The update of this register will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to [Step 10](#) for new values.
13. Wait for the DMA status flag indicating that the buffer transfer is complete. If the transfer has ended, define a new DMA transfer for new duty-cycle values. Go to [Step 5](#).

14. **Figure 55-21. Method 3 (UPDM = 2 and PTRM = 0)**

**Figure 55-22. Method 3 (UPDM = 2 and PTRM = 1 and PTRCS = 0)**

### 55.6.2.10 Update Time for Double-Buffering Registers

All channels integrate a double-buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum value, the polarity, the duty-cycle, the dead-times, the output override, and the synchronous channels update period.

This double-buffering system comprises the following update registers:

- [PWM Sync Channels Update Period Update Register](#)
- [PWM Output Selection Set Update Register](#)
- [PWM Output Selection Clear Update Register](#)
- [PWM Spread Spectrum Update Register](#)
- [PWM Channel Duty Cycle Update Register](#)
- [PWM Channel Period Update Register](#)
- [PWM Channel Dead Time Update Register](#)
- [PWM Channel Mode Update Register](#)

When one of these update registers is written to, the write is stored, but the values are updated only at the next PWM period border. In Left-aligned mode (CALG = 0), the update occurs when the channel counter reaches the period value CPRD. In Center-aligned mode, the update occurs when the channel counter value is decremented and reaches the 0 value.

In Center-aligned mode, it is possible to trigger the update of the polarity and the duty-cycle at the next half period border. This mode concerns the following update registers:

- [PWM Channel Duty Cycle Update Register](#)
- [PWM Channel Mode Update Register](#)

The update occurs at the first half period following the write of the update register (either when the channel counter value is incrementing and reaches the period value CPRD, or when the channel counter value is decrementing and reaches the 0 value). To activate this mode, the user must write a one to the bit UPDS in the [PWM Channel Mode Register](#).

### 55.6.3 PWM Comparison Units

The PWM provides 1 independent comparison units able to compare a programmed value with the current value of the channel 0 counter (which is the channel counter of all synchronous channels, “[Synchronous Channels](#)”). These comparisons are intended to generate pulses on the event lines (used to synchronize ADC, see [PWM Event Lines](#)), to generate software interrupts and to trigger DMA Controller transfer requests for the synchronous channels (see [Method 3: Automatic write of duty-cycle values and automatic trigger of the update](#)).

**Figure 55-23. Comparison Unit Block Diagram**

The comparison x matches when it is enabled by the bit CEN in the [PWM Comparison x Mode Register](#) (PWM\_CMPMx for the comparison x) and when the counter of the channel 0 reaches the comparison value defined by the field CV in [PWM Comparison x Value Register](#) (PWM\_CMPVx for the comparison x). If the counter of the channel 0 is center-aligned (CALG = 1 in [PWM Channel Mode Register](#)), the bit CVM in PWM\_CMPVx defines if the comparison is made when the counter is counting up or counting down (in Left-alignment mode CALG = 0, this bit is useless).

If a fault is active on the channel 0, the comparison is disabled and cannot match (see [Fault Protection](#)).

The user can define the periodicity of the comparison x by the fields CTR and CPR in PWM\_CMPMx. The comparison is performed periodically once every CPR+1 periods of the counter of the channel 0, when

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

the value of the comparison period counter CPRCNT in PWM\_CMPMx reaches the value defined by CTR. CPR is the maximum value of the comparison period counter CPRCNT. If  $CPR = CTR = 0$ , the comparison is performed at each period of the counter of the channel 0.

The comparison x configuration can be modified while the channel 0 is enabled by using the [PWM Comparison x Mode Update Register](#) (PWM\_CMPMUPDx registers for the comparison x). In the same way, the comparison x value can be modified while the channel 0 is enabled by using the [PWM Comparison x Value Update Register](#) (PWM\_CMPVUPDx registers for the comparison x).

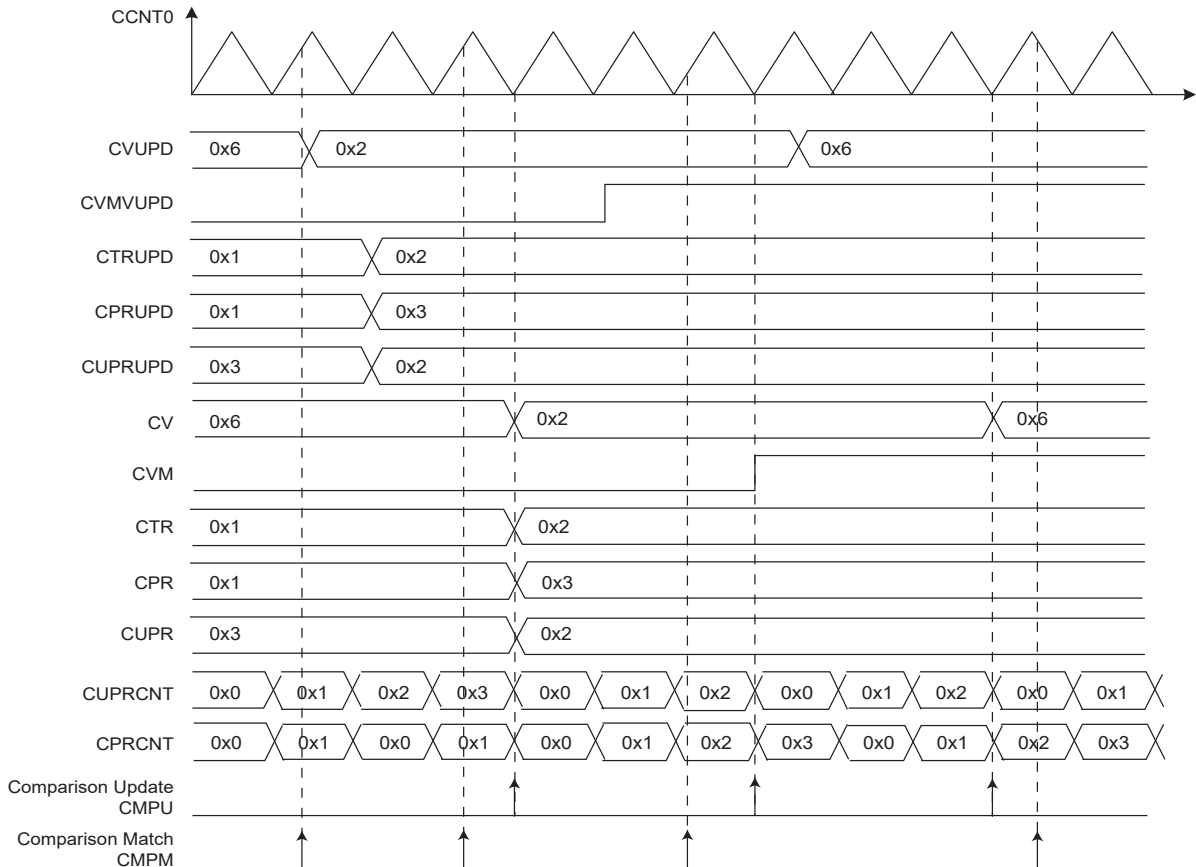

The update of the comparison x configuration and the comparison x value is triggered periodically after the comparison x update period. It is defined by the field CUPR in PWM\_CMPMx. The comparison unit has an update period counter independent from the period counter to trigger this update. When the value of the comparison update period counter CUPRCNT (in PWM\_CMPMx) reaches the value defined by CUPR, the update is triggered. The comparison x update period CUPR itself can be updated while the channel 0 is enabled by using the PWM\_CMPMUPDx register.

The write of PWM\_CMPVUPDx must be followed by a write of PWM\_CMPMUPDx.

The comparison match and the comparison update can be source of an interrupt, but only if it is enabled and not masked. These interrupts can be enabled by the [PWM Interrupt Enable Register 2](#) and disabled by the [PWM Interrupt Disable Register 2](#). The comparison match interrupt and the comparison update interrupt are reset by reading the [PWM Interrupt Status Register 2](#).

**Figure 55-24. Comparison Waveform**

### 55.6.4 PWM Event Lines

The PWM provides 2 independent event lines intended to trigger actions in other peripherals (e.g., for the Analog-to-Digital Converter (ADC)).

A pulse (one cycle of the peripheral clock) is generated on an event line, when at least one of the selected comparisons is matching. The comparisons can be selected or unselected independently by the CSEL bits in the [PWM Event Line x Register](#) (PWM\_ELMRx for the Event Line x).

An example of event generation is provided in the figure [Event Line Generation Waveform \(Example\)](#).

**Figure 55-25. Event Line Block Diagram**

**Figure 55-26. Event Line Generation Waveform (Example)**

### 55.6.5 PWM External Trigger Mode

The PWM channels 1 and 2 can be configured to use an external trigger for generating specific PWM signals. The external trigger source can be selected through the bit TRGSRC of the [PWM External Trigger Register](#) (see the table below).

**Table 55-5. External Event Source Selection**

| Channel | Trigger Source Selection | Trigger Source                    |
|---------|--------------------------|-----------------------------------|
| 1       | PWM_ETRG1.TRGSRC = 0     | From PWMEXTRG1 input              |
|         | PWM_ETRG1.TRGSRC = 1     | From Analog Comparator Controller |
| 2       | PWM_ETRG2.TRGSRC = 0     | From PWMEXTRG2 input              |
|         | PWM_ETRG2.TRGSRC = 1     | From Analog Comparator Controller |

Each external trigger source can be filtered by writing a one to the TRGFILT bit in the corresponding [PWM External Trigger Register](#) (PWM\_ETRGx).

Each time an external trigger event is detected, the corresponding PWM channel counter value is stored in the MAXCNT field of the PWM\_ETRGx register if it is greater than the previously stored value. Reading the PWM\_ETRGx register will clear the MAXCNT value.

Three different modes are available for channels 1 and 2 depending on the value of the TRGMODE field of the PWM\_ETRGx register:

- TRGMODE = 1: External PWM Reset Mode
- TRGMODE = 2: External PWM Start Mode
- TRGMODE = 3: Cycle-By-Cycle Duty Mode

See the following sections.

This feature is disabled when TRGMODE = 0.

This feature should only be enabled if the corresponding channel is left-aligned (CALG = 0 in [PWM Channel Mode Register](#) of channel 1 or 2) and not managed as a synchronous channel (SYNCx = 0 in [PWM Sync Channels Mode Register](#) where x = 1 or 2). Programming the channel to be center-aligned or synchronous while TRGMODE is not 0 could lead to unexpected behavior.

### 55.6.5.1 External PWM Reset Mode

External PWM Reset mode is selected by programming TRGMODE = 1 in the PWM\_ETRGx register.

In this mode, when an edge is detected on the PWMEXTRGx input, the internal PWM counter is cleared and a new PWM cycle is restarted. The edge polarity can be selected by programming the TRGEDGE bit in the PWM\_ETRGx register. If no trigger event is detected when the internal channel counter has reached the CPRD value in the [PWM Channel Period Register](#), the internal counter is cleared and a new PWM cycle starts.

Note that this mode does not guarantee a constant  $t_{ON}$  or  $t_{OFF}$  time.

**Figure 55-27. External PWM Reset Mode**

### 55.6.5.1.1 Application Example

The external PWM Reset mode can be used in power factor correction applications.

In the example below, the external trigger input is the PWMEXTRG1 (therefore the PWM channel used for regulation is the channel 1). The PWM channel 1 period (CPRD in the [PWM Channel Period Register](#) of the channel 1) must be programmed so that the TRGIN1 event always triggers before the PWM channel 1 period elapses.

In the figure below, an external circuit (not shown) is required to sense the inductor current  $I_L$ . The internal PWM counter of the channel 1 is cleared when the inductor current falls below a specific threshold ( $I_{REF}$ ). This starts a new PWM period and increases the inductor current.

**Figure 55-28. External PWM Reset Mode: Power Factor Correction Application**

### 55.6.5.2 External PWM Start Mode

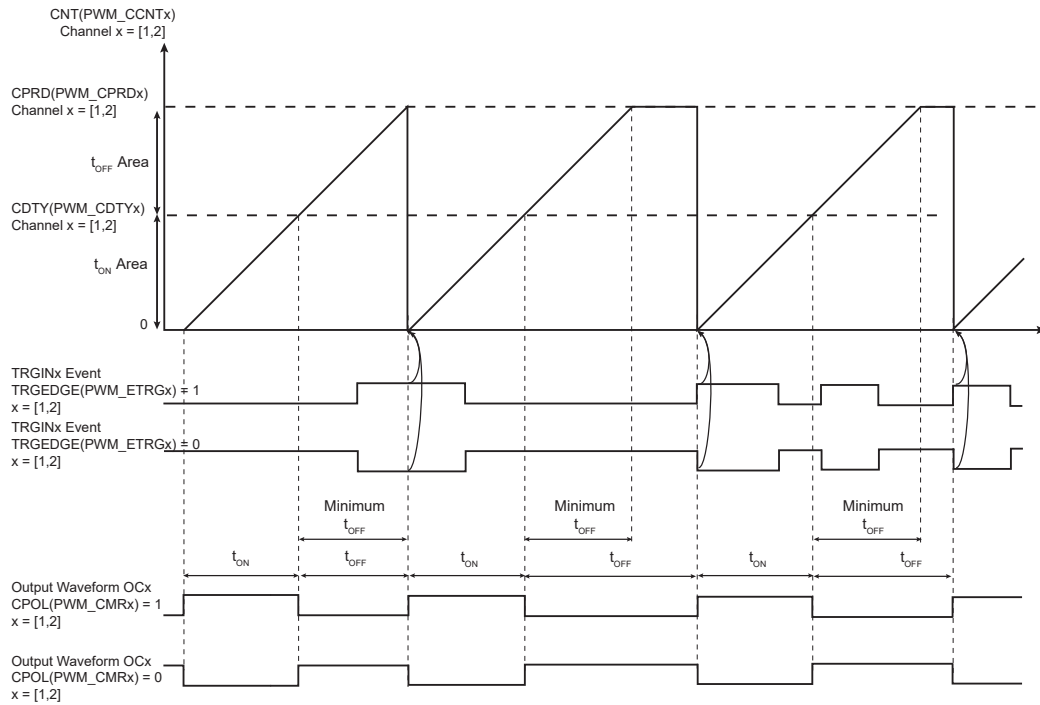

External PWM Start mode is selected by programming  $TRGMODE = 2$  in the  $PWM\_ETRGx$  register.

In this mode, the internal PWM counter can only be reset once it has reached the  $CPRD$  value in the [PWM Channel Period Register](#) and when the correct level is detected on the corresponding external trigger input. Both conditions have to be met to start a new PWM period. The active detection level is defined by the bit  $TRGEDGE$  of the  $PWM\_ETRGx$  register.

Note that this mode guarantees a constant  $t_{ON}$  time and a minimum  $t_{OFF}$  time.

**Figure 55-29. External PWM Start Mode**

### 55.6.5.2.1 Application Example

The external PWM Start mode generates a modulated frequency PWM signal with a constant active level duration ( $t_{ON}$ ) and a minimum inactive level duration (minimum  $t_{OFF}$ ).

The  $t_{ON}$  time is defined by the CDTY value in the [PWM Channel Duty Cycle Register](#). The minimum  $t_{OFF}$  time is defined by CDTY - CPRD ([PWM Channel Period Register](#)). This mode can be useful in Buck DC/DC Converter applications.

When the output voltage  $V_{OUT}$  is above a specific threshold ( $V_{ref}$ ), the PWM inactive level is maintained as long as  $V_{OUT}$  remains above this threshold. If  $V_{OUT}$  is below this specific threshold, this mode guarantees a minimum  $t_{OFF}$  time required for MOSFET driving (see the figure below).

**Figure 55-30. External PWM Start Mode: Buck DC/DC Converter**

### 55.6.5.3 Cycle-By-Cycle Duty Mode

#### 55.6.5.3.1 Description

Cycle-by-cycle duty mode is selected by programming  $TRGMODE = 3$  in  $PWM\_ETRGx$ .

In this mode, the PWM frequency is constant and is defined by the CPRD value in the [PWM Channel Period Register](#).

An external trigger event has no effect on the PWM output if it occurs while the internal PWM counter value is above the CDTY value of the [PWM Channel Duty Cycle Register](#).

If the internal PWM counter value is below the value of CDTY of the [PWM Channel Duty Cycle Register](#), an external trigger event makes the PWM output inactive.

The external trigger event can be detected on rising or falling edge according to the TRGEDGE bit in  $PWM\_ETRGx$ .

**Figure 55-31. Cycle-By-Cycle Duty Mode**

### 55.6.5.3.2 Application Example

The figure below illustrates an application example of the Cycle-by-cycle Duty mode.

In an LED string control circuit, Cycle-by-cycle Duty mode can be used to automatically limit the current in the LED string.

**Figure 55-32. Cycle-By-Cycle Duty Mode: LED String Control**

#### 55.6.5.4 Leading-Edge Blanking (LEB)

PWM channels 1 and 2 support leading-edge blanking. Leading-edge blanking masks the external trigger input when a transient occurs on the corresponding PWM output. It masks potential spurious external events due to power transistor switching.

The blanking delay on each external trigger input is configured by programming the  $LEBDELAYx$  in the [PWM Leading-Edge Blanking Register](#).

The LEB can be enabled on both the rising and the falling edges for the PWMH and PWML outputs through the bits  $PWMLFEN$ ,  $PWMLREN$ ,  $PWMHFEN$ ,  $PWMHREN$ .

Any event on the  $PWMEXTRGx$  input which occurs during the blanking time is ignored.

**Figure 55-33. Leading-Edge Blanking**

## 55.6.6 PWM Controller Operations

### 55.6.6.1 Initialization

Before enabling the channels, they must be configured by the software application as described below:

- Unlock User Interface by writing the WPCMD field in PWM\_WPCR.
- Configuration of the clock generator (DIVA, PREA, DIVB, PREB in the PWM\_CLK register if required).
- Selection of the clock for each channel (CPRE field in PWM\_CMRx)
- Configuration of the waveform alignment for each channel (CALG field in PWM\_CMRx)
- Selection of the counter event selection (if CALG = 1) for each channel (CES field in PWM\_CMRx)
- Configuration of the output waveform polarity for each channel (CPOL bit in PWM\_CMRx)
- Configuration of the period for each channel (CPRD in the PWM\_CPRDx register). Writing in PWM\_CPRDx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_CPRDUPDx register to update PWM\_CPRDx as explained below.
- Configuration of the duty-cycle for each channel (CDTY in the PWM\_CDTYx register). Writing in PWM\_CDTYx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_CDTYUPDx register to update PWM\_CDTYx as explained below.
- Configuration of the dead-time generator for each channel (DTH and DTL in PWM\_DTx) if enabled (DTE bit in PWM\_CMRx). Writing in the PWM\_DTx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_DTUPDx register to update PWM\_DTx
- Selection of the synchronous channels (SYNCx in the PWM\_SCM register)
- Selection of the moment when the WRDY flag and the corresponding DMA Controller transfer request are set (PTRM and PTRCS in the PWM\_SCM register)
- Configuration of the Update mode (UPDM in PWM\_SCM register)
- Configuration of the update period (UPR in PWM\_SCUP register) if needed
- Configuration of the comparisons (PWM\_CMPVx and PWM\_CMPMx)
- Configuration of the event lines (PWM\_ELMRx)
- Configuration of the fault inputs polarity (FPOL in PWM\_FMR)

- Configuration of the fault protection (FMOD and FFIL in PWM\_FMR, PWM\_FPV and PWM\_FPE1)
- Enable of the interrupts (writing CHIDx and FCHIDx in PWM\_IER1, and writing WRDY, UNRE, CMPMx and CMPUX in PWM\_IER2)
- Enable of the PWM channels (writing CHIDx in the PWM\_ENA register)

### 55.6.6.2 Source Clock Selection Criteria

The large number of source clocks can make selection difficult. The relationship between the value in the [PWM Channel Period Register](#) (PWM\_CPRDx) and the [PWM Channel Duty Cycle Register](#) (PWM\_CDTYx) helps the user select the appropriate clock. The event number written in the Period Register gives the PWM accuracy. The Duty-Cycle quantum cannot be lower than 1/CPRDx value. The higher the value of PWM\_CPRDx, the greater the PWM accuracy.

For example, if the user sets 15 (in decimal) in PWM\_CPRDx, the user is able to set a value from between 1 up to 14 in PWM\_CDTYx. The resulting duty-cycle quantum cannot be lower than 1/15 of the PWM period.

### 55.6.6.3 Changing the Duty-Cycle, the Period and the Dead-Times

It is possible to modulate the output waveform duty-cycle, period and dead-times.

To prevent unexpected output waveform, the user must use the [PWM Channel Duty Cycle Update Register](#) (PWM\_CDTYUPDx), the [PWM Channel Period Update Register](#) (PWM\_CPRDUPDx) and the [PWM Channel Dead Time Update Register](#) (PWM\_DTUPDx) to change waveform parameters while the channel is still enabled.

- If the channel is an asynchronous channel (SYNCx = 0 in [PWM Sync Channels Mode Register](#) (PWM\_SCM)), these registers hold the new period, duty-cycle and dead-times values until the end of the current PWM period and update the values for the next period.
- If the channel is a synchronous channel and update method 0 is selected (SYNCx = 1 and UPDM = 0 in PWM\_SCM register), these registers hold the new period, duty-cycle and dead-times values until the bit UPDULOCK is written at '1' (in [PWM Sync Channels Update Control Register](#) (PWM\_SCUC)) and the end of the current PWM period, then update the values for the next period.
- If the channel is a synchronous channel and update method 1 or 2 is selected (SYNCx = 1 and UPDM = 1 or 2 in PWM\_SCM register):
  - registers PWM\_CPRDUPDx and PWM\_DTUPDx hold the new period and dead-times values until the bit UPDULOCK is written at '1' (in PWM\_SCUC) and the end of the current PWM period, then update the values for the next period.
  - register PWM\_CDTYUPDx holds the new duty-cycle value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in [PWM Sync Channels Update Period Register](#) (PWM\_SCUP)) and the end of the current PWM period, then updates the value for the next period.

**Note:** If the update registers PWM\_CDTYUPDx, PWM\_CPRDUPDx and PWM\_DTUPDx are written several times between two updates, only the last written value is taken into account.

**Figure 55-34. Synchronized Period, Duty-Cycle and Dead-Time Update**

#### 55.6.6.4 Changing the Update Period of Synchronous Channels

It is possible to change the update period of synchronous channels while they are enabled. See [Method 2: Manual write of duty-cycle values and automatic trigger of the update](#) and [Method 3: Automatic write of duty-cycle values and automatic trigger of the update](#).

To prevent an unexpected update of the synchronous channels registers, the user must use the [PWM Sync Channels Update Period Update Register \(PWM\\_SCUPUPD\)](#) to change the update period of synchronous channels while they are still enabled. This register holds the new value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in PWM\_SCUP) and the end of the current PWM period, then updates the value for the next period.

**Note:**

1. If the update register PWM\_SCUPUPD is written several times between two updates, only the last written value is taken into account.
2. Changing the update period does make sense only if there is one or more synchronous channels and if the update method 1 or 2 is selected (UPDM = 1 or 2 in [PWM Sync Channels Mode Register](#)).

**Figure 55-35. Synchronized Update of Update Period Value of Synchronous Channels**

#### 55.6.6.5 Changing the Comparison Value and the Comparison Configuration

It is possible to change the comparison values and the comparison configurations while the channel 0 is enabled (see [PWM Comparison Units](#)).

To prevent unexpected comparison match, the user must use the [PWM Comparison x Value Update Register](#) (PWM\_CMPVUPDx) and the [PWM Comparison x Mode Update Register](#) (PWM\_CMPMUPDx) to change, respectively, the comparison values and the comparison configurations while the channel 0 is still enabled. These registers hold the new values until the end of the comparison update period (when CUPRCNT is equal to CUPR in [PWM Comparison x Mode Register](#) (PWM\_CMPMx) and the end of the current PWM period, then update the values for the next period.

The write of the register PWM\_CMPVUPDx must be followed by a write of the register PWM\_CMPMUPDx.

**Note:** If the update registers PWM\_CMPVUPDx and PWM\_CMPMUPDx are written several times between two updates, only the last written value are taken into account.

**Figure 55-36. Synchronized Update of Comparison Values and Configurations**

### 55.6.6.6 Interrupt Sources

Depending on the interrupt mask in PWM\_IMR1 and PWM\_IMR2, an interrupt can be generated at the end of the corresponding channel period (CHIDx in the PWM Interrupt Status Register 1 (PWM\_ISR1)), after a fault event (FCHIDx in PWM\_ISR1), after a comparison match (CMPMx in PWM\_ISR2), after a comparison update (CMPUx in PWM\_ISR2) or according to the Transfer mode of the synchronous channels (WRDY and UNRE in PWM\_ISR2).

If the interrupt is generated by the flags CHIDx or FCHIDx, the interrupt remains active until a read operation in PWM\_ISR1 occurs.

If the interrupt is generated by the flags WRDY or UNRE or CMPMx or CMPUx, the interrupt remains active until a read operation in PWM\_ISR2 occurs.

**A channel interrupt is enabled by setting the corresponding bit in PWM\_IER1 and PWM\_IER2. A channel interrupt is disabled by setting the corresponding bit in PWM\_IDR1 and PWM\_IDR2.**

### 55.6.7 Register Write Protection

To prevent any single software error that may corrupt PWM behavior, the registers listed below can be write-protected by writing the field WPCMD in the [PWM Write Protection Control Register \(PWM\\_WPCR\)](#). They are divided into six groups:

- Register group 0:
  - [PWM Clock Register](#)
- Register group 1:
  - [PWM Disable Register](#)
- Register group 2:
  - [PWM Sync Channels Mode Register](#)
  - [PWM Channel Mode Register](#)
  - [PWM Stepper Motor Mode Register](#)
  - [PWM Fault Protection Value Register 2](#)

- [PWM Leading-Edge Blanking Register](#)
- [PWM Channel Mode Update Register](#)
- Register group 3:
  - [PWM Spread Spectrum Register](#)
  - [PWM Spread Spectrum Update Register](#)
  - [PWM Channel Period Register](#)
  - [PWM Channel Period Update Register](#)
- Register group 4:
  - [PWM Channel Dead Time Register](#)
  - [PWM Channel Dead Time Update Register](#)
- Register group 5:
  - [PWM Fault Mode Register](#)
  - [PWM Fault Protection Value Register 1](#)

There are two types of write protection:

- SW write protection—can be enabled or disabled by software
- HW write protection—can be enabled by software but only disabled by a hardware reset of the PWM controller

Both types of write protection can be applied independently to a particular register group by means of the WPCMD and WPRGx fields in PWM\_WPCR. If at least one type of write protection is active, the register group is write-protected. The value of field WPCMD defines the action to be performed:

- 0: Disables SW write protection of the register groups of which the bit WPRGx is at '1'
- 1: Enables SW write protection of the register groups of which the bit WPRGx is at '1'
- 2: Enables HW write protection of the register groups of which the bit WPRGx is at '1'

At any time, the user can determine whether SW or HW write protection is active in a particular register group by the fields WPSWS and WPHWS in the [PWM Write Protection Status Register](#) (PWM\_WPSR).

If a write access to a write-protected register is detected, the WPVS flag in PWM\_WPSR is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS and WPVSRC fields are automatically cleared after reading PWM\_WPSR.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7 Register Summary

| Offset | Name     | Bit Pos. |                |  |            |      |        |        |           |           |  |
|--------|----------|----------|----------------|--|------------|------|--------|--------|-----------|-----------|--|
| 0x00   | PWM_CLK  | 7:0      | DIVA[7:0]      |  |            |      |        |        |           |           |  |
|        |          | 15:8     |                |  |            |      |        |        | PREA[3:0] |           |  |

## Pulse Width Modulation Controller (PWM)

### 55.7.1 PWM Clock Register

**Name:** PWM\_CLK  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS0 and WPHWS0 are cleared in the [PWM Write Protection Status Register](#).

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | PREB[3:0] |     |     |     |     |     |     |     |

#### Bits 27:24 – PREB[3:0] CLKB Source Clock Selection

| Value | Name        | Description           |
|-------|-------------|-----------------------|
| 0     | CLK         | Peripheral clock      |
| 1     | CLK_DIV2    | Peripheral clock/2    |
| 2     | CLK_DIV4    | Peripheral clock/4    |
| 3     | CLK_DIV8    | Peripheral clock/8    |
| 4     | CLK_DIV16   | Peripheral clock/16   |
| 5     | CLK_DIV32   | Peripheral clock/32   |
| 6     | CLK_DIV64   | Peripheral clock/64   |
| 7     | CLK_DIV128  | Peripheral clock/128  |
| 8     | CLK_DIV256  | Peripheral clock/256  |
| 9     | CLK_DIV512  | Peripheral clock/512  |
| 10    | CLK_DIV1024 | Peripheral clock/1024 |
| Other | –           | Reserved              |

#### Bits 23:16 – DIVB[7:0] CLKB Divide Factor

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Name      | Description   |
|-------|-----------|---|
| 0     | CLKB_POFF | CLKB clock is turned off                                    |
| 1     | PREB      | CLKB clock is clock selected by PREB                        |
| 2-255 | PREB_DIV  | CLKB clock is clock selected by PREB divided by DIVB factor |

### Bits 11:8 – PREA[3:0] CLKA Source Clock Selection

| Value | Name        | Description           |
|-------|-------------|-----------------------|
| 0     | CLK         | Peripheral clock      |
| 1     | CLK_DIV2    | Peripheral clock/2    |
| 2     | CLK_DIV4    | Peripheral clock/4    |
| 3     | CLK_DIV8    | Peripheral clock/8    |
| 4     | CLK_DIV16   | Peripheral clock/16   |
| 5     | CLK_DIV32   | Peripheral clock/32   |
| 6     | CLK_DIV64   | Peripheral clock/64   |
| 7     | CLK_DIV128  | Peripheral clock/128  |
| 8     | CLK_DIV256  | Peripheral clock/256  |
| 9     | CLK_DIV512  | Peripheral clock/512  |
| 10    | CLK_DIV1024 | Peripheral clock/1024 |
| Other | –           | Reserved              |

### Bits 7:0 – DIVA[7:0] CLKA Divide Factor

| Value | Name      | Description   |
|-------|-----------|---|
| 0     | CLKA_POFF | CLKA clock is turned off                                    |
| 1     | PREA      | CLKA clock is clock selected by PREA                        |
| 2-255 | PREA_DIV  | CLKA clock is clock selected by PREA divided by DIVA factor |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.2 PWM Enable Register

**Name:** PWM\_ENA  
**Offset:** 0x04  
**Reset:** –  
**Property:** Write-only

#### Bits 0, 1, 2, 3 – CHIDx Channel ID

| Value | Description                      |
|-------|----------------------------------|
| 0     | No effect.                       |
| 1     | Enable PWM output for channel x. |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.3 PWM Disable Register

**Name:** PWM\_DIS  
**Offset:** 0x08  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS1 and WPHWS1 are cleared in the [PWM Write Protection Status Register](#).

#### Bits 0, 1, 2, 3 – CHIDx Channel ID

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No effect.                        |
| 1     | Disable PWM output for channel x. |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.4 PWM Status Register

**Name:** PWM\_SR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bits 0, 1, 2, 3 – CHIDx Channel ID

| Value | Description                           |
|-------|---------------------------------------|
| 0     | PWM output for channel x is disabled. |
| 1     | PWM output for channel x is enabled.  |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.5 PWM Interrupt Enable Register 1

**Name:** PWM\_IER1  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |        |        |        |        |
|--------|----|----|----|----|--------|--------|--------|--------|
| Bit    | 31 | 30 | 29 | 28 | 27     | 26     | 25     | 24     |
|        |    |    |    |    |        |        |        |        |
| Access |    |    |    |    |        |        |        |        |
| Reset  |    |    |    |    |        |        |        |        |
|        |    |    |    |    |        |        |        |        |

| Access |    |    |    |    | R      | R      | R      | R      |
| Reset  |    |    |    |    | 0      | 0      | 0      | 0      |

**Bits 16, 17, 18, 19 – FCHIDx** Fault Protection Trigger on Channel x

| Value | Description   |
|-------|---|
| 0     | No new trigger of the fault protection since the last read of PWM_ISR1.       |
| 1     | At least one trigger of the fault protection since the last read of PWM_ISR1. |

**Bits 0, 1, 2, 3 – CHIDx** Counter Event on Channel x

| Value | Description  |
|-------|--|
| 0     | No new counter event has occurred since the last read of PWM_ISR1.       |
| 1     | At least one counter event has occurred since the last read of PWM_ISR1. |

### 55.7.9 PWM Sync Channels Mode Register

**Name:** PWM\_SCM  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the [PWM Write Protection Status Register](#).

|        |                         |     |     |      |       |       |           |       |
|--------|-------------------------|-----|-----|------|-------|-------|-----------|-------|
| Bit    | 31                      | 30  | 29  | 28   | 27    | 26    | 25        | 24    |
|        | [Greyed out bits 31-24] |     |     |      |       |       |           |       |
| Access |                         |     |     |      |       |       |           |       |
| Reset  |                         |     |     |      |       |       |           |       |
| Bit    | 23                      | 22  | 21  | 20   | 19    | 18    | 17        | 16    |
|        | PTRCS[2:0]              |     |     | PTRM |       |       | UPDM[1:0] |       |
| Access | R/W                     | R/W | R/W | R/W  |       |       | R/W       | R/W   |
| Reset  | 0                       | 0   | 0   | 0    |       |       | 0         | 0     |
| Bit    | 15                      | 14  | 13  | 12   | 11    | 10    | 9         | 8     |
|        | [Greyed out bits 15-8]  |     |     |      |       |       |           |       |
| Access |                         |     |     |      |       |       |           |       |
| Reset  |                         |     |     |      |       |       |           |       |
| Bit    | 7                       | 6   | 5   | 4    | 3     | 2     | 1         | 0     |
|        | [Greyed out bits 7-4]   |     |     |      | SYNC3 | SYNC2 | SYNC1     | SYNC0 |
| Access |                         |     |     |      | R/W   | R/W   | R/W       | R/W   |
| Reset  |                         |     |     |      | 0     | 0     | 0         | 0     |

**Bits 23:21 – PTRCS[2:0]** DMA Controller Transfer Request Comparison Selection  
 Selection of the comparison used to set the flag WRDY and the corresponding DMA Controller transfer request.

**Bit 20 – PTRM** DMA Controller Transfer Request Mode

| UPDM | PTRM | WRDY Flag and DMA Controller Transfer Request  |
|------|------|--|
| 0    | x    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are never set to '1'.  |
| 1    | x    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> is set to '1' as soon as the update period is elapsed, the DMA Controller transfer request is never set to '1'. |
| 2    | 0    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the update period is elapsed.                            |
|      | 1    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the selected comparison matches.                         |

**Bits 17:16 – UPDM[1:0]** Synchronous Channels Update Mode

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Name  | Description   |
|-------|-------|---|
| 0     | MODE0 | Manual write of double buffer registers and manual update of synchronous channels 1 <sup>(1)</sup> .  |
| 1     | MODE1 | Manual write of double buffer registers and automatic update of synchronous channels 2 <sup>(2)</sup> .   |
| 2     | MODE2 | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the update period is elapsed. |

**Note:**

1. The update occurs at the beginning of the next PWM period, when the UPDULOCK bit in [PWM Sync Channels Update Control Register](#) is set.
2. The update occurs when the Update Period is elapsed.

**Bits 0, 1, 2, 3 – SYNCx** Synchronous Channel x

| Value | Description                             |
|-------|---|
| 0     | Channel x is not a synchronous channel. |
| 1     | Channel x is a synchronous channel.     |

### 55.7.10 PWM DMA Register

**Name:** PWM\_DMAR  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

Only the first 16 bits (channel counter size) are significant.

|        |                |    |    |    |    |    |    |    |
|--------|----------------|----|----|----|----|----|----|----|
| Bit    | 31             | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |                |    |    |    |    |    |    |    |
| Access |                |    |    |    |    |    |    |    |
| Reset  |                |    |    |    |    |    |    |    |
|        |                |    |    |    |    |    |    |    |
| Bit    | 23             | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | DMADUTY[23:16] |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |                |    |    |    |    |    |    |    |
| Bit    | 15             | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | DMADUTY[15:8]  |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |                |    |    |    |    |    |    |    |
| Bit    | 7              | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | DMADUTY[7:0]   |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | –  |

**Bits 23:0 – DMADUTY[23:0]** Duty-Cycle Holding Register for DMA Access

Each write access to PWM\_DMAR sequentially updates PWM\_CDTYUPDx.CDTYUPD with DMADUTY (only for channel configured as synchronous). See [“Method 3: Automatic write of duty-cycle values and automatic trigger of the update”](#) .

**55.7.11 PWM Sync Channels Update Control Register**

**Name:** PWM\_SCUC  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – UPDULOCK** Synchronous Channels Update Unlock  
 This bit is automatically reset when the update is done.

| Value | Description  |
|-------|--|
| 0     | No effect  |
| 1     | If the UPDM field is set to '0' in <a href="#">PWM Sync Channels Mode Register</a> , writing the UPDULOCK bit to '1' triggers the update of the period value, the duty-cycle and the dead-time values of synchronous channels at the beginning of the next PWM period. If the field UPDM is set to '1' or '2', writing the UPDULOCK bit to '1' triggers only the update of the period value and of the dead-time values of synchronous channels. |

### 55.7.12 PWM Sync Channels Update Period Register

**Name:** PWM\_SCUP  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 7:4 – UPRCNT[3:0]** Update Period Counter  
Reports the value of the update period counter.

**Bits 3:0 – UPR[3:0]** Update Period  
Defines the time between each update of the synchronous channels if automatic trigger of the update is activated (UPDM = 1 or UPDM = 2 in [PWM Sync Channels Mode Register](#)). This time is equal to UPR+1 periods of the synchronous channels.

### 55.7.13 PWM Sync Channels Update Period Update Register

**Name:** PWM\_SCUPUPD  
**Offset:** 0x30  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the UPR value. This prevents an unexpected automatic trigger of the update of synchronous channels.

**Bits 3:0 – UPRUPD[3:0] Update Period Update**

Defines the wanted time between each update of the synchronous channels if automatic trigger of the update is activated (UPDM = 1 or UPDM = 2 in [PWM Sync Channels Mode Register](#)). This time is equal to UPR+1 periods of the synchronous channels.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.14 PWM Interrupt Enable Register 2

**Name:** PWM\_IER2  
**Offset:** 0x34  
**Reset:** –  
**Property:** Write-only

|        |       |       |       |       |       |       |       |       |

## Pulse Width Modulation Controller (PWM)

### 55.7.17 PWM Interrupt Status Register 2

**Name:** PWM\_ISR2  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read-only

Reading PWM\_ISR2 automatically clears flags WRDY, UNRE and CMPSx.

#### Bits 16, 17, 18, 19, 20, 21, 22, 23 – CMPUx Comparison x Update

| Value | Description   |
|-------|---|
| 0     | The comparison x has not been updated since the last read of the PWM_ISR2 register.               |
| 1     | The comparison x has been updated at least one time since the last read of the PWM_ISR2 register. |

#### Bits 8, 9, 10, 11, 12, 13, 14, 15 – CMPMx Comparison x Match

| Value | Description  |
|-------|--|
| 0     | The comparison x has not matched since the last read of the PWM_ISR2 register.               |
| 1     | The comparison x has matched at least one time since the last read of the PWM_ISR2 register. |

#### Bit 3 – UNRE Synchronous Channels Update Underrun Error

| Value | Description  |
|-------|--|
| 0     | No Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register.           |
| 1     | At least one Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register. |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

**Bit 0 – WRDY** Write Ready for Synchronous Channels Update

| Value | Description   |
|-------|---|
| 0     | New duty-cycle and dead-time values for the synchronous channels cannot be written. |
| 1     | New duty-cycle and dead-time values for the synchronous channels can be written.    |

**Bits 16, 17, 18, 19 – OSCUPLx** Output Selection Clear for PWML output of the channel x

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Dead-time generator output DTOLx selected as PWML output of channel x at the beginning of the next channel x PWM period. |

**Bits 0, 1, 2, 3 – OSCUPHx** Output Selection Clear for PWMH output of the channel x

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Dead-time generator output DTOHx selected as PWMH output of channel x at the beginning of the next channel x PWM period. |

### 55.7.24 PWM Fault Mode Register

**Name:** PWM\_FMR  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

See [Fault Inputs](#) for details on fault generation.

To prevent an unexpected activation of the status flag F<sub>Sy</sub> in the [PWM Fault Status Register](#), the bit F<sub>MODy</sub> can be set to '1' only if the F<sub>POLy</sub> bit has been previously configured to its final value.

|        |           |    |    |    |    |    |    |    |
|--------|-----------|----|----|----|----|----|----|----|
| Bit    | 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| Access |           |    |    |    |    |    |    |    |
| Reset  |           |    |    |    |    |    |    |    |

| Access | FMOD[7:0] |    |    |    |    |    |    |    |
| Reset  | 0         |    |    |    |    |    |    |    |
|        |           |    |    |    |    |    |    |    |
| Bit    | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Access | FPOL[7:0] |    |    |    |    |    |    |    |
| Reset  | 0         |    |    |    |    |    |    |    |

#### Bits 23:16 – FFIL[7:0] Fault Filtering

For each bit *y* of FFIL, where *y* is the fault input number:

0: The fault input *y* is not filtered.

1: The fault input *y* is filtered.

#### Bits 15:8 – FMOD[7:0] Fault Activation Mode

For each bit *y* of FMOD, where *y* is the fault input number:

0: The fault *y* is active until the fault condition is removed at the peripheral<sup>(1)</sup> level.

1: The fault *y* stays active until the fault condition is removed at the peripheral level<sup>(1)</sup> AND until it is cleared in the [PWM Fault Clear Register](#).

**Note:**

1. The peripheral generating the fault.

**Bits 7:0 – FPOL[7:0] Fault Polarity**

For each bit  $y$  of FPOL, where  $y$  is the fault input number:

0: The fault  $y$  becomes active when the fault input  $y$  is at 0.

1: The fault  $y$  becomes active when the fault input  $y$  is at 1.

### 55.7.25 PWM Fault Status Register

**Name:** PWM\_FSR  
**Offset:** 0x60  
**Reset:** 0x00000000  
**Property:** Read-only

Refer to [Fault Inputs](#) for details on fault generation.

| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 15:8 – FS[7:0] Fault Status

For each bit  $y$  of FS, where  $y$  is the fault input number:

0: The fault  $y$  is not currently active.

1: The fault  $y$  is currently active.

#### Bits 7:0 – FIV[7:0] Fault Input Value

For each bit  $y$  of FIV, where  $y$  is the fault input number:

0: The current sampled value of the fault input  $y$  is 0 (after filtering if enabled).

1: The current sampled value of the fault input  $y$  is 1 (after filtering if enabled).

### 55.7.26 PWM Fault Clear Register

**Name:** PWM\_FCR  
**Offset:** 0x64  
**Reset:** –  
**Property:** Write-only

See [Fault Inputs](#) for details on fault generation.

#### Bits 7:0 – FCLR[7:0] Fault Clear

For each bit y of FCLR, where y is the fault input number:

0: No effect.

1: If bit y of FMODE field is set to '1' and if the fault input y is not at the level defined by the bit y of FPOL field, the fault y is cleared and becomes inactive (FMODE and FPOL fields belong to [PWM Fault Mode Register](#)), else writing this bit to '1' has no effect.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.27 PWM Fault Protection Value Register 1

**Name:** PWM\_FPV1  
**Offset:** 0x68  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

See [Fault Inputs](#) for details on fault generation.

**Bits 16, 17, 18, 19 – FPVLx** Fault Protection Value for PWML output on channel x

This bit is taken into account only if the bit FPZLx is set to '0' in [PWM Fault Protection Value Register 2](#).

| Value | Description  |
|-------|--|
| 0     | PWML output of channel x is forced to '0' when fault occurs. |
| 1     | PWML output of channel x is forced to '1' when fault occurs. |

**Bits 0, 1, 2, 3 – FPVHx** Fault Protection Value for PWMH output on channel x

This bit is taken into account only if the bit FPZHx is set to '0' in [PWM Fault Protection Value Register 2](#).

| Value | Description  |
|-------|--|
| 0     | PWMH output of channel x is forced to '0' when fault occurs. |
| 1     | PWMH output of channel x is forced to '1' when fault occurs. |

### 55.7.28 PWM Fault Protection Enable Register

**Name:** PWM\_FPE  
**Offset:** 0x6C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

Only the first 6 bits (number of fault input pins) of the register fields are significant.

Refer to [Section 6.4 “Fault Inputs”](#) for details on fault generation.

| Access |     | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |     | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 0:7, 8:15, 16:23, 24:31 – FPE<sub>x</sub>** Fault Protection Enable for channel x

For each bit y of FPE<sub>x</sub>, where y is the fault input number:

0: Fault y is not used for the fault protection of channel x.

1: Fault y is used for the fault protection of channel x.

To prevent an unexpected activation of the fault protection, the bit y of FPE<sub>x</sub> field can be set to ‘1’ only if the corresponding FPOL field has been previously configured to its final value in [PWM Fault Mode Register](#).

# SAMA5D2 Series

**Bits 0, 1, 2, 3, 4, 5, 6, 7 – CSELy Comparison y Selection**

| Value | Description   |
|-------|---|
| 0     | A pulse is not generated on the event line x when the comparison y matches. |
| 1     | A pulse is generated on the event line x when the comparison y match.       |

### 55.7.30 PWM Spread Spectrum Register

**Name:** PWM\_SSPR  
**Offset:** 0xA0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

Only the first 16 bits (channel counter size) are significant.

|        |             |     |     |     |     |     |     |       |

|        |             |     |     |     |     |     |     |       |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0     |
|        | SPRD[7:0]   |     |     |     |     |     |     |       |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W   |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0     |

#### Bit 24 – SPRDM Spread Spectrum Counter Mode

| Value | Description  |
|-------|--|
| 0     | Triangular mode. The spread spectrum counter starts to count from -SPRD when the channel 0 is enabled and counts upwards at each PWM period. When it reaches +SPRD, it restarts to count from -SPRD again. |
| 1     | Random mode. The spread spectrum counter is loaded with a new random value at each PWM period. This random value is uniformly distributed and is between -SPRD and +SPRD.                                  |

#### Bits 23:0 – SPRD[23:0] Spread Spectrum Limit Value

The spread spectrum limit value defines the range for the spread spectrum counter. It is introduced in order to achieve constant varying PWM period for the output waveform.

### 55.7.31 PWM Spread Spectrum Update Register

**Name:** PWM\_SSPUP  
**Offset:** 0xA4  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the SPRD value. This prevents an unexpected waveform when modifying the spread spectrum limit value.

Only the first 16 bits (channel counter size) are significant.

## Pulse Width Modulation Controller (PWM)

### 55.7.32 PWM Stepper Motor Mode Register

**Name:** PWM\_SMMR  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |  |    |    |    |    |    |       |       |
|--------|--|----|----|----|----|----|-------|-------|
| Bit    | 31   | 30 | 29 | 28 | 27 | 26 | 25    | 24    |
|        | <div style="display: flex; justify-content: space-between; width: 100%; height: 15px; background-color: #cccccc;"></div> |    |    |    |    |    |       |       |
| Access |  |    |    |    |    |    |       |       |
| Reset  |  |    |    |    |    |    |       |       |
|        |  |    |    |    |    |    |       |       |
| Bit    | 23   | 22 | 21 | 20 | 19 | 18 | 17    | 16    |
|        | <div style="display: flex; justify-content: space-between; width: 100%; height: 15px; background-color: #cccccc;"></div> |    |    |    |    |    | DOWN1 | DOWN0 |
| Access |  |    |    |    |    |    | 0     | 0     |
| Reset  |  |    |    |    |    |    | 0     | 0     |
|        |  |    |    |    |    |    |       |       |
| Bit    | 15   | 14 | 13 | 12 | 11 | 10 | 9     | 8     |
|        | <div style="display: flex; justify-content: space-between; width: 100%; height: 15px; background-color: #cccccc;"></div> |    |    |    |    |    |       |       |
| Access |  |    |    |    |    |    |       |       |
| Reset  |  |    |    |    |    |    |       |       |
|        |  |    |    |    |    |    |       |       |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1     | 0     |
|        | <div style="display: flex; justify-content: space-between; width: 100%; height: 15px; background-color: #cccccc;"></div> |    |    |    |    |    | GCEN1 | GCEN0 |
| Access |  |    |    |    |    |    | R/W   | R/W   |
| Reset  |  |    |    |    |    |    | 0     | 0     |

#### Bits 16, 17 – DOWNx Down Count

| Value | Description   |
|-------|---------------|
| 0     | Up counter.   |
| 1     | Down counter. |

#### Bits 0, 1 – GCENx Gray Count Enable

| Value | Description   |
|-------|---|
| 0     | Disable Gray count generation on PWML[2*x], PWMH[2*x], PWML[2*x + 1], PWMH[2*x + 1] |
| 1     | Enable Gray count generation on PWML[2*x], PWMH[2*x], PWML[2*x + 1], PWMH[2*x + 1]. |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.33 PWM Fault Protection Value Register 2

**Name:** PWM\_FPV2  
**Offset:** 0xC0  
**Reset:** 0x000F000F  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

|        |    |    |    |    |       |       |       |       |
|--------|----|----|----|----|-------|-------|-------|-------|
| Bit    | 31 | 30 | 29 | 28 | 27    | 26    | 25    | 24    |
|        |    |    |    |    |       |       |       |       |
| Access |    |    |    |    |       |       |       |       |
| Reset  |    |    |    |    |       |       |       |       |
|        |    |    |    |    |       |       |       |       |
| Bit    | 23 | 22 | 21 | 20 | 19    | 18    | 17    | 16    |
|        |    |    |    |    | FPZL3 | FPZL2 | FPZL1 | FPZL0 |
| Access |    |    |    |    | R/W   | R/W   | R/W   | R/W   |
| Reset  |    |    |    |    | 1     | 1     | 1     | 1     |
|        |    |    |    |    |       |       |       |       |
| Bit    | 15 | 14 | 13 | 12 | 11    | 10    | 9     | 8     |
|        |    |    |    |    |       |       |       |       |
| Access |    |    |    |    |       |       |       |       |
| Reset  |    |    |    |    |       |       |       |       |
|        |    |    |    |    |       |       |       |       |
| Bit    | 7  | 6  | 5  | 4  | 3     | 2     | 1     | 0     |
|        |    |    |    |    | FPZH3 | FPZH2 | FPZH1 | FPZH0 |
| Access |    |    |    |    | R/W   | R/W   | R/W   | R/W   |
| Reset  |    |    |    |    | 1     | 1     | 1     | 1     |

**Bits 16, 17, 18, 19 – FPZLx** Fault Protection to Hi-Z for PWML output on channel x

| Value | Description  |
|-------|--|
| 0     | When fault occurs, PWML output of channel x is forced to value defined by the bit FPVLx in <a href="#">PWM Fault Protection Value Register 1</a> . |
| 1     | When fault occurs, PWML output of channel x is forced to high-impedance state.   |

**Bits 0, 1, 2, 3 – FPZHx** Fault Protection to Hi-Z for PWMH output on channel x

| Value | Description  |
|-------|--|
| 0     | When fault occurs, PWMH output of channel x is forced to value defined by the bit FPVHx in <a href="#">PWM Fault Protection Value Register 1</a> . |
| 1     | When fault occurs, PWMH output of channel x is forced to high-impedance state.   |

### 55.7.34 PWM Write Protection Control Register

**Name:** PWM\_WPCR  
**Offset:** 0xE4  
**Reset:** –  
**Property:** Write-only

See [Register Write Protection](#) for the list of registers that can be write-protected.

|        |              |       |       |       |       |       |            |    |
|--------|--------------|-------|-------|-------|-------|-------|------------|----|
| Bit    | 31           | 30    | 29    | 28    | 27    | 26    | 25         | 24 |
|        | WPKEY[23:16] |       |       |       |       |       |            |    |
| Access | W            | W     | W     | W     | W     | W     | W          | W  |
| Reset  | 0            | 0     | 0     | 0     | 0     | 0     | 0          | 0  |
| Bit    | 23           | 22    | 21    | 20    | 19    | 18    | 17         | 16 |
|        | WPKEY[15:8]  |       |       |       |       |       |            |    |
| Access | W            | W     | W     | W     | W     | W     | W          | W  |
| Reset  | 0            | 0     | 0     | 0     | 0     | 0     | 0          | 0  |
| Bit    | 15           | 14    | 13    | 12    | 11    | 10    | 9          | 8  |
|        | WPKEY[7:0]   |       |       |       |       |       |            |    |
| Access | W            | W     | W     | W     | W     | W     | W          | W  |
| Reset  | 0            | 0     | 0     | 0     | 0     | 0     | 0          | –  |
| Bit    | 7            | 6     | 5     | 4     | 3     | 2     | 1          | 0  |
|        | WPRG5        | WPRG4 | WPRG3 | WPRG2 | WPRG1 | WPRG0 | WPCMD[1:0] |    |
| Access | W            | W     | W     | W     | W     | W     | W          | W  |
| Reset  | 0            | 0     | 0     | 0     | 0     | –     | 0          | –  |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description  |
|----------|--------|--|
| 0x50574D | PASSWD | Writing any other value in this field aborts the write operation of the WPCMD field. |
| D        |        | Always reads as 0  |

#### Bits 2, 3, 4, 5, 6, 7 – WPRGx Write Protection Register Group x

| Value | Description  |
|-------|--|
| 0     | The WPCMD command has no effect on the register group x. |
| 1     | The WPCMD command is applied to the register group x.    |

#### Bits 1:0 – WPCMD[1:0] Write Protection Command

This command is performed only if the WPKEY corresponds to 0x50574D (“PWM” in ASCII).

| Value | Name            | Description   |
|-------|-----------------|---|
| 0     | DISABLE_SW_PROT | Disables the software write protection of the register groups of which the bit WPRGx is at ‘1’. |
| 1     | ENABLE_SW_PROT  | Enables the software write protection of the register groups of which the bit WPRGx is at ‘1’.  |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Name           | Description   |
|-------|----------------|---|
| 2     | ENABLE_HW_PROT | Enables the hardware write protection of the register groups of which the bit WPRGx is at '1'. Only a hardware reset of the PWM controller can disable the hardware write protection. Moreover, to meet security requirements, the PIO lines associated with the PWM can not be configured through the PIO interface. |

### 55.7.35 PWM Write Protection Status Register

**Name:** PWM\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

|        |             |    |        |        |        |        |        |        |        |
|--------|-------------|----|--------|--------|--------|--------|--------|--------|--------|
| Bit    | 31          | 30 | 29     | 28     | 27     | 26     | 25     | 24     |        |
|        | WPVSR[15:8] |    |        |        |        |        |        |        |        |
| Access | R           | R  | R      | R      | R      | R      | R      | R      |        |
| Reset  | 0           | 0  | 0      | 0      | 0      | 0      | 0      | 0      |        |
| Bit    | 23          | 22 | 21     | 20     | 19     | 18     | 17     | 16     |        |
|        | WPVSR[7:0]  |    |        |        |        |        |        |        |        |
| Access | R           | R  | R      | R      | R      | R      | R      | R      |        |
| Reset  | 0           | 0  | 0      | 0      | 0      | 0      | 0      | 0      |        |
| Bit    | 15          | 14 | 13     | 12     | 11     | 10     | 9      | 8      |        |
|        |             |    | WPHWS5 | WPHWS4 | WPHWS3 | WPHWS2 | WPHWS1 | WPHWS0 |        |
| Access |             |    | R      | R      | R      | R      | R      | R      |        |
| Reset  |             |    | 0      | 0      | 0      | 0      | 0      | 0      |        |
| Bit    | 7           | 6  | 5      | 4      | 3      | 2      | 1      | 0      |        |
|        | WPVS        |    |        | WPSWS5 | WPSWS4 | WPSWS3 | WPSWS2 | WPSWS1 | WPSWS0 |
| Access | R           |    |        | R      | R      | R      | R      | R      | R      |
| Reset  | 0           |    |        | 0      | 0      | 0      | 0      | 0      | 0      |

#### Bits 31:16 – WPVSR[15:0] Write Protect Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bits 8, 9, 10, 11, 12, 13 – WPHWSx Write Protect HW Status

| Value | Description  |
|-------|--|
| 0     | The HW write protection x of the register group x is disabled. |
| 1     | The HW write protection x of the register group x is enabled.  |

#### Bit 7 – WPVS Write Protect Violation Status

| Value | Description  |
|-------|--|
| 0     | No write protection violation has occurred since the last read of PWM_WPSR.  |
| 1     | At least one write protection violation has occurred since the last read of PWM_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

#### Bits 0, 1, 2, 3, 4, 5 – WPSWSx Write Protect SW Status

| Value | Description  |
|-------|--|
| 0     | The SW write protection x of the register group x is disabled. |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

| Value | Description   |
|-------|---|
| 1     | The SW write protection x of the register group x is enabled. |

### 55.7.36 PWM Comparison x Value Register

**Name:** PWM\_CMPVx  
**Offset:** 0x0130 + x\*0x10 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

Only the first 16 bits (channel counter size) of field CV are significant.

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |           |     |     |     |     |     |     | CVM |
| Access |           |     |     |     |     |     |     | R/W |
| Reset  |           |     |     |     |     |     |     | 0   |
|        |           |     |     |     |     |     |     |     |
| Bit    | 23        | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | CV[23:16] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |           |     |     |     |     |     |     |     |
| Bit    | 15        | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | CV[15:8]  |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |           |     |     |     |     |     |     |     |
| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | CV[7:0]   |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bit 24 – CVM Comparison x Value Mode

| Value | Description   |
|-------|---|
| 0     | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is incrementing.  |
| 1     | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is decrementing.<br><br>Note: This bit is not relevant if the counter of the channel 0 is left-aligned (CALG = 0 in <a href="#">PWM Channel Mode Register</a> ) |

#### Bits 23:0 – CV[23:0] Comparison x Value

Define the comparison x value to be compared with the counter of the channel 0.

### 55.7.37 PWM Comparison x Value Update Register

**Name:** PWM\_CMPVUPDx  
**Offset:** 0x0134 + x\*0x10 [x=0..7]  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the CV and CVM values. This prevents an unexpected comparison x match.

Only the first 16 bits (channel counter size) of field CVUPD are significant.

The write of the register PWM\_CMPVUPDx must be followed by a write of the register PWM\_CMPMUPDx.

|        |     |              |    |    |    |    |    |    |        |

#### Bit 24 – CVMUPD Comparison x Value Mode Update

**Note:** This bit is not relevant if the counter of the channel 0 is left-aligned (CALG = 0 in [PWM Channel Mode Register](#))

| Value | Description  |
|-------|--|
| 0     | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is incrementing. |
| 1     | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is decrementing. |

#### Bits 23:0 – CVUPD[23:0] Comparison x Value Update

Define the comparison x value to be compared with the counter of the channel 0.

### 55.7.38 PWM Comparison x Mode Register

**Name:** PWM\_CMPMx  
**Offset:** 0x0138 + x\*0x10 [x=0..7]  
**Reset:** 0x00000000  
**Property:** R/W

**Bits 23:20 – CUPRCNT[3:0]** Comparison x Update Period Counter  
 Reports the value of the comparison x update period counter.

Note: The field CUPRCNT is read-only

**Bits 19:16 – CUPR[3:0]** Comparison x Update Period  
 Defines the time between each update of the comparison x mode and the comparison x value. This time is equal to CUPR+1 periods of the channel 0 counter.

**Bits 15:12 – CPRCNT[3:0]** Comparison x Period Counter  
 Reports the value of the comparison x period counter.

Note: The field CPRCNT is read-only

**Bits 11:8 – CPR[3:0]** Comparison x Period  
 CPR defines the maximum value of the comparison x period counter (CPRCNT). The comparison x value is performed periodically once every CPR+1 periods of the channel 0 counter.

**Bits 7:4 – CTR[3:0]** Comparison x Trigger  
 The comparison x is performed when the value of the comparison x period counter (CPRCNT) reaches the value defined by CTR.

**Bit 0 – CEN** Comparison x Enable

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

| Value | Description                                     |
|-------|---|
| 0     | The comparison x is disabled and can not match. |
| 1     | The comparison x is enabled and can match.      |

### 55.7.39 PWM Comparison x Mode Update Register

**Name:** PWM\_CMPMUPDx  
**Offset:** 0x013C + x\*0x10 [x=0..7]  
**Reset:** –  
**Property:** W

This register acts as a double buffer for the CEN, CTR, CPR and CUPR values. This prevents an unexpected comparison x match.

|        |             |    |    |    |              |    |    |    |        |
|--------|-------------|----|----|----|--------------|----|----|----|--------|
| Bit    | 31          | 30 | 29 | 28 | 27           | 26 | 25 | 24 |        |

|        |             |    |    |    | CPRUPD[3:0]  |    |    |    |        |
| Access |             |    |    |    | W            | W  | W  | W  |        |
| Reset  |             |    |    |    | 0            | 0  | 0  | –  |        |
|        |             |    |    |    |              |    |    |    |        |
| Bit    | 7           | 6  | 5  | 4  | 3            | 2  | 1  | 0  |        |
|        | CTRUPD[3:0] |    |    |    |              |    |    |    | CENUPD |
| Access | W           | W  | W  | W  |              |    | W  |    |        |
| Reset  | 0           | 0  | 0  | –  |              |    | –  |    |        |

**Bits 19:16 – CUPRUPD[3:0]** Comparison x Update Period Update

Defines the time between each update of the comparison x mode and the comparison x value. This time is equal to CUPR+1 periods of the channel 0 counter.

**Bits 11:8 – CPRUPD[3:0]** Comparison x Period Update

CPR defines the maximum value of the comparison x period counter (CPRCNT). The comparison x value is performed periodically once every CPR+1 periods of the channel 0 counter.

**Bits 7:4 – CTRUPD[3:0]** Comparison x Trigger Update

The comparison x is performed when the value of the comparison x period counter (CPRCNT) reaches the value defined by CTR.

**Bit 0 – CENUPD** Comparison x Enable Update

| Value | Description                                     |
|-------|---|
| 0     | The comparison x is disabled and can not match. |
| 1     | The comparison x is enabled and can match.      |

### 55.7.40 PWM Channel Mode Register

**Name:** PWM\_CMRx  
**Offset:** 0x0200 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the [PWM Write Protection Status Register](#).

|        |    |    |      |       |           |      |      |      |
|--------|----|----|------|-------|-----------|------|------|------|
| Bit    | 31 | 30 | 29   | 28    | 27        | 26   | 25   | 24   |
|        |    |    |      |       |           |      |      |      |
| Access |    |    |      |       |           |      |      |      |
| Reset  |    |    |      |       |           |      |      |      |
| Bit    | 23 | 22 | 21   | 20    | 19        | 18   | 17   | 16   |
|        |    |    |      |       | PPM       | DTLI | DTHI | DTE  |
| Access |    |    |      |       | R/W       |      |      |      |
| Reset  |    |    |      |       | 0         | 0    | 0    | 0    |
| Bit    | 15 | 14 | 13   | 12    | 11        | 10   | 9    | 8    |
|        |    |    | TCTS | DPOLI | UPDS      | CES  | CPOL | CALG |
| Access |    |    |      |       | R/W       | R/W  | R/W  | R/W  |
| Reset  |    |    | 0    | 0     | 0         | 0    | 0    | 0    |
| Bit    | 7  | 6  | 5    | 4     | 3         | 2    | 1    | 0    |
|        |    |    |      |       | CPRE[3:0] |      |      |      |
| Access |    |    |      |       | R/W       | R/W  | R/W  | R/W  |
| Reset  |    |    |      |       | 0         | 0    | 0    | 0    |

#### Bit 19 – PPM Push-Pull Mode

The Push-Pull mode is enabled for channel x.

| Value | Description                                   |
|-------|---|
| 0     | The Push-Pull mode is disabled for channel x. |
| 1     | The Push-Pull mode is enabled for channel x.  |

#### Bit 18 – DTLI Dead-Time PWMLx Output Inverted

| Value | Description                                 |
|-------|---|
| 0     | The dead-time PWMLx output is not inverted. |
| 1     | The dead-time PWMLx output is inverted.     |

#### Bit 17 – DTHI Dead-Time PWMHx Output Inverted

| Value | Description                                 |
|-------|---|
| 0     | The dead-time PWMHx output is not inverted. |
| 1     | The dead-time PWMHx output is inverted.     |

#### Bit 16 – DTE Dead-Time Generator Enable

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Description                          |
|-------|--------------------------------------|
| 0     | The dead-time generator is disabled. |
| 1     | The dead-time generator is enabled.  |

### Bit 13 – TCTS Timer Counter Trigger Selection

| Value | Description   |
|-------|---|
| 0     | The comparator of the channel x (OCx) is used as the trigger source for the Timer Counter (TC). |
| 1     | The counter events of the channel x is used as the trigger source for the Timer Counter (TC).   |

### Bit 12 – DPOLI Disabled Polarity Inverted

| Value | Description  |
|-------|--|
| 0     | When the PWM channel x is disabled (CHIDx(PWM_SR) = 0), the OCx output waveform is the same as the one defined by the CPOL bit.          |
| 1     | When the PWM channel x is disabled (CHIDx(PWM_SR) = 0), the OCx output waveform is inverted compared to the one defined by the CPOL bit. |

### Bit 11 – UPDS Update Selection

If the PWM period is center-aligned (CALG=1):

0: The update occurs at the next end of the PWM period after writing the update register(s).

1: The update occurs at the next end of the PWM half period after writing the update register(s).

If the PWM period is left-aligned (CALG=0), the update always occurs at the end of the PWM period after writing the update register(s).

### Bit 10 – CES Counter Event Selection

If the PWM period is center-aligned (CALG=1):

0: The channel counter event occurs at the end of the PWM period.

1: The channel counter event occurs at the end of the PWM period and at half the PWM period.

If the PWM period is left-aligned (CALG=0), the channel counter event occurs at the end of the period and the CES bit has no effect.

### Bit 9 – CPOL Channel Polarity

| Value | Description  |
|-------|--|
| 0     | The OCx output waveform (output from the comparator) starts at a low level.  |
| 1     | The OCx output waveform (output from the comparator) starts at a high level. |

### Bit 8 – CALG Channel Alignment

| Value | Description                   |
|-------|-------------------------------|
| 0     | The period is left-aligned.   |
| 1     | The period is center-aligned. |

### Bits 3:0 – CPRE[3:0] Channel Prescaler

| Value | Name | Description      |
|-------|------|------------------|
|       | MCK  | Peripheral clock |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Name         | Description           |
|-------|--------------|-----------------------|
| 1     | MCK_DIV_2    | Peripheral clock/2    |
| 2     | MCK_DIV_4    | Peripheral clock/4    |
| 3     | MCK_DIV_8    | Peripheral clock/8    |
| 4     | MCK_DIV_16   | Peripheral clock/16   |
| 5     | MCK_DIV_32   | Peripheral clock/32   |
| 6     | MCK_DIV_64   | Peripheral clock/64   |
| 7     | MCK_DIV_128  | Peripheral clock/128  |
| 8     | MCK_DIV_256  | Peripheral clock/256  |
| 9     | MCK_DIV_512  | Peripheral clock/512  |
| 10    | MCK_DIV_1024 | Peripheral clock/1024 |
| 11    | CLKA         | Clock A               |
| 12    | CLKB         | Clock B               |

### 55.7.41 PWM Channel Duty Cycle Register

**Name:** PWM\_CDTYx  
**Offset:** 0x0204 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Only the first 16 bits (channel counter size) are significant.

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |             |     |     |     |     |     |     |     |
| Access |             |     |     |     |     |     |     |     |
| Reset  |             |     |     |     |     |     |     |     |

| Bit    | 23          | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | CDTY[23:16] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |             |     |     |     |     |     |     |     |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | CDTY[15:8]  |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |             |     |     |     |     |     |     |     |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | CDTY[7:0]   |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 23:0 – CDTY[23:0] Channel Duty-Cycle**

Defines the waveform duty-cycle. This value must be defined between 0 and CPRD (PWM\_CPRDx).

### 55.7.42 PWM Channel Duty Cycle Update Register

**Name:** PWM\_CDTYUPDx  
**Offset:** 0x0208 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the CDTY value. This prevents an unexpected waveform when modifying the waveform duty-cycle.

Only the first 16 bits (channel counter size) are significant.

**Bits 23:0 – CDTYUPD[23:0] Channel Duty-Cycle Update**

Defines the waveform duty-cycle. This value must be defined between 0 and CPRD (PWM\_CPRDx).

### 55.7.43 PWM Channel Period Register

**Name:** PWM\_CPRDx  
**Offset:** 0x020C + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

Only the first 16 bits (channel counter size) are significant.

#### Bits 23:0 – CPRD[23:0] Channel Period

If the waveform is left-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

– By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(2 \times X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

### 55.7.44 PWM Channel Period Update Register

**Name:** PWM\_CPRDUPDx  
**Offset:** 0x0210 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the CPRD value. This prevents an unexpected waveform when modifying the waveform period.

Only the first 16 bits (channel counter size) are significant.

#### Bits 23:0 – CPRDUPD[23:0] Channel Period Update

If the waveform is left-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

- By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \text{CPRDUPD})}{f_{\text{peripheral clock}}}$$

- By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \text{CPRDUPD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \text{CPRDUPD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

If the waveform is center-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \text{CPRDUPD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRDUPD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(2 \times X \times \text{CPRDUPD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

### 55.7.45 PWM Channel Counter Register

**Name:** PWM\_CCNTx  
**Offset:** 0x0214 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

Only the first 16 bits (channel counter size) are significant.

|        |     |                         |    |    |    |    |    |    |    |

| Reset  |     | 0                       | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 23:0 – CNT[23:0]** Channel Counter Register

Channel counter value. This register is reset when:

- the channel is enabled (writing CHIDx in the PWM\_ENA register).
- the channel counter reaches CPRD value defined in the PWM\_CPRDx register if the waveform is left-aligned.

### 55.7.46 PWM Channel Dead Time Register

**Name:** PWM\_DT<sub>x</sub>  
**Offset:** 0x0218 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS4 and WPHWS4 are cleared in the [PWM Write Protection Status Register](#).

Only the first 16 bits (dead-time counter size) of fields DTH and DTL are significant.

|        |     |           |     |     |     |     |     |     |     |

|        |     | DTL[7:0]  |     |     |     |     |     |     |     |
| Access |     | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |     | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        | Bit | 15        | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        |     | DTH[15:8] |     |     |     |     |     |     |     |
| Access |     | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |     | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        | Bit | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        |     | DTH[7:0]  |     |     |     |     |     |     |     |
| Access |     | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |     | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:16 – DTL[15:0]** Dead-Time Value for PWML<sub>x</sub> Output

Defines the dead-time value for PWML<sub>x</sub> output. This value must be defined between 0 and CDTY (PWM\_CDTY<sub>x</sub>).

**Bits 15:0 – DTH[15:0]** Dead-Time Value for PWMH<sub>x</sub> Output

Defines the dead-time value for PWMH<sub>x</sub> output. This value must be defined between 0 and the value (CPRD – CDTY) (PWM\_CPRD<sub>x</sub> and PWM\_CDTY<sub>x</sub>).

### 55.7.47 PWM Channel Dead Time Update Register

**Name:** PWM\_DTUPDx  
**Offset:** 0x021C + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Write-only

This register can only be written if bits WPSWS4 and WPHWS4 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the DTH and DTL values. This prevents an unexpected waveform when modifying the dead-time values.

Only the first 16 bits (dead-time counter size) of fields DTHUPD and DTLUPD are significant.

|        |     |              |    |    |    |    |    |    |    |

**Bits 31:16 – DTLUPD[15:0]** Dead-Time Value Update for PWMLx Output

Defines the dead-time value for PWMLx output. This value must be defined between 0 and CDTY (PWM\_CDTYx). This value is applied only at the beginning of the next channel x PWM period.

**Bits 15:0 – DTHUPD[15:0]** Dead-Time Value Update for PWMHx Output

Defines the dead-time value for PWMHx output. This value must be defined between 0 and the value (CPRD – CDTY) (PWM\_CPRDx and PWM\_CDTYx). This value is applied only at the beginning of the next channel x PWM period.

### 55.7.48 PWM Channel Mode Update Register

**Name:** PWM\_CMUPDx  
**Offset:** 0x0400 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the CPOL value. This prevents an unexpected waveform when modifying the polarity value.

**Bit 13 – CPOLINVUP** Channel Polarity Inversion Update

If this bit is written at '1', the write of the bit CPOLUP is not taken into account.

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | The OCx output waveform (output from the comparator) is inverted. |

**Bit 9 – CPOLUP** Channel Polarity Update

The write of this bit is taken into account only if the bit CPOLINVUP is written at '0' at the same time.

| Value | Description  |
|-------|--|
| 0     | The OCx output waveform (output from the comparator) starts at a low level.  |
| 1     | The OCx output waveform (output from the comparator) starts at a high level. |

### 55.7.49 PWM External Trigger Register

**Name:** PWM\_ETRGx  
**Offset:** 0x042C + x\*0x20 [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |     |               |        |         |         |     |     |              |     |
|--------|-----|---------------|--------|---------|---------|-----|-----|--------------|-----|

| Reset  |     | 0             | 0      | 0       | 0       | 0   | 0   | 0            | 0   |
|        |     |               |        |         |         |     |     |              |     |
|        | Bit | 7             | 6      | 5       | 4       | 3   | 2   | 1            | 0   |
|        |     | MAXCNT[7:0]   |        |         |         |     |     |              |     |
| Access |     | R/W           | R/W    | R/W     | R/W     | R/W | R/W | R/W          | R/W |
| Reset  |     | 0             | 0      | 0       | 0       | 0   | 0   | 0            | 0   |

**Bit 31 – RFEN** Recoverable Fault Enable

| Value | Description   |
|-------|---|
| 0     | The TRGINx signal does not generate a recoverable fault.                      |
| 1     | The TRGINx signal generate a recoverable fault in place of the fault x input. |

**Bit 30 – TRGSRC** Trigger Source

| Value | Description  |
|-------|--|
| 0     | The TRGINx signal is driven by the PWMEXTRGx input.              |
| 1     | The TRGINx signal is driven by the Analog Comparator Controller. |

**Bit 29 – TRGFILT** Filtered input

| Value | Description                                   |
|-------|---|
| 0     | The external trigger input x is not filtered. |
| 1     | The external trigger input x is filtered.     |

**Bit 28 – TRGEDGE** Edge Selection

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Name         | Description  |
|-------|--------------|--|
| 0     | FALLING_ZERO | TRGMODE = 1: TRGINx event detection on falling edge.<br>TRGMODE = 2, 3: TRGINx active level is 0 |
| 1     | RISING_ONE   | TRGMODE = 1: TRGINx event detection on rising edge.<br>TRGMODE = 2, 3: TRGINx active level is 1  |

**Bits 25:24 – TRGMODE[1:0]** External Trigger Mode

| Value | Name  | Description                      |
|-------|-------|----------------------------------|
| 0     | OFF   | External trigger is not enabled. |
| 1     | MODE1 | External PWM Reset Mode          |
| 2     | MODE2 | External PWM Start Mode          |
| 3     | MODE3 | Cycle-by-cycle Duty Mode         |

**Bits 23:0 – MAXCNT[23:0]** Maximum Counter value

Maximum channel x counter value measured at the TRGINx event since the last read of the register.

At the TRGINx event, if the channel x counter value is greater than the stored MAXCNT value, then MAXCNT is updated by the channel x counter value.

### 55.7.50 PWM Leading-Edge Blanking Register

**Name:** PWM\_LEBRx  
**Offset:** 0x0430 + x\*0x20 [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |                         |     |     |     |         |         |         |         |  |
|--------|-------------------------|-----|-----|-----|---------|---------|---------|---------|--|
| Bit    | 31                      | 30  | 29  | 28  | 27      | 26      | 25      | 24      |  |
|        | [Greyed out bits 31-24] |     |     |     |         |         |         |         |  |
| Access |                         |     |     |     |         |         |         |         |  |
| Reset  |                         |     |     |     |         |         |         |         |  |

|        | [Greyed out bits 23-20] |     |     |     | PWMHREN | PWMHFEN | PWMLREN | PWMLFEN |  |
| Access |                         |     |     |     | R/W     | R/W     | R/W     | R/W     |  |
| Reset  |                         |     |     |     | 0       | 0       | 0       | 0       |  |
| Bit    | 15                      | 14  | 13  | 12  | 11      | 10      | 9       | 8       |  |
|        | [Greyed out bits 15-8]  |     |     |     |         |         |         |         |  |
| Access |                         |     |     |     |         |         |         |         |  |
| Reset  |                         |     |     |     |         |         |         |         |  |
| Bit    | 7                       | 6   | 5   | 4   | 3       | 2       | 1       | 0       |  |
|        | LEBDELAY[6:0]           |     |     |     |         |         |         |         |  |
| Access |                         | R/W | R/W | R/W | R/W     | R/W     | R/W     | R/W     |  |
| Reset  |                         | 0   | 0   | 0   | 0       | 0       | 0       | 0       |  |

**Bit 19 – PWMHREN** PWMH Rising Edge Enable  
 Leading-edge blanking is enabled on PWMHx output rising edge.

| Value | Description  |
|-------|--|
| 0     | Leading-edge blanking is disabled on PWMHx output rising edge. |
| 1     | Leading-edge blanking is enabled on PWMHx output rising edge.  |

**Bit 18 – PWMHFEN** PWMH Falling Edge Enable

| Value | Description   |
|-------|---|
| 0     | Leading-edge blanking is disabled on PWMHx output falling edge. |
| 1     | Leading-edge blanking is enabled on PWMHx output falling edge.  |

**Bit 17 – PWMLREN** PWML Rising Edge Enable

| Value | Description  |
|-------|--|
| 0     | Leading-edge blanking is disabled on PWMLx output rising edge. |
| 1     | Leading-edge blanking is enabled on PWMLx output rising edge.  |

**Bit 16 – PWMLFEN** PWML Falling Edge Enable

| Value | Description   |
|-------|---|
| 0     | Leading-edge blanking is disabled on PWMLx output falling edge. |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

---

| Value | Description  |
|-------|--|
| 1     | Leading-edge blanking is enabled on PWMLx output falling edge. |

**Bits 6:0 – LEBDELAY[6:0]** Leading-Edge Blanking Delay for TRGINx

Leading-edge blanking duration for external trigger x input. The delay is calculated according to the following formula:

$$\text{LEBDELAY} = (f_{\text{peripheral clock}} \times \text{Delay}) + 1$$

## **56. Secure Fuse Controller (SFC)**

### **56.1 Description**

The Secure Fuse Controller (SFC) interfaces the system with electrical fuses in a secure way.

The default value of a fuse is logic '0' (not programmed). A programmed fuse is logic '1'.

An electrical fuse matrix is a type of non-volatile memory. Each fuse in the matrix can be programmed only one time. They are typically used to store calibration bits for analog cells such as oscillators, configuration settings, chip identifiers or cryptographic keys.

A specific number of fuse bits are programmed during the production tests through the test interface. The remaining 544 fuse bits are programmed by the user and by software through the user interface.

The SFC automatically reads the fuse values on start-up and stores them in 32-bit registers in order to make them accessible by the software. Only fuses set to level '1' are programmed.

Several security mechanisms make irregular data recovery more complex to achieve.

### **56.2 Embedded Characteristics**

- Fuse bits partitioned into two areas:
  - Reserved area
  - 544-bit user area
- Program and read the fuse states by software
- Automatic check of programmed fuses
- Detection of irregular alteration of the fuse states in reserved area during startup and report
- Live detection of irregular alteration of all the fuse states and report
- Part of fuse states maskable for reading

## 56.3 Block Diagram

Figure 56-1. SFC Block Diagram

## 56.4 Functional Description

### 56.4.1 Accessing the SFC

Setting the write-once FUSE bit in the SFR\_SECURE register disables access to the Secure Fuse Controller (SFC).

### 56.4.2 Fuse Partitioning

The fuses are split into a user area of 544 bits and a reserved area.

The reserved area is typically used to store calibration bits for analog cells such as oscillators, configuration settings, chip identifiers, etc. The user area fuses are programmed later on by the user.

### 56.4.3 Fuse Integrity Checking

The SFC automatically reads the fuses values at start-up and stores them in 32-bit registers in order to make them accessible by software. At this time, the SFC checks the integrity of the fuse states in the reserved area.

If an inconsistency is detected, the CHECK error flag (named ACE for the reserved area) in the Status Register (SFC\_SR) is set to '1' and can trigger an interrupt. This flag is automatically cleared at '0', when the Status Register (SFC\_SR) is read.

### 56.4.4 Fuse Integrity Live Checking

The SFC automatically checks the integrity of all fuse states at every time after the start-up is finished. This ensures that the fuses states cannot be changed without notice.

If an inconsistency is detected, the LCHECK error flag in the Status Register (SFC\_SR) is set to '1' and can trigger an interrupt. This flag is automatically cleared at '0', when the Status Register (SFC\_SR) is read.

### 56.4.5 Fuse Access

#### 56.4.5.1 Fuse Reading

The fuse states are automatically latched at core start-up and are available for reading in the Data Registers (SFC\_DRx).

The fuse states of bits 0 to 31 are available in the Data Register 0 (SFC\_DR0), the fuse states of bits 32 to 63 are available in the Data Register 1 (SFC\_DR1) and so on.

When fuse programming is performed, the fuse states are automatically updated in the Data Registers (SFC\_DRx).

#### 56.4.5.2 Fuse Programming

All the fuses can be written by software.

The sequence of instructions to program fuses is the following:

1. Write the key code 0xFB in the Key Register (SFC\_KR).
2. Write the word to program in the corresponding Data Register (SFC\_DRx).  
For example, if fuses 0 to 31 must be programmed, Data Register 0 (SFC\_DR0) must be written. If fuses 32 to 61 must be programmed, Data Register 1 (SFC\_DR1) must be written. Only the data bits set to level '1' are programmed.
3. Wait for flag PGMC to rise in the Status Register (SFC\_SR) by polling or interrupt.
4. Check the value of flag PGMF: if it is set to 1, it means that the programming procedure failed. After programming, the fuses are read back in the corresponding SFC\_DRx.

#### 56.4.5.3 Fuse Masking

It is possible to mask a fuse array. Once the fuse masking is enabled, the data registers from SFC\_DR0 to SFC\_DR7 are read at a value of '0', regardless of the fuse state (the registers that are masked depend on the SFC hardware customizing).

To activate fuse masking, the MSK bit of the SFC Mode Register (SFC\_MR) must be written to level '1'. The MSK bit is set-only. Only a hardware reset can disable fuse masking.

The MSK bit has no effect on the programming of masked fuses.

### 56.4.6 Fuse Functions

The "Fuse Box Controller" section defines the fuse bits that can be used as general purpose bits when standard boot is used.

If secure boot is used, refer to the device "Secure Boot Strategy" application note included in the Secure Package.

### 56.5 Register Summary

| Offset              | Name     | Bit Pos. |             |  |        |  |  |      |      |  |
|---------------------|----------|----------|-------------|--|--------|--|--|------|------|--|
| 0x00                | SFC_KR   | 7:0      | KEY[7:0]    |  |        |  |  |      |      |  |

### 56.5.1 SFC Key Register

**Name:** SFC\_KR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

**Bits 7:0 – KEY[7:0] Key Code**

This field must be written with the correct key code (0xFB) prior to any write in a Data Register (SFC\_DRx) in order to enable the fuse programming. For each write of SFC\_DRx, this field must be written immediately before.

### 56.5.2 SFC Mode Register

**Name:** SFC\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 4 – SASEL Sense Amplifier Selection

| Value | Description                              |
|-------|--|
| 0     | Comparator type sense amplifier selected |
| 1     | Latch type sense amplifier selected      |

#### Bit 0 – MSK Mask Data Registers

The MSK bit is set-only. Only a hardware reset can disable fuse masking.

| Value | Description   |
|-------|---|
| 0     | No effect   |
| 1     | The data registers from SFC_DR0 to SFC_DR7 are always read at 0x00000000. |

### 56.5.3 SFC Interrupt Enable Register

**Name:** SFC\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt

|        |    |    |    |        |    |    |     |      |      |
|--------|----|----|----|--------|----|----|-----|------|------|
| Bit    | 31 | 30 | 29 | 28     | 27 | 26 | 25  | 24   |      |
|        |    |    |    |        |    |    |     |      |      |
| Access |    |    |    |        |    |    |     |      |      |
| Reset  |    |    |    |        |    |    |     |      |      |
|        |    |    |    |        |    |    |     |      |      |
| Bit    | 23 | 22 | 21 | 20     | 19 | 18 | 17  | 16   |      |
|        |    |    |    |        |    |    | ACE |      |      |
| Access |    |    |    |        |    |    | W   |      |      |
| Reset  |    |    |    |        |    |    | –   |      |      |
|        |    |    |    |        |    |    |     |      |      |
| Bit    | 15 | 14 | 13 | 12     | 11 | 10 | 9   | 8    |      |
|        |    |    |    |        |    |    |     |      |      |
| Access |    |    |    |        |    |    |     |      |      |
| Reset  |    |    |    |        |    |    |     |      |      |
|        |    |    |    |        |    |    |     |      |      |

#### Bits 31:0 – DATA[31:0] Fuse Data

| Value | Description  |
|-------|--|
| READ  | Reports the state of the corresponding fuses.  |
| WRITE | The data to be programmed in the corresponding fuses. Only bits with a value of '1' are programmed. Writing this register automatically triggers a programming sequence of the corresponding fuses. Note that a write to the Key Register (SFC_KR) with the correct key code must always precede any write to SFC_DRx. |

## 57. Integrity Check Monitor (ICM)

### 57.1 Description

The Integrity Check Monitor (ICM) is a DMA controller that performs hash calculation over multiple memory regions through the use of transfer descriptors located in memory (ICM Descriptor Area). The Hash function is based on the Secure Hash Algorithm (SHA). The ICM integrates two modes of operation. The first one is used to hash a list of memory regions and save the digests to memory (ICM Hash Area). The second mode is an active monitoring of the memory. In that mode, the hash function is evaluated and compared to the digest located at a predefined memory address (ICM Hash Area). If a mismatch occurs, an interrupt is raised. See the figure below for an example of four-region monitoring. Hash and Descriptor areas are located in Memory instance i2, and the four regions are split in memory instances i0 and i1.

**Figure 57-1. Four-region Monitoring Example**

The ICM SHA engine is compliant with the American FIPS (Federal Information Processing Standard) Publication 180-2 specification.

The following terms are concise definitions of the ICM concepts used throughout this document:

- Region—a partition of instruction or data memory space
- Region Descriptor—a data structure stored in memory, defining region attributes
- Region Attributes—region start address, region size, region SHA engine processing mode, Write Back or Compare function mode
- Context Registers—a set of ICM non-memory-mapped, internal registers which are automatically loaded, containing the attributes of the region being processed
- Main List—a list of region descriptors. Each element associates the start address of a region with a set of attributes.
- Secondary List—a linked list defined on a per region basis that describes the memory layout of the region (when the region is non-contiguous)

- Hash Area—predefined memory space where the region hash results (digest) are stored

## **57.2 Embedded Characteristics**

- DMA AHB Master Interface
- Supports Monitoring of up to 4 Non-Contiguous Memory Regions
- Supports Block Gathering Using Linked Lists
- Supports Secure Hash Algorithm (SHA1, SHA224, SHA256)
- Compliant with FIPS Publication 180-2
- Configurable Processing Period:
  - When SHA1 algorithm is processed, the runtime period is either 85 or 209 clock cycles.
  - When SHA256 or SHA224 algorithm is processed, the runtime period is either 72 or 194 clock cycles.
- Programmable Bus Burden

## 57.3 Block Diagram

Figure 57-2. Integrity Check Monitor Block Diagram

## 57.4 Product Dependencies

### 57.4.1 Power Management

The peripheral clock is not continuously provided to the ICM. The programmer must first enable the ICM clock in the Power Management Controller (PMC) before using the ICM.

### 57.4.2 Interrupt Sources

The ICM interface has an interrupt line connected to the Interrupt Controller.

Handling the ICM interrupt requires programming the interrupt controller before configuring the ICM.

## 57.5 Functional Description

### 57.5.1 Overview

The Integrity Check Monitor (ICM) is a DMA controller that performs SHA-based memory hashing over memory regions. As shown in figure [Integrity Check Monitor Block Diagram](#), it integrates a DMA interface, a Monitoring Finite State Machine (FSM), an integrity scheduler, a set of context registers, a SHA engine, an interface for configuration and status registers.

The ICM integrates a Secure Hash Algorithm engine (SHA). This engine requires a message padded according to FIPS180-2 specification when used as a SHA calculation unit only. Otherwise, if the ICM is used as integrated check for memory content, the padding is not mandatory. The SHA module produces an N-bit message digest each time a block is read and a processing period ends. N is 160 for SHA1, 224 for SHA224, 256 for SHA256.

When the ICM module is enabled, it sequentially retrieves a circular list of region descriptors from the memory (Main List described in figure [ICM Region Descriptor and Hash Areas](#)). Up to four regions may be monitored. Each region descriptor is composed of four words indicating the layout of the memory region (see figure [Region Descriptor](#)). It also contains the hashing engine configuration on a per-region basis. As soon as the descriptor is loaded from the memory and context registers are updated with the data structure, the hashing operation starts. A programmable number of blocks (see TRSIZE field of the ICM\_RCTRL structure member) is transferred from the memory to the SHA engine. When the desired number of blocks have been transferred, the digest is either moved to memory (Write Back function) or compared with a digest reference located in the system memory (Compare function). If a digest mismatch occurs, an interrupt is triggered if unmasked. The ICM module passes through the region descriptor list until the end of the list marked by an end of list marker (WRAP or EOM bit in ICM\_RCFG structure member set to one). To continuously monitor the list of regions, the WRAP bit must be set to one in the last data structure and EOM must be cleared.

**Figure 57-3. ICM Region Descriptor and Hash Areas**

Each region descriptor supports gathering of data through the use of the Secondary List. Unlike the Main List, the Secondary List cannot modify the configuration attributes of the region. When the end of the Secondary List has been encountered, the ICM returns to the Main List. Memory integrity monitoring can be considered as a background service and the mandatory bandwidth shall be very limited. In order to limit the ICM memory bandwidth, use ICM\_CFG.BBC to control the ICM memory load.

**Figure 57-4. Region Descriptor**

The figure below shows an example of the mandatory ICM settings required to monitor three memory data blocks of the system memory (defined as two regions) with one region being not contiguous (two separate areas) and one contiguous memory area. For each region, the SHA algorithm may be independently selected (different for each region). The wrap allows continuous monitoring.

**Figure 57-5. Example: Monitoring of 3 Memory Data Blocks (Defined as 2 Regions)**

### 57.5.2 ICM Region Descriptor Structure

The ICM Region Descriptor Area is a contiguous area of system memory that the controller and the processor can access. When the ICM is activated, the controller performs a descriptor fetch operation at  $*(ICM\_DSCR)$  address. If the Main List contains more than one descriptor (i.e., more than one region is to be monitored), the fetch address is  $*(ICM\_DSCR) + (RID \ll 4)$  where RID is the region identifier.

**Table 57-1. Region Descriptor Structure (Main List)**

| Offset                       | Structure Member         | Name      |
|------------------------------|--------------------------|-----------|
| $ICM\_DSCR+0x000+RID*(0x10)$ | ICM Region Start Address | ICM_RADDR |
| $ICM\_DSCR+0x004+RID*(0x10)$ | ICM Region Configuration | ICM_RCFG  |
| $ICM\_DSCR+0x008+RID*(0x10)$ | ICM Region Control       | ICM_RCTRL |
| $ICM\_DSCR+0x00C+RID*(0x10)$ | ICM Region Next Address  | ICM_RNEXT |

### 57.5.2.1 ICM Region Start Address Structure Member

**Name:** ICM\_RADDR

**Property:** Read/Write

Register offset is calculated as  $ICM\_DSCR+0x000+RID*(0x10)$ .

#### Bits 14:12 – ALGO[2:0] SHA Algorithm

Values which are not listed in the table must be considered as “reserved”.

| Value | Name   | Description                |
|-------|--------|----------------------------|
| 0     | SHA1   | SHA1 algorithm processed   |
| 1     | SHA256 | SHA256 algorithm processed |

#### Bit 10 – PROCDLY Processing Delay

When SHA1 algorithm is processed, the runtime period is either 85 or 209 clock cycles.

When SHA256 algorithm is processed, the runtime period is either 72 or 194 clock cycles.

| Value | Name     | Description                                 |
|-------|----------|---|
| 0     | SHORTEST | SHA processing runtime is the shortest one. |
| 1     | LONGEST  | SHA processing runtime is the longest one.  |

#### Bit 9 – SUIEN Monitoring Status Updated Condition Interrupt (Default Enabled)

| Value | Name | Description  |
|-------|------|--|
| 0     |      | The ICM_ISR.RSU[i] flag is set when the corresponding descriptor is loaded from memory to ICM. |
| 1     |      | The ICM_ISR.RSU[i] flag remains cleared even if the setting condition is met.                  |

#### Bit 8 – ECIEN End Bit Condition Interrupt (Default Enabled)

# SAMA5D2 Series

## Integrity Check Monitor (ICM)

| Value | Name | Description   |
|-------|------|---|
| 0     |      | The ICM_ISR.REC[i] flag is set when the descriptor with the EOM bit set is processed. |
| 1     |      | The ICM_ISR.REC[i] flag remains cleared even if the setting condition is met.         |

**Bit 7 – WCIEN** Wrap Condition Interrupt Disable (Default Enabled)

| Value | Name | Description   |
|-------|------|---|
| 0     |      | The ICM_ISR.RWC[i] flag is set when the WRAP bit is set in a descriptor of the main list. |
| 1     |      | ICM_ISR.RWC[i] flag remains cleared even if the setting condition is met.                 |

**Bit 6 – BEIEN** Bus Error Interrupt Disable (Default Enabled)

| Value | Name | Description  |
|-------|------|--|
| 0     |      | The flag is set when an error is reported on the system bus by the bus matrix. |
| 1     |      | The flag remains cleared even if the setting condition is met.                 |

**Bit 5 – DMIEN** Digest Mismatch Interrupt Disable (Default Enabled)

| Value | Name | Description  |
|-------|------|--|
| 0     |      | The ICM_ISR.RBE[i] flag is set when the hash value just calculated from the processed region differs from expected hash value. |
| 1     |      | The ICM_ISR.RBE[i] flag remains cleared even if the setting condition is met.  |

**Bit 4 – RHIEEN** Region Hash Completed Interrupt Disable (Default Enabled)

| Value | Name | Description  |
|-------|------|--|
| 0     |      | The ICM_ISR.RHC[i] flag is set when the field NEXT = 0 in a descriptor of the main or second list. |
| 1     |      | The ICM_ISR.RHC[i] flag remains cleared even if the setting condition is met.                      |

**Bit 2 – EOM** End Of Monitoring

| Value | Name | Description  |
|-------|------|--|
| 0     |      | The current descriptor does not terminate the monitoring.                  |
| 1     |      | The current descriptor terminates the Main List. WRAP value has no effect. |

**Bit 1 – WRAP** Wrap Command

| Value | Name | Description  |
|-------|------|--|
| 0     |      | The next region descriptor address loaded is the current region identifier descriptor address incremented by 0x10. |
| 1     |      | The next region descriptor address loaded is ICM_DSCR.   |

**Bit 0 – CDWBN** Compare Digest or Write Back Digest

| Value | Name | Description   |
|-------|------|---|
| 0     |      | The digest is written to the Hash area.                             |
| 1     |      | The digest value is compared to the digest stored in the Hash area. |

### 57.5.2.3 ICM Region Control Structure Member

**Name:** ICM\_RCTRL  
**Property:** Read/Write

Register offset is calculated as  $ICM\_DSCR + 0x008 + RID * (0x10)$ .

**Bits 15:0 – TRSIZE[15:0]** Transfer Size for the Current Chunk of Data

.....continued

| Memory Address | Address Offset / Byte Lane |             |             |             |             |             |            |           |
|----------------|----------------------------|-------------|-------------|-------------|-------------|-------------|------------|-----------|
|                | 0x7 / 63:56                | 0x6 / 55:48 | 0x5 / 47:40 | 0x4 / 39:32 | 0x3 / 31:24 | 0x2 / 23:16 | 0x1 / 15:8 | 0x0 / 7:0 |

| 0x078          | 18                         | 00          | 00          | 00          | 00          | 00          | 00         | 00        |

### 57.5.4 Using ICM as SHA Engine

The ICM can be configured to only calculate a SHA1, SHA224, SHA256 digest value.

#### 57.5.4.1 Settings for Simple SHA Calculation

The start address of the system memory containing the data to hash must be configured in the transfer descriptor of the DMA embedded in the ICM.

The transfer descriptor is a system memory area integer multiple of 4 x 32-bit words and the start address of the descriptor must be configured in ICM\_DSCR (the start address must be aligned on 64-bytes; six LSB must be cleared). If the data to hash is already padded according to SHA standards, only a single descriptor is required, and ICM\_RCFG.EOM must be written to 1. If the data to hash does not contain a padding area, it is possible to define the padding area in another system memory location, the ICM can be configured to automatically jump from a memory area to another one by configuring the descriptor register ICM\_RNEXT with a value that differs from 0. Configuring ICM\_RNEXT.NEXT with the start address of the padding area forces the ICM to concatenate both areas, thus providing the SHA result from the start address of the hash area configured in ICM\_HASH.

Whether the system memory is configured as a single or multiple data block area, ICM\_RCFG.CDWBN and ICM\_RCFG.WRAP must be cleared. The bits WBDIS, EOMDIS, SLBDIS must be cleared in ICM\_CFG.

ICM\_RCTRL.RHIEN and ICM\_RCTRL.ECIEN must be written to 1. The flag RHC[i], i being the region index, is set (if RHIEN is set) when the hash result is available at address defined in ICM\_HASH. The flag REC[i], i being the region index, is set (if ECIEN is set) when the hash result is available at the address defined in ICM\_HASH.

An interrupt is generated if the bit RHC[i] is written to 1 in the ICM\_IER (if RHC[i] is set in ICM\_RCTRL of region i) or if the bit REC[i] is written to 1 in the ICM\_IER (if REC[i] is set in ICM\_RCTRL of region i).

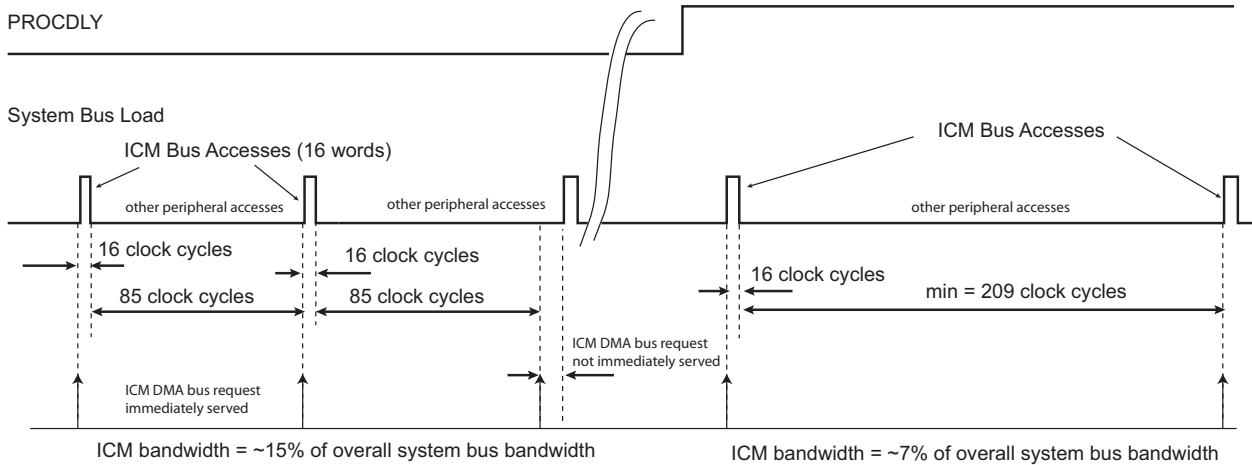

#### 57.5.4.2 Processing Period

The ICM engine has a core (SHA) inherent processing period that may result, depending on the application, in a significant bandwidth usage at system bus level. In some applications, it may be important to keep as much bandwidth as possible for the other peripherals (e.g. CPU, DMA). The ICM SHA engine processing period can be configured to reduce the bandwidth required by writing ICM\_RCFG.PROCDLY=1.

In SHA1 mode, the shortest processing period is 85 clock cycles + 2 clock cycles for start command synchronization (ICM\_RCFG.PROCDLY=0). The longest period is 209 clock cycles + 2 clock cycles when ICM\_RCFG.PROCDLY=1 (see the figure below).

In SHA256 or SHA224 mode, the shortest processing period is 72 clock cycles + 2 clock cycles for start command synchronization. The longest period is 194 clock cycles + 2 clock cycles.

**Figure 57-6. Bandwidth Usage in SHA1 Mode**

### 57.5.5 ICM Automatic Monitoring Mode

ICM\_CFG.ASCD is used to activate the ICM Automatic Monitoring mode. When ICM\_CFG.ASCD is set and bits CDWBN and EOM in ICM.RCFG equal 0, the ICM performs the following actions:

1. The ICM passes through the Main List once to calculate the message digest of the monitored area.
2. When WRAP = 1 in ICM\_RCFG, the ICM begins monitoring. CDWBN in ICM\_RCFG is now automatically set and EOM is cleared. These bits have no effect during the monitoring period that ends when EOM is set.

**57.5.6 Programming the ICM**

**Table 57-6. Region Attributes**

| Transfer Type |  | Main List | ICM_RCFG |      |     | ICM_RNEXT   | Comments   |
|---------------|--|-----------|----------|------|-----|---|--|
|               |  |           | CDWBN    | WRAP | EOM | NEXT  |  |
| Single Region | Contiguous list of blocks<br>Digest written to memory<br>Monitoring disabled     | 1 item    | 0        | 0    | 1   | 0   | The Main List contains only one descriptor. The Secondary List is empty for that descriptor. The digest is computed and saved to memory. |
|               | Non-contiguous list of blocks<br>Digest written to memory<br>Monitoring disabled | 1 item    | 0        | 0    | 1   | Secondary List address of the current region identifier | The Main List contains only one descriptor. The Secondary List describes the layout of the non-contiguous region.                        |
|               | Contiguous list of blocks<br>Digest comparison enabled<br>Monitoring enabled     | 1 item    | 1        | 1    | 0   | 0   | When the hash computation is terminated, the digest is compared with the one saved in memory.  |

.....continued

| Transfer Type    |  | Main List          | ICM_RCFG |                             |                             | ICM_RNEXT              | Comments   |
|------------------|--|--------------------|----------|-----------------------------|-----------------------------|------------------------|--|
|                  |  |                    | CDWBN    | WRAP                        | EOM                         | NEXT                   |  |
| Multiple Regions | Contiguous list of blocks Digest written to memory Monitoring disabled           | More than one item | 0        | 0                           | 1 for the last, 0 otherwise | 0                      | ICM passes through the list once.  |
|                  | Contiguous list of blocks Digest comparison is enabled Monitoring is enabled     | More than one item | 1        | 1 for the last, 0 otherwise | 0                           | 0                      | ICM performs active monitoring of the regions. If a mismatch occurs, an interrupt is raised. |
|                  | Non-contiguous list of blocks Digest is written to memory Monitoring is disabled | More than one item | 0        | 0                           | 1                           | Secondary List address | ICM performs hashing and saves digests to the Hash area.                                     |
|                  | Non-contiguous list of blocks Digest comparison is enabled Monitoring is enabled | More than one item | 1        | 1                           | 0                           | Secondary List address | ICM performs data gathering on a per region basis.   |

### 57.5.7 Security Features

When an undefined register access occurs, the URAD bit in the Interrupt Status Register (ICM\_ISR) is set if unmasked. Its source is then reported in the Undefined Access Status Register (ICM\_UASR). Only the first undefined register access is available through the ICM\_UASR.URAT field.

Several kinds of unspecified register accesses can occur:

- Unspecified structure member set to one detected when the descriptor is loaded
- Configuration register (ICM\_CFG) modified during active monitoring
- Descriptor register (ICM\_DSCR) modified during active monitoring
- Hash register (ICM\_HASH) modified during active monitoring
- Write-only register read access

The URAD bit and the URAT field can only be reset by writing a 1 to the ICM\_CTRL.SWRST bit.

# SAMA5D2 Series

## Integrity Check Monitor (ICM)

### 57.6 Register Summary

| Offset              | Name     | Bit Pos. |             |  |        |               |          |         |        |
|---------------------|----------|----------|-------------|--|--------|---------------|----------|---------|--------|

#### Bits 15:13 – UALGO[2:0] User SHA Algorithm

| Value | Name   | Description                |
|-------|--------|----------------------------|
| 0     | SHA1   | SHA1 algorithm processed   |
| 1     | SHA256 | SHA256 algorithm processed |
| 4     | SHA224 | SHA224 algorithm processed |

#### Bit 12 – UIHASH User Initial Hash Value

| Value | Description  |
|-------|--|
| 0     | The secure hash standard provides the initial hash value.  |
| 1     | The initial hash value is programmable. Field UALGO provides the SHA algorithm. The ALGO field of the ICM_RCFG structure member has no effect. |

#### Bit 9 – DUALBUFF Dual Input Buffer

| Value | Description   |
|-------|---|
| 0     | Dual Input Buffer mode is disabled.   |
| 1     | Dual Input Buffer mode is enabled (better performances, higher bandwidth required on system bus). |

#### Bit 8 – ASCD Automatic Switch To Compare Digest

# SAMA5D2 Series

## Integrity Check Monitor (ICM)

| Value | Description  |
|-------|--|
| 0     | Automatic monitoring mode is disabled.   |
| 1     | The ICM passes through the Main List once to calculate the message digest of the monitored area. When WRAP = 1 in ICM_RCFG, the ICM begins monitoring. |

### Bits 7:4 – BBC[3:0] Bus Burden Control

This field is used to control the burden of the ICM system bus. The number of system clock cycles between the end of the current processing and the next block transfer is set to  $2^{BBC}$ . Up to 32,768 cycles can be inserted.

### Bit 2 – SLBDIS Secondary List Branching Disable

| Value | Description  |
|-------|--|
| 0     | Branching to the Secondary List is permitted.  |
| 1     | Branching to the Secondary List is forbidden. The NEXT field of the ICM_RNEXT structure member has no effect and is always considered as zero. |

### Bit 1 – EOMDIS End of Monitoring Disable

| Value | Description   |
|-------|---|
| 0     | End of Monitoring is permitted.   |
| 1     | End of Monitoring is forbidden. The EOM bit of the ICM_RCFG structure member has no effect. |

### Bit 0 – WBDIS Write Back Disable

When ASCD is set, WBDIS has no effect.

| Value | Description   |
|-------|---|
| 0     | Write Back operations are permitted.  |
| 1     | Write Back operations are forbidden. Context register CDWBN bit is internally set to one and cannot be modified by a linked list element. ICM_RCFG.CDWBN has no effect. |

### 57.6.2 ICM Control Register

**Name:** ICM\_CTRL  
**Offset:** 0x04  
**Reset:** –  
**Property:** Write-only

|        |             |    |    |    |            |       |         |        |
|--------|-------------|----|----|----|------------|-------|---------|--------|
| Bit    | 31          | 30 | 29 | 28 | 27         | 26    | 25      | 24     |
|        |             |    |    |    |            |       |         |        |
| Access |             |    |    |    |            |       |         |        |
| Reset  |             |    |    |    |            |       |         |        |
|        |             |    |    |    |            |       |         |        |
| Bit    | 23          | 22 | 21 | 20 | 19         | 18    | 17      | 16     |
|        |             |    |    |    |            |       |         |        |
| Access |             |    |    |    |            |       |         |        |
| Reset  |             |    |    |    |            |       |         |        |
|        |             |    |    |    |            |       |         |        |
| Bit    | 15          | 14 | 13 | 12 | 11         | 10    | 9       | 8      |
|        | RMEN[3:0]   |    |    |    | RMDIS[3:0] |       |         |        |
| Access | W           | W  | W  | W  | W          | W     | W       | W      |
| Reset  | 0           | 0  | 0  | –  | 0          | 0     | 0       | –      |
|        |             |    |    |    |            |       |         |        |
| Bit    | 7           | 6  | 5  | 4  | 3          | 2     | 1       | 0      |
|        | REHASH[3:0] |    |    |    |            | SWRST | DISABLE | ENABLE |
| Access | W           | W  | W  | W  |            | W     | W       | W      |
| Reset  | 0           | 0  | 0  | –  |            | –     | –       | –      |

**Bits 15:12 – RMEN[3:0]** Region Monitoring Enable  
Monitoring is activated by default.

| Value | Description  |
|-------|--|
| 0     | No effect  |
| 1     | When bit RMEN[i] is set to one, the monitoring of region with identifier i is activated. |

**Bits 11:8 – RMDIS[3:0]** Region Monitoring Disable

| Value | Description  |
|-------|--|
| 0     | No effect  |
| 1     | When bit RMDIS[i] is set to one, the monitoring of region with identifier i is disabled. |

**Bits 7:4 – REHASH[3:0]** Recompute Internal Hash

| Value | Description  |
|-------|--|
| 0     | No effect  |
| 1     | When REHASH[i] is set to one, Region i digest is re-computed. This bit is only available when region monitoring is disabled. |

**Bit 2 – SWRST** Software Reset

# SAMA5D2 Series

## Integrity Check Monitor (ICM)

---

---

| Value | Description     |
|-------|-----------------|
| 0     | No effect       |
| 1     | Resets the ICM. |

### Bit 1 – DISABLE ICM Disable Register

| Value | Description  |
|-------|--|
| 0     | No effect  |
| 1     | The ICM is disabled. If a region is active, this region is terminated. |

### Bit 0 – ENABLE ICM Enable

| Value | Description                            |
|-------|--|
| 0     | No effect                              |
| 1     | When set to one, the ICM is activated. |

### 57.6.3 ICM Status Register

**Name:** ICM\_SR  
**Offset:** 0x08  
**Reset:** –  
**Property:** Read-only

|        |                         |    |    |    |               |    |    |        |
|--------|-------------------------|----|----|----|---------------|----|----|--------|
| Bit    | 31                      | 30 | 29 | 28 | 27            | 26 | 25 | 24     |
|        | [Greyed out bits 31-24] |    |    |    |               |    |    |        |
| Access |                         |    |    |    |               |    |    |        |
| Reset  |                         |    |    |    |               |    |    |        |
| Bit    | 23                      | 22 | 21 | 20 | 19            | 18 | 17 | 16     |
|        | [Greyed out bits 23-16] |    |    |    |               |    |    |        |
| Access |                         |    |    |    |               |    |    |        |
| Reset  |                         |    |    |    |               |    |    |        |
| Bit    | 15                      | 14 | 13 | 12 | 11            | 10 | 9  | 8      |
|        | RMDIS[3:0]              |    |    |    | RAWRMDIS[3:0] |    |    |        |
| Access | R                       | R  | R  | R  | R             | R  | R  | R      |
| Reset  | 0                       | 0  | 0  | –  | 0             | 0  | 0  | –      |
| Bit    | 7                       | 6  | 5  | 4  | 3             | 2  | 1  | 0      |
|        | [Greyed out bits 7-1]   |    |    |    |               |    |    | ENABLE |
| Access |                         |    |    |    |               |    |    | R      |
| Reset  |                         |    |    |    |               |    |    | –      |

#### Bits 15:12 – RMDIS[3:0] Region Monitoring Disabled Status

| Value | Description  |
|-------|--|
| 0     | Region i is being monitored (occurs after integrity check value has been calculated and written to Hash area). |
| 1     | Region i monitoring is not being monitored.  |

#### Bits 11:8 – RAWRMDIS[3:0] Region Monitoring Disabled Raw Status

| Value | Description  |
|-------|--|
| 0     | Region i monitoring has been activated by writing a 1 in RMEN[i] of ICM_CTRL.    |
| 1     | Region i monitoring has been deactivated by writing a 1 in RMDIS[i] of ICM_CTRL. |

#### Bit 0 – ENABLE ICM Enable Register

| Value | Description       |
|-------|-------------------|
| 0     | ICM is disabled.  |
| 1     | ICM is activated. |

### 57.6.4 ICM Interrupt Enable Register

**Name:** ICM\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

|        |          |    |    |    |          |    |    |      |
|--------|----------|----|----|----|----------|----|----|------|
| Bit    | 31       | 30 | 29 | 28 | 27       | 26 | 25 | 24   |
|        |          |    |    |    |          |    |    | URAD |
| Access |          |    |    |    |          |    |    | W    |
| Reset  |          |    |    |    |          |    |    | –    |
|        |          |    |    |    |          |    |    |      |
| Bit    | 23       | 22 | 21 | 20 | 19       | 18 | 17 | 16   |
|        | RSU[3:0] |    |    |    | REC[3:0] |    |    |      |
| Access | W        | W  | W  | W  | W        | W  | W  | W    |
| Reset  | 0        | 0  | 0  | –  | 0        | 0  | 0  | –    |
|        |          |    |    |    |          |    |    |      |
| Bit    | 15       | 14 | 13 | 12 | 11       | 10 | 9  | 8    |
|        | RWC[3:0] |    |    |    | RBE[3:0] |    |    |      |
| Access | W        | W  | W  | W  | W        | W  | W  | W    |
| Reset  | 0        | 0  | 0  | –  | 0        | 0  | 0  | –    |
|        |          |    |    |    |          |    |    |      |
| Bit    | 7        | 6  | 5  | 4  | 3        | 2  | 1  | 0    |
|        | RDM[3:0] |    |    |    | RHC[3:0] |    |    |      |
| Access | W        | W  | W  | W  | W        | W  | W  | W    |
| Reset  | 0        | 0  | 0  | –  | 0        | 0  | 0  | –    |

#### Bit 24 – URAD Undefined Register Access Detection Interrupt Enable

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | The Undefined Register Access interrupt is enabled. |

#### Bits 23:20 – RSU[3:0] Region Status Updated Interrupt Disable

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | When RSU[i] is set to one, the region i Status Updated interrupt is enabled. |

#### Bits 19:16 – REC[3:0] Region End bit Condition Detected Interrupt Enable

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | When REC[i] is set to one, the region i End bit Condition interrupt is enabled. |

#### Bits 15:12 – RWC[3:0] Region Wrap Condition detected Interrupt Enable

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | When RWC[i] is set to one, the Region i Wrap Condition interrupt is enabled. |

**Bits 11:8 – RBE[3:0]** Region Bus Error Interrupt Enable

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | When RBE[i] is set to one, the Region i Bus Error interrupt is enabled. |

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch Interrupt Enable

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | When RDM[i] is set to one, the Region i Digest Mismatch interrupt is enabled. |

**Bits 3:0 – RHC[3:0]** Region Hash Completed Interrupt Enable

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | When RHC[i] is set to one, the Region i Hash Completed interrupt is enabled. |

### 57.6.5 ICM Interrupt Disable Register

**Name:** ICM\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

|        |          |    |    |    |          |    |    |      |  |
|--------|----------|----|----|----|----------|----|----|------|--|
| Bit    | 31       | 30 | 29 | 28 | 27       | 26 | 25 | 24   |  |
|        |          |    |    |    |          |    |    | URAD |  |
| Access |          |    |    |    |          |    |    | W    |  |
| Reset  |          |    |    |    |          |    |    | –    |  |
|        |          |    |    |    |          |    |    |      |  |
| Bit    | 23       | 22 | 21 | 20 | 19       | 18 | 17 | 16   |  |
|        | RSU[3:0] |    |    |    | REC[3:0] |    |    |      |  |
| Access | W        | W  | W  | W  | W        | W  | W  | W    |  |
| Reset  | 0        | 0  | 0  | –  | 0        | 0  | 0  | –    |  |
|        |          |    |    |    |          |    |    |      |  |
| Bit    | 15       | 14 | 13 | 12 | 11       | 10 | 9  | 8    |  |
|        | RWC[3:0] |    |    |    | RBE[3:0] |    |    |      |  |
| Access | W        | W  | W  | W  | W        | W  | W  | W    |  |
| Reset  | 0        | 0  | 0  | –  | 0        | 0  | 0  | –    |  |
|        |          |    |    |    |          |    |    |      |  |
| Bit    | 7        | 6  | 5  | 4  | 3        | 2  | 1  | 0    |  |
|        | RDM[3:0] |    |    |    | RHC[3:0] |    |    |      |  |
| Access | W        | W  | W  | W  | W        | W  | W  | W    |  |
| Reset  | 0        | 0  | 0  | –  | 0        | 0  | 0  | –    |  |

**Bit 24 – URAD** Undefined Register Access Detection Interrupt Disable

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Undefined Register Access Detection interrupt is disabled. |

**Bits 23:20 – RSU[3:0]** Region Status Updated Interrupt Disable

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | When RSU[i] is set to one, the region i Status Updated interrupt is disabled. |

**Bits 19:16 – REC[3:0]** Region End bit Condition detected Interrupt Disable

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | When REC[i] is set to one, the region i End bit Condition interrupt is disabled. |

**Bits 15:12 – RWC[3:0]** Region Wrap Condition Detected Interrupt Disable

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | When RWC[i] is set to one, the Region i Wrap Condition interrupt is disabled. |

**Bits 11:8 – RBE[3:0]** Region Bus Error Interrupt Disable

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | When RBE[i] is set to one, the Region i Bus Error interrupt is disabled. |

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch Interrupt Disable

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | When RDM[i] is set to one, the Region i Digest Mismatch interrupt is disabled. |

**Bits 3:0 – RHC[3:0]** Region Hash Completed Interrupt Disable

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | When RHC[i] is set to one, the Region i Hash Completed interrupt is disabled. |

### 57.6.6 ICM Interrupt Mask Register

**Name:** ICM\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

|        |          |    |    |    |          |    |    |      |

**Bit 24 – URAD** Undefined Register Access Detection Interrupt Mask

| Value | Description           |
|-------|-----------------------|
| 0     | Interrupt is disabled |
| 1     | Interrupt is enabled. |

**Bits 23:20 – RSU[3:0]** Region Status Updated Interrupt Mask

| Value | Description   |
|-------|---|
| 0     | When RSU[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When RSU[i] is set to one, the interrupt is enabled for region i.   |

**Bits 19:16 – REC[3:0]** Region End Bit Condition Detected Interrupt Mask

| Value | Description   |
|-------|---|
| 0     | When REC[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When REC[i] is set to one, the interrupt is enabled for region i.   |

**Bits 15:12 – RWC[3:0]** Region Wrap Condition Detected Interrupt Mask

| Value | Description   |
|-------|---|
| 0     | When RWC[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When RWC[i] is set to one, the interrupt is enabled for region i.   |

**Bits 11:8 – RBE[3:0]** Region Bus Error Interrupt Mask

| Value | Description   |
|-------|---|
| 0     | When RBE[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When RBE[i] is set to one, the interrupt is enabled for region i.   |

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch Interrupt Mask

| Value | Description   |
|-------|---|
| 0     | When RDM[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When RDM[i] is set to one, the interrupt is enabled for region i.   |

**Bits 3:0 – RHC[3:0]** Region Hash Completed Interrupt Mask

| Value | Description   |
|-------|---|
| 0     | When RHC[i] is set to zero, the interrupt is disabled for region i. |
| 1     | When RHC[i] is set to one, the interrupt is enabled for region i.   |

### 57.6.7 ICM Interrupt Status Register

**Name:** ICM\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

|        |          |    |    |    |          |    |    |      |

| Reset  | 0        | 0  | 0  | 0  | 0        | 0  | 0  | 0    |
|        |          |    |    |    |          |    |    |      |
| Bit    | 7        | 6  | 5  | 4  | 3        | 2  | 1  | 0    |
|        | RDM[3:0] |    |    |    | RHC[3:0] |    |    |      |
| Access | R        | R  | R  | R  | R        | R  | R  | R    |
| Reset  | 0        | 0  | 0  | 0  | 0        | 0  | 0  | 0    |

**Bit 24 – URAD** Undefined Register Access Detection Status

The URAD bit is only reset by the SWRST bit in ICM\_CTRL.

The URAT field in ICM\_UASR indicates the unspecified access type.

| Value | Description  |
|-------|--|
| 0     | No undefined register access has been detected since the last SWRST.           |
| 1     | At least one undefined register access has been detected since the last SWRST. |

**Bits 23:20 – RSU[3:0]** Region Status Updated Detected

When RSU[i] is set, it indicates that a region status updated condition has been detected.

**Bits 19:16 – REC[3:0]** Region End Bit Condition Detected

When REC[i] is set, it indicates that an end bit condition has been detected.

**Bits 15:12 – RWC[3:0]** Region Wrap Condition Detected

When RWC[i] is set, it indicates that a wrap condition has been detected.

**Bits 11:8 – RBE[3:0]** Region Bus Error

When RBE[i] is set, it indicates that a bus error has been detected while hashing memory region i.

**Bits 7:4 – RDM[3:0]** Region Digest Mismatch

When RDM[i] is set, it indicates that there is a digest comparison mismatch between the hash value of the region with identifier i and the reference value located in the Hash Area.

**Bits 3:0 – RHC[3:0]** Region Hash Completed

When RHC[i] is set, it indicates that the ICM has completed the region with identifier i.

### 57.6.8 ICM Undefined Access Status Register

**Name:** ICM\_UASR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bits 2:0 – URAT[2:0] Undefined Register Access Trace

Only the first Undefined Register Access Trace is available through the URAT field.

The URAT field is only reset by the SWRST bit in the ICM\_CTRL register.

| Value | Name                 | Description   |
|-------|----------------------|---|
| 0     | UNSPEC_STRUCT_MEMBER | Unspecified structure member set to one detected when the descriptor is loaded. |
| 1     | ICM_CFG_MODIFIED     | ICM_CFG modified during active monitoring.                                      |
| 2     | ICM_DSCR_MODIFIED    | ICM_DSCR modified during active monitoring.                                     |
| 3     | ICM_HASH_MODIFIED    | ICM_HASH modified during active monitoring.                                     |
| 4     | READ_ACCESS          | Write-only register read access.  |

### 57.6.9 ICM Descriptor Area Start Address Register

**Name:** ICM\_DSCR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read/Write

|             |     |     |     |     |     |     |     |     |

|        |     | VAL[7:0]   |    |    |    |    |    |    |    |
| Access |     | W          | W  | W  | W  | W  | W  | W  | W  |
| Reset  |     | 0          | 0  | 0  | 0  | 0  | 0  | 0  | –  |

**Bits 31:0 – VAL[31:0]** Initial Hash Value

When ICM\_CFG.UIHASH is set, the Initial Hash Value is user-programmable.

To meet the desired standard, use the following example values.

For ICM\_UIHVAL0 field:

| Example    | Comment          |
|------------|------------------|
| 0x67452301 | SHA1 algorithm   |
| 0xC1059ED8 | SHA224 algorithm |
| 0x6A09E667 | SHA256 algorithm |

For ICM\_UIHVAL1 field:

| Example    | Comment          |
|------------|------------------|
| 0xEFCDAB89 | SHA1 algorithm   |
| 0x367CD507 | SHA224 algorithm |
| 0xBB67AE85 | SHA256 algorithm |

For ICM\_UIHVAL2 field:

# SAMA5D2 Series

## Integrity Check Monitor (ICM)

| Example    | Comment          |
|------------|------------------|
| 0x98BADCFE | SHA1 algorithm   |
| 0x3070DD17 | SHA224 algorithm |
| 0x3C6EF372 | SHA256 algorithm |

For ICM\_UIHVAL3 field:

| Example    | Comment          |
|------------|------------------|
| 0x10325476 | SHA1 algorithm   |
| 0xF70E5939 | SHA224 algorithm |
| 0xA54FF53A | SHA256 algorithm |

For ICM\_UIHVAL4 field:

| Example    | Comment          |
|------------|------------------|
| 0xC3D2E1F0 | SHA1 algorithm   |
| 0xFFC00B31 | SHA224 algorithm |
| 0x510E527F | SHA256 algorithm |

For ICM\_UIHVAL5 field:

| Example    | Comment          |
|------------|------------------|
| 0x68581511 | SHA224 algorithm |
| 0x9B05688C | SHA256 algorithm |

For ICM\_UIHVAL6 field:

| Example    | Comment          |
|------------|------------------|
| 0x64F98FA7 | SHA224 algorithm |
| 0x1F83D9AB | SHA256 algorithm |

For ICM\_UIHVAL7 field:

| Example    | Comment          |
|------------|------------------|
| 0xBEFA4FA4 | SHA224 algorithm |
| 0x5BE0CD19 | SHA256 algorithm |

Example of Initial Value for SHA-1 Algorithm

| Register Address  | Address Offset / Byte Lane |             |            |           |
|-------------------|----------------------------|-------------|------------|-----------|

## 58. Advanced Encryption Standard Bridge (AESB)

### 58.1 Description

The Advanced Encryption Standard Bridge (AESB) is intended to provide on-the-fly off-chip memory encryption/decryption compliant with the American *FIPS (Federal Information Processing Standard) Publication 197* specification.

The AESB supports three confidentiality modes of operation for symmetrical key block cipher algorithms (ECB, CBC and CTR), as specified in the *NIST Special Publication 800-38A Recommendation*.

The AESB key is loaded by the software.

The 128-bit AESB key is stored in the AESB Key register made of four 32-bit write-only AESB Key Word registers (AESB\_KEYWR0–3).

The 128-bit input data and initialization vector (for some modes) are each stored in four 32-bit registers (AESB\_IDATARx and AESB\_IVRx) which are all write-only.

As soon as the initialization vector, the input data and the key are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data will be ready to be read out on the four 32-bit output data registers (AESB\_ODATARx).

### 58.2 Embedded Characteristics

- On-The-Fly Off-Chip Memory Encryption/Decryption
- Compliant with FIPS Publication 197, Advanced Encryption Standard (AES)
- 128-bit Cryptographic Key
- On-The-Fly Encryption/Decryption
- 10 Clock Cycles Encryption/Decryption Inherent Processing Time
- Double Input Buffer Optimizes Runtime
- Support of the Three Standard Modes of Operation Specified in *NIST Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation - Methods and Techniques*:
  - Electronic Code Book (ECB)
  - Cipher Block Chaining (CBC) including CBC-MAC
  - Counter (CTR)
- Last Output Data Mode Allows Optimized Message Authentication Code (MAC) Generation

### 58.3 Product Dependencies

#### 58.3.1 Power Management

The AESB may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the AESB clock.

#### 58.3.2 Interrupt

The AESB interface has an interrupt line connected to the Interrupt Controller.

Handling the AESB interrupt requires programming the Interrupt Controller before configuring the AESB.

## 58.4 Functional Description

The Advanced Encryption Standard Bridge (AESB) specifies a FIPS-approved cryptographic algorithm that can be used to protect electronic data. The AESB algorithm is a symmetric block cipher that can encrypt (encipher) and decrypt (decipher) information.

Encryption converts data to an unintelligible form called ciphertext. Decrypting the ciphertext converts the data back into its original form, called plaintext. CIPHER in the AESB Mode register (AESB\_MR) allows selection between the encryption and the decryption processes.

The AESB is capable of using cryptographic keys of 128 bits to encrypt and decrypt data in blocks of 128 bits. This 128-bit key is defined in the Key registers (AESB\_KEYWRx).

The input to the encryption processes of the CBC mode includes, in addition to the plaintext, a 128-bit data block called the initialization vector (IV), which must be set in the Initialization Vector Registers (AESB\_IVRx). The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message. The Initialization Vector registers are also used by the CTR mode to set the counter value.

### 58.4.1 Operating Modes

The AESB supports the following modes of operation:

- ECB—Electronic Code Book
- CBC—Cipher Block Chaining
- CTR—Counter

The data pre-processing, post-processing and data chaining for the operating modes are performed automatically. Refer to *NIST Special Publication 800-38A Recommendation* for more complete information.

The modes are selected in AESB\_MR.OPMOD.

In CTR mode, the size of the block counter embedded in the module is 16 bits. Therefore, there is a rollover after processing 1 megabyte of data. If the file to be processed is greater than 1 megabyte, this file must be split into fragments of 1 megabyte or less for the first fragment if the initial value of the counter is greater than 0. Prior to loading the first fragment into AESB\_IDATARx registers, the AESB\_IVRx registers must be cleared. For any fragment, after the transfer is completed and prior to transferring the next fragment, AESB\_IVR0 must be programmed so that the fragment number (0 for the first fragment, 1 for the second one, and so on) is written in the 16 MSB of AESB\_IVR0.

If the initial value of the counter is greater than 0 and the data buffer size to be processed is greater than 1 megabyte, the size of the first fragment to be processed must be 1 megabyte minus 16x(initial value) to prevent a rollover of the internal 1-bit counter.

### 58.4.2 Double Input Buffer

The input data register can be double-buffered to reduce the runtime of large files.

This mode allows writing a new message block when the previous message block is being processed.

AESB\_MR.DUALBUFF must be set to '1' to access the double buffer.

### 58.4.3 Start Modes

AESB\_MR.SMOD allows selection of the Encryption or Decryption Start mode.

### 58.4.3.1 Manual Mode

The sequence is as follows:

1. Write AESB\_MR with all required fields, including but not limited to SMOD and OPMOD.
2. Write the 128-bit key in the Key registers (AESB\_KEYWRx).
3. Write the initialization vector (or counter) in the Initialization Vector registers (AESB\_IVRx).  
**Note:** The Initialization Vector registers concern all modes except ECB.
4. Set DATRDY (Data Ready) in the AESB Interrupt Enable register (AESB\_IER) depending on whether an interrupt is required, or not, at the end of processing.
5. Write the data to be encrypted/decrypted in the authorized Input Data registers (see the table below).

**Table 58-1. Authorized Input Data Registers**

| Operating Mode | Input Data Registers to Write |
|----------------|-------------------------------|
| ECB            | All                           |
| CBC            | All                           |
| CTR            | All                           |

6. Set the START bit in the AESB Control register (AESB\_CR) to begin the encryption or decryption process.
7. When processing is complete, DATRDY in the AESB Interrupt Status register (AESB\_ISR) rises. If an interrupt has been enabled by setting AESB\_IER.DATRDY, the interrupt line of the AESB is activated.
8. When the software reads one of the Output Data registers (AESB\_ODATARx), AESB\_ISR.DATRDY is automatically cleared.

### 58.4.3.2 Auto Mode

In Auto mode, as soon as the correct number of Input Data registers is written, processing starts automatically without any action in AESB\_CR.

### 58.4.4 Last Output Data Mode

Last Output Data mode is used to generate cryptographic checksums on data (MAC) by means of a cipher block chaining encryption algorithm (e.g., the CBC-MAC algorithm).

After each end of encryption/decryption, the output data are available on the output data registers for Manual and Auto modes.

AESB\_MR.LOD allows retrieval of only the last data of several encryption/decryption processes.

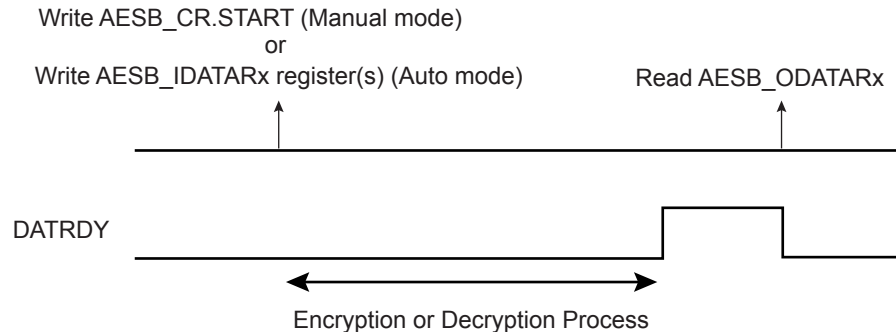

Those data are only available on the Output Data registers (AESB\_ODATARx).

### 58.4.5 Manual and Auto Modes

#### 58.4.5.1 If AESB\_MR.LOD = 0

AESB\_ISR.DATRDY is cleared when at least one of the Output Data registers is read (see the figure below).

**Figure 58-1. Manual and Auto Modes with AESB\_MR.LOD = 0**

If the user does not want to read the output data registers between each encryption/decryption, AESB\_ISR.DATRDY will not be cleared. If AESB\_ISR.DATRDY is not cleared, the user cannot know the end of the following encryptions/decryptions.

### 58.4.5.2 If AESB\_MR.LOD = 1

AESB\_ISR.DATRDY is cleared when at least one Input Data register is written, so before the start of a new transfer (see the figure below). No more Output Data register reads are necessary between consecutive encryptions/decryptions.

**Figure 58-2. Manual and Auto Modes with AESB\_MR.LOD = 1**

## 58.4.6 Automatic Bridge Mode

### 58.4.6.1 Description

The Automatic Bridge mode, when the AESB block is connected between the system bus and a DDR port and the QSPI, provides automatic encryption/decryption without any action on the part of the user. For Automatic Bridge mode, AESB\_MR.OPMOD must be configured to 0x4 (see [AESB Mode Register](#)). If AESB\_MR.AAHB is set and AESB\_MR.OPMOD = 0x4, there is no compliance with the standard CTR mode of operation.

In case of write transfer, this mode automatically encrypts the data before writing it to the final slave destination. In case of read transfer, this mode automatically decrypts the data read from the target slave before putting it on the system bus.

Therefore, this mode does not work if the automatically encrypted data is moved at another address outside of the AESB. This means that for a given data, the encrypted value is not the same if written at different addresses.

### 58.4.6.2 Configuration

The Automatic Bridge mode can be enabled by setting AESB\_MR.AAHB.

The IV (Initialization Vector) field of the AESB Initialization Vector register x (AESB\_IVRx) can be used to add a nonce in the encryption process in order to bring even more security (ignored if not filled). In this

case, any value encrypted with a given nonce can only be decrypted with this nonce. If another nonce is set for the AESB\_IVRx.IV, any value encrypted with the previous nonce can no longer be decrypted (see [AESB Initialization Vector Register x](#)).

Dual buffer usage (AESB\_MR.DUALBUFF='1') is recommended for improved performance.

### 58.4.7 Security Features

#### 58.4.7.1 Unspecified Register Access Detection

When an unspecified register access occurs, AESB\_ISR.URAD rises. Its source is then reported in AESB\_ISR.URAT. Only the last unspecified register access is available through the URAT field.

Several kinds of unspecified register accesses can occur:

- Input Data register written during the data processing when SMOD = IDATAR0\_START
- Output Data register read during data processing
- Mode register written during data processing
- Output Data register read during sub-keys generation
- Mode register written during sub-keys generation
- Write-only register read access

URAD and URAT can only be reset by AESB\_CR.SWRST.

### 58.5.1 AESB Control Register

**Name:** AESB\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

#### Bit 8 – SWRST Software Reset

| Value | Description  |
|-------|--|
| 0     | No effect  |
| 1     | Resets the AESB. A software triggered hardware reset of the AESB interface is performed. |

#### Bit 0 – START Start Processing

| Value | Description                                 |
|-------|---|
| 0     | No effect                                   |
| 1     | Starts manual encryption/decryption process |

#### Bits 23:20 – CKEY[3:0] Key

| Value | Name   | Description   |
|-------|--------|---|
| 0xE   | PASSWD | Must be written with 0xE the first time that AESB_MR is programmed. For subsequent programming of the AESB_MR, any value can be written, including that of 0xE.<br><br>Always reads as 0. |

#### Bit 15 – LOD Last Output Data Mode

| Value | Description   |
|-------|---|
| 0     | No effect.<br><br>After each end of encryption/decryption, the output data will be available either on the output data registers (Manual and Auto modes).<br><br>In Manual and Auto modes, AESB_ISR.DATRDY is cleared when at least one of the Output Data registers is read. |
| 1     | AESB_ISR.DATRDY is cleared when at least one of the Input Data registers is written.<br><br>No additional Output Data register reads are necessary between consecutive encryptions/decryptions (see <a href="#">Last Output Data Mode</a> ).                                  |

# SAMA5D2 Series

## Advanced Encryption Standard Bridge (AESB)

### Bits 14:12 – OPMOD[2:0] Operating Mode

Values which are not listed in the table must be considered as “reserved”.

For CBC-MAC operating mode, configure OPMOD to 0x1 (CBC) and set LOD to 1.

If OPMOD is set to 4 and AAHB = 1, there is no compliance with the standard CTR mode of operation.

| Value | Name | Description                            |
|-------|------|--|
| 0     | ECB  | Electronic Code Book mode              |
| 1     | CBC  | Cipher Block Chaining mode             |
| 2     | –    | Reserved                               |
| 3     | –    | Reserved                               |
| 4     | CTR  | Counter mode (16-bit internal counter) |

### Bits 9:8 – SMOD[1:0] Start Mode

| Value | Name          | Description                        |
|-------|---------------|------------------------------------|
| 0     | MANUAL_START  | Manual mode                        |
| 1     | AUTO_START    | Auto mode                          |
| 2     | IDATAR0_START | AESB_IDATAR0 access only Auto mode |

### Bits 7:4 – PROCDLY[3:0] Processing Delay

Processing Time = 12 × (PROCDLY + 1)

The Processing Time represents the number of clock cycles that the AESB needs in order to perform one encryption/decryption .

**Note:** The best performance is achieved with PROCDLY = 0.

### Bit 3 – DUALBUFF Dual Input Buffer

| Value | Name     | Description   |
|-------|----------|---|
| 0     | INACTIVE | AESB_IDATARx cannot be written during processing of previous block.   |
| 1     | ACTIVE   | AESB_IDATARx can be written during processing of previous block when SMOD = 2. It speeds up the overall runtime of large files. |

### Bit 2 – AAHB Automatic Bridge Mode

| Value | Description                     |
|-------|---------------------------------|
| 0     | Automatic Bridge mode disabled. |
| 1     | Automatic Bridge mode enabled.  |

### Bit 0 – CIPHER Processing Mode

| Value | Description    |
|-------|----------------|
| 0     | Decrypts data. |
| 1     | Encrypts data. |

### 58.5.3 AESB Interrupt Enable Register

**Name:** AESB\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

### 58.5.6 AESB Interrupt Status Register

**Name:** AESB\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 15:12 – URAT[3:0]** Unspecified Register Access

Only the last Unspecified Register Access Type is available through URAT.

URAT field is reset only by AESB\_CR.SWRST.

| Value | Name              | Description   |
|-------|-------------------|---|
| 0x0   | IDR_WR_PROCESSING | Input Data register written during the data processing when SMOD = 0x2 mode |
| 0x1   | ODR_RD_PROCESSING | Output Data register read during the data processing                        |
| 0x2   | MR_WR_PROCESSING  | Mode register written during the data processing                            |
| 0x3   | ODR_RD_SUBKGEN    | Output Data register read during the sub-keys generation                    |
| 0x4   | MR_WR_SUBKGEN     | Mode register written during the sub-keys generation                        |
| 0x5   | WOR_RD_ACCESS     | Write-only register read access   |

**Bit 8 – URAD** Unspecified Register Access Detection Status

URAD is reset only by AESB\_CR.SWRST.

| Value | Description  |
|-------|--|
| 0     | No unspecified register access has been detected since the last SWRST.           |
| 1     | At least one unspecified register access has been detected since the last SWRST. |

# SAMA5D2 Series

## Advanced Encryption Standard Bridge (AESB)

---

---

### Bit 0 – DATRDY Data Ready

DATRDY is cleared when a Manual encryption/decryption occurs (AESB\_CR.START) or when a software triggered hardware reset of the AESB interface is performed (AESB\_CR.SWRST).

AESB\_MR.LOD = 0: In Manual and Auto modes, DATRDY can also be cleared when at least one of the Output Data registers is read.

AESB\_MR.LOD = 1: In Manual and Auto modes, DATRDY can also be cleared when at least one of the Input Data registers is written.

| Value | Description                                    |
|-------|--|
| 0     | Output data not valid.                         |
| 1     | Encryption or decryption process is completed. |

#### Bits 31:0 – KEYW[31:0] Key Word

The four 32-bit Key Word registers set the 128-bit cryptographic key used for encryption/decryption.

AESB\_KEYWR0 corresponds to the first word of the key, AESB\_KEYWR3 to the last one.

These registers are write-only to prevent the key from being read by another application.

#### Bits 31:0 – IDATA[31:0] Input Data Word

The four 32-bit Input Data registers set the 128-bit data block used for encryption/decryption.

AESB\_IDATAR0 corresponds to the first word of the data to be encrypted/decrypted, AESB\_IDATAR3 to the last one.

These registers are write-only to prevent the input data from being read by another application.

# SAMA5D2 Series

## Advanced Encryption Standard Bridge (AESB)

### 58.5.9 AESB Output Data Register x

**Name:** AESB\_ODATARx  
**Offset:** 0x00 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

|        |     |              |    |    |    |    |    |    |    |
|--------|-----|--------------|----|----|----|----|----|----|----|

| Reset  |     | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |     |           |    |    |    |    |    |    |    |
|        | Bit | 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        |     | IV[15:8]  |    |    |    |    |    |    |    |
| Access |     | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  |     | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |     |           |    |    |    |    |    |    |    |
|        | Bit | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        |     | IV[7:0]   |    |    |    |    |    |    |    |
| Access |     | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  |     | 0         | 0  | 0  | 0  | 0  | 0  | 0  | –  |

**Bits 31:0 – IV[31:0] Initialization Vector**

The four 32-bit Initialization Vector registers set the 128-bit Initialization Vector data block that is used by some modes of operation as an additional initial input.

AESB\_IVR0 corresponds to the first word of the Initialization Vector, AESB\_IVR3 to the last one.

These registers are write-only to prevent the Initialization Vector from being read by another application.

For CBC mode, the IV input value corresponds to the initialization vector.

For CTR mode, the IV input value corresponds to the initial counter value.

**Note:** These registers are not used in ECB mode and must not be written. For Automatic Bridge dedicated mode, the IV input value corresponds to the initial nonce.

## 59. Advanced Encryption Standard (AES)

### 59.1 Description

The Advanced Encryption Standard (AES) is compliant with the American FIPS (Federal Information Processing Standard) Publication 197 specification.

The AES supports the following confidentiality modes of operation for symmetrical key block cipher algorithms: ECB, CBC, OFB, CFB, CTR, and XTS), as specified in the NIST Special Publication 800-38A Recommendation, as well as Galois/Counter Mode (GCM) as specified in the NIST Special Publication 800-38D Recommendation. It is compatible with all these modes via DMA Controller channels, minimizing processor intervention for large buffer transfers.

The AES key is loaded by the software.

The 128-bit/192-bit/256-bit AES key is stored in the AES Key Register made of four/six/eight 32-bit write-only AES Key Word registers (AES\_KEYWR0–7).

The 128-bit input data and initialization vector (for some modes) are each stored in four 32-bit write-only AES Input Data registers (AES\_IDATAR0–3) and AES Initialization Vector registers (AES\_IVR0–3).

As soon as the initialization vector, the input data and the key are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data are ready to be read out on the four 32-bit AES Output Data registers (AES\_ODATAR0–3) or through the DMA channels.

### 59.2 Embedded Characteristics

- Compliant with FIPS Publication 197, Advanced Encryption Standard (AES)
- 128-bit/192-bit/256-bit Cryptographic Key
- 10/12/14 Clock Cycles Encryption/Decryption Inherent Processing Time with a 128-bit/192-bit/256-bit Cryptographic Key
- Double Input Buffer Optimizes Runtime
- Automatic Padding supported for IPSEC and SSL standards
- IPSEC and SSL Protocol Layers Improved Performances (Tightly coupled with SHA)
- Support of the Modes of Operation Specified in the NIST Special Publication 800-38A and NIST Special Publication 800-38D:
  - Electronic Codebook (ECB)
  - Cipher Block Chaining (CBC) including CBC-MAC
  - Cipher Feedback (CFB)
  - Output Feedback (OFB)
  - Counter (CTR)
  - Galois/Counter Mode (GCM)
  - XEX-Based Tweaked-Codebook Mode (XTS)
- 8, 16, 32, 64 and 128-bit Data Sizes Possible in CFB Mode
- Last Output Data Mode Allows Optimized Message Authentication Code (MAC) Generation
- Connection to DMA Optimizes Data Transfers for all Operating Modes

## 59.3 Product Dependencies

### 59.3.1 Power Management

The AES is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the AES clock.

### 59.3.2 Interrupt Sources

The AES interface has an interrupt line connected to the Interrupt Controller.

Handling the AES interrupt requires programming the Interrupt Controller before configuring the AES.

## 59.4 Functional Description

The Advanced Encryption Standard (AES) specifies a FIPS-approved cryptographic algorithm that can be used to protect electronic data. The AES algorithm is a symmetric block cipher that can encrypt (encipher) and decrypt (decipher) information.

Encryption converts data to an unintelligible form called ciphertext. Decrypting the ciphertext converts the data back into its original form, called plaintext. The CIPHER bit in the AES Mode register (AES\_MR) allows selection between the encryption and the decryption processes.

The AES is capable of using cryptographic keys of 128/192/256 bits to encrypt and decrypt data in blocks of 128 bits. This 128-bit/192-bit/256-bit key is defined in the user interface AES\_KEYWRx register.

The input to the encryption processes of the CBC, CFB, and OFB modes includes, in addition to the plaintext, a 128-bit data block called the initialization vector (IV), which must be set in AES\_IVRx. The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message. AES\_IVRx are also used by the CTR mode to set the counter value.

### 59.4.1 AES Register Endianness

In ARM processor-based products, the system bus and processors manipulate data in little-endian form. The AES interface requires little-endian format words. However, in accordance with the protocol of the FIPS 197 specification, data is collected, processed and stored by the AES algorithm in big-endian form.

The following example illustrates how to configure the AES:

If the first 64 bits of a message (according to FIPS 197, i.e., big-endian format) to be processed is 0xcafedeca\_01234567, then AES\_IDATAR0 and AES\_IDATAR1 registers must be written with the following pattern:

- AES\_IDATAR0 = 0xcadefeca
- AES\_IDATAR1 = 0x67452301

### 59.4.2 Operating Modes

The AES supports the following modes of operation:

- ECB: Electronic Codebook
- CBC: Cipher Block Chaining
  - CBC-MAC: Useful for CMAC hardware acceleration
- OFB: Output Feedback
- CFB: Cipher Feedback

- CFB8 (CFB where the length of the data segment is 8 bits)
- CFB16 (CFB where the length of the data segment is 16 bits)
- CFB32 (CFB where the length of the data segment is 32 bits)
- CFB64 (CFB where the length of the data segment is 64 bits)
- CFB128 (CFB where the length of the data segment is 128 bits)
- CTR: Counter
- GCM: Galois/Counter Mode
- XTS: XEX-based Tweaked-codebook Mode

The data preprocessing, data postprocessing and data chaining for the concerned modes are performed automatically. Refer to the NIST Special Publication 800-38A and NIST Special Publication 800-38D for more complete information.

Mode selection is done by configuring the OPMOD field in AES\_MR.

In CFB mode, five data sizes are possible (8, 16, 32, 64 or 128 bits), configurable by means of AES\_MR.CFBS.

In CTR mode, the size of the block counter embedded in the module is 16 bits. Therefore, there is a rollover after processing 1 Mbyte of data. If the file to be processed is greater than 1 Mbyte, this file must be split into fragments of 1 Mbyte or less for the first fragment if the initial value of the counter is greater than 0. Prior to loading the first fragment into AES\_IDATARx, AES\_IVRx must be fully programmed with the initial counter value. For any fragment, after the transfer is completed and prior to transferring the next fragment, AES\_IVRx must be programmed with the appropriate counter value.

### **59.4.3 Last Output Data Mode (CBC-MAC)**

This mode is used to generate cryptographic checksums on data (MAC) by means of cipher block chaining encryption algorithm (CBC-MAC algorithm for example).

The CMAC algorithm is a variant of CBC-MAC with post-processing requiring one-block encryption in ECB mode. Thus CBC-MAC is useful to accelerate CMAC.

After each end of encryption/decryption, the output data are available either on AES\_ODATARx for Manual and Auto mode, or at the address specified in the receive buffer pointer for DMA mode (see the table "Last Output Data Mode Behavior versus Start Modes").

AES\_MR.LOD allows retrieval of only the last data of several encryption/decryption processes.

Therefore, there is no need to define a read buffer in DMA mode.

This data are only available in AES\_ODATARx.

#### **59.4.3.1 Manual and Auto Modes**

##### **59.4.3.1.1 If AES\_MR.LOD = 0**

The DATRDY flag is cleared when at least one AES\_ODATARx is read (see the figure below).

**Figure 59-1. Manual and Auto Modes with AES\_MR.LOD = 0**

If the user does not want to read AES\_ODATARx between each encryption/decryption, the DATRDY flag will not be cleared. If the DATRDY flag is not cleared, the user cannot know the end of the following encryptions/decryptions.

### 59.4.3.1.2 If AES\_MR.LOD = 1

This mode is optimized to process AES CBC-MAC operating mode.

The DATRDY flag is cleared when at least one AES\_IDATAR is written (see the figure below). No additional AES\_ODATAR reads are necessary between consecutive encryptions/decryptions.

**Figure 59-2. Manual and Auto Modes with AES\_MR.LOD = 1**

### 59.4.3.2 DMA Mode

#### 59.4.3.2.1 If AES\_MR.LOD = 0

This mode may be used for all AES operating modes except CBC-MAC where AES\_MR.LOD = 1 mode is recommended.

The end of the encryption/decryption is indicated by the end of DMA transfer associated to AES\_ODATARx (see the figure below). Two DMA channels are required: one for writing message blocks to AES\_IDATARx and one to obtain the result from AES\_ODATARx.

**Figure 59-3. DMA Transfer with AES\_MR.LOD = 0**

### 59.4.3.2.2 If AES\_MR.LOD = 1

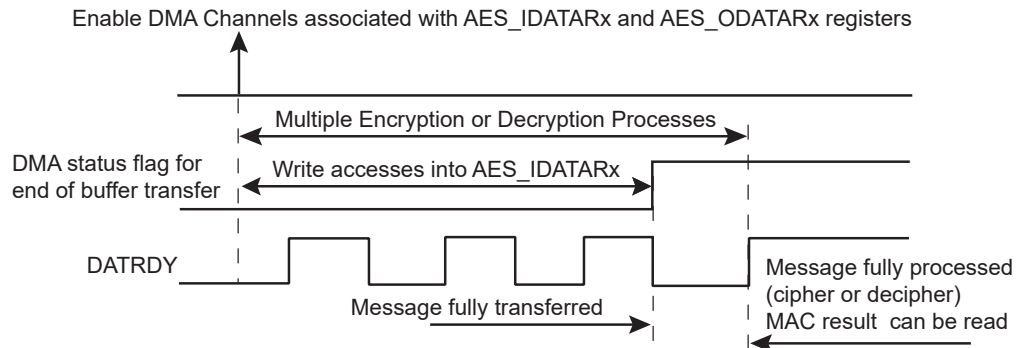

This mode is optimized to process AES CBC-MAC operating mode.

The user must first wait for the DMA buffer transfer complete flag, then for the flag DATRDY to rise to ensure that the encryption/decryption is completed (see the figure below).

The DMA receive channel must not be used. Prior to reading the CBC-MAC result, AES\_MR.SMOD must be written to '0'. To restart a CBC-MAC on a new buffer, AES\_MR.SMOD must be written to '2'.

The output data are only available on AES\_ODATARx.

**Figure 59-4. DMA Transfer with AES\_MR.LOD = 1**

The table below summarizes the different cases.

**Table 59-1. Last Output Data Mode Behavior versus Start Modes**

| Sequence                                      | Manual and Auto Modes                |   | DMA Transfer   |   |
|---|--------------------------------------|---|--|---|
|   | AES_MR.LOD = 0                       | AES_MR.LOD = 1                          | AES_MR.LOD = 0   | AES_MR.LOD = 1  |
| DATRDY Flag Clearing Condition <sup>(1)</sup> | At least one AES_ODATAR must be read | At least one AES_IDATAR must be written | Not used   | Managed by the DMA                                      |
| End of Encryption/Decryption Notification     | DATRDY                               | DATRDY                                  | 2 DMA Buffer transfer complete flags (channel m and channel n)     | DMA buffer transfer complete flag, then AES DATRDY flag |
| Encrypted/Decrypted Data Result Location      | In AES_ODATARx                       | In AES_ODATARx                          | At the address specified in the Channel Buffer Transfer Descriptor | In AES_ODATARx  |

**Note:**

- Depending on the mode, there are other ways of clearing the DATRDY flag. See [AES Interrupt Status Register](#).

**WARNING** In DMA mode, reading AES\_ODATARx before the last data transfer may lead to unpredictable results.

**59.4.4 Galois/Counter Mode (GCM)**

**59.4.4.1 Description**

GCM comprises the AES engine in CTR mode along with a universal hash function (GHASH engine) that is defined over a binary Galois field to produce a message authentication tag (the AES CTR engine and the GHASH engine are depicted in the figure below).

The GHASH engine processes data packets after the AES operation. GCM assures the confidentiality of data through the AES Counter mode of operation for encryption. Authenticity of the confidential data is assured through the GHASH engine. GCM can also provide assurance of data that is not encrypted. Refer to the NIST Special Publication 800-38D for more complete information.

GCM can be used with or without the DMA master. Messages may be processed as a single complete packet of data or they may be broken into multiple packets of data over time.

GCM processing is computed on 128-bit input data fields. There is no support for unaligned data. The AES key length can be whatever length is supported by the AES module.

The recommended programming procedure when using DMAPDC is described in the section [GCM Processing](#).

**Figure 59-5. GCM Block Diagram**

Note: 1. Optional

#### 59.4.4.2 Key Writing and Automatic Hash Subkey Calculation

Whenever a new key is written to the hardware, two automatic actions are processed:

- GCM Hash Subkey  $H$  generation—The GCM hash subkey ( $H$ ) is automatically generated. The GCM hash subkey generation must be complete before doing any other action. AES\_ISR.DATRDY indicates when the subkey generation is complete (with interrupt if configured). The GCM hash subkey calculation is processed with the formula  $H = \text{CIPHER}(\text{Key}, <128 \text{ bits to zero}>)$ . The generated GCM  $H$  value is then available in AES\_GCMHRx. If the application software requires a specific hash subkey, the automatically generated  $H$  value can be overwritten in AES\_GCMHRx. AES\_GCMHRx can be written after the end of the hash subkey generation (see AES\_ISR.DATRDY) and prior to starting the input data feed.
- AES\_GHASHRx Clear—AES\_GHASHRx are automatically cleared. If a hash initial value is needed for the GHASH, it must be written to AES\_GHASHRx
  - after a write to the AES Key Register, if any
  - before starting the input data feed

#### 59.4.4.3 GCM Processing

GCM processing is made up of three phases:

1. Processing the Additional Authenticated Data (AAD), hash computation only.
2. Processing the Ciphertext (C), hash computation + ciphering/deciphering.
3. Generating the Tag using length of AAD, length of C and  $J_0$  (refer to NIST documentation for details).

The Tag generation can be done either automatically, after the end of AAD/C processing if AES\_MR.GTAGEN is set, or manually using AES\_GHASHRx.GHASH (see subsections [Processing a Complete Message with Tag Generation](#) and [Manual GCM Tag Generation](#) for details).

##### 59.4.4.3.1 Processing a Complete Message with Tag Generation

Use this procedure only if  $J_0$  four LSB bytes  $\neq 0xFFFFFFFF$ .

**Note:** If  $J_0$  four LSB bytes =  $0xFFFFFFFF$  or if the value is unknown, use the procedure described in [Processing a Complete Message without Tag Generation](#) followed by the procedure in [Manual GCM Tag Generation](#).

**Figure 59-6. Full Message Alignment**

To process a complete message with Tag generation, the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '1'.
2. Set the AES Key Register and wait until AES\_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. See [Key Writing and Automatic Hash Subkey Calculation](#).
3. Calculate the  $J_0$  value as described in NIST documentation  $J_0 = \text{IV} \parallel 0^{31} \parallel 1$  when  $\text{len}(\text{IV}) = 96$  and  $J_0 = \text{GHASH}_H(\text{IV} \parallel 0^{s+64} \parallel [\text{len}(\text{IV})]64)$  if  $\text{len}(\text{IV}) \neq 96$ . See [Processing a Message with only AAD \(GHASHH\)](#) for  $J_0$  generation.
4. Set AES\_IVRx.IV with  $\text{inc32}(J_0)$  ( $J_0 + 1$  on 32 bits).
5. Configure AES\_AADLENR.AADLEN and AES\_CLENR.CLEN.

6. Fill AES\_IDATARx.IDATA with the message to process according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).
7. Wait for TAGRDY to be set (use interrupt if needed), then read AES\_TAGRx.TAG to obtain the authentication tag of the message.

#### 59.4.4.3.2 Processing a Complete Message without Tag Generation

Processing a message without generating the Tag can be used to customize the Tag generation, or to process a fragmented message. To manually generate the GCM Tag, see [Manual GCM Tag Generation](#).

To process a complete message without Tag generation, the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
2. Set the AES Key Register and wait until AES\_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).
3. Calculate the  $J_0$  value as described in NIST documentation  $J_0 = IV \parallel 0^{31} \parallel 1$  when  $\text{len}(IV) = 96$  and  $J_0 = \text{GHASH}_H(IV \parallel 0^{s+64} \parallel [\text{len}(IV)]64)$  if  $\text{len}(IV) \neq 96$ . See [Processing a Message with only AAD \(GHASHH\)](#) for  $J_0$  generation example when  $\text{len}(IV) \neq 96$ .
4. Set AES\_IVRx.IV with  $\text{inc32}(J_0)$  ( $J_0 + 1$  on 32 bits).
5. Configure AES\_AADLENR.AADLEN and AES\_CLENR.CLEN.
6. Fill AES\_IDATARx.IDATA with the message to process according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).
7. Make sure the last output data have been read if AES\_CLENR.CLEN  $\neq 0$  (or wait for DATRDY), then read AES\_GHASHRx.GHASH to obtain the hash value after the last processed data.

#### 59.4.4.3.3 Processing a Fragmented Message without Tag Generation

If needed, a message can be processed by fragments, in such case automatic GCM Tag generation is not supported.

To process a message by fragments, the sequence is as follows:

- First fragment:
  1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
  2. Set the AES Key Register and wait for AES\_ISR.DATRDY to be set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).
  3. Calculate the  $J_0$  value as described in NIST documentation  $J_0 = IV \parallel 0^{31} \parallel 1$  when  $\text{len}(IV) = 96$  and  $J_0 = \text{GHASH}_H(IV \parallel 0^{s+64} \parallel [\text{len}(IV)]64)$  if  $\text{len}(IV) \neq 96$ . See [Processing a Message with only AAD \(GHASHH\)](#) for  $J_0$  generation example when  $\text{len}(IV) \neq 96$ .
  4. Set AES\_IVRx.IV with  $\text{inc32}(J_0)$  ( $J_0 + 1$  on 32 bits).
  5. Configure AES\_AADLENR.AADLEN and AES\_CLENR.CLEN according to the length of the first fragment, or set the fields with the full message length (both configurations work).
  6. Fill AES\_IDATARx.IDATA with the first fragment of the message to process (aligned on 16-byte boundary) according to the SMOD configuration used. If Manual Mode or Auto Mode is used the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).

7. Make sure the last output data have been read if the fragment ends in C phase (or wait for DATRDY if the fragment ends in AAD phase), then read AES\_GHASHRx.GHASH to obtain the value of the hash after the last processed data and finally read AES\_CTR.CTR to obtain the value of the CTR encryption counter (not needed when the fragment ends in AAD phase).
- Next fragment (or last fragment):
1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
  2. Set the AES Key Register and wait until AES\_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).
  3. Set AES\_IVRx.IV as follows:
    - If the first block of the fragment is a block of Additional Authenticated data, set AES\_IVRx.IV with the  $J_0$  initial value
    - If the first block of the fragment is a block of Plaintext data, set AES\_IVRx.IV with a value constructed as follows: 'LSB96( $J_0$ ) || CTR' value, (96 bit LSB of  $J_0$  concatenated with saved CTR value from previous fragment).
  4. Configure AES\_AADLENR.AADLEN and AES\_CLENR.CLEN according to the length of the current fragment, or set the fields with the remaining message length, both configurations work.
  5. Fill AES\_GHASHRx.GHASH with the value stored after the previous fragment.
  6. Fill AES\_IDATARx.IDATA with the current fragment of the message to process (aligned on 16 byte boundary) according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).
  7. Make sure the last output data have been read if the fragment ends in C phase (or wait for DATRDY if the fragment ends in AAD phase), then read AES\_GHASHRx.GHASH to obtain the value of the hash after the last processed data and finally read AES\_CTR.CTR to obtain the value of the CTR encryption counter (not needed when the fragment ends in AAD phase).

**Note:** Step 1 and 2 are required only if the value of the concerned registers has been modified.

Once the last fragment has been processed, the GHASH value will allow manual generation of the GCM tag. See [Manual GCM Tag Generation](#).

#### 59.4.4.3.4 Manual GCM Tag Generation

This section describes the last steps of the GCM Tag generation.

The Manual GCM Tag Generation is used to complete the GCM Tag Generation when the message has been processed without Tag Generation.

**Note:** The Message Processing without Tag Generation must be finished before processing the Manual GCM Tag Generation.

To generate a GCM Tag manually, the sequence is as follows:

Processing  $S = \text{GHASH}_H(\text{AAD} \parallel 0v \parallel C \parallel 0u \parallel [\text{len}(\text{AAD})]64 \parallel [\text{len}(C)]64)$ :

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
2. Set the AES Key Register and wait for AES\_ISR.DATRDY to be set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).

3. Configure AES\_AADLENR.AADLEN to 0x10 (16 bytes) and AES\_CLENR.CLEN to '0'. This will allow running a single GHASH<sub>H</sub> on a 16-byte input data (see the figure below).
4. Fill AES\_GHASHRx.GHASH with the state of the GHASH field stored at the end of the message processing.
5. Fill AES\_IDATARx.IDATA according to the SMOD configuration used with 'len(AAD)64 || len(C)64' value as described in the NIST documentation and wait for DATRDY to be set; use interrupt if needed.
6. Read AES\_GHASHRx.GHASH to obtain the current value of the hash.

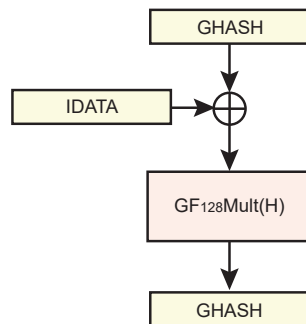

Processing  $T = \text{GCTRK}(J_0, S)$ :

1. Set AES\_MR.OPMOD to CTR.
2. Set AES\_IVRx.IV with ' $J_0$ ' value.
3. Fill AES\_IDATARx.IDATA with the GHASH value read at step 6 and wait for DATRDY to be set (use interrupt if needed).
4. Read AES\_ODATARx.ODATA to obtain the GCM Tag value.

**Note:** Step 4 is optional if the GHASH field is to be filled with value '0' (0 length packet for instance).

#### 59.4.4.3.5 Processing a Message with only AAD (GHASHH)

**Figure 59-7. Single GHASH<sub>H</sub> Block Diagram (AADLEN ≤ 0x10 and CLEN = 0)**

It is possible to process a message with only AAD setting the CLEN field to '0' in AES\_CLENR, this can be used for  $J_0$  generation when  $\text{len}(IV) \neq 96$  for instance.

Example: Processing  $J_0$  when  $\text{len}(IV) \neq 96$

To process  $J_0 = \text{GHASH}_H(IV \parallel 0^{s+64} \parallel [\text{len}(IV)]64)$ , the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
  1. Set the AES Key Register and wait until AES\_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).
  2. Configure AES\_AADLENR.AADLEN with ' $\text{len}(IV \parallel 0^{s+64} \parallel [\text{len}(IV)]64)$ ' in and AES\_CLENR.CLEN to '0'. This will allow running a GHASH<sub>H</sub> only.
  3. Fill AES\_IDATARx.IDATA with the message to process ( $IV \parallel 0^{s+64} \parallel [\text{len}(IV)]64$ ) according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when a GHASH<sub>H</sub> step is over (use interrupt if needed).
  4. Read AES\_GHASHRx.GHASH to obtain the  $J_0$  value.
 

Note: The GHASH value can be overwritten at any time by writing the value of AES\_GHASHRx.GHASH, used to perform a GHASH<sub>H</sub> with an initial value for GHASH (write GHASH field between step 3 and step 4 in this case).

### 59.4.4.3.6 Processing a Single GF128 Multiplication

The AES can also be used to process a single multiplication in the Galois field on 128 bits ( $GF_{128}$ ) using a single  $GHASH_H$  with custom  $H$  value (see the figure above).

To run a  $GF_{128}$  multiplication ( $A \times B$ ), the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
  1. Configure AES\_AADLENR.AADLEN with 0x10 (16 bytes) and AES\_CLENR.CLEN to '0'. This will allow running a single  $GHASH_H$ .
  2. Fill AES\_GCMHRx.H with B value.
  3. Fill AES\_IDATARx.IDATA with the A value according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when a  $GHASH_H$  computation is over (use interrupt if needed).
  4. Read AES\_GHASHRx.GHASH to obtain the result.

**Note:** AES\_GHASHRx.GHASH can be initialized with a value C between step 3 and step 4 to run a  $((A \text{ XOR } C) \times B)$   $GF_{128}$  multiplication.

### 59.4.5 XEX-based Tweaked-codebook Mode (XTS)

XTS mode comprises the AES engine with XOR on inputs and outputs. After each encryption/decryption, the value used for the XOR is multiplied by the first  $GF(2^{128})$  alpha primitive (0x2) and then used for the next encryption/decryption. The XTS mode uses two different keys and defines a Tweak Value (i) as additional input.

XTS processing is computed on 128-bit input data fields. There is no support for unaligned data (padding must be done manually if needed). The AES key length can be any length supported by the AES module.

**Figure 59-8. XTS Block Diagram**

#### 59.4.5.1 XTS Processing Procedure

XTS processing comprises two phases:

1. Generate encrypted tweak with Key2 (this step is only required for the first processing, further consecutive processing does not require this step).
2. Process the data giving encrypted tweak and first alpha primitive for the first encryption/decryption.

##### 59.4.5.1.1 Encrypted Tweak Generation

In the case of a new encryption/decryption, it is necessary to first encrypt the Tweak Value (i) with Key2. Here are the steps to follow to perform this step:

1. Set AES\_MR.OPMODE to ECB and AES\_MR.CIPHER to '1'.
2. Set the AES Key Register with Key2.
3. Fill AES\_IDATARx.IDATA with the Tweak value (i) according to the SMOD configuration used. If Manual mode or Auto mode is used, the DATRDY bit indicates when the data have been processed and can be read in AES\_ODATARx.

##### 59.4.5.1.2 Data Processing

To process data using XTS mode, follow the steps below:

1. Set AES\_MR.OPMODE to XTS.
2. Set the AES Key Register with Key1.
3. Only if the data to process is the first to be processed in the data unit, or if the data block to process is not consecutive to the previous processed data block in the same data unit, then two additional mandatory steps are required:
  - a. AES\_TWRx must be written with the encrypted Tweak Value (see [Encrypted Tweak Generation](#) for details) with bytes swapped as described in [AES Register Endianness](#).
  - b. Write AES\_ALPHARx with the alpha primitive corresponding to the block number in the data unit.
4. Fill AES\_IDATARx.IDATA with the data to process according to the SMOD configuration used. If Manual mode or Auto mode is used, the DATRDY bit indicates when the data have been processed and can be read in AES\_ODATARx. Repeat Step 4 as long as consecutive data blocks are processed in the same data unit.

#### 59.4.6 Double Input Buffer

AES\_IDATARx can be double-buffered to reduce the runtime of large files.

This mode allows a new message block to be written when the previous message block is being processed. This is only possible when DMA accesses are performed (AES\_MR.SMOD = 2).

AES\_MR.DUALBUFF must be set to '1' to access the double buffer.

#### 59.4.7 Start Modes

AES\_MR.SMOD allows selection of the encryption (or decryption) Start mode.

##### 59.4.7.1 Manual Mode

The sequence of actions is as follows:

1. Write AES\_MR with all required fields, including but not limited to SMOD and OPMOD.
2. Write the 128-bit/192-bit/256-bit AES key in AES\_KEYWRx.
3. Write the initialization vector (or counter) in AES\_IVRx.  
Note: AES\_IVRx concerns all modes except ECB.
4. Set the bit DATRDY (Data Ready) in the AES Interrupt Enable register (AES\_IER), depending on whether an interrupt is required or not at the end of processing.

5. Write the data to be encrypted/decrypted in the authorized AES\_IDATARx (see the table below).
6. Set the START bit in the AES Control register (AES\_CR) to begin the encryption or the decryption process.
7. When processing completes, the DATRDY flag in the AES Interrupt Status register (AES\_ISR) is raised. If an interrupt has been enabled by setting AES\_IER.DATRDY, the interrupt line of the AES is activated.
8. When software reads one of AES\_ODATARx, AES\_IER.DATRDY is automatically cleared.

**Table 59-2. Authorized Input Data Registers**

| Operating Mode | Input Data Registers to Write |
|----------------|-------------------------------|
| ECB            | All                           |
| CBC            | All                           |
| OFB            | All                           |
| 128-bit CFB    | All                           |
| 64-bit CFB     | AES_IDATAR0 and AES_IDATAR1   |
| 32-bit CFB     | AES_IDATAR0                   |
| 16-bit CFB     | AES_IDATAR0                   |
| 8-bit CFB      | AES_IDATAR0                   |
| CTR            | All                           |
| GCM            | All                           |
| XTS            | All                           |

**Note:**

1. In 64-bit CFB mode, writing to AES\_IDATAR2 and AES\_IDATAR3 is not allowed and may lead to errors in processing.
2. In 32, 16, and 8-bit CFB modes, writing to AES\_IDATAR1, AES\_IDATAR2 and AES\_IDATAR3 is not allowed and may lead to errors in processing.

### 59.4.7.2 Auto Mode

The Auto Mode is similar to the manual one, except that in this mode, as soon as the correct number of AES\_IDATARx is written, processing is automatically started without any action in AES\_CR.

### 59.4.7.3 DMA Mode

The DMA Controller can be used in association with the AES to perform an encryption/decryption of a buffer without any action by software during processing.

AES\_MR.SMOD must be configured to 2 and the DMA must be configured with non-incremental addresses.

For all operating modes except CBC-MAC (AES\_MR.LOD=1), 2 DMA channels must be programmed (transmit and receive). In CBC-MAC, only 1 transmit channel must be programmed.

The start address of any transfer descriptor must be configured with the address of AES\_IDATAR0.

The DMA chunk size configuration depends on the AES mode of operation and is listed in the table below.

When writing data to AES with a first DMA channel, data are first fetched from a memory buffer (source data). It is recommended to configure the size of source data to “words” even for CFB modes. On the contrary, the destination data size depends on the mode of operation. When reading data from the AES with the second DMA channel, the source data is the data read from AES and data destination is the memory buffer. In this case, the source data size depends on the AES mode of operation and is listed in the table below.

**Table 59-3. DMA Data Transfer Type for the Different Operating Modes**

| Operating Mode | Chunk Size | Destination/Source Data Transfer Type |
|----------------|------------|---------------------------------------|
| ECB            | 4          | Word                                  |
| CBC            | 4          | Word                                  |
| OFB            | 4          | Word                                  |
| CFB 128-bit    | 4          | Word                                  |
| CFB 64-bit     | 1          | Word                                  |
| CFB 32-bit     | 1          | Word                                  |
| CFB 16-bit     | 1          | Half-word                             |
| CFB 8-bit      | 1          | Byte                                  |
| CTR            | 4          | Word                                  |
| GCM            | 4          | Word                                  |
| XTS            | 4          | Word                                  |

### 59.4.8 Automatic Padding Mode

When Automatic Padding mode is configured, the message is automatically padded after the last block is written. Depending on the size of the message, either a padding is performed after the last part of the message and padding blocks are added, or only padding blocks are added.

IPSEC and SSL padding standards are both supported.

The auto padding feature only supports CBC and CTR modes.

**Note:** When automatic padding is enabled and AES\_MR.SMOD=2, AES\_MR.DUALBUFF must be cleared.

#### 59.4.8.1 IPSEC Padding

Automatic Padding is enabled by writing a ‘1’ to the APEN bit in the AES Extended Mode register (AES\_EMR).IPSEC padding mode is selected by writing a ‘0’ to AES\_EMR.APM.

**Figure 59-9. IPSEC Padding**

Each byte of the padding area contains incremental integer values.

The “Pad Length” in bytes is configured in AES\_EMR.PADLEN and the “Next Header” value is configured in AES\_EMR.NHEAD. AES\_EMR.PADLEN must be configured with the length of the padding section, not including the length of the “Pad Length” and “Next Header” sections.

The BCNT field in the AES Byte Counter register (AES\_BCNT) defines the length, in bytes, of the message to process. It must be configured before writing the first data in AES\_IDATARx and the remaining bytes to process can be read at any time (BCNT value is decremented after each AES\_IDATARx access).

AES\_BCNT.BCNT and AES\_EMR.PADLEN must be configured so that the sum of the length of the message (Payload Data) and of the length of the Padding, Pad Length (1 byte) and Next Header (1 byte) sections is a multiple of the AES block size (128 bits).

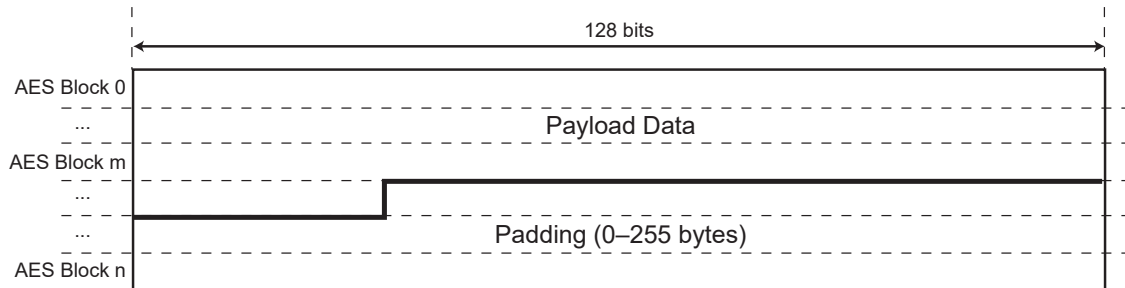

To process an IPSEC message using auto-padding, the sequence is as follows:

1. Set AES\_MR.OPMOD to either CBC or CTR mode.
2. Set AES\_EMR.APEN to ‘1’, AES\_EMR.APM to ‘0’, AES\_EMR.PADLEN to the desired padding length in byte and AES\_EMR.NHEAD to the desired Next Header field value.
3. Configure AES\_BCNT.BCNT with the whole message length, without padding, in byte.
4. Set the AES Key Register.
5. Set AES\_IVRx.IV if needed.
6. Fill AES\_IDATARx.IDATA with the message to process according to the SMOD configuration used. On the last data block, write only what is necessary (e.g., write only AES\_IDATAR0 if last block size is  $\leq 32$  bits).
7. Wait for the DATRDY flag to be raised, meaning auto-padding completion and last block processing.

#### 59.4.8.2 SSL Padding

Auto Padding is enabled by writing a ‘1’ to AES\_EMR.APEN and SSL padding mode is selected by writing a ‘1’ to AES\_EMR.APM.

**Figure 59-10. SSL Padding**

Each byte of the padding area contains the padding length.

The padding length is configured in AES\_EMR.PADLEN.

AES\_BCNT.BCNT defines the length, in bytes, of the message to process. It must be configured before writing the first data in AES\_IDATARx and the remaining bytes to process can be read at anytime (BCNT value is decremented after each AES\_IDATARx access).

AES\_BCNT.BCNT and AES\_EMR.PADLEN must be configured so that the length of the message plus the length of the padding section is a multiple of the AES block size (128 bits).

To process a complete SSL message, the sequence is as follows:

1. Set AES\_MR.OPMOD to either CBC or CTR mode.
2. Set AES\_EMR.APEN to '1', AES\_EMR.APM to '1', AES\_EMR.PADLEN to the desired padding length in bytes.
3. Set AES\_BCNT.BCNT with the whole message length, without padding, in bytes.
4. Set the AES Key Register.
5. Set AES\_IVRx.IV if needed.
6. Fill AES\_IDATARx.IDATA with the message to process according to the SMOD configuration used. On the last data block write only what is necessary (e.g., write only AES\_IDATAR0 if last block size is  $\leq 32$  bits).
7. Wait for the DATRDY flag to be raised, meaning auto-padding completion and last block processing.

#### 59.4.8.3 Flags

AES\_ISR.EOPAD rises as soon as the automatic padding phase is over, meaning that all the extra padding blocks have been processed. Reading AES\_ISR clears this flag.

AES\_ISR.PLENERR indicates an error in the frame configuration, meaning that the whole message length including padding does not respect the standard selected. AES\_ISR.PLENERR rises at the end of the frame in case of wrong message length and is cleared reading AES\_ISR.

In IPSEC/SSL standard message length including padding must be a multiple of the AES block size when CBC mode is used and multiple of 32-bit if CTR mode is used.

#### 59.4.9 Secure Protocol Layers Improved Performances

Secure protocol layers such as IPsec require encryption and authentication. For IPsec, the authentication is based on HMAC, thus SHA is required. To optimize performance, the AES embeds a mode of operation that enables the SHA module to process the input or output data of the AES module. If this mode is enabled, write access is required only into AES\_IDATARx registers, since SHA input data registers are automatically written by AES without software intervention. When the DMA is configured to transfer a buffer of data (input frame), only one transfer descriptor is required for both authentication and

encryption/decryption processes and only one buffer is transferred through the system bus (reducing the load of the system bus).

Improved performance for secure protocol layers requires AES\_EMR.PLIPEN to be set.

**Figure 59-11. Secure Protocol Layers Improved Performances Block Diagram**

### 59.4.9.1 Cipher Mode

When AES\_EMR.PLIPD is cleared and AES\_EMR.PLIPEN=1, the message written into AES\_IDATARx is first encrypted with the AES module and the encrypted message is authenticated with the SHA module. Therefore, when AES\_EMR.PLIPD is cleared, AES\_ODATARx are selected and sent to SHA\_IDATARx as soon as AES\_ODATARx are read. A read access in AES corresponds to a write access to the corresponding SHA\_IDATARx. The number of SHA\_IDATARx is greater than the number of AES\_ODATARx, but the SHA module embeds the decoding logic to automatically dispatch AES\_ODATARx values into the corresponding SHA\_IDATARx without software intervention.

### 59.4.9.2 Decipher Mode

When AES\_EMR.PLIPD is written to '1' and AES\_EMR.PLIPEN=1, the message written into AES\_IDATARx is decrypted with the AES module and also sent to SHA for authentication. Therefore, when AES\_EMR.PLIPD=1, AES\_IDATARx are selected and sent to SHA\_IDATARx as soon as AES\_IDATARx are written. A write access in AES corresponds to a write access to the corresponding SHA\_IDATARx. The number of SHA\_IDATARx is greater than the number of AES\_ODATARx, but the SHA module embeds the decoding logic to automatically dispatch AES\_IDATARx values into the corresponding SHA\_IDATARx without software intervention.

### 59.4.9.3 Encapsulating Security Payload (ESP) IPsec Examples

The following examples describe how to configure AES and SHA to optimize processing an ESP IPsec frame for maximum performance.

The cipher (or decipher) of an ESP IPsec frame requires both encryption (or decryption) and authentication.

For cipher, the input frame located in the system memory must first be padded and the resulting buffer encrypted. The encrypted frame must be written back to the system memory and sent to the authentication module.

When the AES module is configured to improve the performance of the secure protocol layers (AES\_EMR.PLIPEN = 1), the data transfers are simplified, limiting the bandwidth requirements on the system bus.

Before configuring the DMA to start the transfer of the data buffer (input frame) to the AES, the following actions must be taken in registers:

- AES\_BCNT.BCNT must be configured with the length of the message (Input Frame).
- The padding length of the AES must be configured in AES\_EMR.PADLEN. See [Automatic Padding Mode](#) for details.
- The next header value must be configured in AES\_EMR.NHEAD.
- AES\_MR.SMOD and SHA\_MR.SMOD must be configured to 2.  
**Note:** When automatic padding is enabled and AES\_MR.SMOD = 2, AES\_MR.DUALBUFF must be cleared.
- The SHA\_MSR.MSGSIZE must be configured with the length of the authentication message including the optional extended sequence number (ESN) and header and trailer information required by the authentication algorithm used (HMAC, etc.). Refer to the section “Secure Hash Algorithm (SHA)” for more details on configurations for optimized processing of the header information.
- The Security Parameter Index (SPI, sequence number (SEQ#)) and the optional Initialization Vector (IV) must be configured sequentially in SHA\_IDATAR0.
- A first DMA transfer descriptor must be configured to transfer the input frame from the system memory to the AES input data registers (AES\_IDATARx), and a second DMA descriptor must be configured to transfer the encrypted frame from AES to the system memory.  
**Note:** If AES\_EMR.PLIPEN = 1, there is no need to define a transfer descriptor to load the encrypted frame into the SHA input data registers because the transfer is automatically performed while the second descriptor transfer is in progress.

See the figures below.

**Figure 59-12. Generation of an ESP IPsec Frame without ESN**

If the optional extended sequence number is required for authentication, wait for the AES-to-system memory DMA buffer transfer to complete before configuring the ESN value. The ESN value must be configured in the SHA by writing sequentially each 32-bit word of the ESN into the SHA\_IDATAR0 register. Wait for SHA\_ISR.WRDY=1 before each write in the SHA\_IDATAR0 register. See the figure below.

**Figure 59-13. Generation of an ESP IPsec Frame with ESN**

To decipher an ESP IPsec frame without the optional ESN trailer information, two DMA channels are required and the SHA must be configured in Automatic padding mode.

**Note:** AES automatic padding must be disabled when deciphering a frame.

- A first DMA transfer descriptor must be configured to load the received encrypted frame from the system memory to AES\_IDATARx for decryption. The start address of the first transfer descriptor must be defined after the SPI, SEQ#, and optional IV (see the figure below).
- A second DMA descriptor must be configured to transfer the decrypted frame from AES\_ODATARx to the system memory.
- AES\_EMR.PLIPEN and AES\_EMR.PLIPD must be written to '1' so that the data buffer is written in AES\_IDATARx and in SHA\_IDATARx.

The SHA has the capability to perform an automatic check with an expected integrity check value if this value is appended at the end of the frame buffer (SHA\_MR.CHECK=2). Thus, if the first transfer

descriptor includes the ICV for SHA, the first DMA transfer allows the decryption and authentication processes including the automatic check. The decrypted part resulting from ICV is not required for downstream processing and must be considered as dummy data.

The end of the decryption and authentication processes occur when flag `SHA_ISR.CHECKF=1`. The authentication status is provided by `SHA_ISR.CHKST`.

**Figure 59-14. Decryption of an ESP IP Sec Frame without ESN**

If the optional ESN trailer information is part of the ICV (see the figure below), the ESN must be manually written into `SHA_IDATAR0`. The ESN value must be written after completion of the system memory-to-AES DMA buffer transfer. The ESN value must be configured in the SHA by writing sequentially each 32-bit word of the ESN into the `SHA_IDATAR0` register. Wait for `SHA_ISR.WRDY=1` before each write in the `SHA_IDATAR0` register.

When the optional ESN trailer information is part of the ICV, it is not possible to include the ICV received in the input frame to the first transfer descriptor. Moreover, if the HMAC algorithm is used for authentication, no automatic check can be performed when optimizing the processing performances of the SHA module. For more details, refer to the section "Secure Hash Algorithm (SHA)". The result of the HMAC read in the `SHA_IODATARx` must be manually compared with the ICV value of the input frame.

The comparison must be performed after the end of the authentication process. The authentication process is completed when the SHA\_ISR.DATRDY flag is set.

**Figure 59-15. Decryption of an ESP IPsec Frame with ESN**

### 59.4.10 Security Features

#### 59.4.10.1 Unspecified Register Access Detection

When an unspecified register access occurs, AES\_ISR.URAD is raised. Its source is then reported in AES\_ISR.URAT. Only the last unspecified register access is available through the AES\_ISR.URAT.

Several kinds of unspecified register accesses can occur:

- Input Data register written during the data processing when SMOD = IDATAR0\_START
- Output Data register read during data processing
- Mode register written during data processing
- Output Data register read during sub-keys generation
- Mode register written during sub-keys generation

- Write-only register read access

AES\_ISR.URAD and AES\_ISR.URAT can only be reset by AES\_CR.SWRST.

### 59.5.1 AES Control Register

**Name:** AES\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

#### Bit 8 – SWRST Software Reset

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Resets the AES. A software-triggered hardware reset of the AES interface is performed. |

### 59.5.2 AES Mode Register

**Name:** AES\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 23:20 – CKEY[3:0] Key

| Value | Name   | Description   |
|-------|--------|---|
| 0xE   | PASSWD | This field must be written with 0xE the first time AES_MR is programmed. For subsequent programming of AES_MR, any value can be written, including that of 0xE.<br><br>Always reads as 0. |

#### Bits 18:16 – CFBS[2:0] Cipher Feedback Data Size

| Value | Name        | Description |
|-------|-------------|-------------|
| 0     | SIZE_128BIT | 128-bit     |
| 1     | SIZE_64BIT  | 64-bit      |
| 2     | SIZE_32BIT  | 32-bit      |
| 3     | SIZE_16BIT  | 16-bit      |
| 4     | SIZE_8BIT   | 8-bit       |

### Bit 15 – LOD Last Output Data Mode

In DMA mode, reading to the Output Data registers before the last data encryption/decryption process may lead to unpredictable results.

| Value | Description   |
|-------|---|
| 0     | <p>No effect.</p> <p>After each end of encryption/decryption, the output data are available either on the output data registers (Manual and Auto modes) or at the address specified in the Channel Buffer Transfer Descriptor for DMA mode.</p> <p>In Manual and Auto modes, the DATRDY flag is cleared when at least one of the Output Data registers is read.</p> |
| 1     | <p>The DATRDY flag is cleared when at least one of the Input Data Registers is written.</p> <p>No more Output Data Register reads are necessary between consecutive encryptions/decryptions (see <a href="#">Last Output Data Mode</a>).</p>  |

### Bits 14:12 – OPMOD[2:0] Operating Mode

For CBC-MAC operating mode, set OPMOD to CBC and LOD to 1.

| Value | Name | Description                                 |
|-------|------|---|
| 0     | ECB  | ECB: Electronic Codebook mode               |
| 1     | CBC  | CBC: Cipher Block Chaining mode             |
| 2     | OFB  | OFB: Output Feedback mode                   |
| 3     | CFB  | CFB: Cipher Feedback mode                   |
| 4     | CTR  | CTR: Counter mode (16-bit internal counter) |
| 5     | GCM  | GCM: Galois/Counter mode                    |
| 6     | XTS  | XTS: XEX-based tweaked-codebook mode        |

### Bits 11:10 – KEYSIZE[1:0] Key Size

| Value | Name   | Description              |
|-------|--------|--------------------------|
| 0     | AES128 | AES Key Size is 128 bits |
| 1     | AES192 | AES Key Size is 192 bits |
| 2     | AES256 | AES Key Size is 256 bits |

### Bits 9:8 – SMOD[1:0] Start Mode

If a DMA transfer is used, configure SMOD to 2. See [DMA Mode](#) for more details.

| Value | Name          | Description                             |
|-------|---------------|---|
| 0     | MANUAL_START  | Manual Mode                             |
| 1     | AUTO_START    | Auto Mode                               |
| 2     | IDATAR0_START | AES_IDATAR0 access only Auto Mode (DMA) |

### Bits 7:4 – PROCDLY[3:0] Processing Delay

Processing Time =  $N \times (\text{PROCDLY} + 1)$

where

- $N = 10$  when KEYSIZE = 0

- N = 12 when KEYSIZE = 1
- N = 14 when KEYSIZE = 2

The processing time represents the number of clock cycles that the AES needs in order to perform one encryption/decryption.

**Note:** The best performance is achieved with PROCDLY equal to 0.

**Bit 3 – DUALBUFF** Dual Input Buffer

| Value | Name     | Description  |
|-------|----------|--|
| 0     | INACTIVE | AES_IDATARx cannot be written during processing of previous block.   |
| 1     | ACTIVE   | AES_IDATARx can be written during processing of previous block when SMOD = 2. It speeds up the overall runtime of large files. |

**Bit 1 – GTAGEN** GCM Automatic Tag Generation Enable

| Value | Description                            |
|-------|--|
| 0     | Automatic GCM Tag generation disabled. |
| 1     | Automatic GCM Tag generation enabled.  |

**Bit 0 – CIPHER** Processing Mode

| Value | Description    |
|-------|----------------|
| 0     | Decrypts data. |
| 1     | Encrypts data. |

### 59.5.3 AES Interrupt Enable Register

**Name:** AES\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |    |    |    |    |    |         |       |        |
|--------|----|----|----|----|----|---------|-------|--------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26      | 25    | 24     |
|        |    |    |    |    |    |         |       |        |
| Access |    |    |    |    |    |         |       |        |
| Reset  |    |    |    |    |    |         |       |        |
|        |    |    |    |    |    |         |       |        |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18      | 17    | 16     |
|        |    |    |    |    |    | PLENERR | EOPAD | TAGRDY |
| Access |    |    |    |    |    | W       | W     | W      |
| Reset  |    |    |    |    |    | –       | –     | –      |
|        |    |    |    |    |    |         |       |        |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10      | 9     | 8      |
|        |    |    |    |    |    |         |       | URAD   |
| Access |    |    |    |    |    |         |       | W      |
| Reset  |    |    |    |    |    |         |       | –      |
|        |    |    |    |    |    |         |       |        |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2       | 1     | 0      |
|        |    |    |    |    |    |         |       | DATRDY |
| Access |    |    |    |    |    |         |       | W      |
| Reset  |    |    |    |    |    |         |       | –      |

**Bit 18 – PLENERR** Padding Length Error Interrupt Enable

**Bit 17 – EOPAD** End of Padding Interrupt Enable

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Enable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Enable

**Bit 0 – DATRDY** Data Ready Interrupt Enable

### 59.5.4 AES Interrupt Disable Register

**Name:** AES\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |    |    |    |    |    |         |       |        |
|--------|----|----|----|----|----|---------|-------|--------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26      | 25    | 24     |
|        |    |    |    |    |    |         |       |        |
| Access |    |    |    |    |    |         |       |        |
| Reset  |    |    |    |    |    |         |       |        |
|        |    |    |    |    |    |         |       |        |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18      | 17    | 16     |
|        |    |    |    |    |    | PLENERR | EOPAD | TAGRDY |
| Access |    |    |    |    |    | W       | W     | W      |
| Reset  |    |    |    |    |    | –       | –     | –      |
|        |    |    |    |    |    |         |       |        |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10      | 9     | 8      |
|        |    |    |    |    |    |         |       | URAD   |
| Access |    |    |    |    |    |         |       | W      |
| Reset  |    |    |    |    |    |         |       | –      |
|        |    |    |    |    |    |         |       |        |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2       | 1     | 0      |
|        |    |    |    |    |    |         |       | DATRDY |
| Access |    |    |    |    |    |         |       | W      |
| Reset  |    |    |    |    |    |         |       | –      |

**Bit 18 – PLENERR** Padding Length Error Interrupt Disable

**Bit 17 – EOPAD** End of Padding Interrupt Disable

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Disable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Disable

**Bit 0 – DATRDY** Data Ready Interrupt Disable

### 59.5.5 AES Interrupt Mask Register

**Name:** AES\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

|     |    |    |    |    |    |    |    |    |
|-----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|     |    |    |    |    |    |    |    |    |

Access  
Reset

**Bit 18 – PLENERR** Padding Length Error Interrupt Mask

**Bit 17 – EOPAD** End of Padding Interrupt Mask

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Mask

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

### 59.5.6 AES Interrupt Status Register

**Name:** AES\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

|        |           |    |    |    |    |         |       |        |
|--------|-----------|----|----|----|----|---------|-------|--------|
| Bit    | 31        | 30 | 29 | 28 | 27 | 26      | 25    | 24     |
|        |           |    |    |    |    |         |       |        |
| Access |           |    |    |    |    |         |       |        |
| Reset  |           |    |    |    |    |         |       |        |
| Bit    | 23        | 22 | 21 | 20 | 19 | 18      | 17    | 16     |
|        |           |    |    |    |    | PLENERR | EOPAD | TAGRDY |
| Access |           |    |    |    |    | R       | R     | R      |
| Reset  |           |    |    |    |    | 0       | 0     | 0      |
| Bit    | 15        | 14 | 13 | 12 | 11 | 10      | 9     | 8      |
|        | URAT[3:0] |    |    |    |    |         |       | URAD   |
| Access | R         | R  | R  | R  |    |         |       | R      |
| Reset  | 0         | 0  | 0  | 0  |    |         |       | 0      |
| Bit    | 7         | 6  | 5  | 4  | 3  | 2       | 1     | 0      |
|        |           |    |    |    |    |         |       | DATRDY |
| Access |           |    |    |    |    |         |       | R      |
| Reset  |           |    |    |    |    |         |       | 0      |

#### Bit 18 – PLENERR Padding Length Error

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No Padding Length Error occurred. |
| 1     | Padding Length Error detected.    |

#### Bit 17 – EOPAD End of Padding

| Value | Description            |
|-------|------------------------|
| 0     | Padding is not over.   |
| 1     | Padding phase is over. |

#### Bit 16 – TAGRDY GCM Tag Ready

| Value | Description   |
|-------|---|
| 0     | GCM Tag is not valid.   |
| 1     | GCM Tag generation is complete (cleared by reading GCM Tag, starting another processing or when writing a new key). |

**Bits 15:12 – URAT[3:0]** Unspecified Register Access (cleared by writing SWRST in AES\_CR)  
 Only the last Unspecified Register Access Type is available through the URAT field.

# SAMA5D2 Series

## Advanced Encryption Standard (AES)

| Value | Name              | Description  |
|-------|-------------------|--|
| 0     | IDR_WR_PROCESSING | Input Data register written during the data processing when SMOD = 2 mode. |
| 1     | ODR_RD_PROCESSING | Output Data register read during the data processing.                      |
| 2     | MR_WR_PROCESSING  | Mode register written during the data processing.                          |
| 3     | ODR_RD_SUBKGEN    | Output Data register read during the sub-keys generation.                  |
| 4     | MR_WR_SUBKGEN     | Mode register written during the sub-keys generation.                      |
| 5     | WOR_RD_ACCESS     | Write-only register read access.   |

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by writing SWRST in AES\_CR)

| Value | Description  |
|-------|--|
| 0     | No unspecified register access has been detected since the last SWRST.           |
| 1     | At least one unspecified register access has been detected since the last SWRST. |

**Bit 0 – DATRDY** Data Ready (cleared by setting bit START or bit SWRST in AES\_CR or by reading AES\_ODATARx)

| Value | Description                                    |
|-------|--|
| 0     | Output data not valid.                         |
| 1     | Encryption or decryption process is completed. |

**Note:** If AES\_MR.LOD = 1: In Manual and Auto mode, the DATRDY flag can also be cleared by writing at least one AES\_IDATARx.

### 59.5.7 AES Key Word Register x

**Name:** AES\_KEYWRx  
**Offset:** 0x20 + x\*0x04 [x=0..7]  
**Reset:** –  
**Property:** Write-only

These registers are write-only to prevent the key from being read by another application.

|        |             |    |    |    |    |    |    |    |

#### Bits 31:0 – KEYW[31:0] Key Word

The four/six/eight 32-bit Key Word registers set the 128-bit/192-bit/256-bit cryptographic key used for AES encryption/decryption.

AES\_KEYWR0 corresponds to the first word of the key and respectively AES\_KEYWR3/AES\_KEYWR5/AES\_KEYWR7 to the last one.

Whenever a new key (AES\_KEYWRx) is written to the hardware, two automatic actions are processed:

- GCM hash subkey generation
- AES\_GHASHRx Clear

See [Key Writing and Automatic Hash Subkey Calculation](#) for details.

### 59.5.8 AES Input Data Register x

**Name:** AES\_IDATARx  
**Offset:** 0x40 + x\*0x04 [x=0..3]  
**Reset:** –  
**Property:** Write-only

|        |              |    |    |    |    |    |    |    |

| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | IDATA[7:0]   |    |    |    |    |    |    |    |
| Access | W            | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | –  |

**Bits 31:0 – IDATA[31:0]** Input Data Word

The four 32-bit Input Data registers set the 128-bit data block used for encryption/decryption.

AES\_IDATAR0 corresponds to the first word of the data to be encrypted/decrypted, and AES\_IDATAR3 to the last one.

These registers are write-only to prevent the input data from being read by another application.

### 59.5.9 AES Output Data Register x

**Name:** AES\_ODATARx  
**Offset:** 0x50 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

|        |              |    |    |    |    |    |    |    |
|--------|--------------|----|----|----|----|----|----|----|
| Bit    | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | ODATA[31:24] |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | ODATA[23:16] |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |              |    |    |    |    |    |    |    |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | ODATA[15:8]  |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |              |    |    |    |    |    |    |    |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | ODATA[7:0]   |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 31:0 – ODATA[31:0] Output Data**

The four 32-bit Output Data registers contain the 128-bit data block that has been encrypted/decrypted.

AES\_ODATAR0 corresponds to the first word, AES\_ODATAR3 to the last one.

### 59.5.10 AES Initialization Vector Register x

**Name:** AES\_IVRx  
**Offset:** 0x60 + x\*0x04 [x=0..3]  
**Reset:** –  
**Property:** Write-only

|        |           |    |    |    |    |    |    |    |
|--------|-----------|----|----|----|----|----|----|----|
| Bit    | 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | IV[31:24] |    |    |    |    |    |    |    |
| Access | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | IV[23:16] |    |    |    |    |    |    |    |
| Access | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | IV[15:8]  |    |    |    |    |    |    |    |
| Access | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | IV[7:0]   |    |    |    |    |    |    |    |
| Access | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | –  |

**Bits 31:0 – IV[31:0] Initialization Vector**

The four 32-bit Initialization Vector registers set the 128-bit Initialization Vector data block that is used by some modes of operation as an additional initial input.

AES\_IVR0 corresponds to the first word of the Initialization Vector, AES\_IVR3 to the last one.

These registers are write-only to prevent the Initialization Vector from being read by another application.

For CBC, OFB and CFB modes, the IV input value corresponds to the initialization vector.

For CTR mode, the IV input value corresponds to the initial counter value.

**Note:** These registers are not used in ECB mode and must not be written.

### 59.5.11 AES Additional Authenticated Data Length Register

**Name:** AES\_AADLENR  
**Offset:** 0x70  
**Reset:** 0x00000000  
**Property:** Read/Write

|               |     |     |     |     |     |     |     |     |
|---------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit           | 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
| AADLEN[31:24] |     |     |     |     |     |     |     |     |
| Access        | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset         | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|               |     |     |     |     |     |     |     |     |
| Bit           | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| AADLEN[23:16] |     |     |     |     |     |     |     |     |
| Access        | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset         | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|               |     |     |     |     |     |     |     |     |
| Bit           | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| AADLEN[15:8]  |     |     |     |     |     |     |     |     |
| Access        | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset         | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|               |     |     |     |     |     |     |     |     |
| Bit           | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| AADLEN[7:0]   |     |     |     |     |     |     |     |     |
| Access        | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset         | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – AADLEN[31:0]** Additional Authenticated Data Length  
 Length in bytes of the Additional Authenticated Data (AAD) that is to be processed.

**Note:** The maximum byte length of the AAD portion of a message is limited to the 32-bit counter length.

### 59.5.12 AES Plaintext/Ciphertext Length Register

**Name:** AES\_CLENR  
**Offset:** 0x74  
**Reset:** 0x00000000  
**Property:** Read/Write

|             |     |     |     |     |     |     |     |     |

| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – GHASH[31:0] Intermediate GCM Hash Word x**

The four 32-bit Intermediate Hash Word registers expose the intermediate GHASH value. May be read to save the current GHASH value so processing can later be resumed, presumably on a later message fragment. Whenever a new key is written to the AES Key Register two automatic actions are processed:

- GCM hash subkey generation
- AES\_GHASHRx Clear

See [Key Writing and Automatic Hash Subkey Calculation](#) for details.

If an application software-specific hash initial value is needed for the GHASH, it must be written to AES\_GHASHRx:

- after a write to the AES Key Register, if any,
- before starting the input data feed.

### 59.5.14 AES GCM Authentication Tag Word Register x

**Name:** AES\_TAGRx  
**Offset:** 0x88 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

| Access | R/W      | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0        | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – H[31:0] GCM H Word x**

The four 32-bit H Word registers contain the 128-bit GCM hash subkey *H* value.

Whenever a new key is written to the AES Key Register, two automatic actions are processed:

- GCM hash subkey *H* generation
- AES\_GHASHRx Clear

If the application software requires a specific hash subkey, the automatically-generated *H* value can be overwritten in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#) for details.

Generating a GCM hash subkey *H* by a write in AES\_GCMHRx enables to:

- select the GCM hash subkey *H* for GHASH operations,
- select one operand to process a single GF128 multiply.

### 59.5.17 AES Extended Mode Register

**Name:** AES\_EMR  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

| Reset  |                         |     | 0     | 0      |                       |     | 0   | 0    |

#### Bits 23:16 – NHEAD[7:0] IPSEC Next Header

| Value | Description             |
|-------|-------------------------|
| 0-255 | IPSEC Next Header field |

#### Bits 15:8 – PADLEN[7:0] Auto Padding Length

| Value | Description             |
|-------|-------------------------|
| 0-255 | Padding length in bytes |

#### Bit 5 – PLIPD Protocol Layer Improved Performance Decipher

| Value | Description   |
|-------|---|
| 0     | Protocol layer improved performance is in ciphering mode.   |
| 1     | Protocol layer improved performance is in deciphering mode. |

#### Bit 4 – PLIPEN Protocol Layer Improved Performance Enable

| Value | Description                                      |
|-------|--|
| 0     | Protocol layer improved performance is disabled. |
| 1     | Protocol layer improved performance is enabled.  |

#### Bit 1 – APM Auto Padding Mode

# SAMA5D2 Series

## Advanced Encryption Standard (AES)

| Value | Description   |
|-------|---|
| 0     | Auto Padding performed according to IPSEC standard. |
| 1     | Auto Padding performed according to SSL standard.   |

**Bit 0 – APEN** Auto Padding Enable

| Value | Description                       |
|-------|-----------------------------------|
| 0     | Auto Padding feature is disabled. |
| 1     | Auto Padding feature is enabled.  |

**59.5.18 AES Byte Counter Register**

**Name:** AES\_BCNT  
**Offset:** 0xB4  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 31:0 – ALPHA[31:0]** Alpha Word x

The four 32-bit Alpha Word registers contain the 128-bit primitive of GF(2<sup>128</sup>) to use for the first processing.

## 60. Secure Hash Algorithm (SHA)

### 60.1 Description

The Secure Hash Algorithm (SHA) is compliant with the American FIPS (Federal Information Processing Standard) Publication 180-2 specification.

The 512/1024-bit block of message is respectively stored in 16/32 x 32-bit registers, (SHA\_IDATARx/SHA\_IODATARx) which are write-only.

As soon as the input data is written, the hash processing may be started. The registers comprising the block of a padded message must be entered consecutively. Then the message digest is ready to be read out on the 5 up to 8/16 x 32-bit output data registers (SHA\_IODATARx) or through the DMA channels.

### 60.2 Embedded Characteristics

- Supports Hash-based Message Authentication Code (HMAC) Algorithm (HMAC-SHA1, HMAC-SHA224, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512, )
- Compliant with FIPS Publication 180-2
- Supports Automatic Padding of Messages
- Supports Up to 2 Sets of Initial Hash Values Registers (HMAC Acceleration or other)
- Supports Automatic Check of the Hash (HMAC Acceleration or other)
- Tightly Coupled to AES for Protocol Layers Improved Performances
- Configurable Processing Period:
  - 85 Clock Cycles to obtain a fast SHA1 runtime, 88 clock cycles for SHA384, SHA512 or 209 Clock Cycles for Maximizing Bandwidth of Other Applications
  - 72 Clock Cycles to obtain a fast SHA224, SHA256 runtime or 194 Clock Cycles for Maximizing Bandwidth of Other Applications
- Connection to DMA Channel Capabilities Optimizes Data Transfers
- Double Input Buffer Optimizes Runtime

### 60.3 Product Dependencies

#### 60.3.1 Power Management

The SHA may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SHA clock.

#### 60.3.2 Interrupt Sources

The SHA interface has an interrupt line connected to the Interrupt Controller.

Handling the SHA interrupt requires programming the Interrupt Controller before configuring the SHA.

### 60.4 Functional Description

The Secure Hash Algorithm (SHA) module requires a padded message according to FIPS180-2 specification. This message can be provided with the padding to the SHA module, or the padding can be

automatically computed by the SHA module if the size of the message is provided. The first block of the message must be indicated to the module by a specific command. The SHA module produces an N-bit message digest each time a block is written and processing period ends, where N is 160 for SHA1, 224 for SHA224, 256 for SHA256, 384 for SHA384, 512 for SHA512. The SHA module is also capable of computing Hash-based Message Authentication Code (HMAC) algorithm.

### 60.4.1 SHA Algorithm

The SHA can process SHA1, SHA224, SHA256, SHA384, SHA512 by configuring the ALGO field in the SHA Mode register (SHA\_MR).

### 60.4.2 HMAC Algorithm

The HMAC algorithm is as follows:

$$\text{HMAC}_K(m) = h((K_0 \oplus \text{opad}) \parallel h((K_0 \oplus \text{ipad}) \parallel m))$$

where:

- $h$  = SHA function
- $K_0$  = the key  $K$  after any necessary pre-processing to form a block size key
- $m$  = message to authenticate
- $\parallel$  = concatenation operator
- $\oplus$  = XOR operator
- $\text{ipad}$  = predefined constant (0x3636...3636)
- $\text{opad}$  = predefined constant (0x5C5C...5C5C)

The SHA provides a fully optimized processing of the HMAC algorithm by executing the following operations:

- starting the SHA algorithm from any user predefined hash value, thus ' $h(K_0 \oplus \text{ipad})$ ' for first HMAC hash and ' $h(K_0 \oplus \text{opad})$ ' for second HMAC hash
- performing automatic padding
- routing automatically the first hash result ' $h((K_0 \oplus \text{ipad}) \parallel m)$ ' to the source of the second hash processing ' $h((K_0 \oplus \text{opad}) \parallel (\text{first hash result}))$ ' including the concatenation of the first hash result to ' $K_0 \oplus \text{opad}$ '.

To perform the HMAC operation, the ALGO field value must be greater than 7, the automatic padding feature must be enabled (MSGSIZE and BYTCNT fields differ from 0) and the SHA internal initial hash value registers 0 and 1 must be configured, respectively, with the hash results of input blocks " $K_0 \oplus \text{ipad}$ " and " $K_0 \oplus \text{opad}$ " (see [Internal Registers for Initial Hash Value or Expected Hash Result](#)).

The size of the message (' $m$ ') must be written in the MSGSIZE and BYTCNT fields.

The FIRST bit in the SHA Control register (SHA\_CR) should be set before writing the first block of the message.

The SHA can process HMAC-SHA1, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512 by configuring the ALGO field in the SHA\_MR.

### 60.4.3 Processing Period

The processing period can be configured.

The short processing period allocates bandwidth to the SHA module, whereas the long processing period allocates more bandwidth on the system bus to other applications. An example is DMA channels not associated with SHA.

In SHA1 mode, the shortest processing period is 85 clock cycles + 2 clock cycles for start command synchronization. The longest period is 209 clock cycles + 2 clock cycles.

In SHA384, SHA512 mode, the shortest processing period is 88 clock cycles + 2 clock cycles for start command synchronization. The longest period is 209 clock cycles + 2 clock cycles.

In SHA256 and SHA224 mode, the shortest processing period is 72 clock cycles + 2 clock cycles for start command synchronization. The longest period is 194 clock cycles + 2 clock cycles.

#### 60.4.4 Double Input Buffer

The SHA Input Data registers (SHA\_IDATARx) can be double-buffered to reduce the runtime of large files.

Double-buffering allows a new message block to be written while the previous message block is being processed. This is only possible when DMA accesses are performed (SMOD = 2).

The DUALBUFF bit in the SHA\_MR must be set to have double input buffer access.

#### 60.4.5 Internal Registers for Initial Hash Value or Expected Hash Result

The SHA module embeds two sets of internal registers (IR0, IR1) to store different data used by the SHA or HMAC algorithms (See the figure below). These internal registers are accessed through SHA Input Data registers (SHA\_IDATARx).

When the ALGO field selects SHA algorithms, IR0 can be configured with a user initial hash value. This initial hash value can be used to compute a custom hash algorithm with two sets of different initial constants, or to continue a hash computation by providing the intermediate hash value previously returned by the SHA module.

When the ALGO field selects SHA algorithms, IR1 can be configured with either a user initial hash value or an expected hash result. The expected hash result must be configured in the IR1 if the field CHECK = 1 (refer to [Automatic Check](#)). If the field CHECK = 0 or 2, IR1 can be configured with a user initial hash value that differs from IR0 value.

When the ALGO field selects HMAC algorithms, IR0 must be configured with the hash result of  $K_0 \oplus \text{ipad}$  and IR1 must be configured with the hash result of  $K_0 \oplus \text{opad}$ . These pre-computed first blocks speed up the HMAC computation by saving the time to compute the intermediate hash values of the first block which is constant while the secret key is constant (See [HMAC Algorithm](#)).

**Table 60-1. Configuration Values of Internal Registers**

| Register | SHA Modes (ALGO < 8) |                      |                   | HMAC Modes (ALGO > 7)            |
|----------|----------------------|----------------------|-------------------|----------------------------------|
|          | CHECK = 0            | CHECK = 1            | CHECK = 2         |                                  |
| IR0      | User Initial Hash    | User Initial Hash    | User Initial Hash | hash( $K_0 \oplus \text{ipad}$ ) |
| IR1      | User Initial Hash    | Expected Hash Result | User Initial Hash | hash( $K_0 \oplus \text{opad}$ ) |

To calculate the initial HMAC values, follow this sequence:

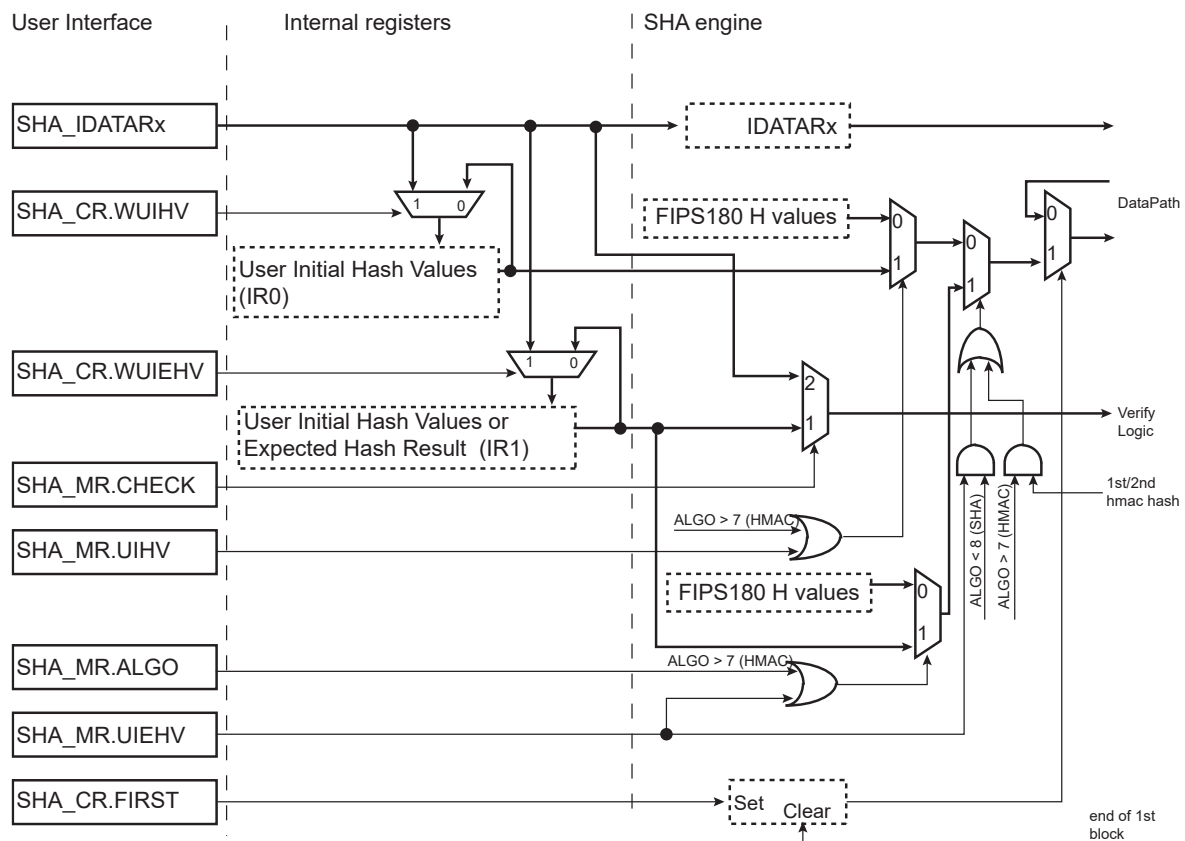

1. Calculate  $K_0$ .
2. Calculate  $K_0 \oplus \text{ipad}$  and  $K_0 \oplus \text{opad}$ .
3. Perform a hash of the result of  $K_0 \oplus \text{ipad}$  and  $K_0 \oplus \text{opad}$  (auto-padding must be disabled for that type of hash).
4. Write  $h(K_0 \oplus \text{ipad})$  and  $h(K_0 \oplus \text{opad})$  in IR0 and IR1 respectively.

To write IR0 or IR1, follow this sequence:

1. Set SHA\_CR.WUIHV (IR0) or SHA\_CR.WUIEHV (IR1).
2. Write the data in SHA\_IDATARx. The number of registers to write depends on the type of data (user initial hash values or expected hash result) and on the type of algorithm selected:
  - SHA\_IDATAR0 to SHA\_IDATAR4 for data used in algorithms based on SHA1
  - SHA\_IDATAR0 to SHA\_IDATAR7 for data used in algorithms based on SHA256
  - SHA\_IDATAR0 to SHA\_IDATAR15 for data used in algorithms based on SHA512
  - SHA\_IDATAR0 to SHA\_IDATAR6 for expected hash result of algorithms based on SHA224
  - SHA\_IDATAR0 to SHA\_IDATAR11 for expected hash result of algorithms based on SHA384
3. Clear SHA\_CR.WUIHV or SHA\_CR.WUIEHV.

IR0 and IR1 are automatically selected for HMAC processing if the field ALGO selects HMAC algorithms. If SHA algorithms are selected, the internal registers are selected if the corresponding UIHV or UIEHV bits are set.

**Figure 60-1. User Initial Hash Value and Expected Hash Internal Register Access**

### 60.4.6 Automatic Padding

The SHA module features an automatic padding computation to speed up the execution of the algorithm.

The automatic padding function requires the following information:

- Complete message size in bytes to be written in the MSGSIZE field of the SHA Message Size register (SHA\_MSR).  
The size of the message is written at the end of the last block, as required by the FIPS180-2 specification (the size is automatically converted into a bit-size).

- Number of remaining bytes (to write in the SHA\_IDATARx) to be written in the BYTCNT field of the SHA Bytes Count register (SHA\_BCR). Automatic padding occurs when the BYTCNT field reaches 0. At each write in the SHA Input registers, the BYTCNT field value is decreased by the number of bytes written.

The BYTCNT field value must be written with the same value as the MSGSIZE field value if the full message is processed. If the message is partially preprocessed and an initial hash value is used, BYTCNT must be written with the remaining bytes to hash while MSGSIZE holds the message size.

To disable the automatic padding feature, the MSGSIZE and BYTCNT fields must be configured with 0.

### 60.4.7 Automatic Check

The SHA module features an automatic check of the hash result with the expected hash. A check failure can generate an interrupt if configured in the SHA Interrupt Enable register (SHA\_IER).

Automatic check requires the automatic padding feature to be enabled (MSGSIZE and BYTCNT fields must be greater than 0).

There are two methods to configure the expected hash result:

- if SHA\_MR.CHECK = 1, the expected hash result is read from the internal register (IR1). This method cannot be used when HMAC algorithms is selected because this register is already used to store user initial hash values for the second hash processing. IR1 cannot be read by software.
- If SHA\_MR.CHECK = 2, the expected hash result is written in the SHA\_IDATARx after the message.

When SHA\_MR.CHECK = 2, the method can provide more flexibility of use if a message is stored in system memory together with its expected hash result. A DMA with linked list can be used to ease the transfer of the message and its expected hash result.

**Figure 60-2. Message and Expected Hash Result Memory Mapping**

The number of 32-bit words of the hash result to check with the expected hash can be selected with SHA\_MR.CHKCNT. The status of the check is available in the CHKST field in the SHA Interrupt Status register (SHA\_ISR).

An interrupt can be generated (if enabled) when the check is completed. The check occurs several clock cycles after the computation of the requested hash, so the interrupt and the CHECKF bit are set several clock cycles after the DATRDY flag of the SHA\_ISR.

### 60.4.8 Protocol Layers Improved Performances

The SHA can be tightly coupled to the AES module to improve performances when processing protocol layers such as IPsec or OpenSSL.

When the AES is configured to be tightly coupled to SHA (AES\_MR), SHA must be always configured in Double Buffer mode (SHA\_MR.DUALBUFF = 1).

Refer to the section “Advanced Encryption Standard (AES)” for details.

### 60.4.9 Start Modes

SHA\_MR.SMOD is used to select the Hash Processing Start mode.

#### 60.4.9.1 Manual Mode

In Manual mode, the sequence is as follows:

1. Set SHA\_IER.DATRDY (Data Ready) , depending on whether an interrupt is required at the end of processing.
2. If the initial hash values differ from the FIPS standard, set SHA\_MR.UIHV and/or SHA\_MR.UIEHV. If the initial hash values comply with the FIPS180-2 specification, clear SHA\_MR.UIHV and/or SHA\_MR.UIEHV.
3. If automatic padding is required, configure SHA\_MSR.MSGSIZE with the number of bytes of the message, and configure SHA\_BCR.BYTCNT with the remaining number of bytes to write. The BYTCNT field must be written with a value different from MSGSIZE field value if the message is preprocessed and completed by using user initial hash values.  
If automatic padding is not required, configure SHA\_MSR.MSGSIZE and SHA\_BCR.BYTCNT to 0.
4. For the first block of a message, the FIRST command must be set by writing a 1 into the corresponding bit of the Control register (SHA\_CR). For the other blocks, there is nothing to write.
5. Write the block to be processed in the SHA\_IDATARx.
6. To begin processing, set SHA\_CR.START.
7. When processing is completed, the bit DATRDY in the Interrupt Status register (SHA\_ISR) rises. If an interrupt has been enabled by setting SHA\_IER.DATRDY, the interrupt line of the SHA is activated.
8. Repeat the write procedure for each block, start procedure and wait for the interrupt procedure up to the last block of the entire message. Each time the start procedure is complete, the DATRDY flag is cleared.
9. After the last block is processed (DATRDY flag is set, if an interrupt has been enabled by setting SHA\_IER.DATRDY, the interrupt line of the SHA is activated), read the message digest in the Output Data registers. The DATRDY flag is automatically cleared when reading the SHA\_IODATARx registers.

#### 60.4.9.2 Auto Mode

In Auto mode, processing starts as soon as the correct number of SHA\_IDATARx is written. No action in the SHA\_CR is necessary.

**60.4.9.3 DMA Mode**

The DMA can be used in association with the SHA to perform the algorithm on a complete message without any action by the software during processing.

SHA\_MR.SMOD must be configured to 2.

The DMA must be configured with non-incremental addresses.

The start address of any transfer descriptor must be set to point to the SHA\_IDATAR0.

The DMA chunk size must be set to transfer, for each trigger request, 16 words of 32 bits.

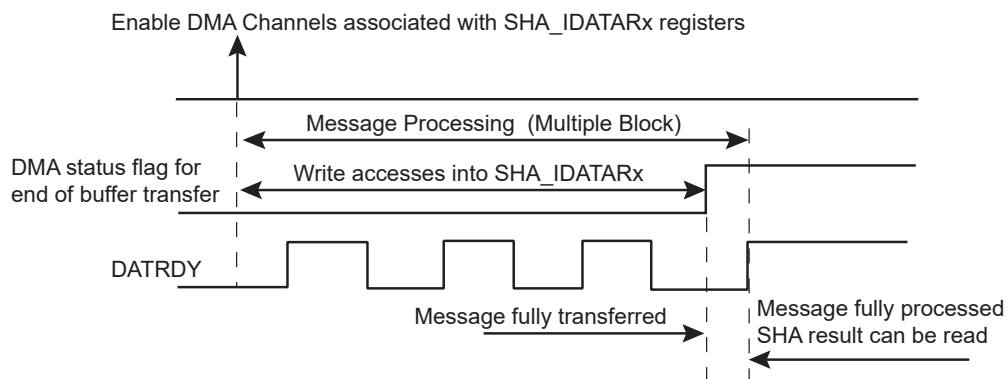

The FIRST bit of the SHA\_CR must be set before starting the DMA when the first block is transferred.

The DMA generates an interrupt when the end of buffer transfer is completed but the SHA processing is still in progress. The end of SHA processing is indicated by the flag DATRDY in the SHA\_ISR.

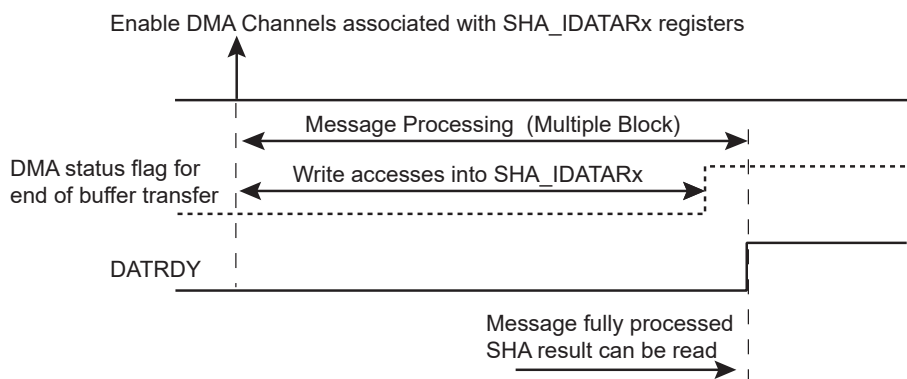

If automatic padding is disabled, the end of SHA processing requires two interrupts to be verified. The DMA end of transfer interrupt must be verified first, then the SHA DATRDY interrupt must be enabled and verified.

If automatic padding is enabled, the end of SHA processing requires only one interrupt to be verified. The DMA end of transfer is not required, so the SHA DATRDY interrupt must be enabled prior to start the DMA and DATRDY interrupt is the only one to be verified. Refer to the figures below.

**Figure 60-3. Interrupts Processing with DMA**

**Figure 60-4. Interrupts Processing with DMA and Automatic Padding**

**60.4.9.4 SHA Register Endianness**

In ARM processor-based products, the system bus and processors manipulate data in little-endian form. The SHA interface requires little-endian format words. However, in accordance with the protocol of FIPS 180-2 specification, data is collected, processed and stored by the SHA algorithm in big-endian form.

### 60.4.10 Security Features

#### 60.4.10.1 Unspecified Register Access Detection

When an unspecified register access occurs, the URAD bit in the SHA\_ISR is set. Its source is then reported in the Unspecified Register Access Type field (URAT). Only the last unspecified register access is available through the URAT field.

Several kinds of unspecified register accesses can occur:

- SHA\_IDATARx written during data processing in DMA mode
- SHA\_IODATARx read during data processing
- SHA\_MR written during data processing
- Write-only register read access

The URAD bit and the URAT field can only be reset by the SWRST bit in the SHA\_CR.

### 60.5 Register Summary

| Offset              | Name     | Bit Pos. |             |           |         |  |                |           |            |
|---------------------|----------|----------|-------------|-----------|---------|--|----------------|-----------|------------|
| 0x00                | SHA_CR   | 7:0      |             |           | FIRST   |  |                |           | START      |
|                     |          | 15:8     |             | WUIEHV    | WUIHV   |  |                |           | SWRST      |
|                     |          | 23:16    |             |           |         |  |                |           |            |
|                     |          | 31:24    |             |           |         |  |                |           |            |
| 0x04                | SHA_MR   | 7:0      | UIEHV       | UIHV      | PROCDLY |  |                | SMOD[1:0] |            |
|                     |          | 15:8     |             |           |         |  | ALGO[3:0]      |           |            |
|                     |          | 23:16    |             |           |         |  |                |           | DUALBUFF   |
|                     |          | 31:24    | CHKCNT[3:0] |           |         |  |                |           | CHECK[1:0] |
| 0x08<br>...<br>0x0F | Reserved |          |             |           |         |  |                |           |            |
| 0x10                | SHA_IER  | 7:0      |             |           |         |  |                |           | DATRDY     |
|                     |          | 15:8     |             |           |         |  |                |           | URAD       |
|                     |          | 23:16    |             |           |         |  |                |           | CHECKF     |
|                     |          | 31:24    |             |           |         |  |                |           |            |
| 0x14                | SHA_IDR  | 7:0      |             |           |         |  |                |           | DATRDY     |
|                     |          | 15:8     |             |           |         |  |                |           | URAD       |
|                     |          | 23:16    |             |           |         |  |                |           | CHECKF     |
|                     |          | 31:24    |             |           |         |  |                |           |            |
| 0x18                | SHA_IMR  | 7:0      |             |           |         |  |                |           | DATRDY     |
|                     |          | 15:8     |             |           |         |  |                |           | URAD       |
|                     |          | 23:16    |             |           |         |  |                |           | CHECKF     |
|                     |          | 31:24    |             |           |         |  |                |           |            |
| 0x1C                | SHA_ISR  | 7:0      |             |           | WRDY    |  |                |           | DATRDY     |

| Access |    |    |        |       | W     |    |    | W     |       |
| Reset  |    |    |        |       | –     |    |    | –     |       |

#### Bit 13 – WUIEHV Write User Initial or Expected Hash Values

| Value | Description  |
|-------|--|
| 0     | SHA_IDATARx accesses are routed to the data registers.           |
| 1     | SHA_IDATARx accesses are routed to the internal registers (IR1). |

#### Bit 12 – WUIHV Write User Initial Hash Values

| Value | Description  |
|-------|--|
| 0     | SHA_IDATARx accesses are routed to the data registers.           |
| 1     | SHA_IDATARx accesses are routed to the internal registers (IR0). |

#### Bit 8 – SWRST Software Reset

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Resets the SHA. A software-triggered hardware reset of the SHA interface is performed. |

#### Bit 4 – FIRST First Block of a Message

| Value | Description   |
|-------|---|
| 0     | No effect.  |
| 1     | Indicates that the next block to process is the first one of a message. |

**Bit 0 – START** Start Processing

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Starts manual hash algorithm process. |

### 60.5.2 SHA Mode Register

**Name:** SHA\_MR  
**Offset:** 0x04  
**Reset:** 0x0000100  
**Property:** Read/Write

|        |             |       |      |         |           |     |            |          |
|--------|-------------|-------|------|---------|-----------|-----|------------|----------|
| Bit    | 31          | 30    | 29   | 28      | 27        | 26  | 25         | 24       |
|        | CHKCNT[3:0] |       |      |         |           |     | CHECK[1:0] |          |
| Access | R/W         | R/W   | R/W  | R/W     |           |     | R/W        | R/W      |
| Reset  | 0           | 0     | 0    | 0       |           |     | 0          | 0        |
|        |             |       |      |         |           |     |            |          |
| Bit    | 23          | 22    | 21   | 20      | 19        | 18  | 17         | 16       |
|        |             |       |      |         |           |     |            | DUALBUFF |
| Access |             |       |      |         |           |     |            | R/W      |
| Reset  |             |       |      |         |           |     |            | 0        |
|        |             |       |      |         |           |     |            |          |
| Bit    | 15          | 14    | 13   | 12      | 11        | 10  | 9          | 8        |
|        |             |       |      |         | ALGO[3:0] |     |            |          |
| Access |             |       |      |         | R/W       | R/W | R/W        | R/W      |
| Reset  |             |       |      |         | 0         | 0   | 0          | 1        |
|        |             |       |      |         |           |     |            |          |
| Bit    | 7           | 6     | 5    | 4       | 3         | 2   | 1          | 0        |
|        |             | UIEHV | UIHV | PROCDLY |           |     | SMOD[1:0]  |          |
| Access |             | R/W   | R/W  | R/W     |           |     | R/W        | R/W      |
| Reset  |             | 0     | 0    | 0       |           |     | 0          | 0        |

#### Bits 31:28 – CHKCNT[3:0] Check Counter

Number of 32-bit words to check. The value 0 indicates that the number of words to compare will be based on the algorithm selected (5 words for SHA1, 7 words for SHA224, 8 words for SHA256, 12 words for SHA384, 16 words for SHA512).

#### Bits 25:24 – CHECK[1:0] Hash Check

Values not listed in table must be considered as “reserved”.

| Value | Name          | Description   |
|-------|---------------|---|
| 0     | NO_CHECK      | No check is performed   |
| 1     | CHECK_EHV     | Check is performed with expected hash stored in internal expected hash value registers. |
| 2     | CHECK_MESSAGE | Check is performed with expected hash provided after the message.                       |

#### Bit 16 – DUALBUFF Dual Input Buffer

| Value | Name     | Description   |
|-------|----------|---|
| 0     | INACTIVE | SHA_IDATARx and SHA_IODATARx cannot be written during processing of previous block.   |
| 1     | ACTIVE   | SHA_IDATARx and SHA_IODATARx can be written during processing of previous block when SMOD value = 2. It speeds up the overall runtime of large files. |

### Bits 11:8 – ALGO[3:0] SHA Algorithm

Values not listed in the table must be considered as “reserved”.

| Value | Name        | Description                               |
|-------|-------------|---|
| 0     | SHA1        | SHA1 algorithm processed                  |
| 1     | SHA256      | SHA256 algorithm processed                |
| 2     | SHA384      | SHA384 algorithm processed                |
| 3     | SHA512      | SHA512 algorithm processed                |
| 4     | SHA224      | SHA224 algorithm processed                |
| 8     | HMAC_SHA1   | HMAC algorithm with SHA1 Hash processed   |
| 9     | HMAC_SHA256 | HMAC algorithm with SHA256 Hash processed |
| 10    | HMAC_SHA384 | HMAC algorithm with SHA384 Hash processed |
| 11    | HMAC_SHA512 | HMAC algorithm with SHA512 Hash processed |
| 12    | HMAC_SHA224 | HMAC algorithm with SHA224 Hash processed |
| 13    | Reserved    | –   |
| 14    | Reserved    | –   |

### Bit 6 – UIEHV User Initial or Expected Hash Value Registers

| Value | Description   |
|-------|---|
| 0     | The SHA algorithm is started with the standard initial values as defined in the FIPS180-2 specification.  |
| 1     | The SHA algorithm is started with the user initial hash values stored in the internal register 1 (IR1). If HMAC is configured, UIEHV has no effect (i.e. IR1 is always selected). |

### Bit 5 – UIHV User Initial Hash Values

| Value | Description   |
|-------|---|
| 0     | The SHA algorithm is started with the standard initial values as defined in the FIPS180-2 specification.  |
| 1     | The SHA algorithm is started with the user initial hash values stored in the internal register 0 (IR0). If HMAC is configured, UIHV has no effect (i.e. IR0 is selected). |

### Bit 4 – PROCDLY Processing Delay

When SHA1 algorithm is processed, runtime period is either 85 or 209 clock cycles.

When SHA256 or SHA224 algorithm is processed, runtime period is either 72 or 194 clock cycles.

When SHA384 or SHA512 algorithm is processed, runtime period is either 88 or 209 clock cycles.

| Value | Name     | Description  |
|-------|----------|--|
| 0     | SHORTEST | SHA processing runtime is the shortest one   |
| 1     | LONGEST  | SHA processing runtime is the longest one (reduces the SHA bandwidth requirement, reduces the system bus overload) |

### Bits 1:0 – SMOD[1:0] Start Mode

Values not listed in the table must be considered as “reserved”.

If a DMA transfer is used, configure the SMOD value to 2. See [DMA Mode](#) for details.

| Value | Name         | Description |
|-------|--------------|-------------|
| 0     | MANUAL_START | Manual mode |

# SAMA5D2 Series

## Secure Hash Algorithm (SHA)

---

---

| Value | Name          | Description   |
|-------|---------------|---|
| 1     | AUTO_START    | Auto mode   |
| 2     | IDATAR0_START | SHA_IDATAR0 access only mode (mandatory when DMA is used) |

### 60.5.3 SHA Interrupt Enable Register

**Name:** SHA\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        | [Greyed out bits] |    |    | WRDY | [Greyed out bits] |    |        | DATRDY |
| Access |                   |    |    | R    |                   |    |        | R      |
| Reset  |                   |    |    | 0    |                   |    |        | 0      |

**Bits 23:20 – CHKST[3:0]** Check Status (cleared by writing START or SWRST bits in SHA\_CR or by reading SHA\_IODATARx)  
 Value 5 indicates identical hash values (expected hash = hash result). Any other value indicates different hash values.

**Bit 16 – CHECKF** Check Done Status (cleared by writing START or SWRST bits in SHA\_CR or by reading SHA\_IODATARx)

| Value | Description  |
|-------|--|
| 0     | Hash check has not been computed.                                    |
| 1     | Hash check has been computed, status is available in the CHKST bits. |

**Bits 14:12 – URAT[2:0]** Unspecified Register Access Type (cleared by writing a 1 to SWRST bit in SHA\_CR)  
 Only the last Unspecified Register Access Type is available through the URAT field.

| Value | Name  |
|-------|---|
| 0     | SHA_IDATAR0 to SHA_IDATAR15 written during the data processing in DMA mode (URAD = 1 and URAT = 0 can occur only if DUALBUFF is cleared in SHA_MR). |
| 1     | Output Data Register read during the data processing.   |
| 2     | SHA_MR written during the data processing.  |
| 3     | Write-only register read access.  |

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by writing a 1 to SWRST bit in SHA\_CR)

| Value | Description  |
|-------|--|
| 0     | No unspecified register access has been detected since the last SWRST.           |
| 1     | At least one unspecified register access has been detected since the last SWRST. |

**Bit 4 – WRDY** Input Data Register Write Ready

| Value | Description                   |
|-------|-------------------------------|
| 0     | SHA_IDATAR0 cannot be written |
| 1     | SHA_IDATAR0 can be written    |

**Bit 0 – DATRDY** Data Ready (cleared by writing a 1 to bit SWRST or START in SHA\_CR, or by reading SHA\_IODATARx)

| Value | Description  |
|-------|--|
| 0     | Output data is not valid.  |
| 1     | 512/1024-bit block process is completed. DATRDY is cleared when one of the following conditions is met: <ul style="list-style-type: none"><li>• Bit START in SHA_CR is set.</li><li>• Bit SWRST in SHA_CR is set.</li><li>• The hash result is read.</li></ul> |

### 60.5.7 SHA Message Size Register

**Name:** SHA\_MSR  
**Offset:** 0x20  
**Reset:** 0x0  
**Property:** Read/Write

|        |                |     |     |     |     |     |     |     |
|--------|----------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31             | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | MSGSIZE[31:24] |     |     |     |     |     |     |     |
| Access | R/W            | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0              | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |                |     |     |     |     |     |     |     |
| Bit    | 23             | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | MSGSIZE[23:16] |     |     |     |     |     |     |     |
| Access | R/W            | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0              | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |                |     |     |     |     |     |     |     |
| Bit    | 15             | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | MSGSIZE[15:8]  |     |     |     |     |     |     |     |
| Access | R/W            | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0              | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |                |     |     |     |     |     |     |     |
| Bit    | 7              | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | MSGSIZE[7:0]   |     |     |     |     |     |     |     |
| Access | R/W            | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0              | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – MSGSIZE[31:0] Message Size**

The size in bytes of the message. When MSGSIZE differs from 0, the SHA appends the corresponding value converted in bits after the padding section, as described in the FIPS180-2 specification.

To disable automatic padding, MSGSIZE field must be written to 0.

### 60.5.8 SHA Bytes Count Register

**Name:** SHA\_BCR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read/Write

|               |     |     |     |     |     |     |     |     |
|---------------|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit           | 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
| BYTCNT[31:24] |     |     |     |     |     |     |     |     |
| Access        | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset         | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit           | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| BYTCNT[23:16] |     |     |     |     |     |     |     |     |
| Access        | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset         | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit           | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
| BYTCNT[15:8]  |     |     |     |     |     |     |     |     |
| Access        | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset         | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit           | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| BYTCNT[7:0]   |     |     |     |     |     |     |     |     |
| Access        | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset         | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – BYTCNT[31:0]** Remaining Byte Count Before Auto Padding

When the hash processing starts from the beginning of a message (without preprocessed hash part), BYTCNT must be written with the same value as the MSGSIZE. If a part of the message has been already hashed and the hash does not start from the beginning, BYTCNT must be configured with the number of bytes remaining to process before padding section.

When read, provides the size in bytes of message remaining to be written before the automatic padding starts.

BYTCNT field is automatically updated each time a write occurs in the SHA\_IDATARx and SHA\_IODATARx.

When BYTCNT reaches 0, the MSGSIZE is converted into bit count and appended at the end of the message after the padding as described in the FIPS180-2 specification.

To disable automatic padding, MSGSIZE and BYTCNT fields must be written to 0.

### 60.5.9 SHA Input Data x Register

**Name:** SHA\_IDATARx  
**Offset:** 0x40 + x\*0x04 [x=0..15]  
**Reset:** –  
**Property:** Write-only

|        |              |    |    |    |    |    |    |    |
|--------|--------------|----|----|----|----|----|----|----|
| Bit    | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | IDATA[31:24] |    |    |    |    |    |    |    |
| Access | W            | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | IDATA[23:16] |    |    |    |    |    |    |    |
| Access | W            | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | IDATA[15:8]  |    |    |    |    |    |    |    |
| Access | W            | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | IDATA[7:0]   |    |    |    |    |    |    |    |
| Access | W            | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | –  |

#### Bits 31:0 – IDATA[31:0] Input Data

The 32-bit Input Data registers allow to load the data block used for hash processing.

These registers are write-only to prevent the input data from being read by another application.

SHA\_IDATAR0 corresponds to the first word of the block, SHA\_IDATAR15 to the last word of the last block in case SHA algorithm is set to SHA1, SHA224, SHA256 or SHA\_IODATA15R to the last word of the block if SHA algorithm is SHA384 or SHA512 (see [SHA Input/Output Data Register x](#)).

### 60.5.10 SHA Input/Output Data Register x

**Name:** SHA\_IODATARx  
**Offset:** 0x80 + x\*0x04 [x=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |               |     |     |     |     |     |     |     |
|--------|---------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31            | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | IODATA[31:24] |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |               |     |     |     |     |     |     |     |
| Bit    | 23            | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | IODATA[23:16] |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |               |     |     |     |     |     |     |     |
| Bit    | 15            | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | IODATA[15:8]  |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
|        |               |     |     |     |     |     |     |     |
| Bit    | 7             | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | IODATA[7:0]   |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 31:0 – IODATA[31:0] Input/Output Data

These registers can be used to read the resulting message digest and to write the second part of the message block when the SHA algorithm is SHA-384 or SHA-512.

SHA\_IODATA0R to SHA\_IODATA15R can be written or read but reading these offsets does not return the content of corresponding parts (words) of the message block. Only results from SHA calculation can be read through these registers.

When SHA processing is in progress, these registers return 0x0000.

SHA\_IODATAR0 corresponds to the first word of the message digest; SHA\_IODATAR4 to the last one in SHA1 mode, SHA\_ODATAR6 in SHA224, SHA\_IODATAR7 in SHA256, SHA\_IODATAR11 in SHA384 or SHA\_IODATAR15 in SHA512.

When SHA224 is selected, the content of SHA\_ODATAR7 must be ignored.

When SHA384 is selected, the content of SHA\_IODATAR12 to SHA\_IODATAR15 must be ignored.

## 61. Triple Data Encryption Standard (TDES)

### 61.1 Description

The Triple Data Encryption Standard (TDES) is compliant with the American FIPS (Federal Information Processing Standard) Publication 46-3 specification.

The TDES supports the four different confidentiality modes of operation (ECB, CBC, OFB and CFB), specified in the FIPS (Federal Information Processing Standard) Publication 81 and is compatible with the Peripheral Data Controller channels for all of these modes, minimizing processor intervention for large buffer transfers.

The TDES key is loaded by the software.

The software can write up to three 64-bit keys, each stored in two 32-bit write-only registers, i.e., Key x Word Registers TDES\_KEYxWR0 and TDES\_KEYxWR1.

The input data (and initialization vector for some modes) are stored in two corresponding 32-bit write-only registers:

- Input Data Registers TDES\_IDATAR0 and TDES\_IDATAR1
- Initialization Vector Registers TDES\_IVR0 and TDES\_IVR1

As soon as the initialization vector, the input data and the keys are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data is ready to be read out on the two 32-bit Output Data registers (TDES\_ODATARx) or through the DMA channels.

### 61.2 Embedded Characteristics

- Supports Single Data Encryption Standard (DES) and Triple Data Encryption Standard (TDES)
- Compliant with FIPS Publication 46-3, Data Encryption Standard (DES)
- 64-bit Cryptographic Key for TDES
- Two-key or Three-key Algorithms for TDES
- 18-clock Cycles Encryption/Decryption Processing Time for DES
- 50-clock Cycles Encryption/Decryption Processing Time for TDES
- Supports eXtended Tiny Encryption Algorithm (XTEA)
- 128-bit key for XTEA and Programmable Round Number up to 64
- Supports the Four Standard Modes of Operation specified in the FIPS Publication 81, DES Modes of Operation
  - Electronic Code Book (ECB)
  - Cipher Block Chaining (CBC)
  - Cipher Feedback (CFB)
  - Output Feedback (OFB)
- 8-, 16-, 32- and 64-bit Data Sizes Possible in CFB Mode
- Last Output Data Mode Allowing Optimized Message (Data) Authentication Code (MAC) Generation
- Connection to DMA Optimizes Data Transfers for all Operating Modes

## 61.3 Product Dependencies

### 61.3.1 Power Management

The TDES may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the TDES clock.

### 61.3.2 Interrupt Sources

The TDES interface has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TDES.

## 61.4 Functional Description

The Data Encryption Standard (DES) and the Triple Data Encryption Algorithm (TDES) specify FIPS-approved cryptographic algorithms that can be used to protect electronic data. The TDES bit in the TDES Mode Register (TDES\_MR) is used to select either the single DES or the Triple DES mode.

Encryption (enciphering) converts data to an unintelligible form called ciphertext. Decrypting (deciphering) the ciphertext converts the data back into its original form, called plaintext. The CIPHER bit in TDES\_MR is used to choose between encryption and decryption.

A DES is capable of using cryptographic keys of 64 bits to encrypt and decrypt data in blocks of 64 bits. This 64-bit key is defined in the Key 1 Registers (TDES\_KEY1WRx).

A TDES key consists of three DES keys, which is also referred to as a key bundle. These three 64-bit keys are defined, respectively, in the Key 1, 2 and 3 Registers (TDES\_KEY1WRx, TDES\_KEY2WRx and TDES\_KEY3WRx). In Triple DES mode (TDESMOD = 1 in TDES\_MR), the KEYMOD bit in TDES\_MR is used to choose between a two- and a three-key algorithm, as summarized in the table below.

**Table 61-1. TDES Algorithms Summary**

| Algorithm | Mode       | Data Processing Sequence Steps |                       |                       |
|-----------|------------|--------------------------------|-----------------------|-----------------------|
|           |            | First                          | Second                | Third                 |
| Three-key | Encryption | Encryption with Key 1          | Decryption with Key 2 | Encryption with Key 3 |
|           | Decryption | Decryption with Key 3          | Encryption with Key 2 | Decryption with Key 1 |
| Two-key   | Encryption | Encryption with Key 1          | Decryption with Key 2 | Encryption with Key 1 |
|           | Decryption | Decryption with Key 1          | Encryption with Key 2 | Decryption with Key 1 |

The input to the encryption processes of the CBC, CFB, and OFB modes includes, in addition to the plaintext, a 64-bit data block called the initialization vector (IV), which must be set in the Initialization Vector Registers (TDES\_IVRx). The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message.

The XTEA algorithm can be used instead of DES/TDES by configuring the TDESMOD field in TDES\_MR with the appropriate value 0x2. An XTEA key consists of a 128-bit key. They are defined in the Key 1 and 2 Registers.

The number of rounds of XTEA is defined in TDES\_XTEA\_RNDR and can be programmed up to 64 (1 round = 2 Feistel network rounds).

All the start and operating modes of the TDES algorithm can be applied to the XTEA algorithm.

### 61.4.1 Operating Modes

The TDES supports the following operating modes:

- ECB—Electronic Code Book
- CBC—Cipher Block Chaining
- OFB—Output Feedback
- CFB—Cipher Feedback
  - CFB8 (CFB where the length of the data segment is 8 bits)
  - CFB16 (CFB where the length of the data segment is 16 bits)
  - CFB32 (CFB where the length of the data segment is 32 bits)
  - CFB64 (CFB where the length of the data segment is 64 bits)

The data pre-processing, post-processing and data chaining for each mode are automatically performed. Refer to the FIPS Publication 81 for more complete information.

These modes are selected by setting the OPMOD field in TDES\_MR.

In CFB mode, four data sizes are possible (8, 16, 32 and 64 bits), configurable by means of the CFBS field in TDES\_MR (see [TDES Mode Register](#)).

### 61.4.2 Start Modes

The SMOD field in TDES\_MR selects the Encryption (or Decryption) start mode.

#### 61.4.2.1 Manual Mode

The sequence is as follows:

1. Write the TDES\_MR register with all required fields, including but not limited to SMOD and OPMOD.
2. Write the 64-bit key(s) in the different Key Registers (TDES\_KEYxWRx), depending on whether one, two or three keys are required.
3. Write the initialization vector (or counter) in the Initialization Vector Registers (TDES\_IVRx).  
**Note:** The Initialization Vector Registers concern all modes except ECB.
4. Set the bit DATRDY (Data Ready) in the TDES Interrupt Enable register (TDES\_IER), depending on whether an interrupt is required or not at the end of processing.
5. Write the data to be encrypted/decrypted in the authorized Input Data Registers (see the table below).  
**Note:** In 32-, 16- and 8-bit CFB modes, writing to TDES\_IDATAR1 is not allowed and may lead to processing errors.
6. Set the START bit in the TDES Control Register (TDES\_CR) to begin the encryption or decryption process.
7. When the processing completes, the bit DATRDY in the TDES Interrupt Status Register (TDES\_ISR) rises. If an interrupt has been enabled by setting the bit DATRDY in TDES\_IER, the interrupt line of the TDES is activated.
8. When the software reads one of the Output Data Registers (TDES\_ODATARx), the DATRDY bit is automatically cleared.

**Table 61-2. Authorized Input Data Registers**

| Operating Mode | Input Data Registers to Write |
|----------------|-------------------------------|
| ECB            | All                           |

| .....continued |                               |
|----------------|-------------------------------|
| Operating Mode | Input Data Registers to Write |
| CBC            | All                           |
| OFB            | All                           |
| CFB 64-bit     | All                           |
| CFB 32-bit     | TDES_IDATAR0                  |
| CFB 16-bit     | TDES_IDATAR0                  |
| CFB 8-bit      | TDES_IDATAR0                  |

**61.4.2.2 Auto Mode**

The Auto Mode is similar to the Manual Mode, except that as soon as the correct number of Input Data registers is written, processing is automatically started without any action in TDES\_CR.

**61.4.2.3 DMA Mode**

The DMA Controller can be used in association with the TDES to perform an encryption/decryption of a buffer without any action by the software during processing.

The SMOD field of TDES\_MR must be set to 0x2 and the DMA must be configured with non-incremental addresses.

For all operating modes except CBC-MAC (TDES\_MR.LOD=1), 2 DMA channels must be programmed (transmit and receive). In CBC-MAC, only 1 transmit channel must be programmed.

The start address of any transfer descriptor must be set in TDES\_IDATAR0.

The DMA chunk size configuration depends on the TDES mode of operation and is listed in the table below.

When writing data to TDES with the first DMA channel, data will be fetched from a memory buffer (source data). It is recommended to configure the size of source data to “words” even for CFB modes. On the contrary, the destination data size depends on the mode of operation. When reading data from the TDES with the second DMA channel, the source data is the data read from TDES and data destination is the memory buffer. In this case, source data size depends on the TDES mode of operation and is listed in the table below.

**Table 61-3. DMA Data Transfer Type for the Different Operating Modes**

| Operating Mode | Chunk Size | Destination/Source Data Transfer Type |
|----------------|------------|---------------------------------------|
| ECB            | 1          | Word                                  |
| CBC            | 1          | Word                                  |
| OFB            | 1          | Word                                  |
| CFB 64-bit     | 1          | Word                                  |
| CFB 32-bit     | 1          | Word                                  |
| CFB 16-bit     | 1          | Half-word                             |
| CFB 8-bit      | 1          | Byte                                  |

### 61.4.3 Last Output Data Mode (CBC-MAC)

This mode is used to generate cryptographic checksums on data (MAC) using a CBC-MAC or a CFB encryption algorithm (refer to *FIPS Publication 81 Appendix F*).

The CMAC algorithm is a variant of CBC-MAC with post-processing requiring one-block encryption in ECB mode. Thus CBC-MAC is useful to accelerate CMAC.

After each end of encryption/decryption, the output data is available either on the output data registers for Manual and Auto modes or at the address specified in the receive buffer pointer for DMA mode (See [Last Output Data Mode Behavior versus Start Modes](#)).

The Last Output Data bit (LOD) in TDES\_MR can be used to retrieve only the last data of several encryption/decryption processes.

This data is only available on the Output Data Registers (TDES\_ODATARx).

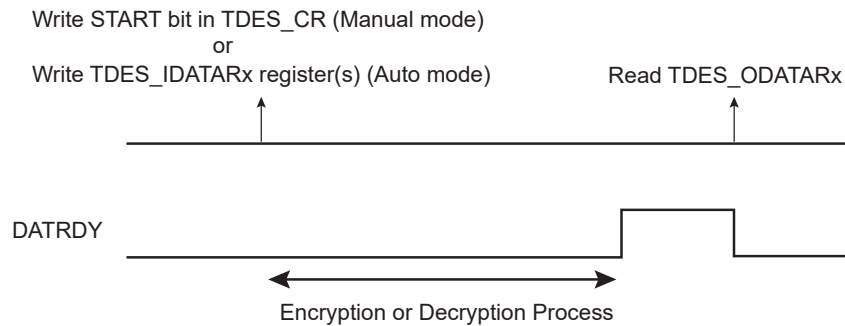

Therefore, there is no need to define a read buffer in DMA mode.

#### 61.4.3.1 Manual and Auto Modes

##### 61.4.3.1.1 TDES\_MR.LOD = 0

The DATRDY flag is cleared when at least one of the Output Data Registers is read. See the figure below.

**Figure 61-1. Manual and Auto Modes with LOD = 0**

If the user does not want to read the output data registers between each encryption/decryption, the DATRDY flag will not be cleared. If the DATRDY flag is not cleared, the user will not be informed of the end of the encryptions/decryptions that follow.

##### 61.4.3.1.2 TDES\_MR.LOD = 1

The DATRDY flag is cleared when at least one Input Data Register is written, before the start of a new transfer. See the figure below. No further Output Data Register reads are necessary between consecutive encryptions/decryptions.

**Figure 61-2. Manual and Auto Modes with LOD = 1**

### 61.4.3.2 DMA Mode

#### 61.4.3.2.1 TDES\_MR.LOD = 0

This mode may be used for all TDES operating modes except CBC-MAC where LOD = 1 mode is recommended.

The end of the encryption/decryption is indicated by the end of DMA transfer associated to TDES\_ODATARx (see the figure below). Two DMA channels are required: one for writing message blocks to TDES\_IDATARx and one to obtain the result from TDES\_ODATARx.

**Figure 61-3. DMA Transfer with LOD = 0**

#### 61.4.3.2.2 TDES\_MR.LOD = 1

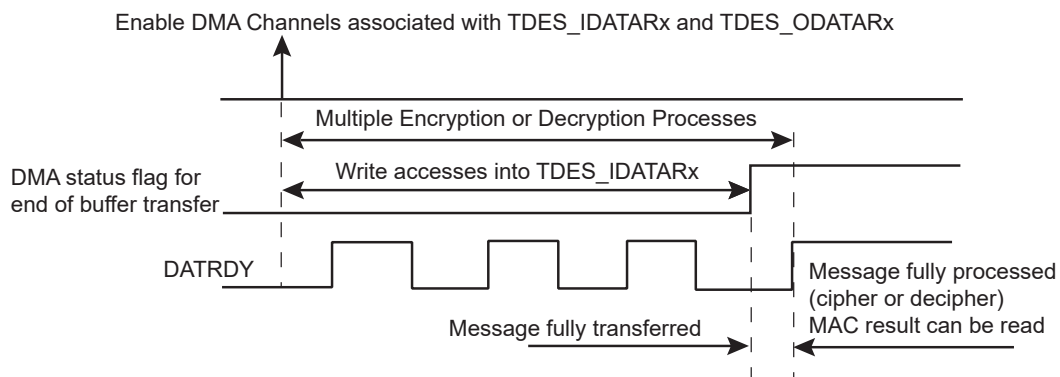

This mode is optimized to process the TDES CBC-MAC operating mode.

The user must first wait for the DMA buffer transfer complete flag, then for the flag DATRDY to rise to ensure that the encryption/decryption is completed (see the figure below).

The DMA receive channel must not be used. Prior to reading the CBC-MAC result, TDES\_MR.SMODO must be written to '0'. To restart a CBC-MAC on a new buffer, TDES\_MR.SMODO must be written to '2'.

The output data is only available on TDES\_ODATARx.

**Figure 61-4. DMA Transfer with LOD = 1**

The table below summarizes the different cases.

**Table 61-4. Last Output Data Mode Behavior versus Start Modes**

| Sequence                                      | Manual and Auto Modes                          |  | DMA Transfer |                    |
|---|--|--|--------------|--------------------|
|   | LOD = 0  | LOD = 1  | LOD = 0      | LOD = 1            |
| DATRDY Flag Clearing Condition <sup>(1)</sup> | At least one Output Data Register must be read | At least one Input Data Register must be written | Not used     | Managed by the DMA |

# SAMA5D2 Series

## Triple Data Encryption Standard (TDES)

.....continued

| Sequence  | Manual and Auto Modes           |                                 | DMA Transfer  |  |
|---|---------------------------------|---------------------------------|---|--|
|   | LOD = 0                         | LOD = 1                         | LOD = 0   | LOD = 1  |
| End of Encryption/<br>Decryption                | DATRDY                          | DATRDY                          | 2 DMA Buffer<br>transfer complete<br>flags (channel m<br>and channel n) | DMA buffer transfer<br>complete flag, then<br>TDES DATRDY flag |
| Encrypted/<br>Decrypted Data<br>Result Location | In the Output Data<br>Registers | In the Output Data<br>Registers | Not available   | In the Output Data<br>Registers                                |

**Note:** Depending on the mode, there are other ways of clearing the DATRDY flag. See [TDES Interrupt Status Register](#).

In DMA mode, reading to the Output Data registers before the last data transfer may lead to unpredictable results.

### 61.4.4 Security Features

#### 61.4.4.1 Unspecified Register Access Detection

When an unspecified register access occurs, the URAD bit in TDES\_ISR is set. Its source is then reported in the Unspecified Register Access Type field (URAT). Only the last unspecified register access is available through the URAT field.

Several kinds of unspecified register accesses can occur:

- Input Data Register written during the data processing in DMA mode
- Output Data Register read during the data processing
- Mode Register written during the data processing
- Write-only register read access

The URAD bit and the URAT field can only be reset by the SWRST bit in TDES\_CR.

### 61.5.1 TDES Control Register

**Name:** TDES\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

#### Bit 8 – SWRST Software Reset

| Value | Description  |
|-------|--|
| 0     | No effect  |
| 1     | Resets the TDES. A software triggered hardware reset of the TDES interface is performed. |

#### Bit 0 – START Start Processing

| Value | Description                                  |
|-------|--|
| 0     | No effect                                    |
| 1     | Starts Manual encryption/decryption process. |

### 61.5.2 TDES Mode Register

**Name:** TDES\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |     |    |     |     |    |     |     |     |
|--------|-----|----|-----|-----|----|-----|-----|-----|
| Bit    | 31  | 30 | 29  | 28  | 27 | 26  | 25  | 24  |
| Access |     |    |     |     |    |     |     |     |
| Reset  |     |    |     |     |    |     |     |     |
| Bit    | 23  | 22 | 21  | 20  | 19 | 18  | 17  | 16  |
| Access |     |    |     |     |    |     | R/W | R/W |
| Reset  |     |    |     |     |    |     | 0   | 0   |
| Bit    | 15  | 14 | 13  | 12  | 11 | 10  | 9   | 8   |
| Access | R/W |    | R/W | R/W |    |     | R/W | R/W |
| Reset  | 0   |    | 0   | 0   |    |     | 0   | 0   |
| Bit    | 7   | 6  | 5   | 4   | 3  | 2   | 1   | 0   |
| Access |     |    |     | R/W |    | R/W | R/W | R/W |
| Reset  |     |    |     | 0   |    | 0   | 0   | 0   |

#### Bits 17:16 – CFBS[1:0] Cipher Feedback Data Size

| Value | Name       | Description |
|-------|------------|-------------|
| 0     | SIZE_64BIT | 64-bit      |
| 1     | SIZE_32BIT | 32-bit      |
| 2     | SIZE_16BIT | 16-bit      |
| 3     | SIZE_8BIT  | 8-bit       |

#### Bit 15 – LOD Last Output Data Mode

In DMA mode, reading to the Output Data registers before the last data encryption/decryption process may lead to unpredictable result.

| Value | Description  |
|-------|--|
| 0     | <p>No effect.</p> <p>After each end of encryption/decryption, the output data is available either on the output data registers (Manual and Auto modes) .</p> <p>In Manual and Auto modes, the DATRDY flag is cleared when at least one of the Output Data registers is read.</p> |

| Value | Description  |
|-------|--|
| 1     | The DATRDY flag is cleared when at least one of the Input Data Registers is written.<br><br>No more Output Data Register reads are necessary between consecutive encryptions/decryptions (see <a href="#">Last Output Data Mode</a> ). |

**Bits 13:12 – OPMOD[1:0]** Operating Mode

For CBC-MAC operating mode, set OPMOD to CBC and LOD to 1.

| Value | Name | Description                |
|-------|------|----------------------------|
| 0     | ECB  | Electronic Code Book mode  |
| 1     | CBC  | Cipher Block Chaining mode |
| 2     | OFB  | Output Feedback mode       |
| 3     | CFB  | Cipher Feedback mode       |

**Bits 9:8 – SMOD[1:0]** Start Mode

If a DMA transfer is used, 0x2 must be configured. See [DMA Mode](#) for more details.

| Value | Name          | Description                          |
|-------|---------------|--------------------------------------|
| 0     | MANUAL_START  | Manual Mode                          |
| 1     | AUTO_START    | Auto Mode                            |
| 2     | IDATAR0_START | TDES_IDATAR0 accesses only Auto Mode |

**Bit 4 – KEYMOD** Key Mode

| Value | Description  |
|-------|--|
| 0     | Three-key algorithm is selected.   |
| 1     | Two-key algorithm is selected. There is no need to write Key 3 Registers TDES_KEY3WRx. |

**Bits 2:1 – TDESMOD[1:0]** ALGORITHM Mode

Values which are not listed in the table must be considered as “reserved”.

| Value | Name       | Description  |
|-------|------------|--|
| 0     | SINGLE_DES | Single DES processing using Key 1 Registers                  |
| 1     | TRIPLE_DES | Triple DES processing using Key 1, Key 2 and Key 3 Registers |
| 2     | XTEA       | XTEA processing using Key 1 and Key 2 Registers              |

**Bit 0 – CIPHER** Processing Mode

| Value | Name    | Description    |
|-------|---------|----------------|
| 0     | DECRYPT | Decrypts data. |
| 1     | ENCRYPT | Encrypts data. |

### 61.5.3 TDES Interrupt Enable Register

**Name:** TDES\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

### 61.5.6 TDES Interrupt Status Register

**Name:** TDES\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

**Bits 13:12 – URAT[1:0]** Unspecified Register Access (cleared by setting bit TDES\_CR.SWRST)  
 Only the last Unspecified Register Access Type is available through the URAT field.

| Value | Name              | Description  |
|-------|-------------------|--|
| 0     | IDR_WR_PROCESSING | Input Data Register written during data processing when SMOD = 0x2 mode. |
| 1     | ODR_RD_PROCESSING | Output Data Register read during data processing.                        |
| 2     | MR_WR_PROCESSING  | Mode Register written during data processing.                            |
| 3     | WOR_RD_ACCESS     | Write-only register read access.   |

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by setting bit TDES\_CR.SWRST)

| Value | Description   |
|-------|---|
| 0     | No unspecified register access has been detected since the last write of bit TDES_CR.SWRST.           |
| 1     | At least one unspecified register access has been detected since the last write of bit TDES_CR.SWRST. |

**Bit 0 – DATRDY** Data Ready (cleared by setting bit START or bit SWRST in TDES\_CR or by reading TDES\_ODATARx)

If TDES\_MR.LOD = 1: In Manual and Auto modes, the DATRDY flag can also be cleared by writing at least one TDES\_IDATARx.

#### Bits 31:0 – KEY1W[31:0] Key 1 Word

The two 32-bit Key 1 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

KEY1W0 refers to the first word of the key and KEY1W1 to the last one.

These registers are write-only to prevent the key from being read by another application.

In XTEA mode, the key is defined on 128 bits. These registers contain the 64 LSB bits of the encryption/decryption key.

### 61.5.8 TDES Key 2 Word Register x

**Name:** TDES\_KEY2WRx  
**Offset:** 0x28 + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

#### Bits 31:0 – KEY2W[31:0] Key 2 Word

The two 32-bit Key 2 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

KEY2W0 refers to the first word of the key and KEY2W1 to the last one.

These registers are write-only to prevent the key from being read by another application.

TDES\_KEY2WRx registers are not used in DES mode.

In XTEA mode, the key is defined on 128 bits. These registers contain the 64 MSB bits of the encryption/decryption key.

### 61.5.9 TDES Key 3 Word Register x

**Name:** TDES\_KEY3WRx  
**Offset:** 0x30 + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

|        |              |    |    |    |    |    |    |    |

| Reset  | –            | –  | –  | –  | –  | –  | –  | –  |

#### Bits 31:0 – KEY3W[31:0] Key 3 Word

The two 32-bit Key 3 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

KEY3W0 refers to the first word of the key and KEY3W1 to the last one.

These registers are write-only to prevent the key from being read by another application.

TDES\_KEY3WRx registers are not used in DES mode, TDES with two-key algorithm selected and XTEA mode.

**61.5.10 TDES Input Data Register x**

**Name:** TDES\_IDATARx  
**Offset:** 0x40 + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

|        | IDATA[7:0]   |    |    |    |    |    |    |    |
| Access | W            | W  | W  | W  | W  | W  | W  | W  |
| Reset  | –            | –  | –  | –  | –  | –  | –  | –  |

**Bits 31:0 – IDATA[31:0] Input Data**

The two 32-bit Input Data registers are used to set the 64-bit data block used for encryption/decryption.

IDATA0 refers to the first word of the data to be encrypted/decrypted, and IDATA1 to the last one.

These registers are write-only to prevent the input data from being read by another application.

### 61.5.11 TDES Output Data Register x

**Name:** TDES\_ODATARx  
**Offset:** 0x50 + x\*0x04 [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read-only

|        |              |    |    |    |    |    |    |    |
|--------|--------------|----|----|----|----|----|----|----|

| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | ODATA[15:8]  |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | ODATA[7:0]   |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – ODATA[31:0] Output Data

The two 32-bit Output Data registers contain the 64-bit data block which has been encrypted/decrypted.

ODATA1 refers to the first word, ODATA2 to the last one.

### 61.5.12 TDES Initialization Vector Register x

**Name:** TDES\_IVRx  
**Offset:** 0x60 + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

|        |           |    |    |    |    |    |    |    |
|--------|-----------|----|----|----|----|----|----|----|
| Bit    | 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | IV[31:24] |    |    |    |    |    |    |    |
| Access | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  | –         | –  | –  | –  | –  | –  | –  | –  |
| Bit    | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | IV[23:16] |    |    |    |    |    |    |    |
| Access | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  | –         | –  | –  | –  | –  | –  | –  | –  |
| Bit    | 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | IV[15:8]  |    |    |    |    |    |    |    |
| Access | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  | –         | –  | –  | –  | –  | –  | –  | –  |
| Bit    | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | IV[7:0]   |    |    |    |    |    |    |    |
| Access | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  | –         | –  | –  | –  | –  | –  | –  | –  |

#### Bits 31:0 – IV[31:0] Initialization Vector

The two 32-bit Initialization Vector registers are used to set the 64-bit initialization vector data block, which is used by some modes of operation as an additional initial input.

IV1 refers to the first word of the Initialization Vector, IV2 to the last one.

These registers are write-only to prevent the Initialization Vector from being read by another application.

These registers are not used for the ECB mode and must not be written.

### 61.5.13 TDES XTEA Rounds Register

**Name:** TDES\_XTEA\_RNDR  
**Offset:** 0x70  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 5:0 – XTEA\_RNDS[5:0] Number of Rounds

This 6-bit field is used to define the number of complete rounds (1 complete round = 2 Feistel rounds) processed in XTEA algorithm.

The value of XTEA\_RNDS has no effect if the TDESMOD field in TDES\_MR is set to 0x0 or 0x1.

0x00 corresponds to 1 complete round, 0x01 corresponds to 2 complete rounds, etc.

## 62. True Random Number Generator (TRNG)

### 62.1 Description

The True Random Number Generator (TRNG) passes the American *NIST Special Publication 800-22 (A Statistical Test Suite for Random and Pseudorandom Number Generators for Cryptographic Applications)* and the *Diehard Suite of Tests*.

The TRNG may be used as an entropy source for seeding an NIST approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3.

### 62.2 Embedded Characteristics

- Passes *NIST Special Publication 800-22 Test Suite*
- Passes *Diehard Suite of Tests*
- May be Used as Entropy Source for seeding a NIST-approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3
- Provides a 32-bit Random Number Every 84 Clock Cycles

### 62.3 Block Diagram

Figure 62-1. TRNG Block Diagram

### 62.4 Product Dependencies

#### 62.4.1 Power Management

The TRNG interface may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the TRNG user interface clock. The user interface clock is independent from any clock that may be used in the entropy source logic circuitry. The source of entropy can be enabled before enabling the user interface clock.

#### 62.4.2 Interrupt Sources

The TRNG interface has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TRNG.

## **62.5 Functional Description**

As soon as the TRNG is enabled in the Control register (TRNG\_CR), the generator provides one 32-bit random value every 84 clock cycles.

The TRNG interrupt line can be enabled in the Interrupt Enable register (TRNG\_IER), and disabled in the Interrupt Disable register (TRNG\_IDR). This interrupt is set when a new random value is available and is cleared when the Status register (TRNG\_ISR) is read. The flag TRNG\_ISR.DATRDY is set when the random data is ready to be read out on the 32-bit Output Data register (TRNG\_ODATA).

| Access |              |    |    |    |    |    |    | W      |
| Reset  |              |    |    |    |    |    |    | –      |

#### Bits 31:8 – WAKEY[23:0] Register Write Access Key

| Value    | Name   | Description   |
|----------|--------|---|
| 0x524E47 | PASSWD | Writing any other value in this field aborts the write operation. |

#### Bit 0 – ENABLE Enable TRNG to Provide Random Values

| Value | Description  |
|-------|--|
| 0     | Disables the TRNG if 0x524E47 (“RNG” in ASCII) is written in WAKEY field at the same time. |
| 1     | Enables the TRNG if 0x524E47 (“RNG” in ASCII) is written in WAKEY field at the same time.  |

### 62.6.2 TRNG Interrupt Enable Register

**Name:** TRNG\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

**Bit 0 – DATRDY** Data Ready Interrupt Enable

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | Enables the corresponding interrupt. |

### 62.6.3 TRNG Interrupt Disable Register

**Name:** TRNG\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

#### Bit 0 – DATRDY Data Ready Interrupt Disable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Disables the corresponding interrupt. |

### 62.6.4 TRNG Interrupt Mask Register

**Name:** TRNG\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 0 – DATRDY** Data Ready Interrupt Mask

| Value | Description                                 |
|-------|---|
| 0     | The corresponding interrupt is not enabled. |
| 1     | The corresponding interrupt is enabled.     |

### 62.6.5 TRNG Interrupt Status Register

**Name:** TRNG\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 0 – DATRDY** Data Ready (cleared on read)

| Value | Description  |
|-------|--|
| 0     | Output data is not valid or TRNG is disabled.                    |
| 1     | New random value is completed since the last read of TRNG_ODATA. |

### 62.6.6 TRNG Output Data Register

**Name:** TRNG\_ODATA  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read-only

| Bit          | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|--------------|----|----|----|----|----|----|----|----|
| ODATA[31:24] |    |    |    |    |    |    |    |    |
| Access       | R  | R  | R  | R  | R  | R  | R  | R  |
| Reset        | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit          | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ODATA[23:16] |    |    |    |    |    |    |    |    |
| Access       | R  | R  | R  | R  | R  | R  | R  | R  |
| Reset        | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit          | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
| ODATA[15:8]  |    |    |    |    |    |    |    |    |
| Access       | R  | R  | R  | R  | R  | R  | R  | R  |
| Reset        | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit          | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ODATA[7:0]   |    |    |    |    |    |    |    |    |
| Access       | R  | R  | R  | R  | R  | R  | R  | R  |
| Reset        | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – ODATA[31:0] Output Data

The 32-bit Output Data register contains the 32-bit random data.

## 63. Analog Comparator Controller (ACC)

### 63.1 Description

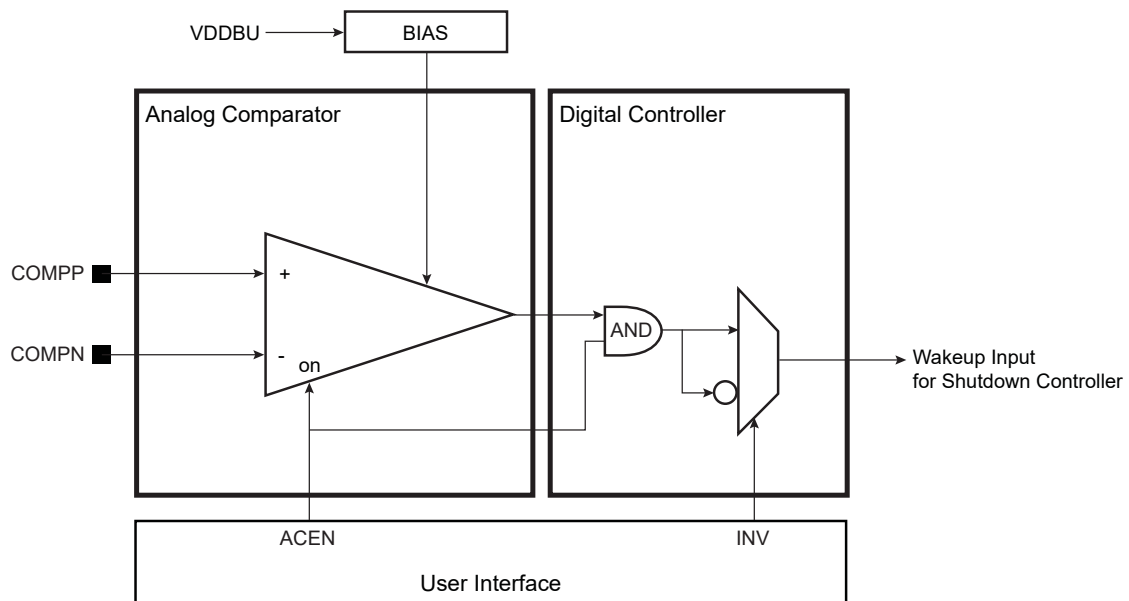

The Analog Comparator Controller (ACC) controls the analog comparator in order to provide an additional source of wakeup when the system wakes up from Wait mode.

### 63.2 Embedded Characteristics

- Source of Wakeup When System Wakes Up from Wait Mode and ULP1 Mode

### 63.3 Block Diagram

Figure 63-1. Analog Comparator Controller Block Diagram

### 63.4 Signal Description

Table 63-1. ACC Signal Description

| Pin Name     | Description                 | Type  |
|--------------|-----------------------------|-------|
| COMPP, COMPN | External analog data inputs | Input |

### 63.5 Product Dependencies

#### 63.5.1 I/O Lines

The analog input pins (COMPP and COMPN) are not multiplexed with digital functions (PIO) on the I/O line.

### 63.5.2 Power Management

By clearing the ACEN bit in the ACC Mode Register (ACC\_MR), the analog comparator power consumption is reduced to current leakage only.

## 63.6 Functional Description

### 63.6.1 Description

The analog comparator is enabled by writing a one to the ACEN bit in the ACC Mode Register (ACC\_MR) and the polarity of the comparator output can be configured with bit ACC\_MR.INV.

The ACC registers are listed in the Register Summary.

### 63.6.2 Register Write Protection

To prevent any single software error from corrupting ACC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the ACC Write Protection Mode Register (ACC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [ACC Write Protection Status Register](#) (ACC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the ACC\_WPSR register.

The following registers can be write-protected:

- [ACC Mode Register](#)

### 63.7 Register Summary

| Offset              | Name     | Bit Pos. |              |  |     |  |  |  |       |
|---------------------|----------|----------|--------------|--|-----|--|--|--|-------|
| 0x00                | ACC_CR   | 7:0      |              |  |     |  |  |  | SWRST |
|                     |          | 15:8     |              |  |     |  |  |  |       |
|                     |          | 23:16    |              |  |     |  |  |  |       |
|                     |          | 31:24    |              |  |     |  |  |  |       |
| 0x04                | ACC_MR   | 7:0      |              |  |     |  |  |  |       |
|                     |          | 15:8     |              |  | INV |  |  |  | ACEN  |
|                     |          | 23:16    |              |  |     |  |  |  |       |
|                     |          | 31:24    |              |  |     |  |  |  |       |
| 0x08<br>...<br>0xE3 | Reserved |          |              |  |     |  |  |  |       |
| 0xE4                | ACC_WPMR | 7:0      |              |  |     |  |  |  | WPEN  |
|                     |          | 15:8     | WPKEY[7:0]   |  |     |  |  |  |       |
|                     |          | 23:16    | WPKEY[15:8]  |  |     |  |  |  |       |

|                     |          | 15:8     |              |  |     |  |  |  |       |
|                     |          | 23:16    |              |  |     |  |  |  |       |
|                     |          | 31:24    |              |  |     |  |  |  |       |

# SAMA5D2 Series

## Analog Comparator Controller (ACC)

### 63.7.1 ACC Control Register

**Name:** ACC\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

**Bit 0 – SWRST** Software Reset

| Value | Description        |
|-------|--------------------|
| 0     | No effect.         |
| 1     | Resets the module. |

### 63.7.2 ACC Mode Register

**Name:** ACC\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ACC Write Protection Mode Register](#).

**Bit 12 – INV** Invert Comparator Output  
 0 (DIS): Analog comparator output is directly processed.  
 1 (EN): Analog comparator output is inverted prior to being processed.

**Bit 8 – ACEN** Analog Comparator Enable  
 0 (DIS): Analog comparator disabled.  
 1 (EN): Analog comparator enabled.

# SAMA5D2 Series

## Analog Comparator Controller (ACC)

### 63.7.3 ACC Write Protection Mode Register

**Name:** ACC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |     |              |    |    |    |    |    |    |     |
|--------|-----|--------------|----|----|----|----|----|----|-----|
|        | Bit | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24  |
|        |     | WPKEY[23:16] |    |    |    |    |    |    |     |
| Access |     | W            | W  | W  | W  | W  | W  | W  | W   |
| Reset  |     | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0   |
|        | Bit | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16  |
|        |     | WPKEY[15:8]  |    |    |    |    |    |    |     |
| Access |     | W            | W  | W  | W  | W  | W  | W  | W   |
| Reset  |     | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0   |
|        | Bit | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8   |
|        |     | WPKEY[7:0]   |    |    |    |    |    |    |     |
| Access |     | W            | W  | W  | W  | W  | W  | W  | W   |
| Reset  |     | 0            | 0  | 0  | 0  | 0  | 0  | 0  | –   |
|        | Bit | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0   |
|        |     | WPEN         |    |    |    |    |    |    |     |
| Access |     |              |    |    |    |    |    |    | R/W |
| Reset  |     |              |    |    |    |    |    |    | 0   |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description   |
|----------|--------|---|
| 0x414343 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. |
| 3        |        | Always reads as 0.  |

#### Bit 0 – WPEN Write Protection Enable

Refer to [Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description  |
|-------|--|
| 0     | Disables the write protection if WPKEY corresponds to 0x414343 (“ACC” in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x414343 (“ACC” in ASCII).  |

### 63.7.4 ACC Write Protection Status Register

**Name:** ACC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

#### Bit 0 – WPVS Write Protection Violation Status

| Value | Description   |
|-------|---|
| 0     | No write protection violation has occurred since the last read of ACC_WPSR.           |
| 1     | A write protection violation (WPEN = 1) has occurred since the last read of ACC_WPSR. |

## **64. Security Module (SECUMOD)**

### **64.1 Description**

The Security Module (SECUMOD) features different levels of security depending on the device reference. This section describes the protections embedded in the SECUMOD available on all SAMA5D2 devices.

This module embeds the secure memories (5 Kbytes of SRAM and a 256-bit register bank) dedicated to the storage of sensitive data. These memories are scrambled with a programmable 32-bit key.

When a fault is detected, regardless of the source, a clear signal can be sent automatically to the secure memories and clear their contents.

For information specific to dynamic tamper protection (PIOBU), refer to the document “SAMA5D2 External Tamper Protections”(document no. 44095).

For information specific to temperature, voltage and frequency monitoring for SAMA5D23 and SAMA5D28, refer to the document “SAMA5D23 and SAMA5D28 Environmental Monitors” (document no. 44036).

### **64.2 Embedded Characteristics**

A PIO Controller managing up to eight pads (PIOBU) and offering:

- Standard I/O function powered in the backup domain
- Eight external switch state change detectors
- Memory erase and scrambling
- Backup SRAM access and Zeroisation process

### 64.3 Block Diagram

Figure 64-1. SECUMOD Block Diagram

The above figure represents the logic inside the SECUMOD. Analog cells are external to the IP and highlighted in green.

#### 64.3.1 I/O Lines Description

Table 64-1. I/O Lines Description

| Name       | Description  | Type  |
|------------|--|-------|
| CLK32KHZ   | 32 kHz system clock from crystal or RC oscillator (SLCK) | Input |
| ICLK       | 64 kHz RC Oscillator                                     | Input |
| PIOBU[7:0] | Parallel IO backup controller, 8 pads                    | I/O   |

| .....continued |  |        |
|----------------|--|--------|
| Name           | Description  | Type   |
| IRQ[1:0]       | Interrupt signals going to secure AIC              | Output |
| SWKUP          | Wakeup signal going to system controller WKUP1 pin | Output |
| FNTRST         | Force Cortex-A5 test port reset                    | Output |

## 64.4 Product Dependencies

### 64.4.1 Interrupt Sources

The SECUMOD provides two interrupt lines, each connected to one of the internal sources of the Advanced Interrupt Controller. Using these interrupts requires the AIC to be programmed first. Note that it is not recommended to use the interrupt lines in Edge-sensitive mode.

The first interrupt line (SECURAM ID) is dedicated to backup memories access right violations signaling, or end of erase (automatic or software erase) signaling.

The second interrupt line (SECUMOD ID) is shared by all the protection mechanisms.

See the [Register Summary](#) section for more information about interrupt acknowledgement.

The SECURAM and the SECUMOD interrupt lines are connected to the Interrupt Controller. The Interrupt Controller must be programmed before configuring the SECURAM or the SECUMOD.

## 64.5 Functional Description

### 64.5.1 Memory Mapping

The SECUMOD embeds 5 Kbytes of SRAM split in two parts: the lower 4 Kbytes are erased in case of intrusion (BUSRAM4KB) while the upper 1 Kbyte is never erased (BUSRAM1KB). A 256-bit register bank is available as an additional memory and is totally erased in case of intrusion (BUREG256b).

All memories support 8-bit, 16-bit and 32-bit access sizes.

For power optimization, the transfers between the processor and these memories are decreased by a factor of 4.

The base address value of the SECURAM is 0xF8044000.

**Figure 64-2. SECUMOD Internal Memory Map**

### 64.5.2 Scrambling Keys

The secure memories (BUSRAM4KB, BUSRAM1KB and BUREG256b) are scrambled. The scrambling is enabled after reset and a scrambling key is automatically generated. The scrambling key can be modified through the Scrambling Key register (SECUMOD\_SCRKEY).

Scrambling can be disabled using the Control register (SECUMOD\_CR).

### 64.5.3 Internal Random Number Generator (IRNG)

The RNG cannot be read through the User Interface (a TrueRNG external to the SECUMOD is available for this purpose).

### 64.5.4 Protection Mechanisms

#### 64.5.4.1 PIO Backup Controller

The SECUMOD includes a PIO Controller powered by VDDBU which handles the eight PIOBU I/O pins.

Each I/O line is controlled by the PIO Controller and each pin can be configured to be driven. This is done by writing in the corresponding SECUMOD PIO Backup register (SECUMOD\_PIOBUx). When SECUMOD\_PIOBUx.OUTPUT is at '0', the corresponding I/O line is used as an input only. When this bit is at '1', the corresponding I/O line is driven by the PIO Backup Controller.

##### 64.5.4.1.1 Output Mode

When SECUMOD\_PIOBUx.OUTPUT is set, the level driven on an I/O line can be determined by setting or clearing the PIO\_SOD bit (Set Output Data). The value of this bit represents the data driven on the corresponding I/O line.

##### 64.5.4.1.2 Input Mode

The level on an I/O line can be read through the PIO\_PDS bit (Pin Data Status) in the corresponding SECUMOD\_PIOBUx. This bit indicates the level of the I/O line regardless of its configuration, whether as an input or driven by the PIO Controller.

##### 64.5.4.1.3 Static Intrusion Detectors and Programmable Internal Pullup/Pulldown

Intrusion detectors can be placed around the system to detect any intrusion attempt. This requires the corresponding I/O lines to be configured as inputs (SECUMOD\_PIOBUx.OUTPUT = 0).

##### 64.5.4.1.4 Static Intrusion Detection

The detectors can be configured to detect either the rising edge or the falling edge on switches via SECUMOD\_PIOBUx.SWITCH.

Example: A detector can consist of a normally-closed switch which sends a zero signal to the Protection Unit. When an intrusion attempt occurs, the switch state changes to an open position. The debounce filter waits until an intrusion has been detected for a programmable continuous period to send an alarm signal to the Protection Unit. This is to prevent erroneous intrusion detections.

##### 64.5.4.1.5 Internal Pullup/Pulldown

The user has the possibility to connect an internal pullup or pulldown (around 100 kΩ) by configuring SECUMOD\_PIOBUx.PULLUP accordingly.

Configuring this field with a pullup or pulldown value activates the corresponding pullup/pulldown permanently.

**Note:** Internal pullups are connected at reset state.

##### 64.5.4.1.6 Scheduled Pullup/Pulldown

In order to reduce the power consumption on the VDDBU power supply, all activated pullups/pulldowns can be scheduled by following the steps below:

1. Activate the required pullup/pulldown.
2. Measure the level on the PIOBUx pin.
3. Deactivate the pullup/pulldown.

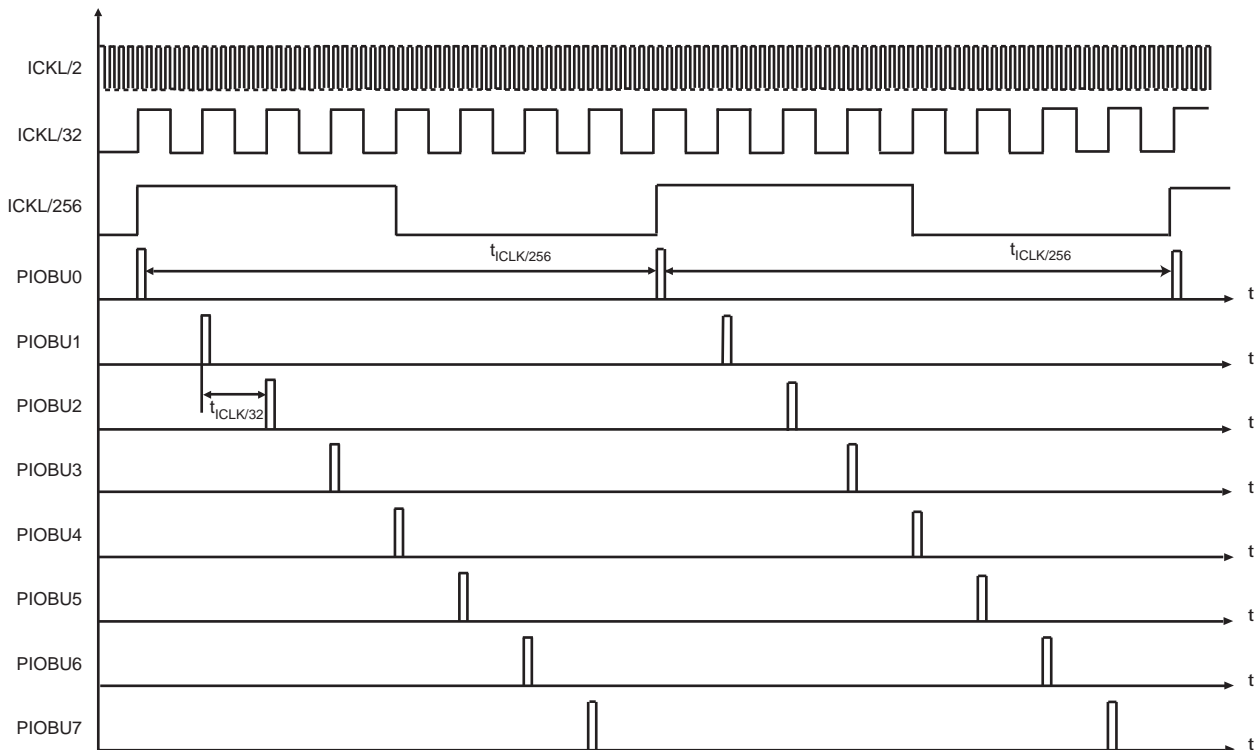

Scheduling is enabled by setting SECUMOD\_PIOBUx.SCHEDULE.

**Note:** This feature is only effective if the PULLUP field indicates that a pullup or a pulldown is connected.

### 64.5.4.1.7 Debouncing Time

The debouncing time is common to all I/Os. The principle is presented in the following figure. A period ( $f_{\text{CLK}}/2$ ) is allocated to each I/O. During that period, if SECUMOD\_PIOBUx.SCHEDULE is set and if a pullup/pulldown is needed (PULLUP field different from 0), the pullup/pulldown is activated, the level is measured and the pullup/pulldown is deactivated. Otherwise, only the level is measured. Measurement is performed at the end of the allocated period.

**Figure 64-3. Schedule Principle**

**Table 64-2. Timings vs.  $f_{\text{CLK}}$**

| Timing               | $f_{\text{CLK}}$ (kHz) |          |          | Units         |
|----------------------|------------------------|----------|----------|---------------|
|                      | Min = 38               | Typ = 64 | Max = 90 |               |
| $t_{\text{CLK}}/2$   | 53                     | 31       | 22       | $\mu\text{s}$ |
| $t_{\text{CLK}}/32$  | 842                    | 500      | 356      | $\mu\text{s}$ |
| $t_{\text{CLK}}/256$ | 6.74                   | 4.00     | 2.84     | ms            |

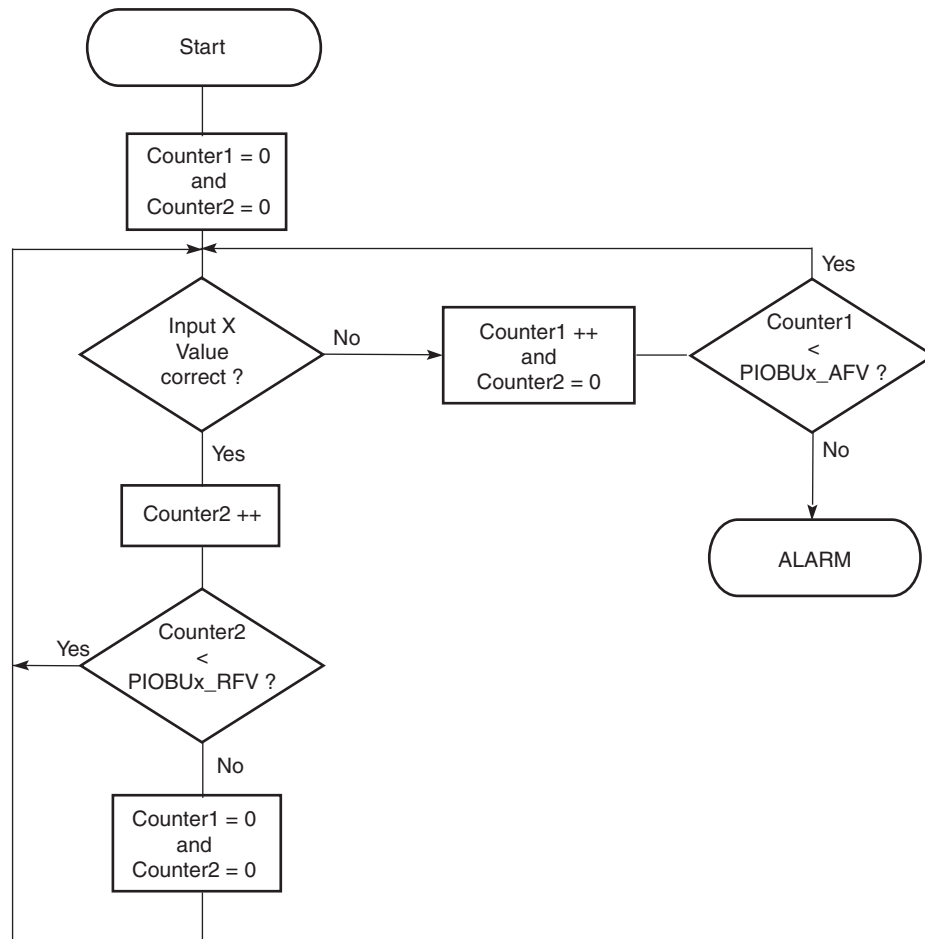

### 64.5.4.1.8 PIOBUx Alarm Filtering in Static Mode

It is possible to filter the PIOBUx alarm detection by programming SECUMOD\_PIOBUx.PIOBU\_AFV. The steps are as follows:

1. A 9-bit counter is incremented each time the value present on the corresponding input is not the expected one.
2. An alarm is sent to the Protection Unit if the counter value reaches the value programmed in PIOBU\_AFV.

The previous 9-bit counter is reset only if the value present on the input is correct and stable for a continuous programmable period defined by SECUMOD\_PIOBUx.PIOBU\_RFV (a second counter is used for that operation). See the figure below.

**Figure 64-4. PIOBUx Alarm Filtering Principle**

At reset state, the debouncers are not activated (PIOBU\_AFV and PIOBU\_RFV fields set to 0), which implies that no alarm can be generated.

Once both the PIOBU\_AFV and the PIOBU\_RFV fields have been programmed, the corresponding protection is activated and a CLR signal is generated automatically when an intrusion is detected. It is possible to generate an interrupt (or a wakeup signal) instead of clearing the secure memories content. To do so, the user must disable the protection in the Normal Mode Protection register (SECUMOD\_NMPPR) and configure the Normal Interrupt Enable Protection register (SECUMOD\_NIEPR).

**Note:** If the Normal Mode Protection/Backup Mode Protection registers are not hidden, their configuration has priority on the debouncer activation in the PIOBUx configuration registers, which means that CLR signal generation is enabled/disabled in those two registers. Setting the PIOBU\_AFV and PIOBU\_RFV fields configure the debouncer sensitivity and does not generate any clear signal when an intrusion is detected.

**Table 64-3. Debouncing Time vs.  $f_{ICLK}$**

| Debouncing Time     | $f_{ICLK}$ (kHz) |          |          | Unit |
|---------------------|------------------|----------|----------|------|
|                     | Min = 38         | Typ = 64 | Max = 90 |      |
| Min (PIOBU_AFV = 1) | 6.74             | 4.00     | 2.84     | ms   |
| Max (PIOBU_AFV = 9) | 3.45             | 2.05     | 1.46     | s    |

**Note:** At reset state, the PIOBU\_AFV and PIOBU\_RFV fields are set to 0.

### 64.5.4.2 JTAG Prevention

#### 64.5.4.2.1 Debug Interface Access Prevention

The SECUMOD can be used to block access to the system through the ARM processor's Debug Access Port interface. This feature is implemented via SECUMOD\_JTAGCR, which enables assertion of the nDBGRESET reset input of the debug interface. Writing a '1' to SECUMOD\_JTAGCR.FNTRST prevents any activity on the TAP (Test Access Port) controller.

On standard devices, FNTRST resets to '0' and thus does not prevent debug access.

FNTRST also locks the boundary scan when set.

#### 64.5.4.2.2 Physical Restrictions for JTAG Debug Mode

Invasive and non-invasive debug modes are controlled by four input pins of the Debug Access Port: DBGEN, SPIDEN, NIDEN and SPNIDEN.

In order to restrict the debug to nonsecure software parts only, the SEC\_DEBUG\_DIS fuse has to be configured in the customer fuse matrix.

Programming this fuse prevents JTAG secure debug irreversibly, but does not lock non-secure debug.

#### 64.5.4.2.3 Software Restrictions for JTAG Debug Mode

Setting SECUMOD\_JTAGCR.CA5\_DEBUG\_MODE sets the DBGEN, SPIDEN, NIDEN and SPNIDEN Cortex inputs to the appropriate level in order to allow different debug permission levels. See [64.6.7 SECUMOD\\_JTAGCR](#) for more information.

#### 64.5.4.2.4 Software Prevention for JTAG Debug

It is possible to prevent JTAG Debug accesses by forcing the reset signal of Debug Access Port by software.

While the reset signal is maintained low, the JTAG Debug interface cannot be used. To maintain the Debug Access Port in reset state, set SECUMOD\_JTAGCR.FNTRST (in this case, Boundary JTAG is also disabled).

The key used for the BUREG256b scrambler/descrambler is derived from the BUSRAM4KB key and thus benefits from the same protection.

### 64.5.5 Erasing Secure Memories

#### 64.5.5.1 BUSRAM4KB Erase Sequence

##### 64.5.5.1.1 Principle

The BUSRAM4KB Erase sequence is controlled by an automaton which is activated by the CLR signal.

The following table shows the time to perform a partial erase (one erased word out of eight on the entire BUSRAM4KB), and the time to perform a full erase.

**Table 64-4. Erase Time Evaluation vs.  $f_{\text{CLK}}$**

| Erase                 | $f_{\text{CLK}}$ Frequency (kHz) |          |          | Unit |
|-----------------------|----------------------------------|----------|----------|------|
|                       | Min = 38                         | Typ = 64 | Max = 90 |      |
| Partial Erase         | 1.68                             | 1.00     | 0.71     | ms   |
| Full Erase (4 Kbytes) | 13.47                            | 8.00     | 5.69     |      |

During the Erase sequence, the upper 1 Kbyte of memory (BUSRAM1KB) is still accessible by the system.

The erase is a write of random values instead of erase to zero.

### 64.5.5.2 BUREG256b Erase Sequence

In parallel to the BUSRAM4KB Erase, the BUREG256b register bank is erased.

BUREG256b is always reset after a VDDBU powerup.

These registers are seen as zero after reset or after an erase.

#### 64.5.5.2.1 During and After BUSRAM4KB and BUREG256b Erase Sequence

Some flags can be read to know the real-time erase state of the memories. On completion of the Erase sequence, the SECURAM ID interrupt line is asserted.

### 64.5.6 Operating Modes

The SECUMOD is supplied by the VDDBU power supply. It is not possible to program the SECUMOD if VDDBU is not present.

The SECUMOD macrocell is able to operate in two different modes:

- When all supplies are present and can be monitored, the SECUMOD can be switched to Normal mode.
- Otherwise, the SECUMOD must be in Backup mode.

**Note:** After a powerup reset, the SECUMOD is in Backup mode.

The mode is selected by setting either SECUMOD\_CR.NORMAL or SECUMOD\_CR.BACKUP.

**Note:** The user must set SECUMOD\_CR.BACKUP to enter Backup mode prior to shutting off the VDDCORE power supplies.

In both modes, the user can enable or disable a protection by writing in the corresponding Mode Protection register. See [64.5.7 Activation or Deactivation of Protections](#) for more information.

#### 64.5.6.1 Protection Unit

The Protection Unit is used to centralize all alarms coming from the different monitors. When an alarm is detected, the Protection Unit sends a Clear signal to the automaton, which starts the secure memories Erase sequence if the memory is not empty.

The Protection Unit can also send:

- an IRQ interrupt signal (only in Normal mode)
- an SWKUP wakeup signal (only in Backup mode).

When an interrupt or a wakeup signal is generated, it is up to the user to detect the source of the alarm and to act accordingly, i.e., to clear the secure memories content or not.

As soon as an alarm is detected, the corresponding bit is set in the Status register (SECUMOD\_SR). The only way to clear this bit is to set it in the Status Clear register (SECUMOD\_SCR).

**Note:** Once a status bit is raised, it should not be cleared before the next slow clock period. If a clear does occur, the status bit rises again and the same alarm will be seen twice. To prevent this, it is recommended to wait at least one slow clock period after reading the Status register before clearing the status bits.

If a Clear of the secure memories content has been performed by the automaton, an ERASE\_DONE flag is set to indicate that the secure memories content is not valid anymore. While the secure memories are erased, write accesses have no effect and read accesses return a static and invalid value (except for BUSRAM1KB).

### 64.5.7 Activation or Deactivation of Protections

It is possible to activate or deactivate each protection separately by writing in the Normal and Backup Mode Protection registers. These registers are hidden and the only way to make them appear is to write SECUMOD\_CR.KEY with the correct value. This command field acts on a toggle basis: writing the correct value makes the registers appear and disappear.

At reset state, all protections are activated except the sixteen corresponding to the intrusion detectors (need to program PIOBUx).

### 64.5.8 Powerup Reset

After a powerup reset, the SECUMOD is in Backup mode, but in an unpredictable state.

The Slow Clock oscillator takes about one second to startup. It is also possible that monitors send alarms to the Protection Unit. However, a Clear command can be performed because the secure memories content is empty.

Care must be taken when writing in BUSRAM4KB or BUREG256b after reset. The user must make sure that no Erase sequence is running, otherwise the write access to BUSRAM4KB or BUREG256b is aborted. It is recommended to wait for the system to be established before accessing BUSRAM4KB or BUREG256b. This can last for at least one or two seconds. The verification is performed by reading the Status register. If there is no error for a continuous period (one second, for example), the user can access BUSRAM4KB or BUREG256b. If at least one error is detected, the user has to wait first for the ERASE\_DONE flag to rise, and then wait again for at least one slow clock period after reading the Status register before writing content in the Status Clear register. At this stage, all status bits should be cleared. The user must then ensure that no error is raised in the Status register during the next second, for example.

#### Bits 31:16 – KEY[15:0] Password

This command field acts on a toggle basis: writing the value 0x89CA alternatively makes the Normal or Backup Protection Registers appear and disappear.

Writing any other value in this field has no effect.

#### Bits 10:9 – SCRAMB[1:0] Memory Scrambling Enable

| Value | Description                       |
|-------|-----------------------------------|
| 10    | Memories are not scrambled.       |
| 01    | Memories are scrambled (default). |
| 00    | No effect                         |
| 11    | No effect                         |

#### Bit 2 – SWPROT Software Protection

| Value | Description                                       |
|-------|---|
| 0     | No effect.  |
| 1     | Starts the BUSRAM4KB and BUREG256b Clear content. |

#### Bit 1 – NORMAL Normal Mode

# SAMA5D2 Series

## Security Module (SECUMOD)

---

---

| Value | Description              |
|-------|--------------------------|
| 0     | No effect.               |
| 1     | Switches to Normal mode. |

### Bit 0 – BACKUP Backup Mode

| Value | Description              |
|-------|--------------------------|
| 0     | No effect.               |
| 1     | Switches to Backup mode. |

### 64.6.2 SECUMOD System Status Register

**Name:** SECUMOD\_SYSR  
**Offset:** 0x0004  
**Reset:** 0x000000D4  
**Property:** Read/Write

| Access | R      | R       |    |    | R     | R      | R        | R/W        |
| Reset  | 1      | 1       |    |    | 0     | 1      | 0        | 0          |

#### Bit 7 – SCRAMB Scrambling Enabled

| Value | Description |
|-------|-------------|
| 0     | Disabled.   |
| 1     | Enabled.    |

#### Bit 6 – AUTOBKP Automatic Backup Mode Enabled

| Value | Description |
|-------|-------------|
| 0     | Disabled.   |
| 1     | Enabled.    |

#### Bit 3 – SWKUP SWKUP State

| Value | Description                                      |
|-------|--|
| 0     | No SWKUP signal sent since the last clear.       |
| 1     | SWKUP signal has been sent since the last clear. |

#### Bit 2 – BACKUP Backup Mode

| Value | Description         |
|-------|---------------------|
| 0     | Normal mode active. |
| 1     | Backup mode active. |

# SAMA5D2 Series

## Security Module (SECUMOD)

### Bit 1 – ERASE\_ON Erase Process Ongoing

When ERASE\_ON returns to 0, ERASE\_DONE is set after half a period of ICLK.

| ERASE_ON | ERASE_DONE | Status   | Action  |
|----------|------------|--|---|
| 0        | 0          | No Erase ongoing or since the last Erase.  | Nothing.  |
| 1        | 0          | An Erase process is running.   | Wait until the ERASE_ON flag is reset.<br>ERASE_DONE will rise, see line below. |
| 0        | 1          | An Erase occurred and is finished.   | Clear the ERASE_DONE flag.  |
| 1        | 1          | An Erase process is running.<br>The ERASE_DONE flag refers to a previous Erase process, but was not cleared. | Wait until the ERASE_ON flag is reset, then clear the ERASE_DONE flag.          |

| Value | Description  |
|-------|--|
| 0     | Erase automaton is not running.                                    |
| 1     | Erase automaton is currently running, memories are not accessible. |

### Bit 0 – ERASE\_DONE Erasable Memories State

| Value | Description   |
|-------|---|
| 0     | Secure memories content has not been erased since the last clear.   |
| 1     | Secure memories content has been erased since the last clear. The user must write 1 into this bit to clear this flag. Note that not clearing this flag does not prevent the next erase processes. This flag also activates the SECURAM interrupt line as long as it is not cleared. |

### 64.6.3 SECUMOD Status Register

**Name:** SECUMOD\_SR  
**Offset:** 0x0008  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: No alarm generated since the last clear.

1: An alarm has been generated by the corresponding monitor since the last clear.

|     |    |    |    |    |    |    |    |    |
|-----|----|----|----|----|----|----|----|----|
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|     |    |    |    |    |    |    |    |    |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – DETx PIOBU Intrusion Detector**

#### 64.6.4 SECUMOD Status Clear Register

**Name:** SECUMOD\_SCR  
**Offset:** 0x0010  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Clears the corresponding alarm flag bit.

If the corresponding alarm was programmed to generate a SWKUP signal, clearing the alarm also clears the SWKUP status bit in the SECUMOD Status register.

|        |                                  |      |      |      |      |      |      |      |

| Reset  |                                  |      |      |      |      |      |      |      |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – DETx PIOBU Intrusion Detector**

**64.6.5 SECUMOD RAM Access Ready Register**

**Name:** SECUMOD\_RAMRDY  
**Offset:** 0x0014  
**Reset:** Undefined  
**Property:** Read-only

**Bit 0 – READY** Ready for System Access Flag

When exiting Idle, System Reset or Backup mode, this flag must be read high before accessing the secure memories. The flag remains low until any ongoing process stops. Refer to the section “Real-time Clock (RTC) Register Summary” for more information.

### 64.6.6 SECUMOD PIO Backup Register x

**Name:** SECUMOD\_PIOBUx  
**Offset:** 0x18 + x\*0x04 [x=0..7]  
**Reset:** 0x00001000  
**Property:** Read/Write

**Note:** The FILTER3\_5 and DYNSTAT fields only exist for even PIOBUs.

#### Bit 15 – SWITCH Switch State for Intrusion Detection

| Value | Description                        |
|-------|------------------------------------|
| 0     | Input default state is low level.  |
| 1     | Input default state is high level. |

#### Bit 14 – SCHEDULE Pullup/Down Scheduled

| Value | Description                       |
|-------|-----------------------------------|
| 0     | Pullup/pulldown is not scheduled. |
| 1     | Pullup/pulldown is scheduled.     |

#### Bits 13:12 – PULLUP[1:0] Programmable Pullup State

This field is used to control the internal pullup or pulldown.

| PULLUP0 | PULLUP1 | Status                       |
|---------|---------|------------------------------|
| 0       | 0       | No pullup/pulldown connected |
| 0       | 1       | Pullup connected             |
| 1       | 0       | Pulldown connected           |

.....continued

| PULLUP0 |   | Status   |
|---------|---|----------|
| 1       | 1 | Reserved |

**Bit 10 – PIO\_PDS** Level on the Pin in Input Mode (OUTPUT = 0)

| Value | Description                 |
|-------|-----------------------------|
| 0     | The I/O line is at level 0. |
| 1     | The I/O line is at level 1. |

**Bit 9 – PIO\_SOD** Set/Clear the I/O Line when configured in Output Mode (OUTPUT =1)

| Value | Description                                   |
|-------|---|
| 0     | Clears the data to be driven on the I/O line. |
| 1     | Sets the data to be driven on the I/O line.   |

**Bit 8 – OUTPUT** Configure I/O Line in Input/Output

| Value | Description                        |
|-------|------------------------------------|
| 0     | The I/O line is a pure input.      |
| 1     | The I/O line is enabled in output. |

**Bits 7:4 – PIOBU\_RFV[3:0]** PIOBUx Reset Filter Value

This field is used to define the number of consecutive valid states to be reached before resetting the AFV counter.

| PIOBU_RFV | Maximum Counter Value    |
|-----------|--------------------------|
| 0         | 0 (No static protection) |
| 1         | 2                        |
| 2         | 4                        |
| 3         | 8                        |
| 4         | 16                       |
| 5         | 32                       |
| 6         | 64                       |
| 7         | 128                      |
| 8         | 256                      |
| 9         | 512                      |

This field must be set to 0 when Dynamic Intrusion is selected.

**Bits 3:0 – PIOBU\_AFV[3:0]** PIOBU Alarm Filter Value

This field is used to define the filter value prior to generating an alarm.

# SAMA5D2 Series

## Security Module (SECUMOD)

| PIOBU_AFV | Maximum Counter Value    |
|-----------|--------------------------|
| 0         | 0 (No static protection) |
| 1         | 2                        |
| 2         | 4                        |
| 3         | 8                        |
| 4         | 16                       |
| 5         | 32                       |
| 6         | 64                       |
| 7         | 128                      |
| 8         | 256                      |
| 9         | 512                      |

This field must be set to 0 when Dynamic Intrusion is selected.

### 64.6.7 SECUMOD JTAG Protection Control Register

**Name:** SECUMOD\_JTAGCR  
**Offset:** 0x0068  
**Reset:** 0x00000008  
**Property:** Read/Write

**Note:** Reset values are all 0 when fuse DEFDBG is programmed.

**Bit 4 – WZO** Write ZERO  
Must be written with 0.

**Bits 3:1 – CA5\_DEBUG\_MODE[2:0]** Cortex-A5 Invasive/Non-Invasive Secure/Non-Secure Debug Permissions

This field is used to set different debug permission levels. For instance, it can be used to prevent debug on secure parts of the code. The table below shows the effect of the field value on the Cortex-A5 pins (SPIDEN, DBGEN, SPNIDEN and NIDEN).

| CA5_DEBUG_MODE Value | Cortex-A5 Debug Permissions                 | SPIDEN | DBGEN | SPNIDEN | NIDEN |
|----------------------|---|--------|-------|---------|-------|
| b000                 | No Debug                                    | 0      | 0     | 0       | 0     |
| b001                 | Non-Invasive, Non-Secure                    | 0      | 0     | 0       | 1     |
| b010                 | Full Non-Secure (Invasive and Non-Invasive) | 0      | 1     | 0       | 0     |
| b011                 | Full Non-Secure + Non-Invasive Secure       | 0      | 1     | 1       | 1     |
| b100                 | Full Debug allowed                          | 1      | 1     | 1       | 1     |

**Bit 0 – FNTRST** Force NTRST

| <b>Value</b> | <b>Description</b>   |
|--------------|--|
| 0            | The ARM processor's TAP controller access and Boundary JTAG are not blocked by the SECUMOD.  |
| 1            | nDBGRESET of the ARM processor's TAP controller and Boundary JTAG reset are held low, preventing the processor to switch to debug state and Boundary JTAG to work. |

**64.6.8 SECUMOD Scrambling Key Register**

**Name:** SECUMOD\_SCRKEY  
**Offset:** 0x0070  
**Reset:** Undefined  
**Property:** Read/Write

|        |               |    |    |    |    |    |    |    |
|--------|---------------|----|----|----|----|----|----|----|
| Bit    | 31            | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | SCRKEY[31:24] |    |    |    |    |    |    |    |
| Access | W             | W  | W  | W  | W  | W  | W  | W  |
| Reset  |               |    |    |    |    |    |    |    |
|        |               |    |    |    |    |    |    |    |
| Bit    | 23            | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | SCRKEY[23:16] |    |    |    |    |    |    |    |
| Access | W             | W  | W  | W  | W  | W  | W  | W  |
| Reset  |               |    |    |    |    |    |    |    |
|        |               |    |    |    |    |    |    |    |
| Bit    | 15            | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | SCRKEY[15:8]  |    |    |    |    |    |    |    |
| Access | W             | W  | W  | W  | W  | W  | W  | W  |
| Reset  |               |    |    |    |    |    |    |    |
|        |               |    |    |    |    |    |    |    |
| Bit    | 7             | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | SCRKEY[7:0]   |    |    |    |    |    |    |    |
| Access | W             | W  | W  | W  | W  | W  | W  | W  |
| Reset  |               |    |    |    |    |    |    |    |

**Bits 31:0 – SCRKEY[31:0] Scrambling Key Value**

This 32-bit key is used by the secure memories scrambler/descrambler logics. When changed, the readable content of the memories is made unintelligible instantaneously.

### 64.6.9 SECUMOD RAM Access Rights Register

**Name:** SECUMOD\_RAMACC  
**Offset:** 0x0074  
**Reset:** 0x00003FFFF  
**Property:** Read/Write

The following configuration values are valid for all listed bit names of this register:

00: No access allowed

01: Only write access allowed

10: Only read access allowed

11: Read and write accesses allowed

Accessing a forbidden area causes an interrupt (SECURAM ID).

|        |          |     |          |     |          |     |          |     |  |
|--------|----------|-----|----------|-----|----------|-----|----------|-----|--|
| Bit    | 31       | 30  | 29       | 28  | 27       | 26  | 25       | 24  |  |
|        |          |     |          |     |          |     |          |     |  |
| Access |          |     |          |     |          |     |          |     |  |
| Reset  |          |     |          |     |          |     |          |     |  |
|        |          |     |          |     |          |     |          |     |  |
| Bit    | 23       | 22  | 21       | 20  | 19       | 18  | 17       | 16  |  |
|        |          |     |          |     |          |     |          |     |  |
| Access |          |     |          |     |          |     |          |     |  |
| Reset  |          |     |          |     |          |     |          |     |  |

| Reset  | 1        | 1   | 1        | 1   | 1        | 1   | 1        | 1   |  |

**Bits 11:10 – RW5[1:0]** Access right for RAM region [5 Kbytes; 6 Kbytes] (register bank BUREG256b)

**Bits 9:8 – RW4[1:0]** Access right for RAM region [4 Kbytes; 5 Kbytes]

**Bits 7:6 – RW3[1:0]** Access right for RAM region [3 Kbytes; 4 Kbytes]

**Bits 5:4 – RW2[1:0]** Access right for RAM region [2 Kbytes; 3 Kbytes]

**Bits 3:2 – RW1[1:0]** Access right for RAM region [1 Kbyte; 2 Kbytes]

**Bits 1:0 – RW0[1:0]** Access right for RAM region [0; 1 Kbyte]

### 64.6.10 SECUMOD RAM Access Rights Status Register

**Name:** SECUMOD\_RAMACCSR  
**Offset:** 0x0078  
**Reset:** 0x00000000  
**Property:** Read/Write

The following configuration values are valid for all listed bit names of this register:

- 00: No access violation occurred
- 01: Write access violation occurred
- 10: Read access violation occurred
- 11: Read and write access violation occurred

Writing any value to this register resets the register and the associated interrupt line (SECURAM ID).

|        |          |     |          |     |          |     |          |     |  |

**Bits 3:2 – RW1[1:0]** Access right status for RAM region [1 Kbytes; 2 Kbytes]

**Bits 1:0 – RW0[1:0]** Access right status for RAM region [0; 1 Kbyte]

### 64.6.11 SECUMOD Backup Mode Protection Register

**Name:** SECUMOD\_BMPR  
**Offset:** 0x007C  
**Reset:** 0xFFFF0CCF  
**Property:** Read/Write

PIO backup protections are off after backup reset whatever the reset value of this register. See SECUMOD\_PIOBUx register descriptions to enable these protections.

|        |      |      |      |      |      |      |      |      |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – DETx** PIOBU Intrusion Detector Protection

Reminder: Enabling PIOBU protection requires additional programming of PIOBUx registers.

| Value | Description          |
|-------|----------------------|
| 0     | Protection disabled. |
| 1     | Protection enabled.  |

### 64.6.12 SECUMOD Normal Mode Protection Register

**Name:** SECUMOD\_NMPR  
**Offset:** 0x0080  
**Reset:** 0xFFFFFFFF  
**Property:** Read/Write

PIO backup protections are off after backup reset whatever the reset value of this register. See SECUMOD\_PIOBUx register descriptions to enable these protections.

| Value | Description  |
|-------|--|
| 0     | No wakeup signal is generated if the corresponding alarm is detected.        |
| 1     | A wakeup signal (SWKUP) is generated if the corresponding alarm is detected. |

## 65. Analog-to-Digital Controller (ADC)

### 65.1 Description

The ADC is based on a 12-bit Analog-to-Digital Converter (ADC) managed by an ADC Controller providing enhanced resolution up to 14 bits. See [65.3 Block Diagram](#). It also integrates a 12-to-1 analog multiplexer, making possible the analog-to-digital conversions of 12 analog lines. The conversions extend from 0V to the voltage carried on pin ADVREF.

Conversion results are reported in a common register for all channels, as well as in a channel-dedicated register.

The 13-bit and 14-bit resolution modes are obtained by averaging multiple samples to decrease quantization noise. For the 13-bit mode, 4 samples are used, which gives a real sample rate of 1/4 of the actual sample frequency. For the 14-bit mode, 16 samples are used, giving a real sample rate of 1/16 of the actual sample frequency. This arrangement allows conversion speed to be traded off against for better accuracy.

The software trigger, external trigger on rising edge of the ADTRG pin or internal triggers from Timer Counter output(s) are configurable.

The comparison circuitry allows automatic detection of values below a threshold, higher than a threshold, in a given range or outside the range, thresholds and ranges being fully configurable.

The ADC Controller internal fault output is directly connected to the PWM fault input. This input can be asserted by means of comparison circuitry to immediately put the PWM output in a safe state (pure combinational path).

The ADC also integrates a Sleep mode and a conversion sequencer and connects with a DMA channel. These features reduce both power consumption and processor intervention.

This ADC has a selectable single-ended or fully differential input.

This ADC Controller includes a Resistive Touchscreen Controller. It supports 4-wire and 5-wire technologies.

### 65.2 Embedded Characteristics

- 12-bit Resolution with Enhanced Mode up to 14 bits
- 1 Msps Conversion Rate
- Digital Averaging Function providing Enhanced Resolution Mode up to 14 bits
- Wide Range of Power Supply Operation
- Selectable Single-Ended or Differential Input Voltage
- Digital correction of offset and gain errors
- Resistive 4-wire and 5-wire Touchscreen Controller
  - Position and Pressure Measurement for 4-wire Screens
  - Position Measurement for 5-wire Screens
  - Average of Up to 8 Measures for Noise Filtering
- Programmable Pen Detection Sensitivity
- Integrated Multiplexer Offering Up to 12 Independent Analog Inputs

- Individual Enable and Disable of Each Channel
- Hardware or Software Trigger from:
  - External Trigger Pin
  - Timer Counter Outputs (Corresponding TIOA Trigger)
  - ADC Internal Trigger Counter
  - Trigger on Pen Contact Detection
  - PWM Event Line
- Drive of PWM Fault Input
- DMA Support
- Two Sleep Modes (Automatic Wakeup on Trigger)
  - Lowest Power Consumption (Voltage Reference OFF Between Conversions)
  - Fast Wakeup Time Response on Trigger Event (Voltage Reference ON Between Conversions)
- Channel Sequence Customizing
- Automatic Window Comparison of Converted Values
- Asynchronous Partial Wakeup (SleepWalking) on External Trigger
- Register Write Protection

### 65.3 Block Diagram

Figure 65-1. Analog-to-Digital Converter Block Diagram

## 65.4 Signal Description

**Table 65-1. ADC Pin Description**

| Pin Name | Description           |
|----------|-----------------------|
| VDDANA   | Analog power supply   |
| ADVREF   | Reference voltage     |
| AD0–AD11 | Analog input channels |
| ADTRG    | External trigger      |

## 65.5 Product Dependencies

### 65.5.1 Power Management

The ADC Controller is not continuously clocked. The programmer must first enable the ADC Controller peripheral clock in the Power Management Controller (PMC) before using the ADC Controller. However, if the application does not require ADC operations, the ADC Controller clock can be stopped when not needed and restarted when necessary. Configuring the ADC Controller does not require the ADC Controller clock to be enabled.

### 65.5.2 Interrupt Sources

The ADC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the ADC interrupt requires the interrupt controller to be programmed first.

### 65.5.3 I/O Lines

The digital input ADTRG is multiplexed with digital functions on the I/O line and the selection of ADTRG is made using the PIO controller.

The ADC\_ADx analog inputs are multiplexed with digital functions on the I/O lines. ADC\_ADx inputs are selected as inputs of the ADCC when writing a one in the corresponding ADC\_CHER.CHx bit and the digital functions are not selected.

### 65.5.4 Hardware Triggers

The ADC can use internal signals to start conversions. See the ADC\_MR.TRGSEL field description in [65.7.2 ADC\\_MR](#) for exact wiring of internal triggers.

### 65.5.5 Fault Output

The ADC Controller has the FAULT output connected to the FAULT input of PWM. See [65.6.18 Fault Event](#) and section “Pulse Width Modulation Controller (PWM)”.

## 65.6 Functional Description

### 65.6.1 Analog-to-Digital Conversion

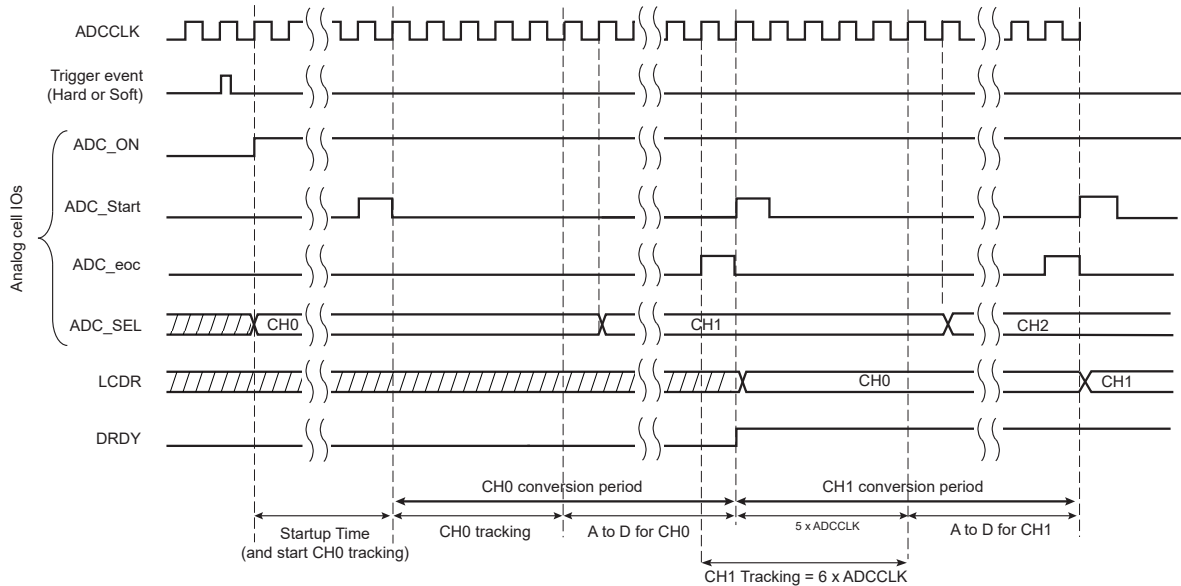

Once the programmed startup time (ADC\_MR.STARTUP) has elapsed, ADC conversions are sequenced by three operating times:

- Tracking time—the time for the ADC to charge its input sampling capacitor to the input voltage. When several channels are converted consecutively, the inherent tracking time is 6 ADC clock

cycles. However, the tracking time can be increased using the TRACKTIM field in the Mode register (ADC\_MR).

- ADC inherent conversion time—the time for the ADC to convert the sampled analog voltage. This time is constant and is defined from start of conversion to end of conversion.
- Channel conversion period—the effective time between the end of the current channel conversion and the end of the next channel conversion.

**Figure 65-2. Sequence of Consecutive ADC Conversions with TRACKTIM = 0**

**Figure 65-3. Sequence of Consecutive ADC Conversions with TRACKTIM = 15**

### 65.6.2 ADC Clock

The ADC uses the ADC clock (ADCCLK) to perform conversions. The ADC clock frequency is selected in the ADC\_MR.PRESCAL.

To generate the ADC clock, the prescaler has two clock sources: the peripheral clock and the GCLK clock. This clock source is selected using the SRCCLK bit in the Extended Mode register (ADC\_EMR).

If GCLK is selected as a source clock, the ADC clock frequency is independent of the processor/bus clock. At reset, the peripheral clock is selected.

If the ADC\_EMR.SRCCLK bit is cleared, the prescaler clock (presc\_clk) is driven by peripheral\_clock. If the ADC\_EMR.SRCCLK bit is set, the prescaler clock is driven by GCLK. The ADC clock frequency is between  $f_{presc\_clk}/2$ , if PRESCAL is 0, and  $f_{presc\_clk}/512$ , if PRESCAL is set to 255 (0xFF).

PRESCAL must be programmed to provide the ADC clock frequency parameter provided in the “Electrical Characteristics” section.

### 65.6.3 ADC Reference Voltage

The voltage reference input of the ADC is the ADVREF pin. Refer to the “Electrical Characteristics” section for further details.

### 65.6.4 Conversion Resolution

The ADC has a native resolution of 12 bits.

The ADC Controller provides enhanced resolution up to 14 bits by means of digital averaging.

If ADTRG is asynchronous to the ADC peripheral clock, the internal resynchronization introduces a jitter of 1 peripheral clock. This jitter may reduce the resolution of the converted signal.

The same applies when using the independent clock (ADC\_MR.SRCCLK = 1), if the provided clock is asynchronous to ADC peripheral clock.

### 65.6.5 Conversion Results

When a conversion is completed, the resulting digital value is stored in the Channel Data register (ADC\_CDRx) of the current channel and in the Last Converted Data register (ADC\_LCDR). By setting the TAG option in ADC\_EMR, ADC\_LCDR presents the channel number associated with the last converted data in the CHNB field.

When a conversion is completed, the channel EOC bit and the DRDY bit in the Interrupt Status register (ADC\_ISR) are set. In the case of a connected DMA channel, DRDY rising triggers a data request. In any case, either EOC and DRDY can trigger an interrupt.

Reading one of the ADC\_CDRx clears the corresponding EOC bit. Reading ADC\_LCDR clears the DRDY bit.

**Figure 65-4. EOCx and DRDY Flag Behavior**

If ADC\_CDR is not read before further incoming data is converted, the corresponding OVREx flag is set in the Overrun Status register (ADC\_OVER).

If new data is converted when DRDY is high, the ADC\_ISR.GOVRE bit is set.

The OVREx flag is automatically cleared when ADC\_OVER is read, and the GOVRE flag is automatically cleared when ADC\_ISR is read.

**Figure 65-5. EOCx, OVREx and GOVREx Flag Behavior**

If the corresponding channel is disabled during a conversion or if it is disabled and then reenabled during a conversion, its associated data and corresponding EOCx and GOVRE flags in ADC\_ISR and OVREx flags in ADC\_OVER are unpredictable.

### 65.6.6 Conversion Results Format

The conversion results can be signed (2's complement) or unsigned depending on the value of the ADC\_EMR.SIGNMODE field.

If conversion results are signed and resolution is less than 16 bits, the sign is extended up to the bit 15 (e.g., 0xF43 for 12-bit resolution is read as 0xFF43, and 0x467 is read as 0x0467).

### 65.6.7 Conversion Triggers

Conversions of the active analog channels are started with a software or hardware trigger. The software trigger is provided by writing the Control register (ADC\_CR) with the START bit at 1.

The list of external/internal events is provided in [65.7.2 ADC\\_MR](#). The hardware trigger is selected using the ADC\_MR.TRGSEL field. The selected hardware trigger is enabled if TRGMOD = 1, 2 or 3 in the Trigger register (ADC\_TRGR).

The ADC also provides a dual trigger mode (ADC\_LCTMR.DUALTRIG = 1) in which the higher index channel can be sampled at a rhythm different from the other channels. The trigger of the last channel is generated by the RTC. See [65.6.12 Last Channel Specific Measurement Trigger](#).

The ADC\_TRGR.TRGMOD field selects the hardware trigger from the following:

- any edge, either rising or falling or both, detected on the external trigger pin ADTRG
- the Pen Detect, depending on how the PENDET bit is set in the Touchscreen Mode register (ADC\_TSMR)
- a continuous trigger, meaning the ADC Controller restarts the next sequence as soon as it finishes the current one
- a periodic trigger, which is defined by programming the ADC\_TRGR.TRGPER field

The minimum time between two consecutive trigger events must be strictly greater than the duration time of the longest conversion sequence according to configuration of registers ADC\_MR, ADC\_CHSR, ADC\_SEQRx, and ADC\_TSMR.

If a hardware trigger is selected, the start of a conversion is triggered after a delay starting at each rising edge of the selected signal. Due to asynchronous handling, the delay may vary in a range of two peripheral clock periods to one ADC clock period. This delay introduces sampling jitter in the A/D conversion process and may therefore degrade the conversion performance (e.g., SNR, THD).

**Figure 65-6. Hardware Trigger Delay**

If one of the TIOA outputs is selected, the corresponding Timer Counter channel must be programmed in Waveform mode.

Only one start command is necessary to initiate a conversion sequence on all the channels. The ADC hardware logic automatically performs the conversions on the active channels, then waits for a new request. The Channel Enable (ADC\_CHER) and Channel Disable (ADC\_CHDR) registers enable the analog channels to be enabled or disabled independently.

If the ADC is used with a DMA, only the transfers of converted data from enabled channels are performed and the resulting data buffers should be interpreted accordingly.

### 65.6.8 Sleep Mode and Conversion Sequencer

The ADC Sleep mode maximizes power saving by automatically deactivating the ADC when it is not being used for conversions. Sleep mode is selected by setting the ADC\_MR.SLEEP bit.

Sleep mode is managed by a conversion sequencer, which automatically processes the conversions of all channels at lowest power consumption.

This mode can be used when the minimum period of time between two successive trigger events is greater than the startup period of the ADC. Refer to section “Electrical Characteristics”.

When a start conversion request occurs, the ADC is automatically activated. As the analog cell requires a startup time, the logic waits during this time and starts the conversion on the enabled channels. When all conversions are complete, the ADC is deactivated until the next trigger. Events triggered during the sequence are ignored.

The conversion sequencer allows automatic processing with minimum processor intervention and optimized power consumption. Conversion sequences can be performed periodically using the internal timer (ADC\_TRGR) or the PWM event line. The periodic acquisition of several samples can be processed automatically without any intervention of the processor via the DMA.

The sequence can be customized by programming the Sequence Channel registers ADC\_SEQR1 and ADC\_SEQR2 and setting the USEQ bit of the Mode register (ADC\_MR). The user can choose a specific order of channels and can program up to 12 conversions by sequence. The user is free to create a personal sequence by writing channel numbers in ADC\_SEQR1 and ADC\_SEQR2. Not only can channel numbers be written in any sequence, channel numbers can be repeated several times. When the ADC\_MR.USEQ bit is set, the ADC\_SEQR1.USCHx and ADC\_SEQR2.USCHx fields are used to define the sequence. Only enabled USCHx fields will be part of the sequence. Each USCHx field has a corresponding enable, CHx-1, in ADC\_CHER.

If all ADC channels (i.e., 12) are used on an application board, there is no restriction of usage of the user sequence. However, if some ADC channels are not enabled for conversion but rather used as pure digital inputs, the respective indexes of these channels cannot be used in the user sequence fields (see ADC\_SEQRx). For example, if channel 4 is disabled (ADC\_CHSR[4] = 0), ADC\_SEQRx fields USCH1 up to USCH12 must not contain the value 4. Thus the length of the user sequence may be limited by this behavior.

As an example, if only four channels over 12 (CH0 up to CH3) are selected for ADC conversions, the user sequence length cannot exceed four channels. Each trigger event may launch up to four successive conversions of any combination of channels 0 up to 3 but no more (i.e., in this case the sequence CH0, CH0, CH1, CH1 is impossible).

A sequence that repeats the same channel several times requires more enabled channels than channels actually used for conversion. For example, the sequence CH0, CH0, CH1, CH1 requires four enabled channels (four free channels on application boards) whereas only CH0, CH1 are really converted.

**Note:** The reference voltage pins always remain connected in Normal mode as in Sleep mode.

### 65.6.9 Comparison Window

The ADC Controller features automatic comparison functions. It compares converted values to a low threshold, a high threshold or both, depending on the value of the ADC\_EMR.CMPMODE field. The comparison can be done on all channels or only on the channel specified in the ADC\_EMR.CMPSEL field. To compare all channels, the ADC\_EMR.CMPALL bit must be set.

If set, the ADC\_EMR.CMPTYPE bit can be used to discard all conversion results that do not match the comparison conditions. Once a conversion result matches the comparison conditions, all the subsequent conversion results are stored in ADC\_LCDR (even if these results do not meet the comparison conditions). Setting the ADC\_CR.CMPRST bit immediately stops the conversion result storage until the next comparison match.

If the ADC\_EMR.CMPTYPE bit is cleared, all conversions are stored in ADC\_LCDR. Only the conversions that match the comparison conditions trigger the ADC\_ISR.COMPE flag.

Moreover, a filtering option can be set by writing the number of consecutive comparison matches needed to raise the flag. This number can be written and read in the ADC\_EMR.CMPFILTER field. The filtering option is dedicated to reinforcing the detection of an analog signal overpassing a predefined threshold. The filter is cleared as soon as ADC\_ISR is read, so this filtering function must be used with peripheral DMA controller and works only when using Interrupt mode (no polling).

The flag can be read on the ADC\_ISR.COMPE bit and can trigger an interrupt.

The high threshold and the low threshold can be read/write in the Compare Window register (ADC\_CWR).

Depending on the sign of the conversion, chosen with the ADC\_EMR.SIGNMODE field, the high threshold and low threshold values must be signed or unsigned to maintain consistency during the comparison. If the conversion is signed, both thresholds must also be signed; if the conversion is unsigned, both thresholds must be unsigned. If comparison occurs on all channels, the ADC\_EMR.SIGNMODE field must be set to ALL\_UNSIGNED or ALL\_SIGNED and the thresholds must be set accordingly.

### 65.6.10 Differential and Single-ended Input Modes

#### 65.6.10.1 Input-output Transfer Functions

The ADC can be configured to operate in the following input voltage modes:

- Single-ended—ADC\_COR.DIFFx = 0. This is the default mode after a reset.
- Differential—ADC\_COR.DIFFx = 1 (see figure below). In Differential mode, the ADC requires differential input signals having a VDD/2 common mode voltage (refer to section “Electrical Characteristics”).
- The following equations give the unsigned ADC input-output transfer function in each mode<sup>(1)</sup>. With signed conversions (see field ADC\_EMR.SIGNMODE), subtract 2047 from the ADC\_LCDR.DATA value given below.

Single-ended mode:

$$ADC\_LCDR.LDATA = \frac{ADx - GNDANA}{ADVREF - GNDANA} \times 2^{12}$$

Differential mode:

$$ADC\_LCDR.LDATA = \left(1 + \frac{ADx - ADx+1}{ADVREF - GNDANA}\right) \times 2^{11}$$

Note: 1. Equations assume ADC\_EMR.OSR = 1

If the ADC\_MR.ANACH bit is set, the ADC can manage both differential channels and single-ended channels. If the ADC\_MR.ANACH bit is cleared, the parameters defined in ADC\_COR are applied to all channels.

The following table gives the internal positive and negative ADC inputs assignment with respect to the programmed mode (ADC\_COR.DIFFx).

For example, if Differential mode is required on channel 0, input pins AD0 and AD1 are used. In this case, only channel 0 must be enabled by writing a 1 to ADC\_CHER.CH0.

**Table 65-2. Input Pins and Channel Numbers**

| Input Pin | Channel Number    |                   |
|-----------|-------------------|-------------------|
|           | Single-ended Mode | Differential Mode |
| AD0       | CH0               | CH0               |
| AD1       | CH1               |                   |
| AD2       | CH2               | CH2               |
| AD3       | CH3               |                   |
| AD4       | CH4               | CH4               |
| AD5       | CH5               |                   |
| AD6       | CH6               | CH6               |
| AD7       | CH7               |                   |
| AD8       | CH8               | CH8               |
| AD9       | CH9               |                   |
| AD10      | CH10              | CH10              |
| AD11      | CH11              |                   |

**Figure 65-7. Analog Full Scale Ranges in Single-Ended/Differential Applications**

**65.6.11 ADC Timings**

The ADC startup time is programmed through the ADC\_MR.STARTUP field. Refer to the “Electrical Characteristics” section.

The ADC Controller provides an inherent tracking time of six ADC clock cycles.

A minimal tracking time is necessary for the ADC to guarantee the best converted final value between two conversions. The tracking time can be adjusted to accommodate a range of source impedances. If more than six ADC clock cycles are required, the tracking time can be increased using the ADC\_MR.TRACKTIM field.

No input buffer amplifier to isolate the source is included in the ADC. Refer to the “Electrical Characteristics” section.

---

### 65.6.12 Last Channel Specific Measurement Trigger

The last channel (higher index available) embeds a specific mode allowing a measurement trigger period which differs from other active channels. This allows efficient management of the conversions especially if the channel is driven by a device with a variation of a different frequency from other converted channels (for example, but not limited to, temperature sensor).

The last channel can be sampled in different ways through the ADC Controller. The different methods of sampling depend on the ADC\_TRGR.TRGMOD configuration field and on the ADC\_CHSR.CH11 bit.

The last channel conversion can be triggered like the other channels by enabling the ADC\_CHER.CH11 bit.

The manual start can only be performed if field TRGMOD = 0. When the ADC\_CR.START bit is set, the last channel conversion is scheduled together with the other enabled channels (if any). The result of the conversion is placed in the ADC\_CDR11 register, and the associated ADC\_ISR.EOC11 flag is set.

If the last channel is enabled in the Channel Status register (ADC\_CHSR), ADC\_LCTMR.DUALTRIG is cleared and field TRGMOD = 1, 2, 3, 5, the last channel is periodically converted together with the other enabled channels and the result is placed in the ADC\_LCDR and ADC\_CDR11 registers. Thus the last channel conversion result is part of the DMA Controller buffer (see the following figure).

When the conversion result matches the conditions defined in ADC\_LCTMR and ADC\_LCCWR, the ADC\_ISR.LCCHG flag is set.

**Figure 65-8. Same Trigger for All Channels (ADC\_CHSR[LCI] = 1 and ADC\_TRGR.TRGMOD = 1, 2, 3, 5)**

Assuming ADC\_CHSR[0] = 1 and ADC\_CHSR[LCI] = 1

If the last channel is driven by a device with a slower variation compared to other channels (temperature sensor for example), the channel can be enabled/disabled at any time. However, this may not be optimal for downstream processing.

The ADC Controller allows a different way of triggering the measurement when DUALTRIG is set in the Last Channel Trigger Mode register (ADC\_LCTMR) but CH11 is not set in ADC\_CHSR.

Under these conditions, the last channel conversion is triggered with a period defined by the OUT1 field in the RTC\_MR (Real-time Clock Mode register) while other channels are still active. OUT1 configures an internal trigger generated by the RTC, totally independent of the internal/external triggers. The RTC event will be processed on the next internal/external trigger event as shown in the following figure. The internal/external trigger for other channels is selected through the ADC\_MR.TRGSEL field.

When DUALTRIG = 1, the result of each conversion of channel 11 is only uploaded in the ADC\_CDR11 register and not in ADC\_LCDR (see the following figure). Therefore, there is no change in the structure of the peripheral DMA controller buffer due to the conversion of the last channel: only the enabled channels are kept in the buffer. The end of conversion of the last channel is reported by the ADC\_ISR.EOC11 flag.

**Figure 65-9. Independent Trigger Measurement for Last Channel (ADC\_CHSR[LCI] = 0 and ADC\_TRGR.TRGMOD = 1, 2, 3, 5)**

Notes:

- ADC\_SEL: Command to the ADC analog cell
- Cx: All ADC channel values except the last channel (highest index)
- LCx: Last channel value
- LCI: Last channel index

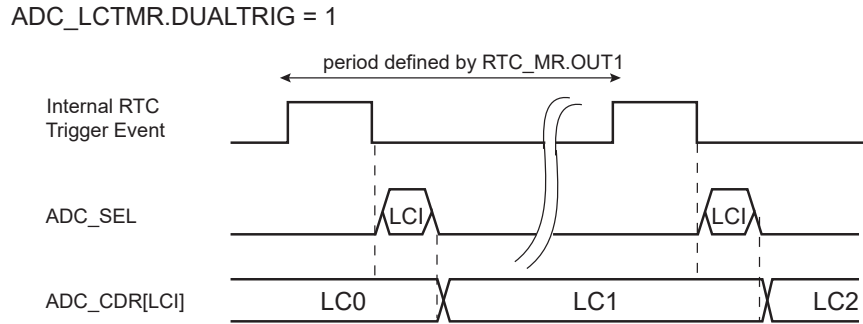

Assuming ADC\_CHSR[0] = 1

If DUALTRIG = 1 and field ADC\_TRGR.TRGMOD = 0 and none of the channels are enabled in ADC\_CHSR (ADC\_CHSR = 0), then only channel 11 is converted at a rate defined by the trigger event signal that can be configured in RTC\_MR.OUT1 (see the following figure).

This mode of operation, when combined with the Sleep mode operation of the ADC Controller, provides a low-power mode for last channel measure. This assumes there is no other ADC conversion to schedule at a high sampling rate or no other channel to convert.

**Figure 65-10. Only Last Channel Measurement Triggered at Low Speed (ADC\_CHSR[LCI] = 0 and ADC\_TRGR.TRGMOD = 0)**

Notes: ADC\_SEL: Command to the ADC analog cell  
LCx: Last channel value  
LCI: Last channel index

### 65.6.13 Enhanced Resolution Mode and Digital Averaging Function

#### 65.6.13.1 Enhanced Resolution Mode

The Enhanced Resolution mode is enabled if the OSR field is configured to 1 or 2 in ADC\_EMR. The enhancement is based on a digital averaging function.

There is no averaging on the last index channel if the measure is triggered by an RTC event.

In this mode, the ADC Controller will trade off conversion speed against accuracy by averaging multiple samples, thus providing a digital low-pass filter function.

The selected oversampling ratio applies to all enabled channels when triggered by an RTC event.

$$ADC\_LCDR.LDATA = \frac{1}{M} \times \sum_{k=0}^{k=N-1} ADC(k)$$

where N and M are given in the table below.

**Table 65-3. Digital Averaging Function Configuration versus OSR Values**

| ADC_EMR.OSR Value | ADC_LCDR.LDATA Length | N Value | M Value | Full Scale Value | Maximum Value |
|-------------------|-----------------------|---------|---------|------------------|---------------|
| 0                 | 12 bits               | 1       | 1       | 4095             | 4095          |
| 1                 | 13 bits               | 4       | 2       | 8191             | 8190          |
| 2                 | 14 bits               | 16      | 4       | 16383            | 16381         |

The average result is valid in ADC\_CDRx (x corresponds to the index of the channel) only if the ADC\_ISR.EOCn flag is set and if the ADC\_OVER.OVREN flag is cleared. The average result for all channels is valid in ADC\_LCDR only if the ADC\_ISR.DRDY bit is set and the ADC\_ISR.GOVRE bit is cleared.

Note that ADC\_CDRs are not buffered. Therefore, when an averaging sequence is ongoing, the value in these registers changes after each averaging sample. However, overrun flags in ADC\_OVER rise as soon as the first sample of an averaging sequence is received. Thus the previous averaged value is not read, even if the new averaged value is not ready.

Consequently, when an overrun flag rises in ADC\_OVER, it means that the previous unread data is lost but it does not mean that this data has been overwritten by the new averaged value as the averaging sequence concerning this channel can still be ongoing.

When an oversampling is performed, the maximum value that can be read on ADC\_CDRx or ADC\_LCDR is not the full-scale value, even if the maximum voltage is supplied on the analog input. See table above.

### 65.6.13.2 Averaging Function versus Trigger Events

The samples can be defined in different ways for the averaging function depending on the configuration of the ADC\_EMR.ASTE bit and the ADC\_MR.USEQ bit.

When USEQ = 0, there are two possible ways to generate the averaging through the trigger event. If ADC\_EMR.ASTE = 0, every trigger event generates one sample for each enabled channel, as described in the following figure. Therefore, four trigger events are required to obtain the result of averaging if OSR = 1.

**Figure 65-11. Digital Averaging Function Waveforms Over Multiple Trigger Events**

ADC\_EMR.OSR = 1, ASTE = 0, ADC\_CHSR[1:0] = 0x3 and ADC\_MR.USEQ = 0

Note: ADC\_SEL: Command to the ADC analog cell  
 0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0\_0, CH0\_1, CH1\_0 and CH1\_1 are final results of average function.

If ADC\_EMR.ASTE = 1 and ADC\_MR.USEQ = 0, the sequence to be converted, defined in ADC\_CHSR, is automatically repeated n times (where n corresponds to the oversampling ratio defined in the ADC\_EMR.OSR field). As a result, only one trigger is required to obtain the result of the averaging function as described in the following figure.

**Figure 65-12. Digital Averaging Function Waveforms on a Single Trigger Event**

ADC\_EMR.OSR = 1, ASTE = 1, ADC\_CHSR[1:0] = 0x3 and ADC\_MR.USEQ = 0

Note: ADC\_SEL: Command to the ADC analog cell  
 0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0\_0, CH0\_1, CH1\_0 and CH1\_1 are final results of average function.

When USEQ = 1, the user can define the channel sequence to be converted by configuring ADC\_SEQRx and ADC\_CHER so that channels are not interleaved during the averaging period. Under these conditions, a sample is defined for each end of conversion as described in the figure below.

When USEQ = 1 and ASTE = 1, OSR can be only configured to 1. Up to three channels can be converted in this mode. The averaging result will be placed in the corresponding ADC\_CDRx and in ADC\_LCDR for each trigger event. The ADC real sample rate remains the maximum ADC sample rate divided by 4.

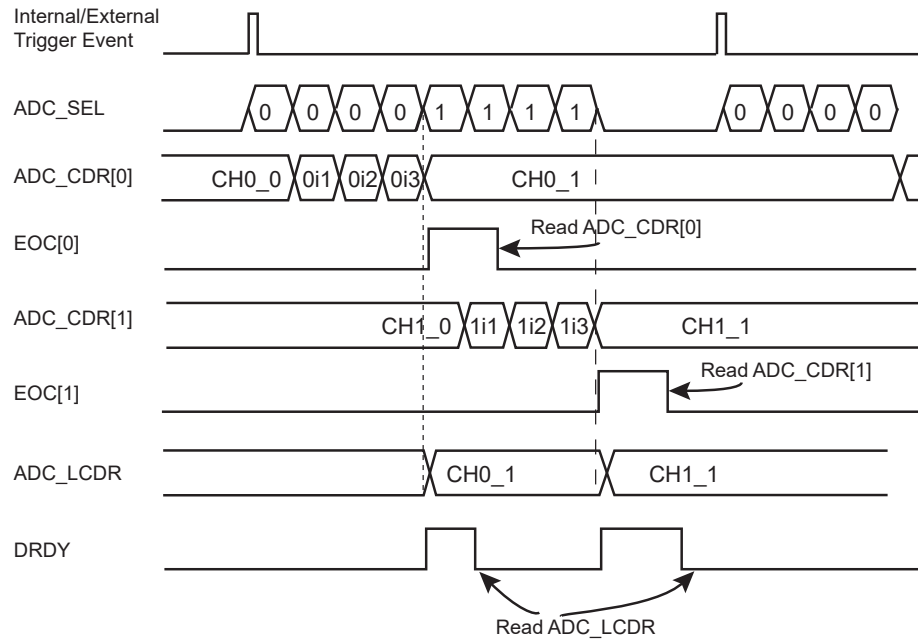

It is important that the user sequence follows a specific pattern. The user sequence must be programmed in such a way that it generates a stream of conversion, where a same channel is successively converted.

**Table 65-4. Example Sequence Configurations (USEQ = 1, ASTE = 1, OSR = 1)**

| Register  | Number of Channels Non-interleaved Averaging - Register Value |                    |                         |
|-----------|---|--------------------|-------------------------|
|           | 1 (e.g., CH0)   | 2 (e.g., CH0, CH1) | 3 (e.g., CH0, CH1, CH2) |
| ADC_CHSR  | 0x0000_000F   | 0x0000_00FF        | 0x0000_0FFF             |
| ADC_SEQR1 | 0x0000_0000   | 0x1111_0000        | 0x1111_0000             |
| ADC_SEQR2 | 0x0000_0000   | 0x0000_0000        | 0x0000_2222             |

**Figure 65-13. Digital Averaging Function Waveforms on a Single Trigger Event, Non-interleaved**

ADC\_EMR.OSR = 1, ASTE = 1, ADC\_CHSR[7:0] = 0xFF and ADC\_MR.USEQ = 1  
ADC\_SEQR1 = 0x1111\_0000

Note: ADC\_SEL: Command to the ADC analog cell  
0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0\_0, CH0\_1, CH1\_0 and CH1\_1 are final results of average function.

#### 65.6.14 Automatic Error Correction

The ADC features automatic error correction of conversion results. Offset and gain error corrections are available. The correction can be enabled for each channel and correction values (offset and gain) are the same for all channels.

To enable error correction, the corresponding ECORRx bit must be set in the Channel Error Correction register (ADC\_CECR). The offset and gain values used to compensate the results are the same for all correction-enabled channels and programmed in the Correction Values register (ADC\_CVR).

The error correction for channels used with the touchscreen is available in the ADC Touchscreen Correction Values register (ADC\_TSCVR).

The ADC\_EMR.ADCMODE field is used to configure a running mode of the ADC Normal mode, Offset Error mode, or Gain Error mode (see 65.7.16 ADC\_EMR). ADCMODE uses 3 internal references to be measured and to extract the offset and gain error from 3 point-measurement codes. If some references already exist on the final application connected to some input channel ADx, they can be used as a replacement of the ADCMODE to generate the 2 or 3 points of calibration and used to extract the GAINCORR and OFFSETCORR.

After a reset, the running mode of the ADC is Normal mode. Offset Error mode and Gain Error mode are used to determine values of offset compensation and gain compensation, respectively, to apply to conversion results. The table below provides formulas to obtain the compensation values, with:

- OFFSETCORR—the Offset Correction value. OFFSETCORR is a signed value.
- GAINCORR—the Gain Correction value
- GCi—the intermediate Gain Compensation value

- Gs—the value 13
- ConvValue—the value converted by the ADC (as returned in ADC\_LCDR or ADC\_CDR)
- Resolution—the resolution used to process the conversion (either RESOLUTION, RESOLUTION+1 or RESOLUTION+2).

**Table 65-5. ADC Running Modes**

| ADC_EMR.ADCMODE | Mode         | Description   |
|-----------------|--------------|---|
| 0               | Normal       | Normal mode of operation to perform conversions   |
| 1               | Offset Error | For unsigned conversions: OFFSETCORR = ConvValue – $2^{(\text{Resolution} - 1)}$                |
|                 |              | For signed conversions: OFFSETCORR = ConvValue  |
| 2               | Gain Error   | G <sub>Ci</sub> = ConvValue   |
| 3               |              | $\text{GAINCORR} = \frac{3584}{\text{G}_{\text{Ci}} - \text{ConvValue}} \times 2^{(\text{Gs})}$ |

The final conversion result after error correction is obtained using the following formula:

$$\text{Corrected Data} = (\text{Converted Data} + \text{OFFSETCORR}) \times \frac{\text{GAINCORR}}{2^{(\text{Gs})}}$$

## 65.6.15 Touchscreen

### 65.6.15.1 Touchscreen Mode

The ADC\_TSMR.TSMODE parameter is used to enable/disable the touchscreen functionality, to select the type of screen (4-wire or 5-wire) and, in the case of a 4-wire screen, to activate (or not) the pressure measurement.

In 4-wire mode, channels 0, 1, 2 and 3 must not be used for classic ADC conversions. Likewise, in 5-wire mode, channels 0, 1, 2, 3, and 4 must not be used for classic ADC conversions.

### 65.6.15.2 4-wire Resistive Touchscreen Principles

A resistive touchscreen is based on two resistive films, each one being fitted with a pair of electrodes, placed at the top and bottom on one film, and on the right and left on the other. In between, there is a layer acting as an insulator, but also enables contact when you press the screen. This is illustrated in the following figure.

The ADC Controller can perform the following tasks without external components:

- position measurement
- pressure measurement
- pen detection

**Figure 65-14. Touchscreen Position Measurement**

**65.6.15.3 4-wire Position Measurement Method**

As shown in the above figure, to detect the position of a contact, a supply is first applied from top to bottom. Due to the linear resistance of the film, there is a voltage gradient from top to bottom. When a contact is performed on the screen, the voltage propagates at the point the two surfaces come into contact. If the input impedance on the right and left electrodes is high enough, the film intrinsic resistor does not affect this voltage.

For the horizontal direction, the same method is used, but by applying supply from left to right. The range depends on the supply voltage and on the loss in the switches that connect to the top and bottom electrodes.

In an ideal world (linear, with no loss through switches), the horizontal position is equal to:

$$VY_M / VDD \text{ or } VY_P / VDD.$$

The implementation with on-chip power switches is shown in the figure below. The voltage measurement at the output of the switch compensates for the switches loss.

It is possible to correct for switch loss by performing the operation:

$$[VY_P - VX_M] / [VX_P - VX_M].$$

This requires additional measurements, as shown in the figure below.

**Figure 65-15. Touchscreen Switches Implementation**

#### 65.6.15.4 4-wire Pressure Measurement Method

The method to measure the pressure ( $R_p$ ) applied to the touchscreen is based on the known resistance of the X-Panel resistance ( $R_{xp}$ ).

Three conversions ( $X_{pos}, Z_1, Z_2$ ) are necessary to determine the value of  $R_p$  ( $Z_{axis}$  resistance).

$$R_p = R_{xp} \times (X_{pos}/1024) \times [(Z_2/Z_1)-1]$$

**Figure 65-16. Pressure Measurement**

### 65.6.15.5 5-wire Resistive Touchscreen Principles

To make a 5-wire touchscreen, a resistive layer with a contact point at each corner and a conductive layer are used.

The 5-wire touchscreen differs from the 4-wire type mainly in that the voltage gradient is applied only to one layer, the resistive layer, while the other layer is the sense layer for both measurements.

The measurement of the X position is obtained by biasing the upper left corner and lower left corner to VDDANA and the upper right corner and lower right to ground.

To measure along the Y axis, bias the upper left corner and upper right corner to VDDANA and bias the lower left corner and lower right corner to ground.

**Figure 65-17. 5-Wire Principle**

### 65.6.15.6 5-wire Position Measurement Method

In an application only monitoring clicks, 100 points per second is typically needed. For handwriting or motion detection, the number of measurements to consider is approximately 200 points per second. This must take into account that multiple measurements are included (over sampling, filtering) to compute the correct point.

The 5-wire touchscreen panel works by applying a voltage at the corners of the resistive layer and measuring the vertical or horizontal resistive network with the sense input. The ADC converts the voltage measured at the point the panel is touched.

A measurement of the Y position of the pointing device is made by:

- Connecting Upper left (UL) and upper right (UR) corners to VDDANA
- Connecting Lower left (LL) and lower right (LR) corners to ground.

The voltage measured is determined by the voltage divider developed at the point of touch (Y position) and the SENSE input is converted by ADC.

A measurement of the X position of the pointing device is made by:

- Connecting the upper left (UL) and lower left (LL) corners to ground
- Connecting the upper right and lower right corners to VDDANA.

The voltage measured is determined by the voltage divider developed at the point of touch (X position) and the SENSE input is converted by ADC.

**Figure 65-18. Touchscreen Switches Implementation**

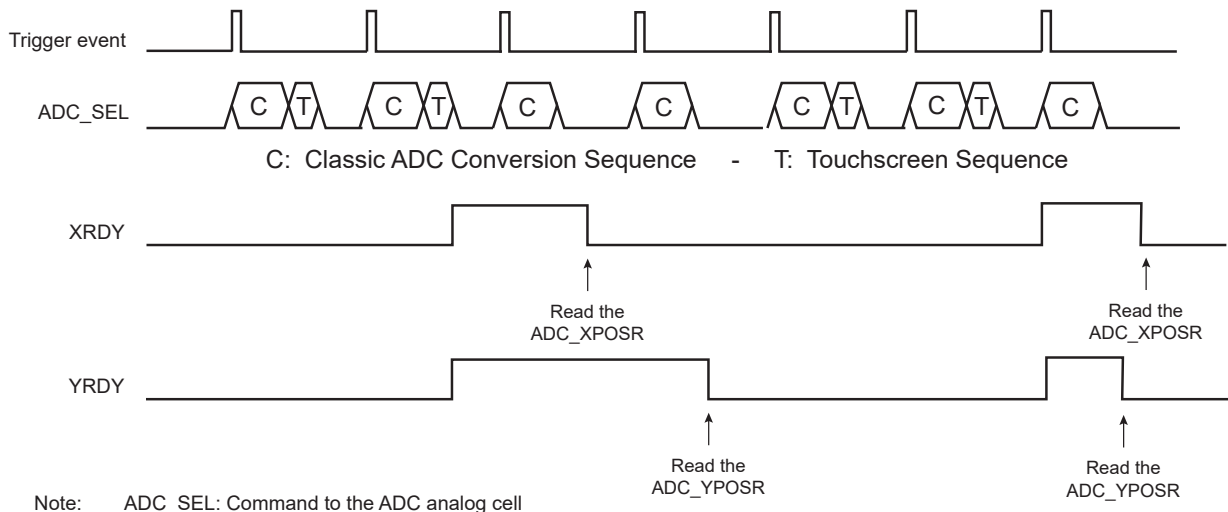

### 65.6.15.7 Sequence and Noise Filtering

The ADC Controller can manage ADC conversions and touchscreen measurement. On each trigger event the sequence of ADC conversions is performed as described in [65.6.8 Sleep Mode and Conversion Sequencer](#). The touchscreen measure frequency can be specified in number of trigger events

by writing the ADC\_TSMR.TSFREQ parameter. An internal counter counts triggers up to TSFREQ, and every time it rolls out, a touchscreen sequence is appended to the classic ADC conversion sequence (see figure below).

Additionally the user can average multiple touchscreen measures by writing the ADC\_TSMR.TSAV parameter. This can be 1, 2, 4 or 8 measures performed on consecutive triggers as illustrated in the figure below. Consequently, the ADC\_TSMR.TSFREQ parameter must be greater than or equal to the ADC\_TSMR.TSAV parameter.

**Figure 65-19. Insertion of Touchscreen Sequences (TSFREQ = 2; TSAV = 1)**

### 65.6.15.8 Measured Values, Registers and Flags

As soon as the controller finishes the Touchscreen sequence, XRDY, YRDY and PRDY are set and can generate an interrupt. These flags can be read in the Interrupt Status register (ADC\_ISR). They are reset independently by reading in the ADC Touchscreen X Position register (ADC\_XPOSR), the ADC Touchscreen Y Position register (ADC\_YPOSR) and the ADC Touchscreen Pressure register (ADC\_PRESSR).

ADC\_XPOSR presents XPOS (VX - VXmin) on its LSB and XSCALE (VXMAX - VXmin) aligned on the 16th bit.

ADC\_YPOSR presents YPOS (VY - VYmin) on its LSB and YSCALE (VYMAX - VYmin) aligned on the 16th bit.

To improve the quality of the measure, the user must calculate XPOS/XSCALE and YPOS/YSCALE.

VXMAX, VXmin, VYMAX, and VYmin are measured at the first startup of the controller. These values can change during use, so it can be necessary to refresh them. Refresh can be done by writing '1' in the ADC\_CR.TSCALIB field.

ADC\_PRESSR presents Z1 on its LSB and Z2 aligned on the 16th bit. See [65.6.15.4 4-wire Pressure Measurement Method](#).

### 65.6.15.9 Pen Detect Method

When there is no contact, it is not necessary to perform a conversion. However, it is important to detect a contact by keeping the power consumption as low as possible.

The implementation polarizes one panel by closing the switch on ( $X_p/U_L$ ) and ties the horizontal panel by an embedded resistor connected to  $Y_M$  / Sense. This resistor is enabled by a fifth switch. Since there is

no contact, no current is flowing and there is no related power consumption. As soon as a contact occurs, a current is flowing in the Touchscreen and a Schmitt trigger detects the voltage in the resistor.

The Touchscreen Interrupt configuration is entered by programming the ADC\_TSMR.PENDET bit. If this bit is written at 1, the controller samples the pen contact state when it is not converting and waiting for a trigger.

To complete the circuit, a programmable debouncer is placed at the output of the Schmitt trigger. This debouncer is programmable up to  $2^{15}$  ADC clock periods. The debouncer length can be selected by programming the ADC\_TSMR.PENDBC field.

Due to the analog switch's structure, the debouncer circuitry is only active when no conversion (touchscreen or classic ADC channels) is in progress. Thus, if the time between the end of a conversion sequence and the arrival of the next trigger event is lower than the debouncing time configured on ADC\_TSMR.PENDBC, the debouncer will not detect any contact.

**Figure 65-20. Touchscreen Pen Detect**

The touchscreen pen detect can be used to generate an ADC interrupt to wake up the system. The pen detect generates two types of status, reported in ADC\_ISR:

- the ADC\_ISR.PEN bit is set as soon as a contact exceeds the debouncing time as defined by the ADC\_TSMR.PENDBC field and remains set until ADC\_ISR is read.
- the ADC\_ISR.NOPEN bit is set as soon as no current flows for a time over the debouncing time as defined by PENDBC and remains set until ADC\_ISR is read.

Both bits are automatically cleared as soon as ADC\_ISR is read, and can generate an interrupt by writing ADC\_IER.

Moreover, the rising of either one of them clears the other, they cannot be set at the same time.

The ADC\_ISR.PENS bit shows the current status of the pen contact.

### 65.6.16 Asynchronous and Partial Wakeup (SleepWalking)

This operating mode is a means of data preprocessing that qualifies an incoming event, thus allowing the ADC to decide whether or not to wake up the system. Asynchronous and partial wakeup is mainly used when the system is in Wait mode (refer to the Power Management Controller (PMC) section for further details). It can also be enabled when the system is fully running.

Once the Asynchronous and partial wakeup mode is enabled, no access must be performed in the ADC before a wakeup is performed by the ADC.

When the Asynchronous and partial wakeup mode is enabled for the ADC (refer to the Power Management Controller (PMC) section), the PMC decodes a clock request from the ADC. The clock request is generated as soon as a trigger event occurs. Only a trigger from RTC or ADTRG pin can be used in partial wakeup mode. The selection between RTC or ADTRG pin is performed through the ADC\_MR.TRGSEL field.

If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the ADC.

To perform a conversion at regular intervals with RTC trigger, the RTC must be configured with the following settings: RTC\_MR.OUT0=7 and RTC\_MR.THIGH=7. The period of the trigger can be defined in RTC\_MR.TPERIOD.

To trigger a conversion using the ADTRG pin, the minimum high level duration of the ADTRG signal must be greater than 2 clock periods of the fast RC oscillator. The maximum duration of the high level must be limited to the amount of startup and conversion time.

As soon as the clock is provided by the PMC, the ADC processes the conversions and compares the converted values with the ADC\_CWR.LOWTHRES and ADC\_CWR.HIGHTHRES field values.

The ADC instructs the PMC to disable the clock if the converted value does not meet the conditions defined by the ADC\_CWR.LOWTHRES and ADC\_CWR.HIGHTHRES field values.

If the converted value meets the conditions, the ADC instructs the PMC to exit the full system from Wait mode.

If the processor and peripherals are running, the ADC can be configured in Asynchronous and partial wakeup mode by enabling PMC\_SLPWK\_ER (refer to the Power Management Controller (PMC) section). When a trigger event occurs, the ADC requests the clock from the PMC and the comparison is performed. If there is a comparison match, the ADC continues to request the clock. If there is no match, the clock is switched off for the ADC only, until a new trigger event is detected.

It is recommended to write a '1' to the ADC\_MR.SLEEP bit to reduce the power consumption of the ADC analog part when the system is waiting for a trigger event.

### 65.6.17 Buffer Structure

The DMA read channel is triggered each time a new data is stored in ADC\_LCDR. The same data structure is repeatedly stored in ADC\_LCDR each time a trigger event occurs. Depending on user mode of operation (ADC\_MR, ADC\_CHSR, ADC\_SEQR1, ADC\_SEQR2, ADC\_TSMR) the structure differs. Each data read to DMA buffer, carried on a half-word (16-bit), consists of last converted data right-aligned and when the ADC\_EMR.TAG is set, the four most significant bits are carrying the channel number thus allowing an easier postprocessing in the DMA buffer or better checking the DMA buffer integrity.

**Figure 65-21. Buffer Structure**

As soon as touchscreen conversions are required, the pen detection function can help the postprocessing of the buffer. See [65.6.17.4 Pen Detection Status](#).

### 65.6.17.1 Classic ADC Channels Only (Touchscreen Disabled)

When no touchscreen conversion is required (i.e., ADC\_TSMR.TSMODE = 0), the data structure within the buffer is defined by ADC\_MR, ADC\_CHSR, ADC\_SEQRx. See figure [Buffer Structure](#).

If the user sequence is not used (i.e., ADC\_MR.USEQ is cleared) then only the value of ADC\_CHSR defines the data structure. For each trigger event, enabled channels will be consecutively stored in ADC\_LCDR and automatically read to the buffer.

When the user sequence is configured (i.e., ADC\_MR.USEQ is set) not only does ADC\_CHSR modify the data structure of the buffer, but ADC\_SEQRx registers may modify the data structure of the buffer as well.

### 65.6.17.2 Touchscreen Channels Only

When only touchscreen conversions are required (i.e., TSMODE ≠ 0 in ADC\_TSMR and ADC\_CHSR equals 0), the structure of data within the buffer is defined by ADC\_TSMR.

When TSMODE = 1 or 3, each trigger event adds two half-words in the buffer (assuming TSAV = 0), first half-word being ADC\_XPOSR.XPOS, then ADC\_YPOSR.YPOS. If TSAV/TSFREQ ≠ 0, the data structure remains unchanged. Not all trigger events add data to the buffer.

When TSMODE = 2, each trigger event adds four half-words to the buffer (assuming TSAV = 0), first half-word being ADC\_XPOSR.XPOS, followed by ADC\_YPOSR.YPOS and finally ADC\_PRESSR.Z1, followed by ADC\_PRESSR.Z2.

When ADC\_EMR.TAG is set, the CHNB field (four most significant bits of ADC\_LCDR) is cleared when ADC\_XPOSR.XPOS is transmitted and set when ADC\_YPOSR.YPOS is transmitted, allowing an easier post-processing of the buffer or a better checking of the buffer integrity. In case 4-wire with Pressure mode is selected, the Z1 value is transmitted to the buffer along with tag set to 2 and Z2 is tagged with value 3.

XSCALE and YSCALE (calibration values) are not transmitted to the buffer because they are supposed to be constant and moreover only measured at the very first startup of the controller or upon user request.

There is no change in buffer structure whatever the value of the PENDET.ADC\_TSMR bit configuration, but it is recommended to use the pen detection function for buffer postprocessing (see [65.6.17.4 Pen Detection Status](#)).

**Figure 65-22. Buffer Structure When Only Touchscreen Channels are Enabled**

Assuming ADC\_TSMR.TSMOD = 1 or 3  
 ADC\_TSMR.TSAV = 0  
 ADC\_CHSR = 0x000\_00000, ADC\_EMR.TAG = 1

Assuming ADC\_TSMR.TSMOD = 1 or 3  
 ADC\_TSMR.TSAV = 0  
 ADC\_CHSR = 0x000\_00000, ADC\_EMR.TAG = 0

Assuming ADC\_TSMR.TSMOD = 2  
 ADC\_TSMR.TSAV = 0  
 ADC\_CHSR = 0x000\_00000, ADC\_EMR.TAG = 1

Assuming ADC\_TSMR.TSMOD = 2  
 ADC\_TSMR.TSAV = 0  
 ADC\_CHSR = 0x000\_00000, ADC\_EMR.TAG = 0

### 65.6.17.3 Interleaved Channels

When both classic ADC channels (CH4/CH5 up to CH12) are set in ADC\_CHSR and touchscreen conversions are required (TSMODE ≠ 0 in ADC\_TSMR), the structure of the buffer differs according to the ADC\_TSMR.TSAV and ADC\_TSMR.TSFREQ values.

If TSFREQ ≠ 0, not all events generate touchscreen conversions, therefore the buffer structure is based on 2<sup>TSFREQ</sup> trigger events. Given a TSFREQ value, the location of touchscreen conversion results depends on TSAV value.

When TSFREQ = 0, TSAV must equal 0.

There is no change in buffer structure whatever the value of the ADC\_TSMR.PENDET bit configuration, but it is recommended to use the pen detection function for buffer post-processing (see [65.6.17.4 Pen Detection Status](#)).

**Figure 65-23. Buffer Structure When Classic ADC and Touchscreen Channels are Interleaved**

Assuming ADC\_TSMR.TSMOD = 1  
 ADC\_TSMR.TSAV = ADC\_TSMR.TSFREQ = 0  
 ADC\_CHSR = 0x000\_0100, ADC\_EMR.TAG = 1

Assuming ADC\_TSMR.TSMOD = 1  
 ADC\_TSMR.TSAV = ADC\_TSMR.TSFREQ = 0  
 ADC\_CHSR = 0x000\_0100, ADC\_EMR.TAG = 0

Assuming ADC\_TSMR.TSMOD = 1  
 ADC\_TSMR.TSAV = 0, ADC\_TSMR.TSFREQ = 1  
 ADC\_CHSR = 0x000\_0100, ADC\_EMR.TAG = 1

Assuming ADC\_TSMR.TSMOD = 1  
 ADC\_TSMR.TSAV = 1, ADC\_TSMR.TSFREQ = 1  
 ADC\_CHSR = 0x000\_0100, ADC\_EMR.TAG = 1

### 65.6.17.4 Pen Detection Status

If the pen detection measure is enabled (ADC\_TSMR.PENDET is set), the XPOS, YPOS, Z1, Z2 values transmitted to the buffer through ADC\_LCDR are cleared (including the CHNB field), if the ADC\_ISR.PENS flag is 0. When the ADC\_ISR.PENS flag is set, XPOS, YPOS, Z1, Z2 are normally transmitted.

Therefore, using pen detection together with tag function eases the post-processing of the buffer, especially to determine which touchscreen converted values correspond to a period of time when the pen was in contact with the screen.

When the pen detection is disabled or the tag function is disabled, XPOS, YPOS, Z1, Z2 are normally transmitted without tag and no relationship can be found with pen status, thus post-processing may not be easy.

**Figure 65-24. Buffer Structure With and Without Pen Detection Enabled**

### 65.6.18 Fault Event

The ADC Controller internal fault output is directly connected to the PWM fault input. The fault event may be asserted depending on the configuration of ADC\_EMR, ADC\_CWR, ADC\_LCMR and ADC\_LCCWR and converted values.

Two types of comparison can trigger a comparison event (fault output pulse):

- The first comparison type is based on ADC\_LCCWR settings, i.e., on all converted channels except the last one;
- The second comparison type is linked to the last channel.

As an example, overcurrent and temperature exceeding limits can trigger a fault to PWM.

When the comparison event occurs, the ADC fault output generates a pulse of one peripheral clock cycle to the PWM fault input. This fault line can be enabled or disabled within PWM. Should it be activated and asserted by the ADC Controller, the PWM outputs are immediately placed in a safe state (pure combinational path). Note that the ADC fault output connected to the PWM is not the COMPE bit. Thus the Fault mode (FMODE) within the PWM configuration must be FMODE = 1.

### 65.6.19 Register Write Protection

To prevent any single software error from corrupting ADC behavior, certain registers in the address space can be write-protected by setting the bit WPEN in the “[ADC Write Protection Mode Register](#)” (ADC\_WPMR).

If a write access to the protected registers is detected, the WPVS flag in the “[ADC Write Protection Status Register](#)” (ADC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS flag is automatically reset by reading ADC\_WPSR.

The following registers are write-protected when ADC\_WPMR.WPEN is set:

- [ADC Mode Register](#)
- [ADC Channel Sequence 1 Register](#)
- [ADC Channel Sequence 2 Register](#)
- [ADC Channel Enable Register](#)
- [ADC Channel Disable Register](#)
- [ADC Last Channel Trigger Mode Register](#)
- [ADC Last Channel Compare Window Register](#)
- [ADC Extended Mode Register](#)
- [ADC Compare Window Register](#)
- [ADC Channel Offset Register](#)
- [ADC Analog Control Register](#)
- [ADC\\_Touchscreen Mode Register](#)
- [ADC Trigger Register](#)
- [ADC Correction Values Register](#)
- [ADC Channel Error Correction Register](#)
- [ADC Touchscreen Correction Values Register](#)

### 65.7.1 ADC Control Register

**Name:** ADC\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

#### Bit 4 – CMPRST Comparison Restart

| Value | Description  |
|-------|--|
| 0     | No effect.   |
| 1     | Stops the conversion result storage until the next comparison match. |

#### Bit 2 – TSCALIB Touchscreen Calibration

If conversion is in progress, the calibration sequence starts at the beginning of a new conversion sequence. If no conversion is in progress, the calibration sequence starts at the second conversion sequence located after the TSCALIB command (Sleep mode, waiting for a trigger event).

TSCALIB measurement sequence does not affect the Last Converted Data register (ADC\_LCDR).

| Value | Description                                       |
|-------|---|
| 0     | No effect.  |
| 1     | Programs screen calibration (VDD/GND measurement) |

#### Bit 1 – START Start Conversion

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | Begins analog-to-digital conversion. |

# SAMA5D2 Series

## Analog-to-Digital Controller (ADC)

---

---

### Bit 0 – SWRST Software Reset

| Value | Description                                  |
|-------|--|
| 0     | No effect.                                   |
| 1     | Resets the ADC, simulating a hardware reset. |

### 65.7.2 ADC Mode Register

**Name:** ADC\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|        |              |          |               |     |               |     |     |     |

| Reset  | 0            | 0        | 0             | 0   | 0             | 0   | 0   | 0   |
|        |              |          |               |     |               |     |     |     |
| Bit    | 7            | 6        | 5             | 4   | 3             | 2   | 1   | 0   |
|        |              | FWUP     | SLEEP         |     | TRGSEL[2:0]   |     |     |     |
| Access |              | R/W      | R/W           |     | R/W           | R/W | R/W |     |
| Reset  |              | 0        | 0             |     | 0             | 0   | 0   |     |

#### Bit 31 – USEQ User Sequence Enable

| Value | Name      | Description   |
|-------|-----------|---|
| 0     | NUM_ORDER | Normal mode: The controller converts channels in a simple numeric order depending only on the channel index.  |
| 1     | REG_ORDER | User Sequence mode: The sequence respects what is defined in ADC_SEQR1 and ADC_SEQR2 registers and can be used to convert the same channel several times. |

#### Bit 30 – MAXSPEED Maximum Sampling Rate Enable in Freerun Mode

This bit should always be set to 0.

#### Bits 29:28 – TRANSFER[1:0] Transfer Time

The TRANSFER field must be set to 2 to guarantee the optimal transfer time.

#### Bits 27:24 – TRACKTIM[3:0] Tracking Time

| Value | Name    | Description                              |
|-------|---------|--|
| 0     | ADCCLK6 | The tracking time is 6 ADC clock cycles. |
| 1-14  | –       | The tracking time is 6 ADC clock cycles. |
| 15    | ADCCLK7 | The tracking time is 7 ADC clock cycles. |

### Bit 23 – ANACH Analog Change

| Value | Name    | Description  |
|-------|---------|--|
| 0     | NONE    | No analog change on channel switching: DIFF0 is used for all channels.           |
| 1     | ALLOWED | Allows different analog settings for each channel. See <a href="#">ADC_COR</a> . |

### Bits 19:16 – STARTUP[3:0] Startup Time

| Value | Name   | Description           |
|-------|--------|-----------------------|
| 0     | SUT0   | 0 periods of ADCCLK   |
| 1     | SUT8   | 8 periods of ADCCLK   |
| 2     | SUT16  | 16 periods of ADCCLK  |
| 3     | SUT24  | 24 periods of ADCCLK  |
| 4     | SUT64  | 64 periods of ADCCLK  |
| 5     | SUT80  | 80 periods of ADCCLK  |
| 6     | SUT96  | 96 periods of ADCCLK  |
| 7     | SUT112 | 112 periods of ADCCLK |
| 8     | SUT512 | 512 periods of ADCCLK |
| 9     | SUT576 | 576 periods of ADCCLK |
| 10    | SUT640 | 640 periods of ADCCLK |
| 11    | SUT704 | 704 periods of ADCCLK |
| 12    | SUT768 | 768 periods of ADCCLK |
| 13    | SUT832 | 832 periods of ADCCLK |
| 14    | SUT896 | 896 periods of ADCCLK |
| 15    | SUT960 | 960 periods of ADCCLK |

### Bits 15:8 – PRESCAL[7:0] Prescaler Rate Selection

$PRESCAL = (f_{\text{peripheral clock}} / (2 \times f_{\text{ADCCLK}})) - 1$ .

### Bit 6 – FWUP Fast Wakeup

| Value | Name | Description   |
|-------|------|---|
| 0     | OFF  | If SLEEP is 1, then both ADC core and reference voltage circuitry are OFF between conversions                   |
| 1     | ON   | If SLEEP is 1, then Fast Wakeup Sleep mode: The voltage reference is ON between conversions and ADC core is OFF |

### Bit 5 – SLEEP Sleep Mode

| Value | Name   | Description  |
|-------|--------|--|
| 0     | NORMAL | Normal Mode: The ADC core and reference voltage circuitry are kept ON between conversions. |
| 1     | SLEEP  | Sleep Mode: The wakeup time can be modified by programming the FWUP bit.                   |

### Bits 3:1 – TRGSEL[2:0] Trigger Selection

The trigger selection can be performed only if  $ADC\_TRGR.TRGMOD = 1, 2$  or  $3$ .

| Value | Name      | Description |
|-------|-----------|-------------|
| 0     | ADC_TRIG0 | ADTRG       |
| 1     | ADC_TRIG1 | TIOA0       |
| 2     | ADC_TRIG2 | TIOA1       |

# SAMA5D2 Series

## Analog-to-Digital Controller (ADC)

| Value | Name      | Description      |
|-------|-----------|------------------|
| 3     | ADC_TRIG3 | TIOA2            |

### 65.7.3 ADC Channel Sequence 1 Register

**Name:** ADC\_SEQR1  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|        |     |            |     |     |     |            |     |     |     |

**Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – USCHx** User Sequence Number x

This register can be used only if the ADC\_MR.USEQ field is set to '1'.

Any USCHx field is processed only if the ADC\_CHSR.CHx-1 bit reads logical '1', else any value written in USCHx does not add the corresponding channel in the conversion sequence.

Configuring the same value in different fields leads to multiple samples of the same channel during the conversion sequence. This can be done consecutively, or not, according to user needs.

Example: for each trigger event, to obtain the "CH3 CH1 CH0 CH4 CH4" conversion sequence, use the following settings:

ADC\_SEQR1.USCH1=3, ADC\_CHSR.CH0=1

ADC\_SEQR1.USCH2=1, ADC\_CHSR.CH1=1

ADC\_SEQR1.USCH3=0, ADC\_CHSR.CH2=1

ADC\_SEQR1.USCH4=4, ADC\_CHSR.CH3=1

ADC\_SEQR1.USCH5=4, ADC\_CHSR.CH4=1

### 65.7.4 ADC Channel Sequence 2 Register

**Name:** ADC\_SEQR2  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

**Bits 3:0 – USCHx[3:0]** User Sequence Number x

This register can be used only if the ADC\_MR.USEQ field is set to '1'.

Any USCHx field is processed only if the ADC\_CHSR.CHx-1 bit reads logical '1', else any value written in USCHx does not add the corresponding channel in the conversion sequence.

Configuring the same value in different fields leads to multiple samples of the same channel during the conversion sequence. This can be done consecutively, or not, according to user needs.

### 65.7.5 ADC Channel Enable Register

**Name:** ADC\_CHER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

| Access | W   | W   | W   | W   | W    | W    | W   | W   |
| Reset  | –   | –   | –   | –   | –    | –    | –   | –   |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx Channel x Enable**

If ADC\_MR.USEQ = 1, CHx corresponds to the enable of sequence number x+1 described in ADC\_SEQR1 and ADC\_SEQR2 (e.g. CH0 enables sequence number USCH1).

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | Enables the corresponding channel. |

### 65.7.6 ADC Channel Disable Register

**Name:** ADC\_CHDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|        |     |     |     |     |      |      |     |     |
|--------|-----|-----|-----|-----|------|------|-----|-----|
| Bit    | 31  | 30  | 29  | 28  | 27   | 26   | 25  | 24  |
|        |     |     |     |     |      |      |     |     |
| Access |     |     |     |     |      |      |     |     |
| Reset  |     |     |     |     |      |      |     |     |
|        |     |     |     |     |      |      |     |     |
| Bit    | 23  | 22  | 21  | 20  | 19   | 18   | 17  | 16  |
|        |     |     |     |     |      |      |     |     |
| Access |     |     |     |     |      |      |     |     |
| Reset  |     |     |     |     |      |      |     |     |
|        |     |     |     |     |      |      |     |     |
| Bit    | 15  | 14  | 13  | 12  | 11   | 10   | 9   | 8   |
|        |     |     |     |     | CH11 | CH10 | CH9 | CH8 |
| Access |     |     |     |     | W    | W    | W   | W   |
| Reset  |     |     |     |     | –    | –    | –   | –   |
|        |     |     |     |     |      |      |     |     |

|        | CH7 | CH6 | CH5 | CH4 | CH3  | CH2  | CH1 | CH0 |
| Access | W   | W   | W   | W   | W    | W    | W   | W   |
| Reset  | –   | –   | –   | –   | –    | –    | –   | –   |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx** Channel x Disable

If the corresponding channel is disabled during a conversion or if it is disabled and then reenabled during a conversion, its associated data and corresponding EOCx and GOVRE flags in ADC\_ISR and OVREx flags in ADC\_OVER are unpredictable

| Value | Description                         |
|-------|-------------------------------------|
| 0     | No effect.                          |
| 1     | Disables the corresponding channel. |

### 65.7.7 ADC Channel Status Register

**Name:** ADC\_CHSR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

|        |     |     |     |     |      |      |     |     |
|--------|-----|-----|-----|-----|------|------|-----|-----|
| Bit    | 31  | 30  | 29  | 28  | 27   | 26   | 25  | 24  |
|        |     |     |     |     |      |      |     |     |
| Access |     |     |     |     |      |      |     |     |
| Reset  |     |     |     |     |      |      |     |     |
|        |     |     |     |     |      |      |     |     |

| Access |     |     |     |     |      |      |     |     |
| Reset  |     |     |     |     |      |      |     |     |
|        |     |     |     |     |      |      |     |     |
| Bit    | 15  | 14  | 13  | 12  | 11   | 10   | 9   | 8   |
|        |     |     |     |     | CH11 | CH10 | CH9 | CH8 |
| Access |     |     |     |     | W    | W    | W   | W   |
| Reset  |     |     |     |     | 0    | 0    | 0   | 0   |
|        |     |     |     |     |      |      |     |     |
| Bit    | 7   | 6   | 5   | 4   | 3    | 2    | 1   | 0   |
|        | CH7 | CH6 | CH5 | CH4 | CH3  | CH2  | CH1 | CH0 |
| Access | W   | W   | W   | W   | W    | W    | W   | W   |
| Reset  | 0   | 0   | 0   | 0   | 0    | 0    | 0   | 0   |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx Channel x Status**

| Value | Description   |
|-------|---|
| 0     | The corresponding channel (or part of sequence, see ADC_SEQyR.USCHx field) is disabled.   |
| 1     | The corresponding channel (or part of sequence, see ADC_SEQyR.USCHx field) is enabled.<br><br>Note: As an example, when ADC_MR.USEQ=1 and a 1 is written to CH2, the channel defined in ADC_SEQ0R.USCH3 is part of the sequence of conversions. |

### 65.7.8 ADC Last Converted Data Register

**Name:** ADC\_LCDR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

|        |              |    |    |    |    |    |    |    |

| Reset  |              |    |    | 0  | 0  | 0  | 0  | 0  |
|        |              |    |    |    |    |    |    |    |
| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |              |    |    |    |    |    |    |    |
| Access |              |    |    |    |    |    |    |    |
| Reset  |              |    |    |    |    |    |    |    |
|        |              |    |    |    |    |    |    |    |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | LDATA[15:8]  |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |              |    |    |    |    |    |    |    |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | LDATA[7:0]   |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 28:24 – CHNBOSR[4:0]** Channel Number in Oversampling Mode

Indicates the last converted channel when the ADC\_EMR.TAG bit is set and the ADC\_EMR0.OSR field is not equal to 0. If the ADC\_EMR.TAG bit is not set, CHNBOSR = 0.

**Bits 15:0 – LDATA[15:0]** Last Data Converted

The analog-to-digital conversion data is placed into this register at the end of a conversion and remains until a new conversion is completed.

If OSR = 0 and TAG = 1 in ADC\_EMR, the 4 MSBs of LDATA carry the channel number to obtain a packed system memory buffer made of 1 converted data stored in a halfword (16-bit) instead of 1 converted data in a 32-bit word, thus dividing by 2 the size of the memory buffer.

### 65.7.9 ADC Interrupt Enable Register

**Name:** ADC\_IER  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |      |       |      |      |       |       |       |      |

| Access |      |       |      |      | R     | R     | R     | R    |
| Reset  |      |       |      |      | 0     | 0     | 0     | 0    |
| Bit    | 7    | 6     | 5    | 4    | 3     | 2     | 1     | 0    |
|        | EOC7 | EOC6  | EOC5 | EOC4 | EOC3  | EOC2  | EOC1  | EOC0 |
| Access | R    | R     | R    | R    | R     | R     | R     | R    |
| Reset  | 0    | 0     | 0    | 0    | 0     | 0     | 0     | 0    |

#### Bit 31 – PENS Pen Detect Status

| Value | Description                                 |
|-------|---|
| 0     | The pen does not press the screen.          |
| 1     | The pen presses the screen.                 |
|       | Note: PENS is not a source of interruption. |

#### Bit 30 – NOPEN No Pen Contact (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No loss of pen contact since the last read of ADC_ISR.           |
| 1     | At least one loss of pen contact since the last read of ADC_ISR. |

#### Bit 29 – PEN Pen contact (cleared on read)

| Value | Description  |
|-------|--|
| 0     | No pen contact since the last read of ADC_ISR.           |
| 1     | At least one pen contact since the last read of ADC_ISR. |

#### Bit 26 – COMPE Comparison Event (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No comparison event since the last read of ADC_ISR.   |
| 1     | At least one comparison event (defined in ADC_EMR and ADC_CWR) has occurred since the last read of ADC_ISR. |

**Bit 25 – GOVRE** General Overrun Error (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No general overrun error occurred since the last read of ADC_ISR.               |
| 1     | At least one general overrun error has occurred since the last read of ADC_ISR. |

**Bit 24 – DRDY** Data Ready (automatically set / cleared)

| Value | Description  |
|-------|--|
| 0     | No data has been converted since the last read of ADC_LCDR.        |
| 1     | At least one data has been converted and is available in ADC_LCDR. |

**Bit 22 – PRDY** Touchscreen Pressure Measure Ready (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No measure has been performed since the last read of ADC_PRESSR.        |
| 1     | At least one measure has been performed since the last read of ADC_ISR. |

**Bit 21 – YRDY** Touchscreen YPOS Measure Ready (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No measure has been performed since the last read of ADC_YPOSR.         |
| 1     | At least one measure has been performed since the last read of ADC_ISR. |

**Bit 20 – XRDY** Touchscreen XPOS Measure Ready (cleared on read)

| Value | Description   |
|-------|---|
| 0     | No measure has been performed since the last read of ADC_XPOSR.         |
| 1     | At least one measure has been performed since the last read of ADC_ISR. |

**Bit 19 – LCCHG** Last Channel Change (cleared on read)

| Value | Description  |
|-------|--|
| 0     | There is no comparison match (defined in the Last Channel Compare Window register (ADC_LCCWR) since the last read of ADC_ISR.                  |
| 1     | The converted value reported on ADC_CDR11 has changed since the last read of ADC_ISR, according to what is defined in ADC_LCTMR and ADC_LCCWR. |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – EOCx** End of Conversion x (automatically set / cleared)

| Value | Description  |
|-------|--|
| 0     | The corresponding analog channel is disabled, or the conversion is not finished. This flag is cleared when reading the corresponding ADC_CDRx registers. |
| 1     | The corresponding analog channel is enabled and conversion is complete.  |

### 65.7.13 ADC Last Channel Trigger Mode Register

**Name:** ADC\_LCTMR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

#### Bits 5:4 – CMPMOD[1:0] Last Channel Comparison Mode

| Value | Name | Description   |
|-------|------|---|
| 0     | LOW  | Generates the ADC_ISR.LCCHG flag when the converted data is lower than the low threshold of the window.   |
| 1     | HIGH | Generates the ADC_ISR.LCCHG flag when the converted data is higher than the high threshold of the window. |
| 2     | IN   | Generates the ADC_ISR.LCCHG flag when the converted data is in the comparison window.                     |
| 3     | OUT  | Generates the ADC_ISR.LCCHG flag when the converted data is out of the comparison window.                 |

#### Bit 0 – DUALTRIG Dual Trigger ON

| Value | Description   |
|-------|---|
| 0     | All channels are triggered by event defined by ADC_MR.TRGSEL.         |
| 1     | Last channel (higher index) trigger period is defined by RTC_MR.OUT1. |

### 65.7.14 ADC Last Channel Compare Window Register

**Name:** ADC\_LCCWR  
**Offset:** 0x38  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|        |                 |     |     |     |     |     |     |     |

| Access | R     | R     | R     | R     | R      | R      | R     | R     |
| Reset  | 0     | 0     | 0     | 0     | 0      | 0      | 0     | 0     |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – OVREx** Overrun Error x

| Value | Description   |
|-------|---|
| 0     | No overrun error on the corresponding channel since the last read of ADC_OVER.              |
| 1     | An overrun error has occurred on the corresponding channel since the last read of ADC_OVER. |

### 65.7.16 ADC Extended Mode Register

**Name:** ADC\_EMR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|        |             |     |                |      |    |         |               |        |  |
|--------|-------------|-----|----------------|------|----|---------|---------------|--------|--|
| Bit    | 31          | 30  | 29             | 28   | 27 | 26      | 25            | 24     |  |

|        | CMPSEL[3:0] |     |                |      |    | CMPTYPE | CMPMODE[1:0]  |        |  |
| Access | R/W         | R/W | R/W            | R/W  |    | R/W     | R/W           | R/W    |  |
| Reset  | 0           | 0   | 0              | 0    |    | 0       | 0             | 0      |  |

**Bits 29:28 – ADCMODE[1:0]** ADC Running Mode  
 See [65.6.14 Automatic Error Correction](#) for details on ADC running mode.

| Value | Name            | Description  |
|-------|-----------------|--|
| 0     | NORMAL          | Normal mode of operation.  |
| 1     | OFFSET_ERROR    | Offset Error mode to measure the offset error. See table <a href="#">ADC Running Modes</a> . |
| 2     | GAIN_ERROR_HIGH | Gain Error mode to measure the gain error. See table <a href="#">ADC Running Modes</a> .     |
| 3     | GAIN_ERROR_LOW  | Gain Error mode to measure the gain error. See table <a href="#">ADC Running Modes</a> .     |

**Bits 26:25 – SIGNMODE[1:0]** Sign Mode  
 If conversion results are signed and resolution is below 16 bits, the sign is extended up to the bit 15 (for example, 0xF43 for 12-bit resolution will be read as 0xFF43 and 0x467 will be read as 0x0467). See [65.6.6 Conversion Results Format](#).

| Value | Name            | Description  |
|-------|-----------------|--|
| 0     | SE_UNSG_DF_SIGN | Single-Ended channels: Unsigned conversions.<br>Differential channels: Signed conversions. |

| Value | Name            | Description  |
|-------|-----------------|--|
| 1     | SE_SIGN_DF_UNSG | Single-Ended channels: Signed conversions.<br>Differential channels: Unsigned conversions. |
| 2     | ALL_UNSIGNED    | All channels: Unsigned conversions.  |
| 3     | ALL_SIGNED      | All channels: Signed conversions.  |

### Bit 24 – TAG Tag of ADC\_LCDR

| Value | Description  |
|-------|--|
| 0     | Sets ADC_LCDR.CHNB field to zero.                                |
| 1     | Appends the channel number to the conversion result in ADC_LCDR. |

### Bit 21 – SRCCLK External Clock Selection

0 (PERIPH\_CLK): The peripheral clock is the source for the ADC prescaler.

1 (GCLK): GCLK is the source clock for the ADC prescaler, thus the ADC clock can be independent of the core/peripheral clock.

### Bit 20 – ASTE Averaging on Single Trigger Event

| Value | Name                | Description                                  |
|-------|---------------------|--|
| 0     | MULTI_TRIG_AVERAGE  | The average requests several trigger events. |
| 1     | SINGLE_TRIG_AVERAGE | The average requests only one trigger event. |

### Bits 17:16 – OSR[1:0] Over Sampling Rate

| Value | Name       | Description   |
|-------|------------|---|
| 0     | NO_AVERAGE | No averaging. ADC sample rate is maximum.                               |
| 1     | OSR4       | 1-bit enhanced resolution by averaging. ADC sample rate divided by 4.   |
| 2     | OSR16      | 2-bit enhanced resolution by averaging. ADC sample rate divided by 16.  |
| 3     | OSR64      | 3-bit enhanced resolution by averaging. ADC sample rate divided by 64.  |
| 4     | OSR256     | 4-bit enhanced resolution by averaging. ADC sample rate divided by 256. |

### Bits 13:12 – CMPFILTER[1:0] Compare Event Filtering

Number of consecutive compare events necessary to raise the flag = CMPFILTER+1

When programmed to 0, the flag rises as soon as an event occurs.

See [65.6.9 Comparison Window](#) when using the filtering option (CMPFILTER > 0).

### Bit 9 – CMPALL Compare All Channels

| Value | Description   |
|-------|---|
| 0     | Only channel indicated in CMPSEL field is compared. |
| 1     | All channels are compared.                          |

### Bits 7:4 – CMPSEL[3:0] Comparison Selected Channel

If CMPALL = 0: CMPSEL indicates which channel has to be compared.

If CMPALL = 1: No effect.

### Bit 2 – CMPTYPE Comparison Type

# SAMA5D2 Series

## Analog-to-Digital Controller (ADC)

| Value | Name            | Description   |
|-------|-----------------|---|
| 0     | FLAG_ONLY       | Any conversion is performed and comparison function drives the ADC_ISR.COMPE flag.                            |
| 1     | START_CONDITION | Comparison conditions must be met to start the storage of all conversions until the ADC_CR.CMPRST bit is set. |

### Bits 1:0 – CMPMODE[1:0] Comparison Mode

| Value | Name | Description   |
|-------|------|---|
| 0     | LOW  | When the converted data is lower than the low threshold of the window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode.   |
| 1     | HIGH | When the converted data is higher than the high threshold of the window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode. |
| 2     | IN   | When the converted data is in the comparison window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode.                     |
| 3     | OUT  | When the converted data is out of the comparison window, generates the ADC_ISR.COMPE flag or, in Partial Wakeup mode, defines the conditions to exit system from Wait mode.                 |

### 65.7.17 ADC Compare Window Register

**Name:** ADC\_CWR  
**Offset:** 0x44  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|        |                |     |                 |     |     |     |     |     |
|--------|----------------|-----|-----------------|-----|-----|-----|-----|-----|
| Bit    | 31             | 30  | 29              | 28  | 27  | 26  | 25  | 24  |
|        |                |     | HIGHTHRES[13:8] |     |     |     |     |     |
| Access |                |     | R/W             | R/W | R/W | R/W | R/W | R/W |

|        | HIGHTHRES[7:0] |     |                 |     |     |     |     |     |
| Access | R/W            | R/W | R/W             | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0              | 0   | 0               | 0   | 0   | 0   | 0   | 0   |
|        |                |     |                 |     |     |     |     |     |
| Bit    | 15             | 14  | 13              | 12  | 11  | 10  | 9   | 8   |
|        |                |     | LOWTHRES[13:8]  |     |     |     |     |     |
| Access |                |     | R/W             | R/W | R/W | R/W | R/W | R/W |
| Reset  |                |     | 0               | 0   | 0   | 0   | 0   | 0   |
|        |                |     |                 |     |     |     |     |     |
| Bit    | 7              | 6   | 5               | 4   | 3   | 2   | 1   | 0   |
|        | LOWTHRES[7:0]  |     |                 |     |     |     |     |     |
| Access | R/W            | R/W | R/W             | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0              | 0   | 0               | 0   | 0   | 0   | 0   | 0   |

**Bits 29:16 – HIGHTHRES[13:0]** High Threshold  
 High threshold associated to compare settings of ADC\_EMR.

**Bits 13:0 – LOWTHRES[13:0]** Low Threshold  
 Low threshold associated to compare settings of ADC\_EMR.

### 65.7.18 Channel Offset Register

**Name:** ADC\_COR  
**Offset:** 0x4C  
**Reset:** 0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|        |     |       |       |       |       |        |        |       |       |

| Reset  |           |     |            |     |     |     |     |     |  |
| Bit    | 15        | 14  | 13         | 12  | 11  | 10  | 9   | 8   |  |
|        |           |     | DATA[13:8] |     |     |     |     |     |  |
| Access |           |     | R/W        | R/W | R/W | R/W | R/W | R/W |  |
| Reset  |           |     | 0          | 0   | 0   | 0   | 0   | 0   |  |
| Bit    | 7         | 6   | 5          | 4   | 3   | 2   | 1   | 0   |  |
|        | DATA[7:0] |     |            |     |     |     |     |     |  |
| Access | R/W       | R/W | R/W        | R/W | R/W | R/W | R/W | R/W |  |
| Reset  | 0         | 0   | 0          | 0   | 0   | 0   | 0   | 0   |  |

**Bits 13:0 – DATA[13:0]** Converted Data

The analog-to-digital conversion data is placed into this register at the end of a conversion and remains until a new conversion is completed. ADC\_CDRx is only loaded if the corresponding analog channel is enabled.

### 65.7.20 ADC Analog Control Register

**Name:** ADC\_ACR  
**Offset:** 0x94  
**Reset:** 0x00000101  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).  
 By default, bits 12 and 13 are set to 1 and 0, respectively, and must not be modified.

**Bits 9:8 – IBCTL[1:0]** ADC Bias Current Control

Adapts performance versus power consumption. Refer to the “Electrical Characteristics” section for further details.

**Bits 1:0 – PENDETSSENS[1:0]** Pen Detection Sensitivity

Modifies the pen detection input pull-up resistor value. Refer to the “Electrical Characteristics” section for further details.

### 65.7.21 ADC Touchscreen Mode Register

**Name:** ADC\_TSMR  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|        |             |         |           |     |              |     |             |        |

| Access |             |         | R/W       | R/W |              |     | R/W         | R/W    |
| Reset  |             |         | 0         | 0   |              |     | 0           | 0      |

**Bits 31:28 – PENDBC[3:0]** Pen Detect Debouncing Period  
 Debouncing period =  $2^{\text{PENDBC}}$  ADCCLK periods.

**Bit 24 – PENDET** Pen Contact Detection Enable  
 When PENDET = 1, XPOS, YPOS, Z1, Z2 values of ADC\_XPOSR, ADC\_YPOSR, ADC\_PRESSR are automatically cleared when ADC\_ISR.PENS = 0.

| Value | Description                     |
|-------|---------------------------------|
| 0     | Pen contact detection disabled. |
| 1     | Pen contact detection enabled.  |

**Bit 22 – NOTSDMA** No TouchScreen DMA

| Value | Description   |
|-------|---|
| 0     | XPOS, YPOS, Z1, Z2 are transmitted in ADC_LCDR.   |
| 1     | XPOS, YPOS, Z1, Z2 are never transmitted in ADC_LCDR, therefore the buffer does not contain touchscreen values. |

**Bits 19:16 – TSSCTIM[3:0]** Touchscreen Switches Closure Time  
 Defines closure time of analog switches necessary to establish the measurement conditions.

The closure time is:

Switch Closure Time = (TSSCTIM × 4) ADCCLK periods.

**Bits 11:8 – TSFREQ[3:0]** Touchscreen Frequency

Defines the touchscreen frequency compared to the trigger frequency.

TSFREQ must be greater or equal to TSAV.

The touchscreen frequency is:

Touchscreen Frequency = Trigger Frequency /  $2^{\text{TSFREQ}}$

**Bits 5:4 – TSAV[1:0]** Touchscreen Average

| Value | Name      | Description                                       |
|-------|-----------|---|
| 0     | NO_FILTER | No Filtering. Only one ADC conversion per measure |
| 1     | AVG2CONV  | Averages 2 ADC conversions                        |
| 2     | AVG4CONV  | Averages 4 ADC conversions                        |
| 3     | AVG8CONV  | Averages 8 ADC conversions                        |

**Bits 1:0 – TSMODE[1:0]** Touchscreen Mode

When TSMOD equals 01 or 10 (i.e., 4-wire mode), channels 0, 1, 2 and 3 must not be used for classic ADC conversions. When TSMOD equals 11 (i.e., 5-wire mode), channels 0, 1, 2, 3, and 4 must not be used.

| Value | Name         | Description                                     |
|-------|--------------|---|
| 0     | NONE         | No Touchscreen                                  |
| 1     | 4_WIRE_NO_PM | 4-wire Touchscreen without pressure measurement |
| 2     | 4_WIRE       | 4-wire Touchscreen with pressure measurement    |
| 3     | 5_WIRE       | 5-wire Touchscreen                              |

**65.7.22 ADC Touchscreen X Position Register**

**Name:** ADC\_XPOSR  
**Offset:** 0xB4  
**Reset:** 0x00000000  
**Property:** Read-only

|        |              |    |    |    |    |    |    |    |

| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | XSCALE[7:0]  |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
|        |              |    |    |    |    |    |    |    |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | XPOS[11:8]   |    |    |    |    |    |    |    |
| Access |              |    |    |    | R  | R  | R  | R  |
| Reset  |              |    |    |    | 0  | 0  | 0  | 0  |
|        |              |    |    |    |    |    |    |    |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | XPOS[7:0]    |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 27:16 – XSCALE[11:0] Scale of XPOS**

Indicates the max value that XPOS can reach. This value should be close to  $2^{12}$ .

**Bits 11:0 – XPOS[11:0] X Position**

The position measured is stored here. If XPOS = 0 or XPOS = XSIZE, the pen is on the border.

When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), XPOS is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

**65.7.23 ADC Touchscreen Y Position Register**

**Name:** ADC\_YPOSR  
**Offset:** 0xB8  
**Reset:** 0x00000000  
**Property:** Read-only

|        |     |              |    |    |    |    |    |    |    |

| Access |     | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  |     | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 27:16 – YSCALE[11:0] Scale of YPOS**

Indicates the max value that YPOS can reach. This value should be close to  $2^{12}$ .

**Bits 11:0 – YPOS[11:0] Y Position**

The position measured is stored here. If YPOS = 0 or YPOS = YSIZE, the pen is on the border.

When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), YPOS is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

**65.7.24 ADC Touchscreen Pressure Register**

**Name:** ADC\_PRESSR  
**Offset:** 0xBC  
**Reset:** 0x00000000  
**Property:** Read-only

|        |         |    |    |    |          |    |    |    |
|--------|---------|----|----|----|----------|----|----|----|
| Bit    | 31      | 30 | 29 | 28 | 27       | 26 | 25 | 24 |
|        |         |    |    |    | Z2[11:8] |    |    |    |
| Access |         |    |    |    | R        | R  | R  | R  |
| Reset  |         |    |    |    | 0        | 0  | 0  | 0  |

|        | Z2[7:0] |    |    |    |          |    |    |    |
| Access | R       | R  | R  | R  | R        | R  | R  | R  |
| Reset  | 0       | 0  | 0  | 0  | 0        | 0  | 0  | 0  |
|        |         |    |    |    |          |    |    |    |
| Bit    | 15      | 14 | 13 | 12 | 11       | 10 | 9  | 8  |
|        |         |    |    |    | Z1[11:8] |    |    |    |
| Access |         |    |    |    | R        | R  | R  | R  |
| Reset  |         |    |    |    | 0        | 0  | 0  | 0  |
|        |         |    |    |    |          |    |    |    |
| Bit    | 7       | 6  | 5  | 4  | 3        | 2  | 1  | 0  |
|        | Z1[7:0] |    |    |    |          |    |    |    |
| Access | R       | R  | R  | R  | R        | R  | R  | R  |
| Reset  | 0       | 0  | 0  | 0  | 0        | 0  | 0  | 0  |

**Bits 27:16 – Z2[11:0]** Data of Z2 Measurement

Data Z2 necessary to calculate pen pressure.

When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), Z2 is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

**Note:** These two values are unavailable if ADC\_TSMR.TSMODE is not set to 2.

**Bits 11:0 – Z1[11:0]** Data of Z1 Measurement

Data Z1 necessary to calculate pen pressure.

When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), Z1 is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

### 65.7.25 ADC Trigger Register

**Name:** ADC\_TRGR  
**Offset:** 0xC0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|              |     |     |     |     |     |             |     |     |
|--------------|-----|-----|-----|-----|-----|-------------|-----|-----|

| Bit          | 15  | 14  | 13  | 12  | 11  | 10          | 9   | 8   |
|              |     |     |     |     |     |             |     |     |
| Access       |     |     |     |     |     |             |     |     |
| Reset        |     |     |     |     |     |             |     |     |
| Bit          | 7   | 6   | 5   | 4   | 3   | 2           | 1   | 0   |
|              |     |     |     |     |     | TRGMOD[2:0] |     |     |
| Access       |     |     |     |     |     | R/W         | R/W | R/W |
| Reset        |     |     |     |     |     | 0           | 0   | 0   |

**Bits 31:16 – TRGPER[15:0]** Trigger Period  
 Effective only if TRGMOD defines a periodic trigger.

Defines the periodic trigger period, with the following equation:

$$\text{Trigger Period} = (\text{TRGPER} + 1) / \text{ADCCLK}$$

The minimum time between two consecutive trigger events must be strictly greater than the duration time of the longest conversion sequence depending on the configuration of registers ADC\_MR, ADC\_CHSR, ADC\_SEQRx, ADC\_TSMR.

When TRGMOD is set to pen detect trigger (i.e., 100) and averaging is used (i.e., field TSAV ≠ 0 in ADC\_TSMR) only one measure is performed. Thus, XRDY, YRDY, PRDY, DRDY will not rise on pen contact trigger. To achieve measurement, several triggers must be provided either by software or by setting the TRGMOD on continuous trigger (i.e., 110) until flags rise.

**Bits 2:0 – TRGMOD[2:0]** Trigger Mode

| Value | Name          | Description   |
|-------|---------------|---|
| 0     | NO_TRIGGER    | No trigger, only software trigger can start conversions             |
| 1     | EXT_TRIG_RISE | Rising edge of the selected trigger event, defined in ADC_MR.TRGSEL |
| 2     | EXT_TRIG_FALL | Falling edge of the selected trigger event                          |
| 3     | EXT_TRIG_ANY  | Any edge of the selected trigger event                              |

# SAMA5D2 Series

## Analog-to-Digital Controller (ADC)

| Value | Name        | Description   |
|-------|-------------|---|
| 4     | PEN_TRIG    | Pen Detect Trigger (shall be selected only if PENDET is set and TSMODE > 0) |
| 5     | PERIOD_TRIG | ADC internal periodic trigger (see field TRGPER)                            |
| 6     | CONTINUOUS  | Continuous mode   |

### 65.7.26 ADC Correction Values Register

**Name:** ADC\_CVR  
**Offset:** 0xD4  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|        |                  |     |     |     |     |     |     |     |

**Bits 31:16 – GAINCORR[15:0]** Gain Correction

Gain correction to apply on converted data. Only bits 0 to 13 are relevant (other bits are ignored and read as 0).

**Bits 15:0 – OFFSETCORR[15:0]** Offset Correction

Offset correction to apply on converted data. The offset is signed (2's complement), only bits 0 to 11 are relevant (other bits are ignored and read as 0).

### 65.7.27 ADC Channel Error Correction Register

**Name:** ADC\_CECR  
**Offset:** 0xD8  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|        |        |        |        |        |         |         |        |        |

| Access | R/W    | R/W    | R/W    | R/W    | R/W     | R/W     | R/W    | R/W    |
| Reset  | 0      | 0      | 0      | 0      | 0       | 0       | 0      | 0      |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – ECORRx** Error Correction Enable for channel x

| Value | Description   |
|-------|---|
| 0     | Automatic error correction is disabled for channel x. |
| 1     | Automatic error correction is enabled for channel x.  |

**65.7.28 ADC Touchscreen Correction Values Register**

**Name:** ADC\_TSCVR  
**Offset:** 0xDC  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

|        |                    |     |     |     |     |     |     |     |

| Reset  | 0                  | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:16 – TSGAINCORR[15:0] Touchscreen Gain Correction**

Gain correction to apply on converted data for the touchscreen channels. Only bits 0 to 13 are relevant (other bits are ignored and read as 0).

**Bits 15:0 – TSOFFSETCORR[15:0] Touchscreen Offset Correction**

Offset correction to apply on converted data for the touchscreen channels. The offset is signed (2's complement), only bits 0 to 11 are relevant (other bits are ignored and read as 0).

### 65.7.29 ADC Write Protection Mode Register

**Name:** ADC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |     |              |    |    |    |    |    |    |     |
|--------|-----|--------------|----|----|----|----|----|----|-----|
|        | Bit | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24  |
|        |     | WPKEY[23:16] |    |    |    |    |    |    |     |

| Reset  |     | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0   |
|        | Bit | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16  |
|        |     | WPKEY[15:8]  |    |    |    |    |    |    |     |
| Access |     | W            | W  | W  | W  | W  | W  | W  | W   |
| Reset  |     | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0   |
|        | Bit | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8   |
|        |     | WPKEY[7:0]   |    |    |    |    |    |    |     |
| Access |     | W            | W  | W  | W  | W  | W  | W  | W   |
| Reset  |     | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0   |
|        | Bit | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0   |
|        |     | WPEN         |    |    |    |    |    |    |     |
| Access |     |              |    |    |    |    |    |    | R/W |
| Reset  |     |              |    |    |    |    |    |    | 0   |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value   | Name   | Description   |
|---------|--------|---|
| 0x41444 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. |
| 3       |        | Always reads as 0   |

#### Bit 0 – WPEN Write Protection Enable

See [65.6.19 Register Write Protection](#) for the list of write-protected registers.

| Value | Description  |
|-------|--|
| 0     | Disables the write protection if WPKEY value corresponds to 0x414443 (“ADC” in ASCII). |
| 1     | Enables the write protection if WPKEY value corresponds to 0x414443 (“ADC” in ASCII).  |

### 65.7.30 ADC Write Protection Status Register

**Name:** ADC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

|        |                         |    |    |    |    |    |    |      |
|--------|-------------------------|----|----|----|----|----|----|------|
| Bit    | 31                      | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        | [Greyed out bits 31-24] |    |    |    |    |    |    |      |
| Access |                         |    |    |    |    |    |    |      |
| Reset  |                         |    |    |    |    |    |    |      |
| Bit    | 23                      | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        | WPVSR[15:8]             |    |    |    |    |    |    |      |
| Access | R                       | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0                       | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 15                      | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]              |    |    |    |    |    |    |      |
| Access | R                       | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0                       | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7                       | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        | [Greyed out bits 7-1]   |    |    |    |    |    |    | WPVS |
| Access |                         |    |    |    |    |    |    | R    |
| Reset  |                         |    |    |    |    |    |    | 0    |

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description   |
|-------|---|
| 0     | No write protection violation has occurred since the last read of ADC_WPSR.   |
| 1     | A write protection violation has occurred since the last read of ADC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 66. Electrical Characteristics

### 66.1 Absolute Maximum Ratings

**Table 66-1. Absolute Maximum Ratings\***

|   |                  |   |
|---|------------------|---|
| <b>Storage Temperature</b>  | -60°C to + 150°C | <b>Note:</b> Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. |
| <b>Voltage on Input Pins with Respect to Ground</b>               | -0.3V to +4.0V   |   |
| <b>Maximum Voltage on Power Input Pins with Respect to Ground</b> |                  |   |
| VDDCORE, VDDPLLA, VDDUTMIC and VDDHSIC                            | 1.5V             |   |
| VDDIODDR  | 2.0V             |   |
| VDDBU   | 4.0V             |   |
| VDDIOPx, VDDUTMII, VDDISC, VDDSDMMC, VDDOSC, VDDANA, VDDAUDIOPLL  | 4.0V             |   |
| VDDFUSE   | 3.0V             |   |
| <b>Total DC Output Current on all I/O lines</b>                   | 350 mA           |   |

### 66.2 DC Characteristics

The following characteristics are applicable to the ambient operating temperature range  $T_A = -40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$  for -CN devices, and  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  for -CU devices, unless otherwise specified.

**Table 66-2. Recommended Thermal Operating Conditions**

| Symbol     | Parameter                              | Conditions                                | Min | Typ  | Max  | Unit |
|------------|--|---|-----|------|------|------|
| $T_A$      | Ambient Temperature                    | –   | -40 | –    | +105 | °C   |
| $T_J$      | Junction Temperature                   | –   | -40 | –    | +125 | °C   |
| $R_{thJA}$ | Junction-to-ambient thermal resistance | LFBGA289                                  | –   | 34.8 | –    | °C/W |
|            |  | TFBGA256                                  | –   | 27.4 | –    |      |
|            |  | TFBGA196                                  | –   | 44.6 | –    |      |
| $R_{thJC}$ | Junction-to-case thermal resistance    | LFBGA289                                  | –   | 10.9 | –    | °C/W |
|            |  | TFBGA256                                  | –   | 9.3  | –    |      |
|            |  | TFBGA196                                  | –   | 11.2 | –    |      |
| $P_D$      | Allowable Power Dissipation            | At $T_A = 85^{\circ}\text{C}$ , LFBGA289  | –   | –    | 1149 | mW   |
|            |  | At $T_A = 105^{\circ}\text{C}$ , LFBGA289 | –   | –    | 575  | mW   |

|           |                    | GPIO_IO           | –   | 13  | –   | Ω    |
|           |                    | GPIO_CLK, GPIO_AD | –   | 0   | –   | Ω    |

**Note:**

1.  $V_{DDIO}$  voltage must be equal to  $V_{DDIN}$  voltage.
2. Current injection may lead to performance degradation or functional failures.

| GPIO Type | Description              | Name      | Conditions   | Min | Max | Unit |
|-----------|--------------------------|-----------|--------------|-----|-----|------|
| GPIO_QSPI | Maximum output frequency | $f_{max}$ | Load = 30 pF | –   | 133 | MHz  |
|           | Output duty cycle        | –         | Load = 30 pF | 45  | 55  | %    |

### 66.3 Power Consumption

This section provides information about the current consumption on different power supply rails of the device. It gives current consumption in:

- Active mode when running a CoreMark and in predefined use cases
- Low-power modes: Backup mode, Idle mode and Ultra Low-power mode

- By peripheral with representative activity

### 66.4 Active Mode

Active mode is the normal running mode with the Arm core clock running off a PLL. The power management controller is used to adapt the frequency and to disable the peripheral clocks.

#### 66.4.1 Active Mode Power Consumption Versus Modes

The power consumption values are measured under the following operating conditions:

- Parts are from typical process
- $V_{DDIOPx} = 3.3V$
- $V_{DDSDMMC0}$  and  $V_{DDSDMMC1} = 1.8V$  to  $3.3V$  (high frequency)
- $V_{DDCORE} = 1.2V \pm 2\%$
- $V_{DDBU} = 1.6V$  to  $3.6V$
- $T_A =$  as specified in tables "Typical Peripheral Power Consumption by Peripheral in Active Mode" and "Power Consumption in Active Mode: AMP2"
- There is no consumption on the device I/Os.
- All peripheral clocks are disabled.

**Figure 66-1. Measurement Schematics**

**Table 66-5. Typical Peripheral Power Consumption by Peripheral in Active Mode**

Measurements made at  $T_A = 25^\circ C$  and with peripheral clock enabled.

| Peripheral | Clock | Consumption on VDDCORE | Conditions  | Consumption (typ)   | Unit   |
|------------|-------|------------------------|-------------|---|--------|
| GMAC       | MCK/2 | –                      | See Note 1. | $12 * MCK + 1840 * DR$ (Data rate in Mbits/s)                     | μA     |
| XDMAC0     | MCK   | –                      | See Note 2. | $17.6 * MCK + 4.92 * DR$ (MCK in MHz, Data rate in Mbytes/s)      |        |
| XDMAC1     | MCK   | –                      |             |   |        |
| ICM        | MCK/2 | 3.52                   | –           | –   | μA/MHz |
| AES        | MCK   | 8.79                   |             |   |        |
| AESB       | MCK   | 7.49                   |             |   |        |
| TDES       | MCK/2 | 0.85                   |             |   |        |
| SHA        | MCK   | 3.88                   |             |   |        |
| MPDDRC     | MCK   | 45.21                  | See Note 3. | $67 * MCK + 3.11 * DR + 1609$ (MCK in MHz, Data rate in Mbytes/s) | μA     |

## Electrical Characteristics

.....continued

| Peripheral | Clock | Consumption on VDDCORE | Conditions | Consumption (typ) | Unit   |
|------------|-------|------------------------|------------|-------------------|--------|
| PDMIC      | MCK/2 | 8.24                   | –          | –                 | μA/MHz |
| QSPI0      | MCK   | 1.94                   |            |                   |        |
| QSPI1      | MCK   | 1.94                   |            |                   |        |
| I2SC0      | MCK/2 | 0.61                   |            |                   |        |
| I2SC1      | MCK/2 | 0.61                   |            |                   |        |
| CAN0       | MCK/2 | 9.7                    |            |                   |        |
| CAN1       | MCK/2 | 7.27                   |            |                   |        |

**Note:**

1. In Linux OS, use the ‘iperf’ command to perform bidirectional data transfers. Measure GMAC consumption at different transfer speeds.
2. XDMAC is initialized and one channel performs a memory-to-memory transfer. During test, the data rate is adjusted by changing the DMA setting and the burst size.
3. DDR3 devices are initialized (fully functional). XDMAC performs a memory-to-memory transfer inside the DDR area. Total consumption of MPDDRC and XDMAC is measured. MPDDRC consumption is calculated by discounting XDMAC consumption.
4. In Linux OS, measure UPHPS consumption at different transfer speeds.
5. In Linux OS, build a mass storage using UDPHS. Measure UDPHS consumption at different transfer speeds.
6. The LCD timing engine and each display layer are switched on in sequence. The static image (using random data) is displayed under various resolutions. The 24-bpp RGB888 color space is set for all layers. Auxiliary functions such as rotation, scaling, color space conversion, color look-up table, and chroma upsampling are disabled.
7. ISC performs image sensor preview.

In order to maximize performance, each Peripheral Clock has been timed to H32MX clock frequency. The peripheral frequency can be reduced with the help of a divider in PMC\_PCR.

**Table 66-6. Power Consumption in Active Mode: AMP2**

| Conditions T <sub>A</sub> = 25°C   |       | Consumption    |               |
|--|-------|----------------|---------------|
|  |       | Dhrystone (mA) | CoreMark (mA) |
| PLL clock is 1000 MHz, Arm Core clock is 500 MHz, MCK is 166 MHz.<br>– Caches L1 and L2 enabled<br>– Code running off of internal SRAM<br>– Code speed optimization<br>– Run Dhrystone / CoreMark benchmark<br>– Peripheral clock disabled | MRL C | 114.4          | 108.8         |
|  | MRL B |                |               |
|  | MRL A | 237.2          | 233.7         |

### 66.5 Low-power Modes

Low-power modes provide a way to balance device power consumption against wake-up time. The modes are described below, in the order of lowest to highest power consumption.

### 66.5.1 Backup Mode

Backup mode achieves the lowest power consumption in the system with limited functionality.

In this mode, only the backup area is powered, maintaining the RTC, the back-up registers, the back-up SRAM and the security module running. This mode is entered by shutting down all the power rails except the VDDBU (refer to the section [Shutdown Controller \(SHDWC\)](#)). To exit Backup mode, the SHDN pin (connected to the enable of the external Power Management IC) must be driven high by an internal event (RTC) or by one of the external events listed below:

- WKUP0 to WKUP9 pins (level transition, configurable debouncing)
- Character received on a serial com receiver (RXLP)
- Analog comparison

Backup mode functionality has been extended with the possibility to keep the DDR memory in Self-refresh state.

### 66.5.2 Backup Mode with DDR in Self-Refresh

Backup mode with DDR in Self-refresh is used to keep the DDR contents when the system is powered off. This mode is achieved by maintaining the backup area and the VDDIODDR powered. To enter Backup Self-refresh mode, follow the sequence below:

- Software saves all the context information to resume (application-dependent).
- Put the DDR in Self-refresh mode and wait until the Self-refresh status is OK (refer to the section [Multiport DDR-SDRAM Controller \(MPDDRC\)](#)).
- Set SFRBU\_DDRBUMCR.BUMEN (see [SFRBU DDR BU Mode Control Register](#)).
- Enter Backup mode as described above.

To exit this mode, follow the sequence below:

- Once the system is restarted, the software checks the state of SFRBU\_DDRBUMCR.BUMEN.
- Restore all the context information.
- Check that the Self-refresh status is OK (refer to the section [Multiport DDR-SDRAM Controller \(MPDDRC\)](#)).
- Disable SFRBU\_DDRBUMCR.BUMEN (see [SFRBU DDR BU Mode Control Register](#)).
- The DDR memory exits Self-refresh mode when a memory access in the DDR memory space is performed.

### 66.5.3 Ultra Low-power (ULP) Mode

Ultra Low-power mode achieves the lowest power consumption with the system in Retention mode and able to resume on wake-up events (any interrupt or hardware event). This mode is a combination of the Wait for Interrupt mode of the Arm core and a reduced frequency or shut-off of the system clocks.

To obtain the best results, care must be taken that the I/Os (pull-up/pull-down, etc.), USB transceivers, etc., are set to the appropriate state.

The Ultra Low-power mode features two submodes:

- ULP0 mode
- ULP1 mode

#### 66.5.3.1 ULP0 Mode

ULP0 mode maintains a very low frequency clock to wake up on any interrupt.

The selection of the clock depends on the current consumption target versus wake-up time. The higher the frequency, the higher the power consumption.

The sequence to enter ULP0 mode is detailed below. The code used to enter this mode must be executed out of the internal SRAM.

1. Set the DDR to Self-Refresh mode.
2. Set the interrupts to wake up the system.
3. Disable all peripheral clocks.
4. Set the I/Os to an appropriate state and disable the USB transceivers (refer to the section [Special Function Registers \(SFR\)](#)).
5. Switch the system clock to the selected clock (RC12MHZ, 32 KHz Slow Clock.) according to the power consumption and wake-up time awaited (see table [VDDCORE Power Consumption in Ultra Low-power Mode: AMP2](#)).
6. Disable the PLLs and all unused clocks (main oscillator, 12 MHz RC oscillator or 32 KHz oscillator).
7. Enter the Wait for Interrupt mode and disable the PCK clock in the PMC\_SCDR.

The wake-up from ULP0 mode is triggered by any enabled interrupt. When resuming, the software reconfigures the system (oscillator, PLL, etc.) in the same state as before WFI.

### 66.5.3.2 ULP1 Mode

Unlike ULP0 mode, all the clocks are off in ULP1 mode, but the number of wake-up sources is limited to the list below:

- WKUP0 pin (level transition, configurable debouncing)
- WKUP1 Secumod wake-up signal
- WKUP2 pin to WKUP9 pin (shared with PIOBU0 to PIOBU7)
- RTC alarm
- USB Resume from Suspend mode
- SDMMC card detect
- RXLP event
- ACC event
- Any SleepWalking event coming from TWI, FLEXCOMx, SPI, or ADC

The sequence to enter the ULP1 mode is detailed below. The code used to enter this mode must be executed out of the internal SRAM.

1. Set the DDR to Self-Refresh mode.
2. Set the events to enable a system wake-up.
3. Disable all peripheral clocks.
4. Set the I/Os to an appropriate state and disable the USB transceivers (refer to the section [Special Function Registers \(SFR\)](#)).
5. Switch the system clock to the 12 MHz RC oscillator.
6. Disable the PLLs and the main oscillator.
7. Enter the ULP1 mode by either:
  - 7.1. setting the WAITMODE bit in CKGR\_MOR, or
  - 7.2. setting the LPM bit in PMC\_FSMR and executing the processor WaitForEvent (WFE) instruction.
8. After setting the WAITMODE bit or using the WFE instruction, wait for the PMC\_SR.MCKRDY bit to be set.

### 66.5.4 Idle Mode

In Idle mode, power consumption of the device versus response time is optimized. In this mode, only the core clock is stopped. The peripheral clocks, including the DDR controller clock, can be enabled. The current consumption in this mode is application-dependent and can be reduced by enabling Dynamic Clock Gating (L2CC\_POWCR.DCKGATEN = 1).

This mode is entered via the Wait for Interrupt (WFI) instruction and PCK disabling.

The processor can be awakened from an interrupt. The system resumes where it was before entering WFI mode.

### 66.5.5 Low-power Mode Summary Table

The modes detailed above are the main low-power modes. Each part can be set to on or off separately and wake-up sources can be configured individually. The table below gives a summary of the low-power mode configurations.

**Table 66-7. Low-power Mode Configuration Summary**

| Submode  | Low-power Mode  |  |  |  |                                       |
|--|---|--|--|--|---------------------------------------|
|  | Backup  |  | Ultra-low-power                                    |  | Idle                                  |
|  | –   | Self-refresh   | ULP0   | ULP1   |                                       |
| 64 kHz RC Oscillator, 32 kHz Oscillator, RTC, Backup Memory and Registers, POR | ON  |  |  |  |                                       |
| 12 MHz RC Oscillator   | OFF   |  |  |  | ON                                    |
| VDDCORE Regulator  | OFF   |  | ON   |  |                                       |
| Core   | OFF (not powered)   |  | Powered (not clocked)                              |  |                                       |
| Memory, Peripherals  | OFF (not powered)   |  | Powered (512 Hz)                                   | Powered (not clocked)                        | Powered (clocked)                     |
| Mode Entry   | Shutdown Controller, FLEXCOM SleepWalking   | DDR in Self-refresh, Shutdown Controller   | DDR in Self-refresh, Frequency reduced in PMC, WFI | DDR in Self-refresh, CKGR_MOR.WAIT-MODE=1    | DDR in Self-refresh, WFI              |
| Potential Wake-up Sources  | WKUP0 pin, any PIOBU configured as WKUP pin, RTC alarm, any level above comparator source or character received | Backup mode sources  | Any interrupt                                      | Wake-up pins, WOL                            | Any interrupt                         |
| Core at Wake-up  | Reset   |  | Clocked back at 512 Hz                             | Clocked back at 12 MHz                       | Clocked back at full speed            |
| PIO State While in Low-power Mode  | Reset   |  | Previous state saved                               |  |                                       |
| PIO State at Wake-up   | Inputs with pull-ups  | Unchanged  |  |  |                                       |
| Consumption <sup>(2)</sup>   | I <sub>VDDDBU</sub> = 4.5 μA <sub>typ</sub> <sup>(3)</sup> at 25°C/3.0V   | I <sub>VDDDBU</sub> = 4.5 μA <sub>typ</sub> <sup>(3)</sup> at 25°C/3.0V<br>I <sub>VDDIODDR</sub> = 40 μA | 0.21 mA at 25°C/1.1V<br>0.27 mA at 25°C/1.2V       | 0.17 mA at 25°C/1.1V<br>0.27 mA at 25°C/1.2V | 28 mA at 25°C/<br>1.2V <sup>(4)</sup> |
| Wake-up Time <sup>(1)</sup>  | Start-up time   | Start-up time  | 300 ms   | 15 μs  | 800 ns at 498 MHz                     |

**Note:**

1. When considering wake-up time, the time required to start the PLL is not taken into account. Once started, the device works with the main oscillator. The user has to add the PLL start-up time if it is needed in the system. The wake-up time is defined as the time taken for wake-up until the first instruction is fetched.
2. The external loads on PIOs are not taken into account in the calculation.
3. Total current consumption.
4. Dynamic Clock Gating enabled (L2CC\_POWCR.DCKGATEN = 1).

### 66.5.6 Low-power Consumption Versus Modes

The low-power consumption values are measured under the following operating conditions:

- Parts are from typical process
- $V_{DDIOPx} = 3.3V$
- $V_{DDSDMMC0}$  and  $V_{DDSDMMC1} = 1.8V$  to  $3.3V$  (high frequency)
- $V_{DDCORE} = 1.2V \pm 2\%$
- $V_{DDBU} = 1.6V$  to  $3.6V$
- $T_A =$  as specified in the tables below
- There is no consumption on the device I/Os.
- All peripheral clocks are disabled.

**Figure 66-2. Measurement Schematics**

In order to maximize performances, each Peripheral Clock has been timed to H32MX clock frequency. The peripheral frequency can be reduced with the help of a divider in PMC\_PCR.

**Table 66-8. Typical Power Consumption in Idle Mode: AMP2**

| Conditions  | Consumption |            |            |             | Unit |
|---|-------------|------------|------------|-------------|------|
|   | $T_A$ 25°C  | $T_A$ 70°C | $T_A$ 85°C | $T_A$ 105°C |      |
| PLL clock is 1000 MHz, Arm Core clock is 500 MHz, MCK is 166 MHz.<br>– Core clock is stopped<br>– Peripheral clocks, including the DDR Controller clock, can be enabled<br>– Mode is entered via Wait for Interrupt (WFI) instruction and PCK disabling<br>– Measure IDDCORE + IDDBU<br>– Peripheral clock disabled | 28.2        | 29.6       | 30.8       | 33.4        | mA   |

**Table 66-9. VDDCORE Power Consumption in Ultra-Low-Power Mode: AMP2**

| Mode             | Conditions                                 | Consumption (mA) |            |            |             | Wake-up Time ( $\mu s$ ) |

| 3.4       | 5.5        | 14.1                   | 21.6                  | 39.7                  |                        |         |
| 3.5       | 6.2        | 14.9                   | 22.4                  | 40.5                  |                        |         |
| 3.6       | 7          | 15.7                   | 23.3                  | 41.4                  |                        |         |

### 66.6 Clock Characteristics

The following characteristics are applicable to the ambient operating temperature range T<sub>A</sub> = -40°C to +105°C for -CN devices, and T<sub>A</sub> = -40°C to +85°C for -CU devices, unless otherwise specified.

### 66.6.1 Processor Clock Characteristics

**Table 66-11. Processor Clock Waveform Parameters**

| Symbol     | Parameter                 | Conditions           | Min                | Max | Unit |
|------------|---------------------------|----------------------|--------------------|-----|------|
| 1/(tCPPCK) | Processor Clock Frequency | VDDCORE[1.1V, 1.32V] | 250 <sup>(1)</sup> | 400 | MHz  |
|            |                           | VDDCORE[1.2V, 1.32V] | 250 <sup>(1)</sup> | 500 |      |

**Note:**

1. Limitation for DDR2 (125 MHz) usage only. There are no limitations to DDR3, DDR3L, LPDDR1, LPDDR2 and LPDDR3.

### 66.6.2 Master Clock Characteristics

The master clock is the maximum clock at which the system is able to run. It is given by the smallest value of the internal bus clock and EBI clock.

**Table 66-12. Master Clock Waveform Parameters**

| Symbol  | Parameter              | Conditions   | Min                | Max                | Unit |
|---|------------------------|--|--------------------|--------------------|------|
| 1/(tCPMCK)  | Master Clock Frequency | VDDCORE[1.1V, 1.32V]   | 125 <sup>(1)</sup> | 133                | MHz  |
|   |                        | VDDCORE[1.2V, 1.32V],<br>in DDR2 or LPDDR1 mode,<br>VDDIODDR[1.8V, 1.9V] | 125 <sup>(1)</sup> | 166 <sup>(2)</sup> |      |
|   |                        | in LPDDR2 or LPDDR3 mode,<br>VDDIODDR[1.2V, 1.30V]                       |                    |                    |      |
|   |                        | in DDR3 mode,<br>VDDIODDR[1.5V, 1.575V]                                  |                    |                    |      |
| in DDR3L mode,<br>VDDIODDR[1.35V, 1.45V]<br>Security disabled |                        |  |                    |                    |      |

**Note:**

1. Limitation for DDR2 usage only. There are no limitations to DDR3, DDR3L, LPDDR1, LPDDR2 and LPDDR3.
2. The JEDEC standard specifies a maximum clock frequency of 125 MHz for DDR3 and DDR3L in DLL Off mode. However, check with memory suppliers for higher frequencies.

## 66.7 Oscillator Characteristics

### 66.7.1 Main Oscillator Characteristics

**Table 66-13. 8 to 24 MHz Crystal Oscillator Characteristics**

| Symbol | Parameter           | Conditions                   | Min | Typ | Max | Unit |
|--------|---------------------|------------------------------|-----|-----|-----|------|
| fOSC   | Operating Frequency | FREQ <sup>(2)</sup> = 00, 11 | 8   |     | 12  | MHz  |
|        |                     | FREQ = 01                    | 12  | –   | 16  |      |
|        |                     | FREQ = 10                    | 16  |     | 24  |      |
| –      | Duty Cycle          | –                            | 40  | 50  | 60  | %    |

# SAMA5D2 Series

## Electrical Characteristics

.....continued

| Symbol                | Parameter                                     | Conditions   | Min | Typ        | Max               | Unit |
|-----------------------|---|--|-----|------------|-------------------|------|
| t <sub>START</sub>    | Startup Time                                  | FREQ <sup>(2)</sup> = 00, 11<br>FREQ = 01<br>FREQ = 10 | –   | –          | 18.5<br>10.5<br>6 | ms   |
| I <sub>DDON</sub>     | Current Consumption (on VDDIO)                | @ 12 MHz<br>@ 24 MHz                                   | –   | 1.2<br>1.7 | 3.5<br>4          | mA   |
| I <sub>DD_STDBY</sub> | Standby Current                               | –  | –   | 0.02       | 0.1               | μA   |
| C <sub>PARA</sub>     | Internal Parasitic Capacitance <sup>(1)</sup> | From XIN to XOUT                                       | 1.4 | 1.6        | 1.8               | pF   |
| P <sub>ON</sub>       | Drive level                                   | FREQ = 00<br>FREQ = 01, 11<br>FREQ = 10                | –   | –          | 150<br>300<br>400 | μW   |

### Note:

- The values of external capacitors can be determined by using the following formula:

$$C_{LEXT} = (2 \times C_{CRYSTAL}) - C_{BOARD} - (C_{PARA} \times 2)$$

where:

- C<sub>LEXT</sub> is the external capacitor value which must be soldered from XIN to GND and XOUT to GND
  - C<sub>CRYSTAL</sub> is crystal targeted load
  - C<sub>BOARD</sub> is the external board parasitic capacitance (from XIN to GND or XOUT to GND)
  - C<sub>PARA</sub> is the internal parasitic capacitance
- The SFR\_UTMICKTRIM.FREQ field defines the input frequency for the UTMI and the main oscillator. It is important to select the correct FREQ value because this has a direct influence on USB frequency.

|                     |                                |                          |     | C <sub>CRYSTAL32</sub> = 6 pF    | 600 | 900  |    |
|                     |                                | ESR < 100k ohm           |     | C <sub>CRYSTAL32</sub> = 12.5 pF | 800 | 1200 |    |
|                     |                                |                          |     | C <sub>CRYSTAL32</sub> = 6 pF    | 700 | 1200 |    |
| C <sub>PARA32</sub> | Internal Parasitic Capacitance | Between XIN32 and XOUT32 | 1.4 | 1.6                              | 1.8 | pF   |    |

**Figure 66-4. 32 kHz Oscillator Schematics**

**Table 66-18. Recommended 32.768 kHz Crystal Characteristics**

| Symbol                 | Parameter                           | Conditions                 | Min | Typ | Max  | Unit |
|------------------------|-------------------------------------|----------------------------|-----|-----|------|------|
| ESR                    | Equivalent Series Resistor          | Crystal at 32.768 kHz      | -   | -   | 100  | kΩ   |
| -                      | Duty Cycle                          | -                          | 40  | 50  | 60   | %    |
| C <sub>m</sub>         | Motional Capacitance                | Crystal at 32.768 kHz      | 3   | -   | 8    | fF   |
| C <sub>SHUNT</sub>     | Shunt Capacitance                   | Crystal at 32.768 kHz      | 0.6 | -   | 2    | pF   |
| C <sub>CRYSTAL32</sub> | Allowed Crystal Capacitance Load(1) | From crystal specification | 6   | -   | 12.5 | pF   |
| PON                    | Drive Level                         | -                          | -   | -   | 0.2  | μW   |

**Note:** The value of the external capacitors can be determined by using the following formula:

$$C_{LEXT32} = (2 \times C_{CRYSTAL32}) - C_{BOARD} - (C_{PARA32} \times 2)$$

where:

- C<sub>LEXT32</sub> is the external capacitor value which must be soldered from XIN to GND and XOUT to GND
- C<sub>CRYSTAL32</sub> is crystal targeted load
- C<sub>BOARD</sub> is the external board parasitic capacitance (from XIN to GND or XOUT to GND)
- C<sub>PARA32</sub> is the internal parasitic capacitance

### 66.7.4 64 kHz RC Oscillator Characteristics

### 66.9 USB HS Characteristics

#### 66.9.1 Electrical Characteristics

The device conforms to all voltage, power, and timing characteristics and specifications set forth in the USB 2.0 Specification. Refer to the USB 2.0 Specification for more information.

#### 66.9.2 Dynamic Power Consumption

**Table 66-23. USB Transceiver Dynamic Power Consumption**

| Symbol    | Parameter                               | Conditions                              | Min | Typ | Max | Unit |
|-----------|---|---|-----|-----|-----|------|
| IBIAS     | Bias Generator Current Consumption      | –                                       | –   | 0.7 | 0.8 | mA   |
| IVDDUTMII | HS Transceiver Current Consumption      | HS transmission                         | –   | 47  | 60  | mA   |
|           | HS Transceiver Current Consumption      | HS reception                            | –   | 18  | 27  | mA   |
|           | LS / FS Transceiver Current Consumption | FS transmission 0m cable <sup>(1)</sup> | –   | 4   | 6   | mA   |
|           | LS / FS Transceiver Current Consumption | FS transmission 5m cable <sup>(1)</sup> | –   | 26  | 30  | mA   |
|           | LS / FS Transceiver Current Consumption | FS reception <sup>(1)</sup>             | –   | 3   | 4.5 | mA   |
| IVDDUTMIC | Core                                    | –                                       | –   | 5.5 | 9   | mA   |

**Note:** Including 1 mA due to pull-up/pull-down current consumption.

### 66.10 PTC Characteristics

**Table 66-24. PTC Characteristics**

| Symbol | Parameter                            | Conditions                   | Min | Typ | Max | Unit |
|--------|--------------------------------------|------------------------------|-----|-----|-----|------|
| CC     | Compensation Capacitance             | Programmable max code 0x3FFF | 30  | –   | –   | pF   |
| ERS    | Error on Serial Filtering Resistance | 20, 50, 100 kOhm             | -20 | –   | 20  | %    |
| IPTCT  | PTC Current Consumption              | –                            | –   | –   | 500 | μA   |

### 66.11 ADC Characteristics

The following characteristics are applicable to the ambient operating temperature range  $T_A = -40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$  for -CN devices, and  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  for -CU devices, unless otherwise specified.

ADVREF is the positive reference of the ADC.

#### 66.11.1 ADC Power Supply

##### 66.11.1.1 Power Supply Characteristics

**Table 66-25. Power Supply Characteristics**

| Symbol | Parameter                  | Conditions                   | Min | Typ | Max | Unit |
|--------|----------------------------|------------------------------|-----|-----|-----|------|
| IVDDIN | Analog Current Consumption | Sleep mode <sup>(1)</sup>    | –   | 2   | 4   | μA   |
|        |                            | Fast Wake-up mode            | –   | 0.4 | 0.6 | mA   |
|        |                            | Normal mode, single sampling | –   | 2.2 | 3.0 | mA   |

# SAMA5D2 Series

## Electrical Characteristics

.....continued

| Symbol   | Parameter                   | Conditions                | Min | Typ | Max | Unit |
|----------|-----------------------------|---------------------------|-----|-----|-----|------|
| IVDDCORE | Digital Current Consumption | Sleep mode <sup>(1)</sup> | –   | 1   | 2   | μA   |
|          |                             | Normal mode               |     | 80  | 100 | μA   |

**Note:** In Sleep mode, the ADC core, the Sample and Hold and the internal reference operational amplifier are off.

### 66.11.1.2 ADC Bias Current

The field IBCTL in ADC\_ACR controls the ADC biasing current.

The table below gives the IBCTL settings according to the ADC sample rate value.

| IBCTL | Max Data Rate (Ksps) |
|-------|----------------------|
| 00    | 250                  |
| 01    | 500                  |
| 10    | 1000                 |
| 11    | 1000                 |

### 66.11.2 External Reference Voltage

$V_{ADVREF}$  is an external reference voltage applied on the pin ADVREF. The quality of the reference voltage  $V_{ADVREF}$  is critical to the performance of the ADC. A DC variation of the reference voltage  $V_{ADVREF}$  is converted to a gain error by the ADC. The noise generated by  $V_{ADVREF}$  is converted by the ADC to count noise.

**Table 66-26. ADVREF Electrical Characteristics**

| Symbol       | Parameter          | Conditions                                     | Min | Typ | Max    | Unit |
|--------------|--------------------|--|-----|-----|--------|------|
| $V_{ADVREF}$ | Voltage Range      | Full operational                               | 2   | –   | VDDANA | V    |
|              | RMS Noise          | Bandwidth 10 kHz to 1 MHz                      | –   | –   | 100    | μV   |
| $R_{ADVREF}$ | Input DC Impedance | ADC reference resistance bridge <sup>(1)</sup> | 6   | 8   | 10     | kΩ   |
| $I_{ADVREF}$ | Current            | $V_{ADVREF} = 3.3V$                            | –   | –   | 460    | μA   |

**Note:**

- When the ADC is off, the ADVREF impedance has a minimum of 1 MΩ.

### 66.11.3 ADC Timings

**Table 66-27. ADC Timing Characteristics**

| Symbol           | Parameter                         | Conditions                       | Min | Typ | Max | Unit |
|------------------|-----------------------------------|----------------------------------|-----|-----|-----|------|
| $f_{ADC\_Clock}$ | Clock Frequency                   | –                                | 0.2 | –   | 20  | MHz  |
| $f_S$            | Sampling Frequency <sup>(1)</sup> | –                                | –   | –   | 1   | MHz  |
| $t_{START}$      | ADC Start-up Time                 | Sleep mode to Normal mode        | –   | –   | 4   | μs   |
|                  |                                   | Fast Wake-up mode to Normal mode |     |     | 2   |      |

**Note:**  $t_{ADC\_Clock} = 1/f_{ADC\_Clock}$  ADC conversion time = 21  $t_{ADC\_Clock}$ . The Tracking time of the ADC has a minimal value of  $t_{TRACKTIM} = 15 t_{ADC\_Clock}$ .

### 66.11.4 ADC Transfer Function

The DATA code in ADC\_CDR is up to 12-bit positive integer or two's complement (signed integer).

#### 66.11.4.1 Differential Mode (12-bit mode)

A differential input voltage  $V_{IN} = V_{INP} - V_{INN}$  can be applied between two selected differential pins, e.g. ADC0\_AD0 and ADC0\_AD1. The ideal code  $C_i$  is calculated by using the following formula and rounding the result to the nearest positive integer.

$$C_i = \frac{2047}{V_{ADVREF}} \times V_{IN}$$

For the other resolution defined by RES, the code  $C_i$  is extended to the corresponding resolution.

The table below is a computation example for the above formula, where  $V_{ADVREF} = 3V$ .

**Table 66-28. Input Voltage Values in Differential Mode, Non-signed Output**

| Signed $C_i$ | $V_{IN}$ |
|--------------|----------|
| -2048        | -3       |
| 0            | 0        |
| 2047         | 3        |

#### 66.11.4.2 Single-ended Mode (12-bit mode)

A single input voltage  $V_{IN}$  can be applied to selected pins, e.g., ADC0\_AD0 or ADC0\_AD1. The ideal code  $C_i$  is calculated using the following formula and rounding the result to the nearest positive integer.

The single-ended ideal code conversion formula is:

$$C_i = \frac{4095}{V_{ADVREF}} \times V_{IN}$$

For the other resolution defined by RES, the code  $C_i$  is extended to the corresponding resolution.

The table below is a computation example for the above formula, where  $V_{ADVREF} = 3V$ :

**Table 66-29. Input Voltage Values in Single-ended Mode**

| Non-signed $C_i$ | $V_{IN}$ |
|------------------|----------|
| 0                | 0        |
| 2047             | 1.5      |
| 4095             | 3        |

#### 66.11.4.3 Example of LSB Computation

The LSB is relative to the analog scale  $V_{ADVREF}$ .

The term LSB expresses the quantization step in volts, also used for one ADC code variation.

- Single-ended (SE) (ex:  $V_{ADVREF} = 3.0V$ )
  - Gain = 1,  $LSB = (3.0V / 4096) = 732 \mu V$
- Differential (DIFF) (ex:  $V_{ADVREF} = 3.0V$ )
  - Gain = 0.5,  $LSB = (6.0V / 4096) = 1465 \mu V$

The data include the ADC performances, as the PGA and ADC core cannot be separated. The temperature and voltage dependencies are given as separate parameters.

### 66.11.4.4 Gain and Offset Errors

For:

- a given gain error:  $E_G$  (%)
  - a given ideal code ( $C_i$ )
  - a given offset error:  $E_O$  (LSB of 12 bits)
- in 12-bit mode, the actual code ( $C_A$ ) is calculated using the following formula

$$C_A = \left(1 + \frac{E_G}{100}\right) \times (C_i - 2047) + 2047 + E_O$$

#### Differential Mode

In Differential mode, the offset is defined when the differential input voltage is zero.

**Figure 66-5. Gain and Offset Errors in Differential Mode**

where:

- Full-scale error  $E_{FS} = (E_{FS+}) - (E_{FS-})$ , unit is LSB code
- Offset error  $E_O$  is the offset error measured for  $V_{IN} = 0V$
- Gain error  $E_G = 100 \times E_{FS} / 4096$ , unit in %

The error values in "ADC Offset and Gain Error,  $V_{ADVREF} = 3.3V$ " include the sample-and-hold error as well as the PGA gain error.

#### Single-ended Mode

The figure below illustrates the ADC output code relative to an input voltage  $V_{IN}$  between 0V (Ground) and  $V_{ADVREF}$ . The ADC is configured in Single-ended mode by connecting internally the negative differential input to  $V_{ADVREF} / 2$ . As the ADC continues to work internally in Differential mode, the offset is measured at  $V_{ADVREF} / 2$ . The offset at  $V_{INP} = 0$  can be computed using the transfer function and the corresponding  $E_G$  and  $E_O$ .

**Figure 66-6. Gain and Offset Errors in Single-ended Mode**

where:

- Full-scale error  $E_{FS} = (E_{FS+}) - (E_{FS-})$ , unit is LSB<sup>2</sup> code
- Offset error  $E_O$  is the offset error measured for  $V_{INP} = 0V$
- Gain error  $E_G = 100 \times E_{FS} / 2048$ , unit in %

The error values in the table "ADC Offset and Gain Error,  $V_{ADVREF} = 3.3V$ " include the DAC, the sample-and-hold error as well as the PGA gain error.

### 66.11.5 ADC Electrical Characteristics

**Table 66-30. ADC INL and DNL,  $V_{ADVREF} = 3.3V$**

| Symbol                   | Parameter                  | Conditions | Min | Typ | Max | Unit |
|--------------------------|----------------------------|------------|-----|-----|-----|------|
| <b>Differential Mode</b> |                            |            |     |     |     |      |
| INL                      | Integral Non-Linearity     | –          | 1   | –   | 1   | LSB  |
| DNL                      | Differential Non-Linearity | –          | 1   | –   | 1   | LSB  |
| <b>Single-Ended Mode</b> |                            |            |     |     |     |      |
| INL                      | Integral Non-Linearity     | –          | 1.5 | –   | 1.5 | LSB  |
| DNL                      | Differential Non-Linearity | –          | 1   | –   | 1   | LSB  |

**Table 66-31. ADC Offset and Gain Error,  $V_{ADVREF} = 3.3V$**

| Symbol                   | Parameter                 | Conditions | Min  | Typ | Max | Unit |
|--------------------------|---------------------------|------------|------|-----|-----|------|
| <b>Differential Mode</b> |                           |            |      |     |     |      |
| $E_O$                    | Differential Offset Error | –          | -2.0 | –   | 2.0 | LSB  |
| $E_G$                    | Differential Gain Error   | –          | -0.2 | –   | 0.2 | %    |
| <b>Single-Ended Mode</b> |                           |            |      |     |     |      |
| $E_O$                    | Single-ended Offset Error | –          | -2.0 | –   | 2.0 | LSB  |
| $E_G$                    | Single-ended Gain Error   | –          | -0.2 | –   | 0.2 | %    |

**Table 66-32. ADC Analog Input Characteristics**

| Symbol             | Parameter   | Conditions                         | Min  | Typ | Max                      | Unit |
|--------------------|---|------------------------------------|--|-----|--------------------------|------|
| V <sub>FS</sub>    | Analog Input Full Scale Range <sup>(1)</sup>      | ADC_COR.DIFFx = 0                  | 0  | –   | V <sub>ADVREF</sub>      | V    |
|                    |   | ADC_COR.DIFFx = 1                  | -V <sub>ADVREF</sub>                       | –   | V <sub>ADVREF</sub>      |      |
| V <sub>INCM</sub>  | Common Mode input range <sup>(2)</sup>            | ADC_COR.DIFFx = 1                  | 0.4 × V <sub>DDANA</sub>                   | –   | 0.6 × V <sub>DDANA</sub> | V    |
| C <sub>IN</sub>    | ADC sampling capacitance                          | –                                  | –  | –   | 3                        | pF   |
| C <sub>P_ADx</sub> | Analog input parasitic capacitance <sup>(4)</sup> | ADx pin configured as analog input | –  | –   | 10                       |      |
| Z <sub>IN</sub>    | Common Mode Input impedance <sup>(3)</sup>        | On ADx pin                         | 1 / (f <sub>S</sub> × C <sub>P_ADx</sub> ) | –   | –                        | Ω    |

**Note:**

1. V<sub>FS</sub> = V<sub>ADx</sub> in Single-ended mode, V<sub>FS</sub> = (V<sub>ADx</sub> - V<sub>ADx+1</sub>) in Differential mode.
2. V<sub>INCM</sub> = (V<sub>ADx</sub> + V<sub>ADx+1</sub>) / 2.
3. See the figure "Input Channel Model". When converting one single channel, most of the input parasitic capacitance is not switched, therefore the common mode input impedance reduces to Z<sub>IN</sub> = 1 / (f<sub>S</sub> × C<sub>IN</sub>).
4. Includes C<sub>IN</sub>.

**66.11.6 Pen Detect Characteristics**

The pen detection sensibility is based on a programmable pull-down controlled by the field PENDETSENS of the ADC\_ACR register.

| PENDETSENS | Detection Resistor (KOhm) |
|------------|---------------------------|
| 00         | 200                       |
| 01         | 150                       |
| 10         | 100                       |
| 11         | 50                        |

**66.11.7 ADC Channel Input Impedance**

**Figure 66-7. Input Channel Model**

where:

- Z<sub>IN</sub> is the input impedance in Single-ended or Differential mode

- $C_{IN} = 2 \text{ pF} \pm 20\%$  depending on the gain value and mode (SE or DIFF); temperature dependency is negligible
- $R_{ON}$  is typical  $2 \text{ k}\Omega$  and  $8 \text{ k}\Omega$  max (worst case process and high temperature)

The following formula is used to calculate input impedance:

$$Z_{IN} = \frac{1}{f_S \times C_{IN}}$$

where:

- $f_S$  is the sampling frequency of the ADC channel
- Typ values are used to compute ADC input impedance  $Z_{IN}$

**Table 66-33.  $Z_{IN}$  Input Impedance**

| $f_S$ (MHz)             | 1   | 0.5 | 0.25 | 0.125 | 0.0625 | 0.03125 | 0.015625 | 0.007813 |
|-------------------------|-----|-----|------|-------|--------|---------|----------|----------|
| $C_{IN} = 2 \text{ pF}$ |     |     |      |       |        |         |          |          |
| $Z_{IN}$ (M $\Omega$ )  | 0.5 | 1   | 2    | 4     | 8      | 16      | 32       | 64       |

### Track and Hold Time versus Source Output Impedance

The figure below shows a simplified acquisition path.

**Figure 66-8. Simplified Acquisition Path**

During the tracking phase, the ADC tracks the input signal during the tracking time shown below:

$$t_{TRACK} = n \times C_{IN} \times (R_{ON} + Z_{SOURCE}) / 1000$$

where

- Tracking time expressed in ns and  $Z_{SOURCE}$  expressed in  $\Omega$
- $n = 8$  for 12-bit accuracy
- $R_{ON} = 2 \text{ k}\Omega$

**Table 66-34. Number of Tau:n**

| Resolution (bits) | 12 |
|-------------------|----|
| RES               | 0  |
| n                 | 8  |

The ADC already includes a tracking time of  $15 t_{ADC \text{ Clock}}$ .

### 66.12 Analog Comparator Characteristics

**Table 66-35. Analog Comparator Characteristics**

| Symbol                        | Parameter                                       | Conditions                   | Min  | Typ | Max               | Unit |
|-------------------------------|---|------------------------------|------|-----|-------------------|------|
| V <sub>DDBU</sub>             | Power Supply Voltage Range (V <sub>DDBU</sub> ) | –                            | 1.65 | 3.3 | 3.6               | V    |
| V <sub>COMPx</sub>            | Input Voltage Range                             | On COMPP or COMPN input      | 0    | –   | V <sub>DDBU</sub> | V    |
| V <sub>hys</sub>              | Hysteresis                                      | –                            | 35   | –   | 70                | mV   |
| TPD                           | Propagation Delay                               | 100mV Overdrive              | –    | –   | 350               | μs   |
| f <sub>in</sub>               | COMPx Input Signal Frequency                    | Common mode and differential | –    | –   | 1                 | kHz  |
| I <sub>V<sub>DDBU</sub></sub> | Current Consumption (V <sub>DDBU</sub> )        | OFF Mode (ACC_MR.ACEN = 0)   | –    | –   | 50                | nA   |
|                               |   | ON Mode (ACC_MR.ACEN = 1)    | –    | 100 | 200               |      |
| t <sub>START</sub>            | Startup Time                                    | –                            | –    | –   | 300               | μs   |

### 66.13 POR Characteristics

The figure below provides a general presentation of Power-On-Reset (POR) characteristics.

**Figure 66-9. General Presentation of POR Behavior**

When a very slow (versus  $t_{RST}$ ) supply rising slope is applied on the POR VDD pin, the reset time becomes negligible and the reset signal is released when VDD raises higher than  $V_{T+}$ .

When a very fast (versus  $t_{RST}$ ) supply rising slope is applied on the POR VDD pin, the voltage threshold becomes negligible and the reset signal is released after  $t_{RST}$ . It is the smallest possible reset time.

**Table 66-36. V<sub>DDBU</sub> Power-On Reset Characteristics**

| Symbol           | Parameter                 | Conditions | Min  | Typ | Max  | Unit |
|------------------|---------------------------|------------|------|-----|------|------|
| V <sub>T+</sub>  | Threshold Voltage Rising  | –          | 1.3  | –   | 1.5  | V    |
| V <sub>T-</sub>  | Threshold Voltage Falling | –          | 1.22 | –   | 1.4  | V    |
| V <sub>hys</sub> | Hysteresis Voltage        | –          | 50   | –   | 160  | mV   |
| t <sub>RST</sub> | Reset Timeout Period      | –          | 890  | –   | 5100 | μs   |

# SAMA5D2 Series

## Electrical Characteristics

**Table 66-37. VDDCORE Power-On Reset Characteristics**

| Symbol           | Parameter                 | Conditions | Min   | Typ | Max   | Unit |
|------------------|---------------------------|------------|-------|-----|-------|------|
| V <sub>T+</sub>  | Threshold Voltage Rising  | –          | 0.927 | –   | 1.075 | V    |
| V <sub>T-</sub>  | Threshold Voltage Falling | –          | 0.848 | –   | 1.025 | V    |
| V <sub>hys</sub> | Hysteresis Voltage        | –          | 38    | –   | 109   | mV   |
| t <sub>RST</sub> | Reset Timeout Period      | –          | 150   | –   | 650   | μs   |

**Table 66-38. VDDANA Power-On Reset Characteristics**

| Symbol           | Parameter                 | Conditions | Min  | Typ | Max | Unit |
|------------------|---------------------------|------------|------|-----|-----|------|
| V <sub>T+</sub>  | Threshold Voltage Rising  | –          | 1.3  | –   | 1.5 | V    |
| V <sub>T-</sub>  | Threshold Voltage Falling | –          | 1.22 | –   | 1.4 | V    |
| V <sub>hys</sub> | Hysteresis Voltage        | –          | 50   | –   | 160 | mV   |
| t <sub>RST</sub> | Reset Timeout Period      | –          | 130  | –   | 650 | μs   |

## 66.14 SMC Timings

### 66.14.1 Timing Conditions

SMC timings are given in max corners.

Timings assuming a capacitance load on data, control and address pads are given in the table below.

**Table 66-39. Capacitance Load**

| Supply | Corner |      |
|--------|--------|------|
|        | Max    | Min  |
| 3.3V   | 50 pF  | 5 pF |
| 1.8V   | 30 pF  | 5 pF |

In the tables that follow, t<sub>CPMCK</sub> is the MCK period.

### 66.14.2 SMC IOSET1 Timing Extraction

#### 66.14.2.1 SMC IOSET1 Read Timings

**Table 66-40. SMC IOSET1 Read Signals - NRD Controlled (READ\_MODE = 1)**

| Symbol  | Parameter                  | Min  |      | Unit |
|---|----------------------------|------|------|------|
|   |                            | 1.8V | 3.3V |      |
| NO HOLD SETTINGS (nrd hold = 0)                       |                            |      |      |      |
| SMC <sub>1</sub>                                      | Data Setup before NRD High | 16.4 | 15   | ns   |
| SMC <sub>2</sub>                                      | Data Hold after NRD High   | 0    | 0    | ns   |
| HOLD SETTINGS (nrd hold ≠ 0)                          |                            |      |      |      |
| SMC <sub>3</sub>                                      | Data Setup before NRD High | 14.4 | 13   | ns   |
| SMC <sub>4</sub>                                      | Data Hold after NRD High   | 0    | 0    | ns   |
| HOLD or NO HOLD SETTINGS (nrd hold ≠ 0, nrd hold = 0) |                            |      |      |      |

# SAMA5D2 Series

## Electrical Characteristics

.....continued

| Symbol | Parameter  | Min   |   | Unit |
|--------|--|---|---|------|
|        |  | 1.8V  | 3.3V  |      |
| SMC5   | NBS0/A0, NBS1, NBS2/A1, NBS3, A2–A25 Valid before NRD High | $(nrd\ setup + nrd\ pulse) \times t_{CPMCK}$                  | $(nrd\ setup + nrd\ pulse) \times t_{CPMCK}$                  | ns   |
| SMC6   | NCS low before NRD High                                    | $(nrd\ setup + nrd\ pulse - ncs\ rd\ setup) \times t_{CPMCK}$ | $(nrd\ setup + nrd\ pulse - ncs\ rd\ setup) \times t_{CPMCK}$ | ns   |
| SMC7   | NRD Pulse Width  | $nrd\ pulse \times t_{CPMCK}$                                 | $nrd\ pulse \times t_{CPMCK}$                                 | ns   |

**Figure 66-17. Minimum and Maximum Access Time for SPI Output Signal**

### 66.15.3 FLEXCOM TWI Timings

Refer to the section [TWI Timings](#).

### 66.16 USART in Asynchronous Modes

In Asynchronous modes, the maximum baud rate that can be achieved is  $MCK2 / 8$ , if the bit USART\_MR.OVER=1.

Example: if MCK2 = 83 MHz, the baud rate is 10.375 Mbit/s.

### 66.17 SPI Timings

#### 66.17.1 Maximum SPI Frequency

The following formulas give maximum SPI frequency in Master Read and Write modes and in Slave Read and Write modes.

- Master Write Mode  
The SPI sends data to a slave device only, e.g. an LCD. The limit is given by SPI<sub>2</sub> (or SPI<sub>5</sub>) timing.

- Master Read Mode

$$f_{\text{SPCKmax}} = \frac{1}{\text{SPI}_0(\text{or SPI}_3) + t_{\text{VALID}}}$$

$t_{\text{VALID}}$  is the slave time response to output data after deleting an SPCK edge.

The  $f_{\text{SPCKmax}}$  is given between the maximum frequency given by the above formula and the pad I/O limitation.

- Slave Read Mode

In Slave mode, SPCK is the input clock for the SPI. The max SPCK frequency is given by setup and hold timings SPI<sub>7</sub>/SPI<sub>8</sub> (or SPI<sub>10</sub>/SPI<sub>11</sub>). Since this gives a frequency well above the pad limit, the limit in Slave Read mode is given by the SPCK pad.

- Slave Write Mode

$$f_{\text{SPCKmax}} = \frac{1}{\text{SPI}_6(\text{or SPI}_9) + t_{\text{SETUP}}}$$

$t_{\text{SETUP}}$  is the setup time from the master before sampling data (6 ns).

The  $f_{\text{SPCKmax}}$  is given between the maximum frequency given by the above formula and the pad I/O limitation.

### 66.17.2 Timing Conditions

Timings assuming a capacitance load on MISO, SPCK and MOSI are given in the table below.

**Table 66-59. Capacitance Load for MISO, SPCK and MOSI (SPI0 and SPI1)**

| Supply | Corner |      |
|--------|--------|------|
|        | Max    | Min  |
| 3.3V   | 40 pF  | 5 pF |
| 1.8V   | 20 pF  | 5 pF |

### 66.17.3 Timing Extraction

In the first two figures below, “SPI Master Modes 1 and 2” and “SPI Master Modes 0 and 3”, the MOSI line shifting edge is represented with a hold time = 0. However, it is important to note that for this device, the MISO line is sampled prior to the MOSI line shifting edge. As shown in “MISO Capture in Master Mode”, the device sampling point extends the propagation delay ( $t_p$ ) for slave and routing delays to more than half the SPI clock period, whereas the common sampling point allows only less than half the SPI clock period.

As an example, an SPI Slave working in Mode 0 is safely driven if the SPI Master is configured in Mode 0.

| t <sub>su(start)</sub> | Setup Time for a Repeated START condition        | f <sub>TWCK</sub> ≤ 100 kHz | t <sub>HIGH</sub>   | –  | μs   |
|                        |  | f <sub>TWCK</sub> > 100 kHz | t <sub>HIGH</sub>   | –  | μs   |
| t <sub>h(data)</sub>   | Data Hold Time                                   | f <sub>TWCK</sub> ≤ 100 kHz | 0   | (HOLD + 3) × t <sub>peripheral clock</sub> | μs   |
|                        |  | f <sub>TWCK</sub> > 100 kHz | 0   | (HOLD + 3) × t <sub>peripheral clock</sub> | μs   |
| t <sub>su(data)</sub>  | Data Setup Time                                  | f <sub>TWCK</sub> ≤ 100 kHz | t <sub>LOW</sub> - (HOLD + 3) × t <sub>peripheral clock</sub> | –  | ns   |
|                        |  | f <sub>TWCK</sub> > 100 kHz | t <sub>LOW</sub> - (HOLD + 3) × t <sub>peripheral clock</sub> | –  | ns   |
| t <sub>su(stop)</sub>  | Setup time for STOP condition                    | f <sub>TWCK</sub> ≤ 100 kHz | t <sub>HIGH</sub>   | –  | μs   |
|                        |  | f <sub>TWCK</sub> > 100 kHz | t <sub>HIGH</sub>   | –  | μs   |
| t <sub>BUF</sub>       | Bus free time between a STOP and START condition | f <sub>TWCK</sub> ≤ 100 kHz | t <sub>LOW</sub>  | –  | μs   |
|                        |  | f <sub>TWCK</sub> > 100 kHz | t <sub>LOW</sub>  | –  | μs   |

**Note:**

1. Required only for f<sub>TWCK</sub> > 100 kHz.
2. C<sub>B</sub> = capacitance of one bus line in pF. Per I2C Standard, C<sub>b</sub> Max = 400 pF
3. The TWCK low period is defined as follows: t<sub>LOW</sub> = ((CLDIV × 2<sup>CKDIV</sup>) + 3) × t<sub>MCK</sub>
4. The TWCK high period is defined as follows: t<sub>HIGH</sub> = ((CHDIV × 2<sup>CKDIV</sup>) + 3) × t<sub>MCK</sub>

## 66.19 QSPI Timings

### 66.19.1 Maximum QSPI Frequency

The following formulas give maximum QSPI frequency in Master Read and Write modes.

- Master Write Mode  
The QSPI sends data to a slave device only, e.g. an LCD. The limit is given by QSPI<sub>2</sub> (or QSPI<sub>5</sub>) timing.
- Master Read Mode

$$f_{QSCk}^{\max} = \frac{1}{QSPI_0(\text{or } QSPI_3) + t_{VALID}}$$

t<sub>VALID</sub> is the slave time response to output data after detecting a QSCk edge.

The  $f_{QSCk}$  max is given between the maximum frequency given by the above formula and the pad I/O limitation.

### 66.19.2 Timing Conditions

Timings assuming a capacitance load are given in the table below.

**Table 66-66. Capacitance Load (QSPI 0 and QSPI1)**

| Supply | Corner |      |
|--------|--------|------|
|        | Max    | Min  |
| 3.3V   | 30 pF  | 5 pF |
| 1.8V   | 20 pF  | 5 pF |

### 66.19.3 Timing Extraction

**Figure 66-26. QSPI Master Mode 0**

### 66.20 MPDDRC Timings

The following characteristics are applicable to the ambient operating temperature range  $T_A = -40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$  for -CN devices, and  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  for -CU devices, unless otherwise specified.

#### 66.20.1 Board Design Constraints

As the SAMA5D2 series embeds impedance calibrated pads, there are no capacitive constraints on DDR signals. However, a board must be designed and equipped in order to respect propagation time and intrinsic delay in the SDRAM device. In all cases, line length to memory device must not exceed 5 cm.

#### 66.20.2 DDR2-SDRAM

**Note:** For DDR2 memory, the SHIFT\_SAMPLING field value in the MPRDDRC\_RD\_DATA\_PATH register must be configured to 1.

**Table 66-73. System Clock Waveform Parameters**

| Symbol             | Parameter        | Conditions                                    | Min | Max | Unit |
|--------------------|------------------|---|-----|-----|------|
| $t_{\text{DDRCK}}$ | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V]                          | 7.5 | 8.0 | ns   |
|                    |                  | VDDCORE[1.2V, 1.32V],<br>VDDIODDR[1.8V, 1.9V] | 6.0 | 8.0 | ns   |

#### 66.20.3 LPDDR1-SDRAM

**Note:** For LPDDR1 memory, the SHIFT\_SAMPLING field value in the MPRDDRC\_RD\_DATA\_PATH register must be configured as follows:

SHIFT\_SAMPLING = 0 for 0 < DDR\_CLK < 94 MHz

SHIFT\_SAMPLING = 1 for 94 MHz < DDR\_CLK < 166 MHz

**Table 66-74. System Clock Waveform Parameters**

| Symbol             | Parameter        | Conditions                                    | Min | Max | Unit |
|--------------------|------------------|---|-----|-----|------|
| t <sub>DDRCK</sub> | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V]                          | 7.5 | –   | ns   |
| t <sub>DDRCK</sub> | DDRCK Cycle Time | VDDCORE[1.2V, 1.32V],<br>VDDIODDR[1.8V, 1.9V] | 6   | –   | ns   |

### 66.20.4 LPDDR2/LPDDR3-SDRAM

**Note:** For LPDDR2/LPDDR3 memory, the SHIFT\_SAMPLING field value in the MPRDDRC\_RD\_DATA\_PATH register must be configured as follows:

SHIFT\_SAMPLING = 0 for 0 < DDR\_CLK < 80 MHz

SHIFT\_SAMPLING = 1 for 80 MHz < DDR\_CLK < 166 MHz

**Table 66-75. System Clock Waveform Parameters**

| Symbol             | Parameter        | Conditions                                     | Min | Max | Unit |
|--------------------|------------------|--|-----|-----|------|
| t <sub>DDRCK</sub> | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V]                           | 7.5 | –   | ns   |
| t <sub>DDRCK</sub> | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V],<br>VDDIODDR[1.18V, 1.3V] | 6   | –   | ns   |

### 66.20.5 DDR3/DDR3L-SDRAM

**Note:** For DDR3/DDR3L memory, the SHIFT\_SAMPLING field value in the MPRDDRC\_RD\_DATA\_PATH register must be configured to 2.

**Table 66-76. System Clock Waveform Parameters**

| Symbol             | Parameter        | Conditions                                     | Min | Max | Unit |
|--------------------|------------------|--|-----|-----|------|
| t <sub>DDRCK</sub> | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V]                           | 8.0 | –   | ns   |
| t <sub>DDRCK</sub> | DDRCK Cycle Time | VDDCORE[1.1V, 1.32V],<br>VDDIODDR[1.18V, 1.3V] | 8.0 | –   | ns   |

## 66.21 SSC Timings

### 66.21.1 Timing Conditions

Timings assuming a capacitance load are given in the table below.

**Table 66-77. Capacitance Load (SSC0 and SSC1)**

| Supply | Corner |      |
|--------|--------|------|
|        | Max    | Min  |
| 3.3V   | 30 pF  | 5 pF |
| 1.8V   | 20 pF  | 5 pF |

## 66.22 PDMIC Timings

### 66.22.1 Timing Conditions

Timings assuming capacitance loads are given in the table below.

**Table 66-82. Capacitance Load**

| Supply | Corner |      |
|--------|--------|------|
|        | Max    | Min  |
| 3.3V   | 30 pF  | 5 pF |
| 1.8V   | 20 pF  | 5 pF |

### 66.22.2 Timing Extraction

**Figure 66-38. PDMIC Timing Diagram**

**Table 66-83. PDMIC IOSET1 Timings**

### 66.23 I2SC Timings

#### 66.23.1 Timing Conditions

Timings assuming capacitance loads are given in the table below.

**Table 66-85. Capacitance Load (I2SC0 and I2SC1)**

| Supply | Corner |      |
|--------|--------|------|
|        | Max    | Min  |
| 3.3V   | 30 pF  | 5 pF |
| 1.8V   | 20 pF  | 5 pF |

#### 66.23.2 Timing Extraction

**Table 66-86. I2SC0 IOSET1 Timings**

| Symbol            | Parameter                             | Power Supply |     | 1.8V |     | 3.3V |  | Unit |
|-------------------|---------------------------------------|--------------|-----|------|-----|------|--|------|
|                   |                                       | Min          | Max | Min  | Max |      |  |      |

| ISC <sub>5</sub> | PIXCLK frequency                                       | –            | 96  | –    | 96  | MHz  |     |      |

### 66.25 SDMMC Timings

The Secure Digital Multimedia Card (SDMMC) Controller supports the embedded MultiMedia Card (e.MMC) Specification V4.51, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification.

Features are different for the two instances of SDMMC:

SDMMC0: SD 3.0, eMMC 4.51, 8 bits

SDMMC1: SD 2.0, eMMC 4.41, 4 bits only

In SDR104 mode (SD 3.0), SDMMC0 is limited to 120 MHz (instead of 208 MHz). In HS200 mode (eMMC 4.51), SDMMC0 is limited to 120 MHz (instead of 200 MHz).

### 66.26 GMAC Timings

#### 66.26.1 Timing Conditions

Timings assuming a capacitance load on data and clock are given in the table below.

**Table 66-95. Capacitance Load on Data, Clock Pads**

| Supply | Corner |      |
|--------|--------|------|
|        | Max    | Min  |
| 3.3V   | 20 pF  | 0 pF |

#### 66.26.2 Timing Constraints

**Table 66-96. Ethernet MAC Signals Relative to GMDC**

| Symbol            | Parameter                                      | Min | Max | Unit |
|-------------------|--|-----|-----|------|
| EMAC <sub>1</sub> | Setup for GMDIO from GMDC rising               | 10  | –   | ns   |
| EMAC <sub>2</sub> | Hold for GMDIO from GMDC rising                | 10  | –   | ns   |
| EMAC <sub>3</sub> | GMDIO toggling from GMDC rising <sup>(1)</sup> | 0   | 300 | ns   |

**Note:**

- For Ethernet MAC output signals, minimum and maximum access times are defined. The minimum access time is the time between the GMDC rising edge and the signal change. The maximum access time is the time between the GMDC rising edge and the signal stabilizes. The figure below illustrates minimum and maximum accesses for EMAC<sub>3</sub>.

**Figure 66-40. Minimum and Maximum Access Times of Ethernet MAC Output Signals**

#### 66.26.2.1 Ethernet MAC MII Mode

### 68. Schematic Checklist

The schematic checklist provides the user with the requirements regarding the different pin connections that must be considered before starting any new board design as well as information on the minimum hardware resources required to quickly develop an application with the SAMA5D2. It does not consider PCB layout constraints.

It also provides recommendations regarding low-power design constraints to minimize power consumption.

This information is not intended to be exhaustive. Its objective is to cover as many configurations of use as possible.

The checklist contains a column for use by designers, making it easy to track and verify each line item.

#### 68.1 Power Supply

The board design must comply with the power-up and power-down sequence guidelines provided in the data sheet to ensure reliable operation of the device.

---

### Note:

1. These values are given only as typical examples.
2. Decoupling capacitors must be connected as close as possible to the microprocessor and on each relevant pin

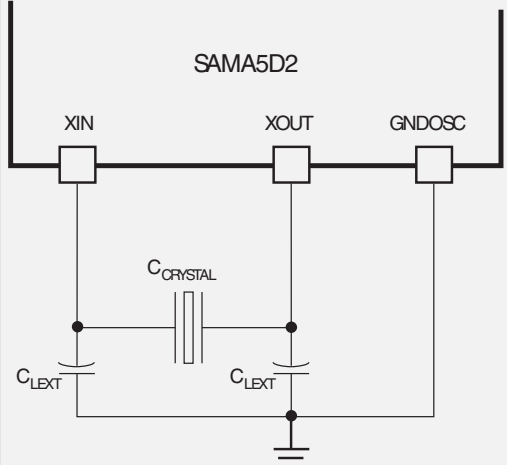

For more information, see the table "VDDCORE Power-On Reset Characteristics" in the section "Electrical Characteristics".

### 68.2 Power-On Reset

The SAMA5D2 embeds several Power-On Resets (PORs) to ensure the power supply is established when the reset is released. These PORs are dedicated to VDDBU, VDDANA and VDDCORE respectively.

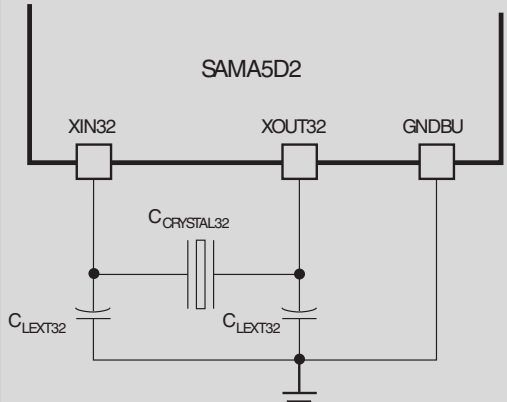

### 68.3 Clock, Oscillator and PLL

**Table 68-2. Clock, Oscillator and PLL Connections**

## Schematic Checklist

| .....continued                      |             |  |   |
|-------------------------------------|-------------|--|---|
| <input checked="" type="checkbox"/> | Signal Name | Recommended Pin Connection   | Description   |
|                                     | TDO         | Floating<br><br>If Debug mode is not required, this pin can be used as GPIO.   | Output driven at up to $V_{DDIOP}$ .  |
|                                     | NTRST       | Refer to the section Pin Description.<br><br>If Debug mode is not required, this pin can be used as GPIO.  | This pin is a Schmitt trigger input.<br><br>Internal pull-up resistor to $V_{DDIOP}$ (100 k $\Omega$ ).               |
|                                     | JTAGSEL     | In harsh environments <sup>(2)</sup> , it is strongly recommended to tie this pin to GNDBU if not used or to add an external low-value resistor (such as 1 k $\Omega$ ). | Internal pull-down resistor to GNDBU (15 k $\Omega$ ).<br><br>Must be tied to $V_{DDBU}$ to enter JTAG Boundary Scan. |

**Note:**

1. These values are given only as typical examples.
2. In a well-shielded environment subject to low magnetic and electric field interference, the pin may be left unconnected. In noisy environments, a connection to ground is recommended.

### 68.5 Reset and Test

**Table 68-4. Reset and Test Connections**

| ☑ | Signal Name | Recommended Pin Connection  | Description  |
|---|-------------|---|--|
|   | NRST        | <p>Application-dependent</p> <p>Can be connected to a push button for hardware reset.</p> <p>In applications with a storage element on VDDBU (battery, supercapacitor, etc.), NRST must be tied to a non-permanent supply (satisfying VIH conditions on NRST) and not to VDDBU. Typically, this may be the application's primary 3.3V supply (VDDIOP0, VDDIOP1 or any other). The recommended pull-up value is 10 kOhms minimum. Doing so, the NRST level is 'L' when the non-permanent supply is removed. On the contrary, if this pin is tied to VDDBU:</p> <ul style="list-style-type: none"> <li>• the circuit driving this pin low may not be operational when the input power of the application is removed. Therefore the processor may not be properly reset during power-up or power-down phases,</li> <li>• a leakage path from VDDBU to the application's input power may be created when this input power is removed. (This may be for example through a clamping diode that may be present on an external integrated circuit driving NRST.)</li> </ul> | <p>NRST pin is a Schmitt trigger input.</p> <p>No internal pull-up resistor.</p>                 |
|   | TST         | <p>In harsh environments<sup>(1)</sup>, it is strongly recommended to tie this pin to GNDBU to add an external low-value resistor (such as 10 kΩ).</p>  | <p>This pin is a Schmitt trigger input.</p> <p>Internal pull-down resistor to GNDBU (15 kΩ).</p> |

**Note:**

1. In a well-shielded environment subject to low magnetic and electric field interference, the pin may be left unconnected. In noisy environments, a connection to ground is recommended.

### 68.6 Shutdown/Wake-up Logic

**Table 68-5. Shutdown/Wake-up Logic Connections**

| ☑ | Signal Name | Recommended Pin Connection   | Description  |
|---|-------------|--|--|
|   | SHDN        | Application-dependent<br><br>A typical application connects pin SHDN to the shutdown input of the DC/DC Converter providing the main power supplies. | Push-pull output.  |
|   | WKUP        | 0V to V <sub>DDBU</sub>  | Input only. WKUP behavior can be configured through the Shutdown Controller (SHDWC). |

### 68.7 Parallel Input/Output (PIO)

**Table 68-6. PIO Connections**

| ☑ | Signal Name              | Recommended Pin Connection | Description  |
|---|--------------------------|----------------------------|--|
|   | PAx<br>PBx<br>PCx<br>PDx | Application-dependent      | <p>All PIOs are pulled up inputs (100 kΩ) at reset except those which are multiplexed with the Address Bus signals that require to be enabled as peripherals:</p> <p>In the section <a href="#">Package and Pinout</a>, refer to the column 'Reset State' of the Pin Description table.</p> <p>Schmitt trigger on all inputs.</p> <p>To reduce power consumption if not used, the relevant PIO can be configured as an output, driven at '0' with internal pull-up disabled.</p> |

### 68.8 Analog-to-Digital Converter (ADC)

**Table 68-7. ADC Connections**

| ☑ | Signal Name | Recommended Pin Connection  | Description  |
|---|-------------|---|--|
|   | ADVREF      | 3.3 V to VDDANA<br><br>Decoupling/filtering capacitors<br>Application-dependent | <p>ADVREF is a pure analog input.</p> <p>To reduce power consumption if the ADC is not used, connect ADVREF to GNDANA.</p> |

### 68.9 External Bus Interface (EBI)

**Table 68-8. EBI Connections**

| ☑ | Signal Name | Recommended Pin Connection | Description   |
|---|-------------|----------------------------|---|
|   | D0–D15      | Application-dependent      | Data Bus (D0 to D15)<br>All data lines are pulled up inputs at reset.       |
|   | A0–A25      | Application-dependent      | Address Bus (A0 to A25)<br>All address lines are pulled up inputs at reset. |

The tables below detail the connections to be applied between the EBI pins and the external devices for each memory controller.

**Table 68-9. EBI Pins and External Static Devices Connections**

| Signals:        | Pins of the Interfaced Device  |                          |                       |
|-----------------|--------------------------------|--------------------------|-----------------------|
| EBI_            | 8-bit Static Devices           | 2 x 8-bit Static Devices | 16-bit Static Devices |

## 68.10 USB High-Speed Host Port (UHPHS) / USB High-Speed Device Port (UDPHS)

**Table 68-11. UHPHS/UDPHS Connections**

|       | Signal Name  | Recommended Pin Connection              | Description               |
|-------|--|---|---------------------------|
| UHPHS | HHSDPA/DHSDPB <sup>(1)</sup><br>HHSDMA/<br>DHSDMB <sup>(1)</sup> | Application-dependent <sup>(2)(3)</sup> | Pull-down output at reset |
| UDPHS | HHSDP/HHSDM  | Application-dependent <sup>(2)</sup>    | Pull-down output at reset |
| HSIC  | HHSTROBE/<br>HHDATA  | Application-dependent <sup>(2)</sup>    | Pull-down output at reset |

**Note:**

- UDPHS shares Port A with UHPHS.

2. Example of a USB High Speed Host connection, refer to the section [USB Host High Speed Port \(UHPHS\)](#).

3. Typical USB High Speed Device connection, refer to the section [USB Host High Speed Port \(UHPHS\)](#).

**Note:** The values shown on the 22 kΩ and 15 kΩ resistors are only valid with 3.3V supplied PIOs.

### 68.11 Boot Program Hardware Constraints

Refer to the section [Standard Boot Strategies](#) for more details on the boot program.

### 68.12 Layout and Design Constraints

**Note:** All PIOs shared, multiplexed, connected to various components and connectors must be connected through serial resistors 22R and 39R for clock signals. The resistors must be populated as close as possible to the SAMA5D2.

### 68.12.1 General Considerations

This chapter provides routing guidelines for layout and design of a printed circuit board using high-speed interfaces, Serial, Ethernet and USB 2.0. The signal integrity rules for high-speed interfaces need to be considered. In fact, it is highly recommended that the board design be simulated to determine optimum layout for signal integrity and quality. Keep in mind that this document can only highlight the most important issues that should be considered when designing the SAMA5D2 board. The designer has to take into account the corresponding information (specification, design guidelines, etc.) contained in the documentation of all other devices that are to be implemented on board.

### 68.12.2 Considerations for High-Speed Differential Interfaces

The following recommendations for designing with high-speed differential signals are useful to maintain maximum SAMA5D2 board performance when implementing these interfaces.

- Use controlled impedance PCB traces that match the specified differential impedance.
- Keep the trace lengths of the differential signal pairs as short as possible.
- The differential signal pair traces should be trace-length matched.
- Maintain parallelism and symmetry between differential signals with the trace spacing needed to achieve the specified differential impedance.
- Maintain maximum possible separation between the differential pairs and any high-speed clocks/periodic signals (CMOS/TTL) and any connector leaving the PCB (such as I/O connectors, control and signal headers, or power connectors).
- Route differential signals on the signal layer nearest to the ground plane using a minimum of vias and corners. This will reduce signal reflections and impedance changes. Use GND stitching vias when changing layers.
- It is best to put CMOS/TTL and differential signals on different layers which should be isolated by the power and ground planes.
- Avoid tight bends. When it becomes necessary to turn 90°, use two 45° turns or an arc instead of making a single 90° turn.
- Do not route traces under crystals, crystal oscillators, clock synthesizers, magnetic devices or ICs that use, and/or generate, clocks.
- Stubs on differential signals should be avoided due to the fact that stubs cause signal reflections and affect signal quality.
- Keep the length of high-speed clock and periodic signal traces that run parallel to high-speed signal lines at a minimum to avoid crosstalk. Based on EMI testing experience, the minimum suggested spacing to clock signals is 50 mil.
- Use a minimum of 20 mil spacing between the differential signal pairs and other signal traces for optimal signal quality. This helps to prevent crosstalk.
- Route all traces over continuous planes (VCC or GND) with no interruptions.
- Avoid crossing over anti-etch if at all possible. Crossing over anti-etch (split planes) increases inductance and radiation levels by forcing a greater loop area.

### 68.12.3 DDR Layout and Design Considerations

Refer to the document “SAMA5D2 Layout Recommendations”, document no. 44041.

### 68.12.4 e.MMC Routing

Refer to the Micron Technical Note TN-FC-35: *e.MMC PCB Design Guide*. This document is intended as guide for PCB designers using Micron e.MMC devices and discusses the primary issues affecting design and layout.

### 68.12.5 USB Trace Routing Guidelines

- Maintain parallelism between USB differential signals with the trace spacing needed to achieve 90-ohm differential impedance. Deviations will normally occur due to package breakout and routing to connector pins. Just ensure the amount and lengths of the deviations are kept to the minimum possible.
- Use an impedance calculator to determine the trace width and spacing required for the specific board stack-up being used. Example: Layer Stacking, 7.5-mil traces with 7.5-mil spacing results in approximately 90-ohm differential trace impedance.
- Minimize the length of high-speed clock and periodic signal traces that run parallel to high-speed USB signal lines, to minimize crosstalk.
- Based on EMI testing experience, the minimum suggested spacing to clock signals is 50 mils. Based on simulation data, use 20-mil minimum spacing between high-speed USB signal pairs and other signal traces for optimal signal quality. This helps to prevent crosstalk.

**Table 68-12. USB Trace Routing Guidelines**

| Parameter   | Trace Routing  |
|---|--|
| Signal length allowance for the SAMA5D2                               | 14.0 inches<br><br>Valid for a damping value of the PCB trace of 0.11 dB/inch @ 0.4 GHz (common value for FR-4 based material) |
| Differential impedance  | 90 ohms $\pm$ 15%  |
| Single-ended impedance  | 45 ohms $\pm$ 10%  |
| Trace width (W)   | 5 mils (microstrip routing)  |
| Spacing between differential pairs (intra-pair)                       | 6 mils (microstrip routing)  |
| Spacing between pairs (inter-pair)                                    | Min. 20 mils   |
| Spacing between differential pairs and high-speed periodic signals    | Min. 50 mils   |
| Spacing between differential pairs and low-speed non-periodic signals | Min. 20 mils   |
| Length matching between differential pairs (intra-pair)               | 150 mils   |
| Reference plane   | GND referenced preferred   |
| Spacing from edge of plane  | Min. 40 mils   |
| Vias usage  | Try to minimize the number of vias   |

### 68.12.6 QSPI Pull-up Resistors

The ROM code **removes** the internal pull-up resistors when it configures PIO controller to mux the QSPI controller I/O lines. Therefore the probing step may fail if the Quad I/O mode of the memory has not been enabled yet and if this memory does not embed internal pull-up resistor on #HOLD or #RESET pin.

For this reason, it is recommended to add external pull-up resistors if needed on the four I/O data lines MOSI/IO0, MISO/IO1, #WP/IO2 and #HOLD/IO3.

Another solution is to update the Quad Enable non-volatile bit in the relevant register to reassign #WP and #HOLD/#RESET pins to functions IO2 and IO3.

### 68.12.7 Considerations for PTC Interface

Particular care must be taken during the layout of the PTC interface for the signals PTC\_Xm and PTC\_Yn. The PTC Debug Port (PTC\_PORT\_x) can be routed normally.

#### X-Lines (PTC\_Xm)

- Must be routed on TOP and BOTTOM side as often as possible.
- Can be routed in inner layer when necessary.
- A maximum of 4 vias per line is allowed.
- Is possible to cross the lines if necessary.
- X-lines must be as short as possible with a maximum intrinsic capacitance of 15pF.

#### Y-Lines (PTC\_Yn)

- Must be routed on TOP side only.
- Only one via per line is allowed.
- Never cross the Y-lines.
- Y-lines must be as short as possible with a maximum intrinsic capacitance of 15pF.

Respect an absolute clearance in PTC routing area. No ground path or plane, no power path or plane, and no signals except other PTC lines respecting the recommendations above should overlay the PTC signals in another PCB layer.

**69. Marking**

Top marking follows the scheme below:

with possible values:

| Line | Description                | Values   |
|------|----------------------------|--|
| 1    | Company Logo               | Atmel  |
| 2    | Device Name                | ATSAMA5D21<br>ATSAMA5D22<br>ATSAMA5D23<br>ATSAMA5D24<br>ATSAMA5D26<br>ATSAMA5D27<br>ATSAMA5D28 |
| 3    | Device Information         | CN<br>CU   |
| 4    | Date Code, Design Revision | YYWW C<br>YYWW B<br>YYWW A   |
| 5    | Lot Traceability, ARM logo | YYWWNNN ARM  |

### 70. Ordering Information

| Ordering Code                    | MRL | Package       | Carrier Type  | Operating Temperature Range |
|----------------------------------|-----|---------------|---------------|-----------------------------|
| ATSAMA5D21C-CU                   | C   | TFBGA196      | Tray          | -40°C to 85°C               |
| ATSAMA5D21C-CUR                  | C   |               | Tape and reel |                             |
| ATSAMA5D22C-CN                   | C   |               | Tray          | -40°C to 105°C              |
| ATSAMA5D22C-CNR                  | C   |               | Tape and reel |                             |
| ATSAMA5D22C-CU                   | C   |               | Tray          | -40°C to 85°C               |
| ATSAMA5D22C-CUR                  | C   |               | Tape and reel |                             |
| ATSAMA5D23C-CN                   | C   |               | Tray          | -40°C to 105°C              |
| ATSAMA5D23C-CNR                  | C   |               | Tape and reel |                             |
| ATSAMA5D23C-CU                   | C   |               | Tray          | -40°C to 85°C               |
| ATSAMA5D23C-CUR                  | C   |               | Tape and reel |                             |
| ATSAMA5D24C-CU                   | C   | TFBGA256      | Tray          | -40°C to 85°C               |
| ATSAMA5D24C-CUF01 <sup>(1)</sup> | C   |               | Tape and reel |                             |
| ATSAMA5D24C-CUR                  | C   |               | Tape and reel |                             |
| ATSAMA5D26C-CN                   | C   | LFBGA289      | Tray          | -40°C to 105°C              |
| ATSAMA5D26C-CNR                  | C   |               | Tape and reel |                             |
| ATSAMA5D26C-CU                   | C   |               | Tray          | -40°C to 85°C               |
| ATSAMA5D26C-CUR                  | C   |               | Tape and reel |                             |
| ATSAMA5D27C-CN                   | C   |               | Tray          | -40°C to 105°C              |
| ATSAMA5D27C-CNR                  | C   |               | Tape and reel |                             |
| ATSAMA5D27C-CU                   | C   |               | Tray          | -40°C to 85°C               |
| ATSAMA5D27C-CUR                  | C   |               | Tape and reel |                             |
| ATSAMA5D28C-CN                   | C   |               | Tray          | -40°C to 105°C              |
| ATSAMA5D28C-CNR                  | C   |               | Tape and reel |                             |
| ATSAMA5D28C-CU                   | C   | Tray          | -40°C to 85°C |                             |
| ATSAMA5D28C-CUR                  | C   | Tape and reel |               |                             |

**Note:**

- The Boot Configuration Word reset value for ATSAMA5D24C-CUF01 is 0x00000C00, meaning that the boot on SDMMC1 and SDMMC0 are disabled. Refer to [Boot Configuration Word](#).

## 71. Revision History

### 71.1 Revision DS60001476C

| Changes  |
|--|
| <p><b>Global format change</b><br/>In peripheral sections:</p> <ul style="list-style-type: none"> <li>- User Interface table is now called Register Summary and features new information.</li> <li>- Details for registers have changed. The details are now Name, Offset, Reset and Property <b>(Note)</b>.</li> <li>- Each bitfield now displays its Access and Reset value.</li> </ul> <p><b>Note:</b> Absolute register addresses are available in <a href="#">Memories</a>.</p> |
| Updated <a href="#">Block Diagram</a> .  |
| Updated <a href="#">Signal Description List</a> for PTC signals.   |
| Table <a href="#">Pin Description (all packages)</a> : added note on JTAG boundary scan.   |
| <b>Memory Mapping</b>  |
| In <a href="#">Figure 8-1</a> , updated SYSCWP, PMC, RTC and RSTC.   |
| <b>Debug and Test Features</b>   |
| Updated <a href="#">Figure 15-2</a> .  |
| Deleted section <i>Chip Access Using JTAG Connection</i> .   |
| Updated Product part number and JTAG ID Code value in <a href="#">Boundary JTAG ID Register</a> .  |
| Updated Product Version Number and Debug Port JTAG IDCODE in <a href="#">JTAG-DP Device ID Code Register</a> .   |
| <b>Standard Boot Strategies</b>  |
| Updated <a href="#">Boot Configuration</a> .   |
| <b>Matrix (H64MX/H32MX)</b>  |
| Updated table <a href="#">Peripheral Identifiers</a> .   |
| <a href="#">Master to Slave Access on H32MX</a> : connection between ICM and H32MX removed.  |
| Added note on AESB after table <a href="#">Master to Slave Access on H64MX</a> .   |
| Section "TrustZone Extension to AHB and APB" renamed to <a href="#">18.12 TrustZone Technology</a> and reorganized content.  |
| In <a href="#">Principles</a> , renamed 'Always Non-secure' to 'Never Secure'  |
| <b>Special Function Registers (SFR)</b>  |
| Section <a href="#">19.3.2 SFR_OHCIICR</a> : updated SUSPEND_A, SUSPEND_B and SUSPEND_C definitions  |
| <b>Advanced Interrupt Controller (AIC)</b>   |
| Updated <a href="#">Figure 21-8</a> .  |
| Updated Figure in Section <a href="#">21.3 Block Diagram</a> ; updated Section <a href="#">21.7.3 Interrupt Sources</a> .  |
| <b>Shutdown Controller (SHDWC)</b>   |
| Added information on Write Protection.   |
| <b>Periodic Interval Timer (PIT)</b>   |
| Added information on Write Protection.   |

.....continued

### Changes

#### Real-time Clock (RTC)

Updated content of section [Waveform Generation](#).

Added information about how to clear bits/fields.

#### System Controller Write Protection

Section [27.1.2 Register Write Protection](#): updated list of write-protected registers.

#### Slow Clock Controller (SCKC)

Updated:

- Section [28.1 Description](#)
- Section [28.3 Block Diagram](#)
- Section [28.4 Functional Description](#)
- Section [28.4.1 Switching from Embedded 64 kHz RC Oscillator to 32.768 kHz Crystal Oscillator](#)
- Section [28.4.2 Switching from 32.768 kHz Crystal Oscillator to Embedded 64 kHz RC Oscillator](#)
- Section [28.5.1 SCKC\\_CR](#)

#### Power Management Controller (PMC)

[Clock Assignments](#): removed LCDC row.

Removed content related to the CKGR\_UCKR.BIASEN bit in Section [32.19 Programming Sequence](#) and Section [32.22.7 CKGR\\_UCKR](#)

Updated Section [32.9 Peripheral and Generic Clock Controller](#).

#### Parallel Input/Output Controller (PIO)

Updated [Figure 33-2](#).

#### External Memories

[Table 34-2](#): Added note on connecting DDR\_DQSN.

#### AHB Multiport DDR-SDRAM Controller (MPDDRC)

[Embedded Characteristics](#): added “Write Leveling not supported” and added “Low-cost LPDDR1with 2 internal banks” and “Arbitration policies” characteristics

Updated [Block Diagram](#).

[DDR2-SDRAM Initialization](#): added Step 2.

[Low-power DDR2-SDRAM Initialization](#): added Step 2.

[DDR3-SDRAM/DDR3L-SDRAM Initialization](#): added Step 2.

Restored title of [Refresh \(Autorefresh Command\)](#).

[Scrambling/Unscrambling Function](#): MPDDRC\_KEY1/2 replaced with KEY1/2.

Added [Monitor](#).

Updated [Sequential Mapping DDR-SDRAM Configuration Mapping: 8K Rows, 512/1024 Columns, 8 banks](#) and [Interleaved Mapping DDR-SDRAM Configuration Mapping: 8K Rows, 512/1024 Columns, 8 banks](#).

[MPDDRC Mode Register](#): updated DAI bit description.

[MPDDRC Configuration Register](#): updated UNAL bit description.

[MPDDRC Memory Device Register](#): updated WL, RL3, MANU\_ID, REV\_ID, TYPE, DENSITY and IO\_WIDTH bit descriptions.

[MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Timing Calibration Register](#): updated RZQI bit description.

[MPDDRC I/O Calibration Register](#): updated CALCODEP and CALCODEN field descriptions.

[MPDDRC Read Data Path Register](#): updated SHIFT\_SAMPLING field description.

.....continued

### Changes

[MPDDRC Monitor Configuration Register](#): updated REFR\_CALIB bit description.

### DMA Controller (XDMAC)

Section [37.5.1 Basic Definitions](#): added "Stride" definition; added [37.5.2 Data Striding Diagram](#).

Updated Section [37.8 XDMAC Software Requirements](#); Section [37.9.28 XDMAC\\_CC](#): updated PROT bit description.

### Ethernet MAC (GMAC)

[MAC Transmit Block](#): removed reference to non-existing bit HDFC.

[GMAC Network Status Register](#): updated reset value for GMAC\_NSR.

### USB High Speed Device Port (UDPHS)

Updated [Endpoint Configuration](#) and [DPRAM Management](#).

Removed figure Example of DPRAM Allocation and Reorganization.

### USB Host High Speed Port (UHPHS)

Updated Section [41.3 Block Diagram](#), Section [41.5.1 I/O Lines](#), Section [41.6.2 EHCI](#), and Section [41.6.3 OHCI](#).

[Power Management](#): removed reference to bit BIASEN (UTMI BIAS Enable).

Updated [Figure 41-2](#).

Added Section [41.6.1 UTMI Transceivers Sharing](#).

Section [41.7.4 UHPHS\\_USBCMD](#): USBCMD reset value set to 0x00080B00 (instead of "0x00080000 or 0x00080B00").

Section [41.7.11 UHPHS\\_PORTSCx](#): UHPHS\_PORTSCx reset value set to 0x00002000 (instead of "0x00002000 or 0x00003000").

Deleted registers UHPHS\_INSNREG00 to UHPHS\_INSNREG05.

### Two-wire Interface (TWIHS)

[Table 45-1](#): START byte support now available. Updated Note 2.

Replaced sections "Master Mode FIFOs" and "Slave Mode FIFOs" by a single Section "FIFOs".

Section FIFOs, sub-section [Overview](#), the description for FIFO disable/enable has been changed.

### Flexible Serial Communication Controller (FLEXCOM)

Section [46.10.7 FLEX\\_US\\_MR \(SPI\\_MODE\)](#): restored CHMODE field and updated CHMODE description.

Section [46.7.3.1 Transmitter Operations](#): updated Figure [Transmitter Status](#)

Section [46.10.55 FLEX\\_SPI\\_FMR](#): updated RXRDYM field description

Updated [46.7.4.1 ISO7816 Mode Overview](#)

Section [46.7.6 RS485 Mode](#): updated Figure [Example of RTS Drive with Timeguard](#)

[TWI Clock Waveform Generator Register](#): deleted CKSRC description.

### Universal Asynchronous Receiver Transmitter (UART)

Section [47.3 Block Diagram](#): RXD/TXD pins were renamed to URXD/UTXD.

Section [47.5.7 Register Write Protection](#): added UART Receiver Time-out Register to the list.

### Quad Serial Peripheral Interface (QSPI)

[QSPI Bus Clock Modes](#): updated column "Capture QSCK Edge".

### Secure Digital MultiMedia Card Controller (SDMMC)

[SDMMC Preset Value Register](#): deleted Note from SDMMC\_PVRx register description.

.....continued

### Changes

[SDMMC Maximum Current Capabilities Register](#): corrected access to Read/Write. Added note on CAPWREN below register table.

[SDMMC Capabilities Control Register](#): updated CAPWREN bit description.

### Image Sensor Controller (ISC)

Section [51.6.1 ISC\\_CTRLLEN](#): added bit FUPPRO at index 9 and bit description.

Section [51.6.30 ISC\\_GAM\\_CTRL](#): added bit BIPART at index 4 and bit description.

### Controller Area Network (MCAN)

[Description](#), Section [52.2 Embedded Characteristics](#): added information on ISO non-compliance

### Pulse Width Modulation Controller (PWM)

[PWM Clock Generator](#): updated figure.

### Secure Fuse Controller (SFC)

Number of maskable Data Registers modified to 8. Number of Data Registers modified to 17.

Modified ACE bit name in Section [56.5.3 SFC\\_IER](#), Section [56.5.4 SFC\\_IDR](#), Section [56.5.5 SFC\\_IMR](#) and Section [56.5.6 SFC\\_SR](#).

### Integrity Check Monitor (ICM)

Updated Section [57.5.4.2 Processing Period](#).

### Advanced Encryption Standard (AES)

Section [59.1 Description](#): added XTS to supported modes.

Section [59.4.2 Operating Modes](#): added bullet for XTS mode; added bullet for CBC-MAC.

[Last Output Data Mode](#): Added (CBC-MAC) to section title. Added details on CMAC algorithm.

Section [59.4.7.1 Manual Mode](#): table "Authorized Input Data Registers": updated for XTS algorithm.

Section [59.4.7.3 DMA Mode](#): table "DMA Data Transfer Type for the Different Operating Modes": updated for XTS algorithm.

[IPSEC Padding](#): added detail on padding length.

[SSL Padding](#): added detail on incremental integer values.

Updated [DMA Mode](#).

Updated [If AES\\_MR.LOD = 1](#).

### Triple Data Encryption Standard (TDES)

[Last Output Data Mode \(CBC-MAC\)](#): added "CBC-MAC" in section title and added second paragraph.

Updated Section [61.4.2.3 DMA Mode](#) and Section [61.4.3.2.2 TDES\\_MR.LOD = 1](#).

### Analog-to-Digital Controller (ADC)

[ADC Channel Status Register](#): updated CHx bit description

Updated USCHx field description in [ADC Channel Sequence 1 Register](#) and [ADC Channel Sequence 2 Register](#)

### Electrical Characteristics

In [DC Characteristics](#) updated:

- Vhyst parameter

- VDDIODDR

- conditions for VOL and VOH

Updated Section [66.5.2 Backup Mode with DDR in Self-Refresh](#).

[Master Clock Waveform Parameters](#): changed VDDIODDR range.

.....continued

### Changes

Corrected references to CKGR\_MOR bits and added VIL\_XIN and VIH\_XIN parameters in [XIN Clock Electrical Characteristics](#).

Updated [12 MHz RC Oscillator Characteristics](#).

Updated [PLLA Characteristics](#).

Added [ADC Bias Current](#).

Added [Pen Detect Characteristics](#).

Updated [Analog Comparator Characteristics](#).

[Two Wire Serial Bus Requirements](#): corrected definition of TWCK high and low periods.

[DDR2-SDRAM System Clock Waveform Parameters](#): VDDIODDR range changed.

[LPDDR1-SDRAM System Clock Waveform Parameters](#): VDDIODDR range changed.

Section [66.21 SSC Timings](#): added SSC14 and SSC15 timings

### Schematic Checklist

[ICE and JTAG](#): added note on JTAG boundary scan.

### Errata

Removed from data sheet to create separate document, *SAMA5D2 Family Silicon Errata and Data Sheet Clarification*, document number DS80000803.

## 71.2 Revision DS60001476B

### Changes

#### Section 6. “Package and Pinout”

Table 6-2 Pin Description: added notes (2) and (3).

Table 6-3 Pin Description (SAMA5D23 pins different from those in Table 6-2 “Pin Description”): added note (2).

Table 6-4 Pin Description (SAMA5D28B/C pins different from those in Table 6-2 “Pin Description”): added note (2).

#### Section 7. “Power Considerations”

Updated Figure 7-1 “Recommended Powerup Sequence” and Table 7-2 “Powerup Timing Specification”.

#### Section 16. “Standard Boot Strategies”

Updated Section 16.4.7.3 “SDCard / e.MMC Boot”.

Reworked Section 16.4.7.6 “QSPI NOR Flash Boot for MRL C”.

#### Section 29. “Peripheral Touch Controller (PTC)”

- Replaced “Peripheral Touch Controller” with “Peripheral Touch Controller Subsystem”.

- Changed “PTC\_IRQ\_EVT” to “PTC\_IRQ”.

- Replaced “PIO” and “IO” with “GPIO”.

Updated:

- Figure 29-1. “PTC Block Diagram”

- Section 29.2 “Embedded Characteristics”

- Section 29.5.2 “I/O Lines”

- Section 29.5.3 “Interrupt Sources”

.....continued

### Changes

- Section 29.6.2.3 “Firmware in SRAM Code Area”

Section 29.5.1 “Power Management”: updated description of “SLCK”.

Section 29.6.3.1 “PTC Digital Controller Operations”: modified Sensing mode description.

Renamed and reworked Section 29.7.1 “PTC Command Register” and Section 29.7.2 “PTC Interrupt Status Register”.

Section 29.7.3 “PTC Enable Register”: removed field CLR\_IRQEN, and replaced field SET\_IRQEN with bits IER0, IER1, IER2, IER3.

Renamed the following registers:

- “Mode 1: Write Access” to “PTC Command Register”

- “Host Flags” to “PTC Interrupt Status Register”

- “Host Flags Control” to “PTC Enable Register”

Section 39. “LCD Controller (LCDC)”

Corrected Figure 39-1. Block Diagram (added “PP Layer” block).

### Section 66. “Electrical Characteristics”

Added Section 66.10 “PTC Characteristics”.

Section 66.5.3.1 “ULP0 Mode”: updated steps (5) and (6).

Table 66-9 “Typical Peripheral Power Consumption by Peripheral in Active Mode”: corrected UPHPS consumption value from “12 \*MCK + 4900\*DR” to “12 \*MCK + 490\*DR” and UDPHS consumption value from “10 \*MCK + 2060\*DR” to “10 \*MCK + 206\*DR”

Table 66-13 “VDDCORE Power Consumption in Ultra Low-power Mode: AMP2”: removed ULP0 512 Hz row.

### Section 68. “Schematic Checklist”

Removed Section 68.3 “Shutdown Considerations” and Section 68.4 “Wakeup Considerations” (redundant with content in Section 7. “Power Considerations”).

Table 68-1 “Power Supply Connections”: updated VDDCORE recommended pin connection from “1.08V to 1.32V” to “1.1V to 1.32V”.

Table 68-2 “Clock, Oscillator and PLL Connections”: updated main oscillator recommended pin connection from “Crystals between 8 and 16 MHz” to “Crystals between 8 and 24 MHz”.

Table 68-6 “Reset and Test Connections”: updated NRST recommended pin connection.

### Section 69. “Marking”

Updated marking information.

### Section 71. “Errata”

Added the following issues in Section 71.1 “Errata - SAMA5D2 MRL C Parts”:

Section 71.1.9 “Master CAN-FD Controller (MCAN)” to Section 71.1.18 “MCAN High Priority Message (HPM)” and Section 71.1.19 “ROM Code: Using JTAG IOSET 4”.

Added the following issues in Section 71.2 “Errata - SAMA5D2 MRL B Parts”:

Section 71.2.10 “Master CAN-FD Controller (MCAN)” to Section 71.2.19 “MCAN High Priority Message (HPM)” and Section 71.2.20 “ROM Code: Using JTAG IOSET 4”.

Added the following issues in Section 71.3 “Errata - SAMA5D2 MRL A Parts”:

Section 71.3.26 “Master CAN-FD Controller (MCAN)” to Section 71.3.35 “MCAN High Priority Message (HPM)” and Section 71.3.36 “ROM Code: Using JTAG IOSET 4”.

### 71.3 Revision DS60001476A

| Changes  |
|--|
| <b>General</b>   |
| - Template update: Moved from Atmel to Microchip template.   |
| - The datasheet is assigned a new document number (DS60001476) and revision letter is reset to A.                                      |
| --- Document number DS60001476 revision A corresponds to what would have been 11267 revision F.  |
| - ISBN number assigned.  |
| <b>“Features”</b> : added PTC.   |
| <b>Table 2. “Configuration Summary”</b> : added PTC. Corrected number of Timers.   |
| <b>Section 3. “Block Diagram”</b>  |
| Figure 3-1 “SAMA5D2 Series Block Diagram”: corrected SDMMC signals. Updated peripheral bridge naming. Added PTC. Removed signal names. |
| <b>Section 4. “Signal Description”</b>   |
| Table 4-1 “Signal Description List”: renamed SDMMCx_VDDSEL to SDMMCx_1V8SEL. Added PTC pins on PD0 to PD18.                            |
| Added <b>Section 5. “Safety and Security Features”</b> .   |
| <b>Section 6. “Package and Pinout”</b>   |
| Added Note on IO sets.   |
| Table 6-2 “Pin Description”: for P15/R14 renamed SDMMC0_VDDSEL to SDMMC0_1V8SEL.   |
| <b>Section 7. “Power Considerations”</b>   |
| Table 7-1 “SAMA5D2 Power Supplies”: in VDDBU row, corrected RC Oscillator frequency to 64 kHz.   |
| <b>Section 8. “Memories”</b>   |
| Figure 8-1 “Memory Mapping”: renamed MATRIXx blocks. Added PTC. Renamed TC blocks. Added SYSCWP block.                                 |
| <b>Section 11. “Peripherals”</b>   |
| Table 11-1 “Peripheral Identifiers”: corrected reference to SDMMC. Assigned ID 58 to Peripheral Touch Controller (PTC).                |
| Section 11.4 “Peripheral Clock Types”: removed clock type HCLOCK and PCLOCK from table.  |
| <b>Section 12. “Chip Identifier (CHIPID)”</b>  |
| Table 12-1 “SAMA5D2 Chip ID Registers”: added chip ids for MRL C revision.   |
| <b>Section 13. “ARM Cortex-A5”</b>   |
| Section 13.4.7.3 “Debug”: updated Note.  |
| <b>Section 16. “Standard Boot Strategies”</b>  |
| Replaced all occurrences of “Spansion” by “Cypress”.   |
| Updated Section 16.3 “Chip Setup”.   |
| Updated Section 16.4.1 “Boot Configuration Word”.  |
| Section 16.4.2 “Boot Sequence Controller Configuration Register”: updated BUREG_VALID bit description.                                 |
| Added Note to descriptions of SDMMC_0 and SDMMC_1 in Section 16.4.4 “Boot Configuration Word”.   |
| Updated Section 16.4.5 “NVM Boot Sequence” and figures.  |
| Renamed Section 16.4.7.5 “QSPI Flash Boot for MRL A and MRL B”.  |

.....continued

### Changes

Added Section 16.4.7.6 “QSPI Flash Boot for MRL C”.

Updated Section 16.4.8 “Hardware and Software Constraints”:

-- added Table 16-5 “Clock Frequencies during External Memory Boot Sequence”.

-- Table 16-6 “PIO Driven during Boot Program Execution”: renamed SDMMC\_VDDSEL to SDMMC0\_1V8SEL. Added column “Drive Strength (MRL C only)”.

Section 16.5 “SAM-BA Monitor”: deleted sentence on Main Clock; updated 3rd paragraph.

Updated Section 16.6.1 “Fuse Bit Mapping”.

### Section 18. “Matrix (H64MX/H32MX)”

Table 18-5 “List of H32MX Slaves”: added Peripheral Touch Controller (PTC) at Slave 6.

Table 18-6 “Master to Slave Access on H32MX”: added Peripheral Touch Controller (PTC) at Slave 6.

Table 18-9 “Peripheral Identifiers”: added PTC at ID 58.

### Section 19. “Special Function Registers (SFR)”

Section 19.3.5 “UTMI Clock Trimming Register”: VBG now 2 bits wide at index [17:16] (was [19:16]).

### Section 20. “Special Function Registers Backup (SFRBU)”

Section 20.3.3 “SFRBU DDR BU Mode Control Register” changed occurrences of VCCCORE to VDDCORE.

### Section 26. “Real-time Clock (RTC)”

Table 26-1 “Register Mapping”: updated offsets as of 0xCC. Deleted RTC\_WPMR at offset 0xE4.

Deleted “Section 25.6.23 RTC Write Protection Mode Register”.

Added Section 27. “System Controller Write Protection (SYSCWP)”.

Added Section 29. “Peripheral Touch Controller (PTC)”.

### Section 33. “Power Management Controller (PMC)”

Reorganized order of sub-sections within the chapter.

Updated Figure 33-2 “H32MX 32-bit Matrix Clock Configuration”.

Figure 33-1 “General Clock Block Diagram”: updated PMC\_PCR block.

Added Section 33.8 “Core and Bus Independent Clocks for Peripherals”.

Added Section 33.9 “Peripheral and Generic Clock Controller”.

Deleted section “Peripheral Clock Controller”.

Deleted section “Generic Clock Controller”.

Figure 33-10 “Clock Failure Detection (Example)”: corrected CDFEV to CFDEV and CDFS to CFDS.

Section 33.19 “Programming Sequence”: deleted paragraph on DIVA from Step 6.

Section 33.22.10 “PMC Clock Generator PLLA Register”: changed DIVA description for value ‘0’.

### Section 35. “External Memories”

Updated Figure 35-2 “MPDDRC Block Diagram”.

Table 35-1 “DDR/LPDDR I/O Lines Description”: DDR\_DQS[3:0] and DDR\_DQSN[3:0] now type I/O.

Aligned signal names in schematics of Section 35.1 “Multiport DDR-SDRAM Controller (MPDDRC)” with signal names in Table 35-2 “I/O Lines Usage vs Operating Modes”.

### Section 36. “Multiport DDR-SDRAM Controller (MPDDRC)”

.....continued

### Changes

Section 36.1 “Description”: corrected supported CAS latency.

Section 36.4.1 “Low-power DDR1-SDRAM Initialization”: updated Step 12.

Section 36.4.2 “DDR2-SDRAM Initialization”: updated Step 22.

Section 36.4.3 “Low-power DDR2-SDRAM Initialization”: updated Step 22.

Section 36.4.4 “DDR3-SDRAM/DDR3L-SDRAM Initialization”: updated Step 13.

Section 36.4.5 “Low-power DDR3-SDRAM Initialization”: updated Step 22.

Table 36-1 “CAS Write Latency”: added row for Low-power DDR3-SDRAM. Corrected typo in note.

Table 36-2 “CAS Read Latency”: added row for Low-power DDR3-SDRAM. Corrected typo in note.

Section 36.7.2 “MPDDRC Refresh Timer Register”: updated the method to compute COUNT.

Section 36.7.3 “MPDDRC Configuration Register”: updated NC field description table.

Section 36.7.6 “MPDDRC Timing Parameter 2 Register”: in TRPA description, added “In the case of LPDDR2-SDRAM, this field is equivalent to tRPAB.”

Section 36.7.10 “MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Calibration and MR4 Register”: in COUNT\_CAL field description, added ‘One ZQCS command can effectively correct at least 1.5% of output impedance errors within Tzqcs.’ and ‘TSens and VSens are given by the manufacturer (Output Driver Sensitivity definition). Tdriftrate and Vdriftrate are defined by the end user.’

### Section 38. “DMA Controller (XDMAC)”

Added information regarding XDMAC\_CC.INITD in Section 38.8 “XDMAC Software Requirements” and Section 38.9.28 “XDMAC Channel x [x = 0..15] Configuration Register”.

Section 38.9.3 “XDMAC Global Weighted Arbiter Configuration Register”: replaced “XDMAC scheduler” with “DMAC scheduler” throughout.

### Section 39. “LCD Controller (LCDC)”

Standardized signal names from ‘LCD\_XXX’ to ‘LCDXXX’ (‘underscore’ character removed)

Section 39.2 “Embedded Characteristics”: removed “(at synthesis time)” from characteristic “Asynchronous Output Mode Supported”.

### Section 40. “Ethernet MAC (GMAC)”

Section 40.2 “Embedded Characteristics”: deleted queue sizes (now found in Table 40-6 “Queue Size”).

Table 40.6.3.9 “Priority Queueing in the DMA”: added Table 40-6 “Queue Size” and updated queue sizes.

Section 40.6.15 “Timestamp Unit”: changed pin reference from “TIOB11/PD22” to “TIOA11/PD21”.

Added Section 40.6.18 “Energy-efficient Ethernet Support”

Updated Section 40.6.19 “802.1Qav Support - Credit-based Shaping”: added definitions of portTransmitRate and IdleSlope; updated content on queue priority management.

Added Section 40.6.20 “LPI Operation in the GMAC”.

Table 40-18 “Register Mapping”: added registers at offsets 0x270 to 0x27C.

Section 40.8.1 “GMAC Network Control Register”: added bit 19: TXLPIEN: Enable LPI Transmission (was ‘reserved’). Added bit description. Changed description of SRTSM bit.

Section 40.8.3 “GMAC Network Status Register”: added bit 7: RXLPIS: LPI Indication (was ‘reserved’). Added bit description.

Added bit 27: RXLPISBC: Receive LPI indication Status Bit Change and bit description and added bit 29: TSUTIMCOMP: TSU timer comparison interrupt and bit description in:

- Section 40.8.10 “GMAC Interrupt Status Register”

- Section 40.8.11 “GMAC Interrupt Enable Register”

- Section 40.8.12 “GMAC Interrupt Disable Register”

.....continued

### Changes

- Section 40.8.13 “GMAC Interrupt Mask Register”

Section 40.8.13 “GMAC Interrupt Mask Register”: added bit 26, SRI, and bit 28, WOL, and bit descriptions.

Added following sections:

- Section 40.8.106 “GMAC Received LPI Transitions”

- Section 40.8.107 “GMAC Received LPI Time”

- Section 40.8.108 “GMAC Transmit LPI Transitions”

- Section 40.8.109 “GMAC Transmit LPI Time”

Section 40.8.115 “GMAC Credit-Based Shaping IdleSlope Register for Queue A” and Section 40.8.116 “GMAC Credit-Based Shaping IdleSlope Register for Queue B”: updated example for calculation of IdleSlope.

### Section 41. “USB High Speed Device Port (UDPHS)”

Table 41-6 “Register Mapping”: offsets 0xD0 to 0xDC now ‘reserved’.

Deleted internal registers:

- UDPHS Test SOF Counter Register

- UDPHS Test A Counter Register

- UDPHS Test B Counter Register

- UDPHS Test Mode Register

### Section 43. “Audio Class D Amplifier (CLASSD)”

Section 43.6.6 “Application Schematics For Use Case Examples”: for Use Case 1, added information on external MOSFET selection.

### Section 44. “Inter-IC Sound Controller (I2SC)”

In text, tables and figures, pin names changed to:

- I2SC\_MCK

- I2SC\_CK

- I2SC\_WS

- I2SC\_DI

- I2SC\_DO

Updated Figure 44-1 “I2SC Block Diagram”.

Section 44.6.1 “Initialization”: added detail on configuring SFR\_I2SCLKSEL.

Section 44.6.5 “Serial Clock and Word Select Generation”: updated paragraph on I2SC input clock selection in Master mode.

Updated Figure 44-3 “I2SC Clock Generation”.

Updated figures in Section 44.7 “I2SC Application Examples”.

Section 44.8.2 “I2SC Mode Register”: updated MODE bit description for value ‘1’. Updated IMCKDIV and IMCKMODE field descriptions.

### Section 46. “Two-wire Interface (TWIHS)”

Added Section 46.7.2 “TWIHS Control Register (FIFO\_ENABLED)”.

Added Section 46.7.8 “TWIHS Status Register (FIFO\_ENABLED)”.

### Section 47. “Flexible Serial Communication Controller (FLEXCOM)”

Corrected Figure 47-27 “RTS Line Software Control when FLEX\_US\_MR.USART\_MODE = 2”.

Reworked Section 47.7.11 “USART FIFOs”.

.....continued

### Changes

Updated Section 47.8.3.5 “Peripheral Selection”.

Reworked Section 47.8.7 “SPI FIFOs”.

Section 47.9.3.9 “SMBus Mode”: corrected typo in SMBEN bit name (was ‘SMEN’).

Created Section 47.9.6 “TWI FIFOs” by merging Section 10.3.15 “TWI Master Mode FIFOs” and Section 10.5.9 “TWI Slave Mode FIFOs”

Section 47.10.43 “SPI Control Register”: updated TXFCLR and RXFCLR bit descriptions.

Section 47.10.50 “SPI Status Register”: updated RDRF and TDRE bit descriptions.

Section 47.10.55 “SPI FIFO Mode Register”: updated TXRDYM description for value ‘1’. Deleted row for value ‘2’. Updated RXRDYM description for value ‘1’ and for value ‘2’.

Added Section 47.10.61 “TWI Control Register (FIFO\_ENABLED)”.

Added Section 47.10.67 “TWI Status Register (FIFO\_ENABLED)”.

### Section 49. “Serial Peripheral Interface (SPI)”

Section 49.7.3.5 “Peripheral Selection”: modified sub-section “Variable Peripheral Select Mode”.

Section 49.7.5 “SPI Comparison Function on Received Character”: replace ‘When the CMPMODE bit is cleared in SPI\_CMPR’ with ‘When SPI\_MR.CMPMODE is cleared’

In Section 49.7.7 “FIFOs” updated:

- Section 49.7.7.1 “Overview”

- Section 49.7.7.2 “Sending Data with FIFO Enabled”

- Section 49.7.7.3 “Receiving Data with FIFO Enabled”

- Section 49.7.7.5 “TXEMPTY, TDRE and RDRF Behavior”

- Section 49.7.7.6 “Single Data Mode”

- Section 49.7.7.7 “Multiple Data Mode”

- “TDRE and RDRF Configuration”

Section 49.8.1 “SPI Control Register”: updated TXFCLR and RXFCLR bit descriptions.

Section 49.8.8 “SPI Status Register”: updated RDRF and TDRE bit descriptions.

Section 49.8.13 “SPI FIFO Mode Register”: updated TXRDYM description for value ‘1’. Deleted row for value ‘2’. Updated RXRDYM description for value ‘1’ and for value ‘2’.

Updated “DMAC” in Section 49.7.7.7 “Multiple Data Mode”.

### Section 50. “Quad Serial Peripheral Interface (QSPI)”

Section 50.1 “Description”: added Note on device support.

Removed references to Double Data Rate (DDR) in Section 50.2 “Embedded Characteristics” and Section 50.6.5.2 “Instruction Frame Transmission”.

Section 50.6.5 “QSPI Serial Memory Mode”: updated text on data transfer constraint.

Updated Figure 50-8 “Instruction Frame”.

Figure 50-9 “Instruction Transmission Flow Diagram”:

- Corrected typos:

--- “Wait for flag QSPI\_SR.INSTRE ... “ (was “QSPI\_CR“)

--- “Wait for flag QSPI\_SR.CSR ... “ (was “QSPI\_CR“)

- Added new instruction: “Read QSPI\_SR (dummy read) to clear QSPI\_SR.INSTRE and QSPI\_SR.CSR“

.....continued

### Changes

Updated Figure 50-10 “Continuous Read Mode”, Figure 50-16 “Instruction Transmission Waveform 6”, Figure 50-17 “Instruction Transmission Waveform 7” and Figure 50-18 “Instruction Transmission Waveform 8”.

#### Section 51. “Secure Digital MultiMedia Card Controller (SDMMC)”

Section 51.2 “Embedded Characteristics”: updated bullets on support for MMC at default speed and at high speed.

Section 51.3 “Embedded Features for SDMMC0 and SDMMC1”: updated information on SDMMC1.

Section 51.10.1.3 “Boot Procedure, ADMA Mode”: removed note after step j.

Section 51.13.2 “SDMMC Block Size Register” updated BLKSIZE field description.

Section 51.13.9 “SDMMC Present State Register”: updated BUFWREN field description.

Section 51.13.16 “SDMMC Clock Control Register”: updated SDCLKFSEL field description.

Section 51.13.17 “SDMMC Timeout Control Register”: updated equation in DTCVAL field description.

Section 51.13.18 “SDMMC Software Reset Register”: in SWRSTALL field description, updated list of registers cleared to 0 .

Section 51.13.21 “SDMMC Error Interrupt Status Register (SD\_SDIO)”: in CURLIM bit description, corrected reference to SDMMC\_PCR (was SDMMC\_PSR).

Section 51.13.22 “SDMMC Error Interrupt Status Register (e.MMC)”: updated ACMD bit description.

Section 51.13.31 “SDMMC Auto CMD Error Status Register”: changed register access to Read-only.

Section 51.13.32 “SDMMC Host Control 2 Register (SD\_SDIO)”: corrected typo in bit 7 name (is SCLKSEL; was SLCKSEL). Updated VS18EN bit description.

Section 51.13.33 “SDMMC Host Control 2 Register (e.MMC)”: corrected typo in bit 7 name (is SCLKSEL; was SLCKSEL).

Section 51.13.41 “SDMMC Preset Value Register”: in Table 51-8 “Preset Value Register Select Condition”: corrected HSEN value in row for High Speed.

Section 51.13.45 “SDMMC e.MMC Control 1 Register”: in DDR bit description Note, replaced ‘HSEN’ with ‘DDR’.

Section 51.13.51 “SDMMC Retuning Counter Value Register”: updated description for TCVAL.

#### Section 53. “Controller Area Network (MCAN)”

Section 53.1 “Description”: updated information on compliance.

Section 53.4.4 “Address Configuration”: added cross-reference for clarity.

Section 53.5.1.4 “Transmitter Delay Compensation”: changed NTSEG1 to TSEG1.

#### Section 54. “Timer Counter (TC)”

Table 54-1 “Timer Counter Clock Assignment”: added Note below table.

Section 54.6.16.2 “Input Preprocessing”: removed unit following equation in 3rd paragraph. Added limitation on maximum pulse duration.

Section 54.6.16.4 “Position and Rotation Measurement”: in 3rd paragraph, added “The process must be started by configuring TC\_CCR.CLKEN and TC\_CCR.SWTRG.”

Section 54.6.16.6 “Detecting a Missing Index Pulse”: corrected value of TC\_RC0.RC in example in 2nd paragraph.

Added Section 54.6.16.7 “Detecting Contamination/Dust at Rotary Encoder Low Speed”.

Section 54.7.16 “TC Block Mode Register”: updated MAXFILT field description.

In Section 54.7.17 “TC QDEC Interrupt Enable Register”, Section 54.7.18 “TC QDEC Interrupt Disable Register” and Section 54.7.19 “TC QDEC Interrupt Mask Register”: at index 3, added bit MPE and bit description.

Corrected occurrences of ‘MAXMP’ to ‘MAXCMP’ in Section 54.7.19 “TC QDEC Interrupt Mask Register” and in Section 54.7.20 “TC QDEC Interrupt Status Register”

#### Section 56. “Pulse Width Modulation Controller (PWM)”

.....continued

### Changes

Section 56.6.2.2 “Comparator”: corrected ‘CRPD’ to ‘CPRD’ in formulae.

Table 56-8 “Register Mapping”: modified offsets for “PWM External Trigger Register 1”, “PWM Leading-Edge Blanking Register 1”, “PWM External Trigger Register 2” and “PWM Leading-Edge Blanking Register 2”.

Section 56.7.43 “PWM Channel Period Register”: corrected ‘CRPD’ to ‘CPRD’ in CPRD description.

Section 56.7.44 “PWM Channel Period Update Register”: corrected ‘CRPDUPD’ to ‘CPRDUPD’ in CPRDUPD description.

### Section 57. “Secure Fuse Controller (SFC)”

Removed all occurrences of ‘Atmel reserved area’ ( now just ‘reserved area’).

Modified bit names for APLE and ACE in:

- Section 57.5.3 “SFC Interrupt Enable Register”

- Section 57.5.4 “SFC Interrupt Disable Register”

- Section 57.5.5 “SFC Interrupt Mask Register”

- Section 57.5.6 “SFC Status Register”

### Section 58. “Integrity Check Monitor (ICM)”

Updated Section 58.5.5 “ICM Automatic Monitoring Mode”.

Section 58.6.1 “ICM Configuration Register”: updated ASCD description.

### Section 59. “Advanced Encryption Standard Bridge (AESB)”

Section 59.1 “Embedded Characteristics”: replaced “12 clock cycles encryption/decryption processing time with a 128-bit cryptographic key” with “10 clock cycles encryption/decryption inherent processing time”.

In Section 59.3.6 “Automatic Bridge Mode”, updated Section 59.3.6.1 “Description”.

### Section 60. “Advanced Encryption Standard (AES)”

Replaced references to “keys” and to “AES\_KEYWRx registers” with “AES Key Registers”.

Section 60.1 “Description”: corrected index of AES\_KEYWR0 registers from 3 to 7.

Section 60.2 “Embedded Characteristics” replaced “12/14/16 Clock Cycles Encryption/Decryption Processing Time” with “10/12/14 Clock Cycles Encryption/Decryption Inherent Processing Time”

### Section 61. “Secure Hash Algorithm (SHA)”

Corrected typos in some figures.

Section 61.4.9.1 “Manual Mode”: updated Step 2.

Section 61.5.2 “SHA Mode Register”: updated SMOD bit description.

### Section 62. “Triple Data Encryption Standard (TDES)”

Replaced references to “TDES\_KEYxWRx registers” with “Key Registers”.

### Section 63. “True Random Number Generator (TRNG)”

Section 63.6.1 “TRNG Control Register”: changed field name to WAKEY (was KEY).

Added **Section 64. “Security Module (SECUMOD)”**.

### Section 65. “Analog-to-Digital Converter (ADC)”

Section 65.5.3 “I/O Lines”: “ADC\_ADTRG” corrected to “ADTRG”.

Section 65.6.14 “Automatic Error Correction”: added information about ADCMODE field.

Table 65-7 “ADC Running Modes”: updated Offset Error row.

.....continued

### Changes

Section 65.6.18 “Fault Event”: reworked and renamed section (was previously “Fault Output”).

Section 65.7.2 “ADC Mode Register”: at index 30, added bit MAXSPEED and bit description

Section 65.7.12 “ADC Interrupt Status Register”: updated LCCHG bit description.

Section 65.7.20 “ADC Analog Control Register”: added Note (1).

### Section 66. “Electrical Characteristics”

Table 66-3 “DC Characteristics”: updated min and max valued for low-level and high-level input currents (all pads). Changed ISI\_MCK to ISC\_MCK.

Updated Table 66-8 “Typical Peripheral Power Consumption by Peripheral in Active Mode” with new column “Clock”.

Table 66-10 “Power Consumption in Active Mode: AMP2”: Removed columns DMIPS and CoreMark.

In Section 66.14 “FLEXCOM Timings”, added Section 66.14.1 “FLEXCOM USART in Asynchronous Modes” and Section 66.14.3 “FLEXCOM TWI Timings”.

In Section 66.14.2 “FLEXCOM SPI Timings”, removed note below all tables from Table 66-52 “FLEXCOM0 in SPI Mode IOSET1 Timings” to Table 66-61 “FLEXCOM4 in SPI Mode IOSET3 Timings”.

Added Section 66.15 “USART in Asynchronous Modes”.

Section 66.16 “SPI Timings”: updated limitation on fSPCK in “Master Read Mode” and “Slave Write Mode”. Removed note below Table 66-63 “SPI0 IOSET1 Timings”, Table 66-64 “SPI0 IOSET2 Timings”, Table 66-65 “SPI1 IOSET1 Timings”, Table 66-66 “SPI1 IOSET2 Timings” and Table 66-67 “SPI1 IOSET3 Timings”.

Section 66.18 “QSPI Timings”: updated limitation on fQSCK in “Master Read Mode”.

Section 66.19.3 “LPDDR1-SDRAM”, Table 66-76 “System Clock Waveform Parameters”: updated min value of tDDRCK for VDDCORE[1.2V, 1.32V].

Section 66.19.4 “LPDDR2/LPDDR3-SDRAM”, Table 66-77 “System Clock Waveform Parameters”: updated min value of tDDRCK for VDDCORE[1.2V, 1.32V].

Section 66.19.5 “DDR3/DDR3L-SDRAM”: updated min values in Table 66-78 “System Clock Waveform Parameters”.

Section 66.23 “ISC Timings”: updated Figure 66-40 “ISC Timing Diagram” and Timings tables.

### Section 68. “Schematic Checklist”

Table 68-1 “Power Supply Connections”: removed reference to VCCCORE.

Added Section 68.14.7 “Considerations for PTC Interface”.

### Section 70. “Ordering Information”

Updated Table 70-1 “SAMA5D2 Ordering Information” with MRL C ordering codes.

### Section 71. “Errata”

Added Section 71.1 “Errata - SAMA5D2 MRL C Parts”.

Section 71.2 “Errata - SAMA5D2 MRL B Parts”: added Section 71.1.1 “GMAC Timestamps and PTP packets”.

Section 71.3 “Errata - SAMA5D2 MRL A Parts”: added

- Section 71.1.1 “GMAC Timestamps and PTP packets”

- Section 71.3.4 “ROM Code: SPI Bootup Frequency”.

### 71.4 Revision 11267E

#### Changes

Deleted Section 61. "Security Module".

### 71.5 Revision 11267D

#### Changes

Minor formatting and editorial changes throughout

#### "Introduction"

Updated listed DDR memories

#### "Features"

Frequency of digital fractional PLL for audio "11.289 MHz" corrected to "11.2896 MHz"

"Two 64-bit, 16-channel DMA controllers" changed to "51 DMA Channels including two 16-channel 64-bit Central DMA Controllers"

#### Section 1. "Description"

Updated description of Low-power modes

#### Section 2. "Configuration Summary"

"Class D amplifier" changed to "stereo Class D amplifier"

Updated text at end of section

#### Section 3. "Block Diagram"

Figure 3-1 "SAMA5D2 Series Block Diagram": added ISC\_MSK input; updated description of crystal oscillators; "PWMEXTRIG0-1" renumbered to "PWMEXTRG1-2"

Added note "See Section 35. "DMA Controller (XDMAC)" for peripheral connections to DMA."

#### Section 4. "Signal Description"

Table 4-1 "Signal Description List": NRST signal function "Microcontroller Reset" changed to "Microprocessor Reset"; "PWMEXTRG0-1" renumbered to "PWMEXTRG1-2"; "Self-refresh mode" changed to "Backup Self-refresh mode" in DDR\_CKE comments

#### Section 5. "Package and Pinout"

Separated content into Section 5.1 "Packages" and Section 5.2 "Pinouts"

Table 5-2 "Pin Description (SAMA5D21, SAMA5D22, SAMA5D24, SAMA5D26, SAMA5D27, SAMA5D28A)": "ADVREFF" corrected to "ADVREF"; "PWMEXTRG0" and "PWMEXTRG1" renumbered to "PWMEXTRG1" and "PWMEXTRG2"; removed empty function cells for primary signals PA30, PA31, and PB0-PB7; removed "SEC, FILTER" from "Reset State" column header; added footnote on reset states

Added Table 5-3 "Pin Description (SAMA5D23 pins different from those in SAMA5D21/SAMA5D2)" and Table 5-4 "Pin Description (SAMA5D28B pins different from those in SAMA5D28A)"

#### Section 6. "Power Considerations"

Table 6-1 "SAMA5D2 Power Supplies": updated rows VDDUTMIC, VDDHSIC and VDDOSC

Section 6.4.1 "VDDBU Power Architecture": reworded second paragraph and deleted "typically less than 2  $\mu$ A"

#### Section 7. "Memories"

Section 7.2.1 "External Bus Interface": "The slew rates are determined by programming the SFR\_EBICFG bit in SFR registers" changed to "The drive levels are configured with the DRIVEx field in the EBI Configuration Register (SFR\_EBICFG)"

#### Section 8. "Event System"

Section 8-1 "Real-time Event Mapping List": instance of "ADC\_ADTRG" corrected to "ADTRG"

.....continued

### Changes

#### Section 9. “System Controller”

Section 9.1 “Power-On Reset”: “dedicated to VDDBU, VDDIOP and VDDCORE” changed to “dedicated to monitoring VDDBU, VDDIOP and VDDCORE”

#### Section 10. “Peripherals”

Table 10-1 “Peripheral identifiers”: in ‘Instance Name’ column, renamed CAN0 and CAN1 to MCAN0 and MCAN1

Section 10.4 “Peripheral Clock Types”: in SLOW\_CLOCK description, “32768-Hz crystal oscillator or by the on-chip 32-kHz RC oscillator” changed to “32.768 kHz crystal oscillator or by the on-chip 64 kHz RC oscillator”

#### Section 11. “Chip Identifier (CHIPID)”

Updated Table 11-1 “SAMA5D2 Chip ID Registers”

#### Section 13. “L2 Cache Controller (L2CC)”

Table 13-2 “Register Mapping”: reset value 0x0000\_0000 changed to 0x0000\_0111 for L2CC\_TRCR and L2CC\_DRCR

#### Section 14. “Debug and Test Features”

Table 14-1 “Debug and Test Pin List”: NRST pin function “Microcontroller Reset” changed to “Microprocessor Reset”

#### Section 15. “Standard Boot Strategies”

“Boot Sequence Control Register (BSCR)” renamed to “Boot Sequence Controller Configuration Register”

Section 15.1 “Description”: “This microcontroller can be configured” changed to “This microprocessor can be configured”

Figure 15-10 “Galois Field Table Mapping”: modified Galois field table offsets

Section 15.4.2 “Boot Sequence Controller Configuration Register”: added address

Section 15.4.3 “Boot Configuration Word”: added reference to “Customer Fuse Matrix”

Added Section 15.4.6.5 “QSPI Flash Boot”

Table 15-3 “PIO Driven during Boot Program Execution”: NAND Flash PIO line PIOC17 changed to PIOB0

#### Section 18. “Special Function Registers (SFR)”

Table 18-1 “Register Mapping”: removed EBI Configuration Register / SFR\_EBICFG (offset 0x40 now reserved)

Section 18.3.1 “DDR Configuration Register”: added note

Removed section “EBI Configuration Register”

#### Section 21. “Watchdog Timer (WDT)”

Section 21.4 “Functional Description”: in eighth paragraph, “To prevent a software deadlock that continuously triggers the watchdog, the reload of the watchdog must occur...” changed to “The reload of the watchdog must occur...”

#### Section 25. “Real-time Clock (RTC)”

Reworked Section 25.5.6 “Updating Time/Calendar”

Reworked Figure 25-7 “Calibration Circuitry Waveforms”

AD index ‘7’ replaced with generic ‘n’ in Section 25.5.8 “Waveform Generation”

Updated Figure 25-8 “Waveform Generation for ADC Trigger Event”

Section 25.6.2 “RTC Mode Register”:

- updated descriptions of fields OUT0 and OUT1

- added fields TPERIOD and THIGH

#### Section 27. “Low Power Asynchronous Receiver (RXLP)”

.....continued

### Changes

Pin/signal name “LPRXD” changed to “RXD”

#### Section 29. “Clock Generator”

Section 29.2 “Embedded Characteristics”: AUDIOPLLCK changed to AUDIOPLLCLK

Figure 29-1 “Clock Generator Block Diagram”: lines changed to arrows for OSCSEL to multiplexer, for MOSCSEL to multiplexer, and for PLLADIV2 to “PLLA and Divider” block

Figure 29-5 “Divider and PLLA Block Diagram”: added PLLADIV2 divider

Updated Section 29.8 “Audio PLL”

#### Section 30. “Power Management Controller (PMC)”

AUDIOPLLCK changed to AUDIOPLLCLK in Section 30.15 “Programmable Clock Controller” and Section 30.16 “Generic Clock Controller”

Figure 30-1 “General Clock Block Diagram”: added PLLA block; repositioned PLLACK signal; at bottom of diagram “PCKx” changed to “PCKx (to pads)”

Table 30-3 “Register Mapping”: PMC\_AUDIO\_PLL0 reset value ‘0x0000\_0000’ changed to ‘0x0000\_00D0’

Section 30.22.11 “PMC Master Clock Register”: updated CSS field description

Section 30.22.13 “PMC Programmable Clock Register”: added addresses 0xF0014044 and 0xF0014048; updated CSS field description

Section 30.22.39 “PMC Audio PLL Control Register 0”: added fields DCO\_FILTER (bits 29:28), DCO\_GAIN (bits 27:24) and PLLFLT (bits 7:4)

Section 30.22.40 “PMC Audio PLL Control Register 1”: updated DIV field description

#### Section 31. “Parallel Input/Output Controller (PIO)”

Section 31.4.2 “External Interrupt Lines”: “are generally multiplexed” changed to “are multiplexed”

Section 31.5 “Functional Description”: removed entire section “Peripheral Muxing Example”

Table 31-4 “Register Mapping”:

- added reset value for PIO\_CFGR, PIO\_ODSR, PIO\_IMR, S\_PIO\_CFGR, S\_PIO\_ODSR and S\_PIO\_IMR

- “PIO I/O Freeze Register” corrected to “PIO I/O Freeze Configuration Register”

- defined offset range 0x400–0x4FC as reserved

- reserved offset range 0x5E8–0x5F8 changed to 0x5E8–0x5FC

- “Secure PIO I/O Freeze Register” corrected to “Secure PIO I/O Freeze Configuration Register”

Removed duplicated or invalid addresses in Section 31.7.1 “PIO Mask Register”, Section 31.7.2 “PIO Configuration Register”, Section 31.7.3 “PIO Pin Data Status Register”, Section 31.7.4 “PIO Lock Status Register”, Section 31.7.5 “PIO Set Output Data Register”, and Section 31.7.6 “PIO Clear Output Data Register”

Section 31.7.7 “PIO Output Data Status Register”: removed duplicated or invalid addresses; access “Read-only or Read/Write” corrected to “Read/Write”

Removed duplicated or invalid addresses in Section 31.7.8 “PIO Interrupt Enable Register”, Section 31.7.9 “PIO Interrupt Disable Register”, Section 31.7.10 “PIO Interrupt Mask Register”, and Section 31.7.11 “PIO Interrupt Status Register”

Section 31.7.12 “PIO I/O Freeze Configuration Register”: corrected title (was “PIO Freeze Configuration Register”); removed duplicated or invalid addresses; access “Read/Write” corrected to “Write-only”

Removed duplicated or invalid addresses in Section 31.7.15 “Secure PIO Mask Register”, Section 31.7.16 “Secure PIO Configuration Register”, Section 31.7.17 “Secure PIO Pin Data Status Register”, Section 31.7.18 “Secure PIO Lock Status Register”, Section 31.7.19 “Secure PIO Set Output Data Register” and Section 31.7.20 “Secure PIO Clear Output Data Register”

Section 31.7.21 “Secure PIO Output Data Status Register”: removed duplicated or invalid addresses; access “Read-only or Read/Write” corrected to “Read/Write”

.....continued

### Changes

Removed duplicated or invalid addresses in Section 31.7.22 “Secure PIO Interrupt Enable Register”, Section 31.7.23 “Secure PIO Interrupt Disable Register”, Section 31.7.24 “Secure PIO Interrupt Mask Register”, and Section 31.7.25 “Secure PIO Interrupt Status Register”

Section 31.7.29 “Secure PIO I/O Freeze Configuration Register”: corrected title (was “Secure PIO Freeze Configuration Register”); removed duplicated or invalid addresses; access “Read/Write” corrected to “Write-only”

Section 31.7.30 “Secure PIO Slow Clock Divider Debouncing Register”: added sentence about register write protection

### Section 32. “External Memories”

Table 32-1 “DDR/LPDDR I/O Lines Description”: updated DDR\_VREF function description

### Section 33. “Multiport DDR-SDRAM Controller (MPDDRC)”

Section 33.4.1 “Low-power DDR1-SDRAM Initialization”: in first paragraph, removed content about configuring register SFR\_DDRCFG

Section 33.6 “Software Interface/SDRAM Organization, Address Mapping”: modified description of Interleaved mode (“at each SDRAM end page” corrected to “at each DDRSDRAM end of page”)

Harmonized register naming throughout Section 33.7 “AHB Multiport DDR-SDRAM Controller (MPDDRC) User Interface”

Removed all MPDDRC DLL registers (offset range 0x100–0x158 now reserved)

Section 33.7.3 “MPDDRC Configuration Register”: modified description of DECOD bit value ‘1’ (“at each SDRAM end page” corrected to “at each DDR-SDRAM end of page”)

Section 33.7.12 “MPDDRC I/O Calibration Register”: updated RZQ values in RDIV field description

### Section 34. “Static Memory Controller (SMC)”

Section 34.17.3 “NFC Initialization”: instances of “rbn” changed to “Ready/Busy”

Section 34.20.3 “NFC Status Register”: bit RB\_EDGE3 (bit 27) replaced by RB\_EDGE0 (bit 24); updated RB\_RISE and RB\_FALL bit descriptions

Bit RB\_EDGE3 (bit 27) replaced by RB\_EDGE0 (bit 24) in Section 34.20.4 “NFC Interrupt Enable Register”, Section 34.20.5 “NFC Interrupt Disable Register” and Section 34.20.6 “NFC Interrupt Mask Register”

Deleted invalid addresses in Section 34.20.30 “PMECC Error Location SIGMA0 Register” and Section 34.20.31 “PMECC Error Location SIGMAx Register”

Section 34.20.32 “PMECC Error Location x Register”: register index “x=0..23” corrected to “x=0..31”

Section 34.20.36 “Timings Register”: removed RBNSEL field

### Section 35. “DMA Controller (XDMAC)”

Added XDMAC\_CCx.CSIZE configuration to Table 35-2 “DMA Channels Definition (XDMAC0)” and Table 35-3 “DMA Channels Definition (XDMAC1)”

Table 35-5 “Register Mapping”:

- XDMAC\_GCFG access Read-only corrected to Read/Write

- XDMAC\_GWAC access Read-only corrected to Read/Write

Section 35.9.2 “XDMAC Global Configuration Register”: access Read-only corrected to Read/Write

Section 35.9.3 “XDMAC Global Weighted Arbiter Configuration Register”: access Read-only corrected to Read/Write

### Section 36. “LCD Controller (LCDC)”

Updated “Section 36.2 “Embedded Characteristics”

Updated Section 36.6.1.1 “Pixel Clock Period Configuration”

### Section 37. “Ethernet MAC (GMAC)”

Table 37-1 “GMAC Connections in Different Modes”: added table Note on GTXCK

.....continued

### Changes

Updated Section 37.5.3 “Interrupt Sources”

Section 37.7.1.2 “Receive Buffer List” and Section 37.7.1.3 “Transmit Buffer List”: added note at end of sections on queue pointer initialization

Section 37.8.107 “GMAC Transmit Buffer Queue Base Address Register Priority Queue x” and Section 37.8.108 “GMAC Receive Buffer Queue Base Address Register Priority Queue x”: changed sentence on register initialization

### Section 39. “USB Host High Speed Port (UHPHS)”

Section 39.2 “Embedded Characteristics”: “X Hosts (A and B) High Speed (EHCI)” corrected to “2 Hosts (A and B) High Speed (EHCI)”

Table 39-2 “Register Mapping”: inserted reserved offset 0x0C

Section 39.7.19 “EHCI: REG06 - AHB Error Status”: instances of “INSNREG[8:4]” changed to “INSNREG06[8:4]”

### Section 40. “Audio Class D Amplifier (CLASSD)”

Section 40.2 “Embedded Characteristics”: DSP clock frequency “11.289 MHz” corrected to “11.2896 MHz”

Section 40.5.2 “Power Management”: field name “NOVRLAP” corrected to “NOVRVAL”

Figure 40-21 “Use Case 4B: Stereo Audio DAC With Passive Low Pass Filter and Single-ended Outputs”: changed title (was “Use Case 4B: Stereo Audio DAC With Passive Low Pass Filter and Differential Outputs”)

### Section 42. “Synchronous Serial Controller (SSC)”

Figure 42-19 “Interrupt Block Diagram”: “RXSYNC” renamed to “RXSYN”; “TXSYNC” renamed to “TXSYN”

Section 42.8.10 “Register Write Protection”: in first sentence, “AIC behavior” corrected to “SSC behavior”

### Section 43. “Two-wire Interface (TWIHS)”

Section 43.6.3.10 “SMBus Mode”: Deleted “A dedicated bus line, SMBALERT, allows a slave to get a master attention” from listed exceptions

Section 43.6.5.6 “SMBus Mode”: Deleted “A dedicated bus line, SMBALERT, allows a slave to get a master attention” from listed exceptions

Deleted note about debugger read access in Section 43.7.6 “TWIHS Status Register”, Section 43.7.13 “TWIHS Receive Holding Register” and Section 43.7.25 “TWIHS Write Protection Status Register”

### Section 44. “Flexible Serial Communication Controller (FLEXCOM)”

Section 44.7.1.2 “Fractional Baud Rate in Asynchronous Mode”: in first paragraph, deleted sentence “This feature is only available when using USART Normal mode.”

Figure 44-8 “Preamble Patterns, Default Polarity Assumed”: instances of “8 bit width” changed to “8-bit”

Figure 44-11 “Asynchronous Start Detection”: added missing arrowheads

Section 44.7.3.11 “Receiver Timeout”: removed redundant paragraphs on STTTO and RETTO; reworded two bullets

Section 44.7.4 “ISO7816 Mode”: at end of second paragraph, “value 0x5 for protocol T = 1” changed to “value 0x6 for protocol T = 1”

Section 44.7.4.2 “Protocol T = 0”: reworded content under “Receive NACK Inhibit”

Section 44.7.7 “USART Comparison Function on Received Character”: modified information about the CMPMODE bit

Table 44-18 “Register Mapping”: added TWI SleepWalking Matching Register (FLEX\_TWI\_SWMR)

Section 44.10.41 “USART Write Protection Mode Register”: rephrased WPEN bit description

Corrected order of all sections from Section 44.10.66 “TWI Interrupt Enable Register” to Section 44.10.76 “TWI SleepWalking Matching Register”

Section 44.10.76 “TWI SleepWalking Matching Register”: added addresses

### Section 46. “Serial Peripheral Interface (SPI)”

Figure 46-1 “Block Diagram”: added GCLK output from PMC to SPI

Modified transmission condition description in Section 46.7.3 “Master Mode Operations”

.....continued

### Changes

Section 46.7.4 “SPI Slave Mode”: added sentence about NSS rising between characters

Section 46.7.5 “SPI Comparison Function on Received Character”: in seventh paragraph, added “if SleepWalking mode is disabled” to sentence “The comparison trigger event is...”

Updated Section 46.7.8 “Register Write Protection”

Section 46.8.2 “SPI Mode Register”: added bits BRSRCCLK (Bit Rate Source Clock) and LSBHALF (LSB Timing Selection); updated description of field DLYBCS

Section 46.8.12 “SPI Chip Select Register”: updated description of fields CSNAAT, SCBR, DLYBS and DLYBCT

### Section 47. “Quad Serial Peripheral Interface (QSPI)”

Section 47.2 “Embedded Characteristics”: added bullet “Interface to Serial Flash Memories Operating in Single Data Rate or Double Data Rate Modes”

### Section 47. “Quad Serial Peripheral Interface (QSPI)” (cont’d)

NSS renamed to QCS in Figure 47-2 “QSPI Transfer Format (QSPI\_SCR.CPHA = 0, 8 bits per transfer)” and Figure 47-3 “QSPI Transfer Format (QSPI\_SCR.CPHA = 1, 8 bits per transfer)”

Section 47.7.2 “QSPI Mode Register”: added note “This field is forced to LASTXFER when SMM is written to ‘1’ to CSMODE field description; modified equation in description of fields DLYBCT and DLYCS

Section 47.7.5 “QSPI Status Register”: updated descriptions of bits CSR and INSTRE

Section 47.7.9 “QSPI Serial Clock Register”: modified equation in description of fields SCBR and DLYBS

### Section 48. “Secure Digital Multimedia Card Controller (SDMMC)”

Added Section 48.3 “Embedded Features for SDMMC0 and SDMMC1”

Figure 48-1 “Block Diagram”: added two notes

Table 48-3 “Register Mapping”: updated SDMMC\_APSR reset value (SDMMC0 different from SDMMC1)

Section 48.13.18 “SDMMC Software Reset Register”: updated SWRSTCMD bit description

Section 48.13.58 “SDMMC Calibration Control Register”: in CNTVAL field description, “tSTARTUP = ...” corrected to “tSTARTUP = 2 μs”

### Section 49. “Image Sensor Controller (ISC)”

Added Section 49.4 “Product Dependencies”

Table 49-18 “Register Mapping”: defined offset range 0x404–0x40C as reserved

### Section 50. “Controller Area Network (MCAN)”

“GCLK3” changed to “GCLK” in Section 50.3 “Block Diagram” and Section 50.4.2 “Power Management”

Added Table 50-2 “Peripheral IDs”

Updated Section 50.5.1.3 “CAN FD Operation”

Section 50.5.1.4 “Transmitter Delay Compensation”: modified title (was “Transceiver Delay Compensation”); revised content

Section 50.5.1.5 “Restricted Operation Mode”: added ‘Note’

Section 50.5.3 “Timeout Counter”: “baud rate” changed to “bit rate” in ‘Note’

Section 50.5.4.1 “Acceptance Filtering”: “described in Section” corrected to “described in “Rx FIFO Overwrite Mode”

Updated Figure 50-5 “Standard Message ID Filter Path” and Figure 50-6 “Extended Message ID Filter Path”

Updated register names in Figure 50-7 “Rx FIFO Status” and Figure 50-8 “Rx FIFO Overflow Handling”

Section 50.5.7.2 “Rx Buffer and FIFO Element”: “R1 Bit 21 FDF: Extended Data Length” renamed to “R1 Bit 21 FDF: FD Format”

Section 50.5.7.4 “Tx Event FIFO Element”: “E1 Bit 21 FDF: Extended Data Length” renamed to “E1 Bit 21 FDF: FD Format”

.....continued

### Changes

Table 50-14 “Register Mapping”:

- deleted row “0x00–0x04 / Reserved”

- “Fast Bit Timing and Prescaler Register” renamed to “Data Bit Timing and Prescaler Register”

#NAME?

Section 50.6.4 “MCAN Data Bit Timing and Prescaler Register”: changed name (was “MCAN Fast Bit Timing and Prescaler Register”); field FBRP replaced by field DBRP

Section 50.6.7 “MCAN CC Control Register”: updated descriptions of fields FDOE, BRSE, PXHD and EFB; removed NISO bit

Section 50.6.8 “MCAN Nominal Bit Timing and Prescaler Register”: “NBRP: Nominal Baud Rate Prescaler” changed to “NBRP: Nominal Bit Rate Prescaler”

Section 50.6.9 “MCAN Timestamp Counter Configuration Register”: updated TSS field description

Section 50.6.10 “MCAN Timestamp Counter Value Register”: updated TSC field description

Section 50. “Controller Area Network (MCAN)” (cont’d)

Section 50.6.20 “MCAN Global Filter Configuration”: added details on register description; updated ANFE and ANFS field descriptions.

Added details on register description in Section 50.6.21 “MCAN Standard ID Filter Configuration” and Section 50.6.22 “MCAN Extended ID Filter Configuration”

Section 50.6.24 “MCAN High Priority Message Status”: updated description of MSI field value ‘1’

### Section 51. “Timer Counter (TC)”

Replaced TIOA, TIOB, TCLK with TIOAx, TIOBx, TCLKx

Table 51-1 “Timer Counter Clock Assignment”: updated definitions

Section 51.6.3 “Clock Selection”: updated bullet “Internal clock signals”, updated notes 1 and 2

Section 51.6.9 “Transfer with DMAC in Capture Mode”: updated title (added “in Capture Mode”)

Updated Figure 51-5 “Example of Transfer with DMAC in Capture Mode”

Section 51.6.16.4 “Position and Rotation Measurement”: updated text in first paragraph

Added Section 51.6.16.6 “Detecting a Missing Index Pulse”

Updated TCCLKS field description in Section 51.7.2 “TC Channel Mode Register: Capture Mode” and Section 51.7.3 “TC Channel Mode Register: Waveform Mode”

### Section 53. “Pulse Width Modulation Controller (PWM)”

Throughout, “PWMTRG” and “EXTTRG” renamed to “PWMEXTRG”

Table 53-2 “I/O Lines”: “PWMEXTRG0” and “PWMEXTRG1” renumbered to “PWMEXTRG1” and “PWMEXTRG2”

Updated Section “Recoverable Fault”

Updated Figure 53-1 “Pulse Width Modulation Controller Block Diagram” and added note below figure

Updated Figure 53-16 “Fault Protection”

### Section 54. “Secure Fuse Controller (SFC)”

Table 54-1 “Register Mapping”: removed reset value from SFC\_IER and SFC\_IDR (both registers are write-only)

### Section 55. “Integrity Check Monitor (ICM)”

Table 55-8 “Register Mapping”: ICM\_SR access “Write-only” corrected to “Read-only”

### Section 57. “Advanced Encryption Standard (AES)”

Table 57-5 “Register Mapping”: AES\_ALPHAR[0..3] access “Write” corrected to “Write-only”

.....continued

### Changes

Section 57.5.20 “AES Alpha Word Register x”: access “Write” corrected to “Write-only”

### Section 59. “Triple Data Encryption Standard (TDES)”

Section 59.4.1 “Operating Modes”: deleted sentence “The OFB and CFB modes of operation are only available if 2-key mode is selected (KEYMOD = 1 in TDES\_MR).”

Section 59.4.3 “Last Output Data Mode”: deleted sentence “No more Output Data Register reads are necessary between consecutive encryptions/decryptions (see Section 59.4.3 “Last Output Data Mode”).”

Section 59.5.2 “TDES Mode Register”: in OPMOD field description, deleted sentence “The OFB and CFB modes of operation are only available if 2-key mode is selected (KEYMOD = 1).”

### Section 61. “Security Module”

Updated Figure 61-2 “Security Module Internal Memory Map”

### Section 62. “Analog-to-Digital Converter (ADC)”

Section 62.1 “Description”:

- deleted sentence “A digital error correction circuit based on the multi-bit redundant signed digit (RSD) algorithm is implemented to reduce INL and DNL errors.”

- deleted sentence “Finally, the user can configure ADC timings, such as startup time and tracking time.”

Updated Section 62.2 “Embedded Characteristics”

Updated Figure 62-1 “Analog-to-Digital Converter Block Diagram”

Revised Section 62.5 “Product Dependencies”

Revised Section 62.6.1 “Analog-to-Digital Conversion”

Updated Section 62.6.3 “ADC Reference Voltage” and Section 62.6.4 “Conversion Resolution”

Updated Section 62.6.7 “Conversion Triggers”

Section 62.6.9 “Comparison Window”: in fourth paragraph, instance of “ADC\_SR” corrected to “ADC\_ISR”

Section 62.6.10 “Differential and Single-ended Input Modes”: changed title (was “Differential Inputs”) and revised content

Updated Section 62.6.11 “ADC Timings”, Section 62.6.12 “Last Channel Specific Measurement Trigger”, Section 62.6.13 “Enhanced Resolution Mode and Digital Averaging Function” and Section 62.6.14 “Automatic Error Correction”

Instances of GND renamed to GNDANA in Figure 62-15 “Touchscreen Switches Implementation”, Figure 62-18 “Touchscreen Switches Implementation” and Figure 62-20 “Touchscreen Pen Detect”

Updated Section 62.6.16 “Asynchronous and Partial Wakeup (SleepWalking)”

Section 62.6.17.1 “Classic ADC Channels Only (Touchscreen Disabled)”: changed title (was “Classical ADC Channels Only”)

Section 62.6.19 “Register Write Protection”: updated list of protectable registers

Table 62-8 “Register Mapping”:

.....continued

### Changes

- defined 0x48 as reserved
- added row 0x4C / Channel Offset Register / ADC\_COR
- added offset 0x7C for ADC\_CDR11
- defined offset range 0x80–0x90 as reserved
- added row 0x94 / Analog Control Register / ADC\_ACR
- defined offset range 0xC4–0xD0 as reserved
- added row 0xD4 / Correction Values Register / ADC\_CVR
- added row 0xD8 / Channel Error Correction Register / ADC\_CECR
- added row 0xDC / Touchscreen Correction Values Register / ADC\_TSCVR
- defined offset 0xE0 as reserved

Section 62.7.2 “ADC Mode Register”: updated TRACKIM field description

Added LCCHG (Last Channel Change) bit in Section 62.7.9 “ADC Interrupt Enable Register”, Section 62.7.10 “ADC Interrupt Disable Register”, Section 62.7.11 “ADC Interrupt Mask Register” and Section 62.7.12 “ADC Interrupt Status Register”

Section 62.7.13 “ADC Last Channel Trigger Mode Register”: updated CMPMOD field description

Section 62.7.16 “ADC Extended Mode Register”: updated CMPMODE field description; added descriptions for fields OSR ASTE

Section 62.7.18 “ADC Channel Offset Register”: added address; removed bits OFF11:OFF0 from bitmap; modified DIFFx field description

Section 62.7.20 “ADC Analog Control Register”: added address; added IBCTL field

Section 62.7.25 “ADC Trigger Register”: added sentence about write protection

Removed Section “Correction Select Register”

Added sentence about write protection in Section 62.7.26 “ADC Correction Values Register” and Section 62.7.27 “ADC Channel Error Correction Register”

Added Section 62.7.28 “ADC Touchscreen Correction Values Register”

### Section 63. “Electrical Characteristics”

“ADVREFP” corrected to “ADVREF”

Section 63.2 “DC Characteristics”: in first sentence, “TA = -40°C to +85°C” changed to “TA = -40°C to +105°C”

Added Table 63-2 “Recommended Thermal Operating Conditions”

Updated Section 63.4 “Active Mode”

Table 63-8 “Low-power Mode Configuration Summary”: updated values for ‘Consumption’ and ‘Wakeup Time’

Updated Section 63.5.6 “Low-power Consumption Versus Modes”

Table 63-9 “Typical Power Consumption in Idle Mode: AMP2”: updated consumption values

Table 63-10 “VDDCORE Power Consumption in Ultra Low-power Mode: AMP2”: updated consumption values; updated wakeup time for ULP1 Fast Wakeup mode

Table 63-11 “Typical Power Consumption for Backup Mode”: updated consumption values

Updated Table 63-12 “Processor Clock Waveform Parameters” and Table 63-13 “Master Clock Waveform Parameters”

Updated Section 63.7.1 “Main Oscillator Characteristics”

Table 63-17 “12 MHz RC Oscillator Characteristics”: updated startup time values

Updated Section 63.7.3 “32.768 kHz Crystal Oscillator Characteristics”

Updated Table 63-23 “Audio PLL Characteristics”

|  |
|--|
| .....continued   |
| <b>Changes</b>   |
| Section 63.10 “ADC Characteristics”: deleted sentence “The VREFN pin must be connected to ground.”   |
| Table 63-25 “Power Supply Characteristics”: updated Analog Current Consumption value for Fast Wakeup mode  |
| Table 63-26 “ADVREF Electrical Characteristics”: “VREFP” corrected to “ADVREF”; updated Current value  |
| Section 63.10.4.1 “Differential Mode (12-bit mode)” and Section 63.10.4.2 “Single-ended Mode (12-bit mode)”: in equation, “VVREFP” corrected to “VADVREF”  |
| Section 63.10.4.4 “Gain and Offset Errors”: “VVREFP” corrected to “VADVREF”  |
| Table 63-27 “ADC Timing Characteristics”: updated footnote   |
| Added Table 63-32 “ADC Analog Input Characteristics”   |
| Table 63-37 “VDDCORE Power-On Reset Characteristics”: updated Hysteresis Voltage values  |
| Section 63.14.1 “Maximum SPI Frequency”: updated values in “Master Read Mode” and “Slave Write Mode”   |
| Revised Section 63.18 “MPDDRC Timings”   |
| Corrected CKI values in Figure 63-33 “SSC Transmitter, TK and TF in Input”, Figure 63-35 “SSC Receiver, RK in Input and RF in Output”, Figure 63-36 “SSC Receiver, RK and RF in Output” and Figure 63-38 “Minimum and Maximum Access Time of Output Signals” |
| <b>Section 65. “Schematic Checklist”</b>   |
| Figure 65-1 “1.2V, 1.35V/1.5V, 2V, 2.5V, 3.3V Power Supplies Schematics(1)”: GNDHSIC changed to GNDUTMIC   |
| Table 65-1 “Power Supply Connections”: updated GNDUTMIC row; removed GNDHSIC row; in second footnote, “microcontroller” changed to “microprocessor”  |
| Table 65-2 “Clock, Oscillator and PLL Connections”: “(internal 32-kHz RC oscillator) changed to “(internal 64 kHz RC oscillator)”  |
| Section 65.5.1 “How to Define the Oscillator Load Capacitance”: instances of “32-KHz Oscillator” changed to “32.768 kHz Oscillator”  |
| Added Section 65.14.6 “QSPI Pull-up Resistors”   |
| Updated <b>Section 67. “Ordering Information”</b>  |
| <b>Section 68. “Errata”</b>  |
| Updated and reorganized content (errata now collected in Section 68.1 “Errata - SAMA5D2 MRL-B Parts” and Section 68.2 “Errata - SAMA5D2 MRL-A Parts”)  |

## 71.6 Revision 11267C

|   |
|---|
| <b>Changes</b>  |
| Changed datasheet status from ‘Preliminary’ to ‘Complete’.                                |
| Added “Introduction” and transferred Description to Section 1.                            |
| <b>Section 2. “Configuration Summary”</b>   |
| Added device compatibility information  |
| <b>Section 4. “Signal Description”</b>  |
| Table 4-1 “Signal Description List”: modified rows PIOBU 0-7 and DDR_RESETN               |
| <b>Section 6. “Power Considerations”</b>  |
| Added Section 6.4.1 “VDDBU Power Architecture”  |
| Updated Section 6.2 “Power-Up Considerations” and Section 6.3 “Power-Down Considerations” |
| <b>Section 7. “Memories”</b>  |

.....continued

### Changes

Updated Section 7.1.2 "Internal ROM"

#### Section 10. "Peripherals"

Updated Table 10-1 "Peripheral identifiers" and Section 10.4 "Peripheral Clock Types"

#### Section 16. "AXI Matrix (AXIMX)"

Table 16-1 "Register Mapping": removed 0x00000000 reset value from all rows

#### Section 17. "Matrix (H64MX/H32MX)"

Section 17.2 "Embedded Characteristics": removed "Master number forwarding to slaves" characteristic

Updated Table 17-1 "List of H64MX Masters", Table 17-2 "List of H64MX Slaves", Table 17-4 "List of H32MX Masters", Table 17-5 "List of H32MX Slaves"

Table 17-3 "Master to Slave Access on H64MX": updated 'SDMMC0-SDMMC1' row

Table 17-6 "Master to Slave Access on H32MX": updated 'Slave 5' rows

Section 17.12.2 "Security of APB Slaves": added introduction and bulleted list introduced by "As a general rule"

Added Section 17.12.3 "Security Types of AHB Master Peripherals" and Section 17.12.4 "Security Types of AHB Slave Peripherals"

Section 17-9 "Peripheral Identifiers": corrected some security type names

Section 17.13 "AHB Matrix (MATRIX) User Interface": added introduction and modified reset value of Updated Security Areas Split Slave x Registers in Table 17-10 "Register Mapping"

#### Section 21. "Watchdog Timer (WDT)"

Replaced "Idle mode" with "Sleep mode (Idle mode)" in Section 21.1 "Description" and with "Sleep mode" in Section 21.4 "Functional Description"

#### Section 22. "Reset Controller (RSTC)"

Renamed 'proc\_nreset' to 'Processor Reset', 'periph\_nreset' to 'Peripheral Reset', 'backup\_nreset' to 'Backup Reset', 'rstc\_irq' to 'Reset Controller Interrupt', 'wd\_fault' to 'Watchdog Fault', 'user\_reset' to 'User Reset'.

Updated text and figures to show that Processor Reset and Peripheral Reset signals are merged.

#### Section 23. "Shutdown Controller (SHDWC)"

Updated Figure 23-1 "Shutdown Controller Block Diagram" and Table 23-1 "I/O Lines Description"

Section 23.7.3 "Shutdown Status Register": corrected register table (added WKUPIS9)

Section 23.7.4 "Shutdown Wake-up Inputs Register": corrected register table (added WKUPT9 and WKUPEN9)

#### Section 25. "Real-time Clock (RTC)"

Removed RTC Milliseconds Register (RTC\_MSR) and all related information in Section 25.1 "Description", Section 25.2 "Embedded Characteristics", Section 25.5 "Functional Description" and Section 25.6 "Real-time Clock (RTC) User Interface".

Table 25-1 "Register Mapping": modified RTC\_CALR reset value

Section 25.6.1 "RTC Control Register": updated CALEVSEL field description

Updated Section 25.6.22 "RTC TimeStamp Source Register"

#### Section 29. "Clock Generator"

Section 29.2 "Embedded Characteristics": replaced "400 to 1000 MHz programmable PLL" with "600 to 1200 MHz programmable PLL" and replaced "HCLOCK" with "HCLOCK\_LS/HS" and "PCLOCK" with "PCLOCK\_LS/HS"

Section 29.4 "Slow Clock": removed "This allows the slow clock to be valid in a short time (about 100 μs)"

Section 29.8 "Audio PLL": updated all equations and added "in the 700 MHz range" after "The PLL core operates at 700 MHz (AUDIOCORECLOCK)"

.....continued

### Changes

Updated Figure 29-3. Main Clock Block Diagram and Figure 29-4. Main Clock Source Selection

#### Section 30. “Power Management Controller (PMC)”

Updated Section 30.6 “Matrix Clock Controller”

Updated Section 30-1 “General Clock Block Diagram”

Section 30.19 “Programming Sequence”, sub-section “Selecting Master Clock and Processor Clock”: updated sequence following “If a new value for CSS field corresponds to PLL Clock”

Section 30.22.11 “PMC Master Clock Register”: updated H32MXDIV field description

#### Section 33. “Multi-port DDR-SDRAM Controller (MPDDRC)”

Section 33-2 “Single Write Access, Row Closed, DDR-SDRAM Devices” to Section 33-8 “SINGLE Write Access Followed by a Read Access, DDR2-SDRAM Devices”: replaced “D[15:0]” with “DATA”

Updated Section 33.7.9 “MPDDRC Low-power DDR2 Low-power DDR3 Low-power Register”

Section 33.7.10 “MPDDRC Low-power DDR2 Low-power DDR3 and DDR3 Calibration and MR4 Register”: updated MR4\_READ field description

#### Section 34. “Static Memory Controller (SMC)”

Removed NFCCMD field and modified Section 34.17.2.1 “Building NFC Address Command Example” and Section 34.17.2.2 “NFC Address Command” accordingly

Table 34-20 “Register Mapping”: corrected offset values of PMECC Error Location 31 Register and of subsequent reserved range; removed reset value from HSMC\_CTRL (register is write-only)

#### Section 35. “DMA Controller (XDMAC)”

Section 35.5.4.1 “Single Block With Single Microblock Transfer”: added text on memory-to-memory transfer

Section 35.8 “XDMAC Software Requirements”: added bullet on memory-to-memory transfer

Table 35-5 “Register Mapping”: corrected access of XDMAC\_GTYPE, XDMAC\_GWAC, XDMAC\_CIM

Section 35.9.6 “XDMAC Global Interrupt Mask Register”: corrected access to Read-only

Section 35.9.28 “XDMAC Channel x [x = 0..15] Configuration Register”: corrected INITD and PERID field descriptions

#### Section 36. “LCD Controller (LCDC)”

Modified width of fields in Section 36.7.2 “LCD Controller Configuration Register 1” and Section 36.7.3 “LCD Controller Configuration Register 2”

#### Section 40. “Audio Class D Amplifier (CLASSD)”

Replaced ‘audio clock’ with ‘generic clock’ and ‘ACLK’ with ‘GCLK’ throughout the section

#### Section 41. “Inter-IC Sound Controller (I2SC)”

Section 41.6.3 “Master, Controller and Slave Modes”: removed text fragment: ‘in order to avoid unwanted glitches on the I2SWS and I2SCK pins.’

Section 41.8.2 “Inter-IC Sound Controller Mode Register”: removed text fragment: ‘in order to avoid unexpected behavior on the I2SWS, I2SCK and I2SDO outputs.’ and added note (2) below IMCKDIV field description.

#### Section 44. “Flexible Serial Communication Controller (FLEXCOM)”

Restored all references to ISO7816 specification

Updated Figure 44-3 “Fractional Baud Rate Generator”

Added Figure 44-27 “RTS line software control when FLEX\_US\_MR.USART\_MODE = 2”

Section 44.10.6 “USART Mode Register”: updated USART\_MODE field description (SPI\_MASTER item)

.....continued

### Changes

Section 44.10.44 “SPI Mode Register”: added LBHPC bit

#### **Section 45. “Universal Asynchronous Receiver Transmitter (UART)”**

Section 45.6.9 “UART Baud Rate Generator Register”: in CD field description, corrected equation after “If BRSRCCK = 1”

#### **Section 47. “Quad SPI Interface (QSPI)”**

Section 47.7.5 “QSPI Status Register”: updated RDRF, TDRE, TXEMPTY, and OVRES field descriptions

#### **Section 48. “Secure Digital Multimedia Card (SDMMC)”**

Section 48.12.41 “SDMMC Preset Value Register”: updated CLKGSEL field description

#### **Section 49. “Image Sensor Controller (ISC)”**

Section 49.1 “Description”: removed “serial csi-2 based CMOS/CCD sensor” (not supported).

#### **Section 50. “Controller Area Network (MCAN)”**

Changed MCAN interrupt line names to MCAN\_INT0 and MCAN\_INT1 throughout the section

Section 50.6.7 “MCAN CC Control Register”: added bit NISO

#### **Section 51. “Timer Counter (TC)”**

Reformatted and renamed Table 51-2 “Channel Signal Description”

Section 51.6.3 “Clock Selection”: updated notes (1) and (2)

#### **Section 52. “Pulse Density Modulation Interface Controller (PDMIC)”**

Replaced all instances of “PCK” with “GCLK”

Section 52.2 “Embedded Characteristics”: removed ‘Multiplexed PDM Input Support’ characteristic

Updated Section 52.5.2 “Power Management” and Section 52.6.2.1 “Description”

Section 52.6.2.6 “Gain and Offset Compensation”: updated dgain bullet

Section 52.7.3 “PDMIC Converted Data Register”: updated DATA field description

Section 52.7.8 “PDMIC DSP Configuration Register 0”: updated OSR field description

#### **Section 61. “Security Module”**

Section 61.5.5 “SECUMOD Status Clear Register”: removed MCKM field description

Section 61.5.18 “SECUMOD Wake Up Register”: removed TPML field description

#### **Section 62. “Analog-to-Digital Converter (ADC)”**

Section 62.7.2 “ADC Mode Register”: updated TRACKTIM and TRANSFER field descriptions.

#### **Section 63. “Electrical Characteristics”**

Updated tables from Table 63-2 “DC Characteristics” to Table 63-33 “Analog Comparator Characteristics”

Updated Figure 63-2 “Main Oscillator Schematics”

Corrected Gain Error formula under Figure 63-5 “Gain and Offset Errors in Single-ended Mode”

Removed Figure 63-4 “Single-ended Mode ADC” and Figure 63-5 “Differential Mode ADC”

Updated wake-up pin numbers in Section 63.5.1 “Backup Mode” and Section 63.5.3.2 “ULP1 Mode”

Updated Section 63.5.4 “Idle Mode” and Section 63.23 “SDMMC Timings”

Section 63.14.3 “Timing Extraction”: added introduction and Figure 63-11 “MISO Capture in Master Mode”

#### **Section 65. “Schematic Checklist”**

.....continued

### Changes

Removed Table 65-12. “EBI Pins and NAND Flash Device Connections” and Table 65-13. “DDR2 I/O Lines Usage vs Operating Modes”

Reorganized **Section 67. “Ordering Information”**

**Updated Section 68. “Errata”**

## 71.7 Revision 11267B

### Changes

“Features”

Updated Security features

#### **Section 2. “Block Diagram”**

Updated Figure 2-1 “SAMA5D2 Series Block Diagram”.

#### **Section 4. “Package and Pinout”**

Updated Table 4-2 “Pin Description”

Removed Section 4.2 “Input/Output Description” and Section 4-3 “SAMA5D2 I/O Type Description”

#### **Section 5. “Power Considerations”**

Updated Table 5-1 “SAMA5D2 Power Supplies”

Updated Figure 5-1 “Recommended Power-Up Sequence”, Figure 5-2 “Recommended Power-Down Sequence”, Figure 5-3 “Recommended Backup Mode Entry”, Figure 5-4 “Recommended Power Supply Sequencing at Wake-Up”

#### **Section 7. “Event System”**

Updated Table 7-1 “Real-time Event Mapping List”

#### **Section 14. “Standard Boot Strategies”**

Replaced all instances of “GPBR” with “BUREG”.

#### **Section 17. “Special Function Registers (SFR)”**

Updated Section 17.3.15 “I2S Register”

#### **Section 19. “Advanced Interrupt Controller (AIC)”**

Removed Sections “Interrupt Vectoring” and “Fast Interrupt Vectoring”

Updated Section 19.8.3.3 “Interrupt Handlers” and Section 19.8.4.3 “Fast Interrupt Handlers”

#### **Section 29. “Power Management Controller (PMC)”**

Replaced “generated clock” with “generic clock”, and “GCK” with “GCLK”

Updated Section 29.22.8 “PMC Clock Generator Main Oscillator Register”

#### **Section 30. “Parallel Input/Output Controller (PIO)”**

Removed all references to programmable I/O delay

Added **Section 31. “External Memories”**

#### **Section 32. “Multi-port DDR-SDRAM Controller (MPDDRC)”**

Section 32.4.3 “Low-power DDR2-SDRAM Initialization”: added Step 14., Step 15. and Step 21.

Section 32.4.5 “Low-power DDR3-SDRAM Initialization”: added Step 14., Step 15. and Step 21.

Section 32.7.8 “MPDDRC Memory Device Register”: updated DBW field description; corrected location of fields RL3 and WL

.....continued

### Changes

#### Section 36. “Ethernet MAC (GMAC)”

Updated Section 36.1 “Description”

Section 36.5.2 “Power Management”: deleted reference to PMC\_PCER

Section 36.5.3 “Interrupt Sources”: deleted reference to ‘Advanced Interrupt Controller’. Replaced by ‘Interrupt Controller’.

Section 36.6.14 “IEEE 1588 Support”: deleted reference to GMAC\_TSSx. Removed reference to ‘output pins’ in 2nd paragraph.

Section 36.6.15 “Time Stamp Unit”: added information on GTSUCOMP signal in last paragraph

#### Section 39. “Audio Class D Amplifier (CLASSD)”

Updated Figure 39-1. CLASSD Block Diagram

#### Section 40. “Inter-IC Sound Controller (I2SC)”

Replaced all instances of “PCKx” with “GCLK”

Removed all references to Time Division Multiplexed (TDM) format (not supported)

Section 40.1 “Description”: replaced “The I2SC can use either a single DMA Controller channel for both audio channels or one DMA Controller channel per audio channel.” with “The I2SC uses a single DMA Controller channel for both audio channels.”, and updated Section 40.2 “Embedded Characteristics” and Section 40.6.8 “DMA Controller Operation” accordingly

Section 40.8.2 “Inter-IC Sound Controller Mode Register”: removed fields RXDMA and TXDMA

#### Section 43. “Flexible Serial Communication Controller (FLEXCOM)”

Added SPI mode in UART/USART

Replaced all instances of ‘PCK’ with ‘GCLK’

Replaced all instances of ‘DMAC/PDC’ with ‘DMAC’

Removed SleepWalking characteristic from UART/USART mode

Removed all references to ISO7816 specification

Section 43.10.6 “USART Mode Register” updated USCLKS field description

Section 43.10.42 “SPI Mode Register”: updated BR SRCCLK and DLYBCS field descriptions

Section 43.10.52 “SPI Chip Select Register”: updated CSNAAT, SCBR, DLYBS and DLYBCT field descriptions

Section 43.10.62 “TWI Clock Waveform Generator Register”: updated BR SRCCLK and CKSRC field descriptions

Updated Figure 43-1 “FLEXCOM Block Diagram” and Figure 43-63 “Master Mode Block Diagram”

#### Section 42. “Two-wire Interface (TWIHS)”

Replaced all instances of “PMC\_PCK” with “GCLK”

#### Section 44. “Universal Asynchronous Receiver Transmitter (UART)”

Replaced “Processor-Independent Source Clock” with “Processor-Independent Generic Source Clock” and “PCK” with “GCLK”

#### Section 47. “Secure Digital Multimedia Card (SDMMC)”

Updated revision of supported e.MMC specification (from V4.41 to V4.51)

#### Section 51. “Pulse Density Modulation Interface Controller (PDMIC)”

Removed all references to PDC

Removed Section 1.6.4 “Buffer Structure”

#### Section 53. “Secure Fuse Controller (SFC)”

Removed all references to lock fuse (not supported)

.....continued

### Changes

Section 53.4.5.3 “Fuse Masking”: corrected data register names

Section 53.5.2 “SFC Mode Register”: updated MSK field description

Table 53-1 “Register Mapping”: modified SFC\_IER and SFC\_IDR access type from “Read/Write” to “Write-only”

### Section 56. “Advanced Encryption Standard (AES)”

Updated Figure 56-12 “Generation of an ESP IPsec Frame without ESN” and Figure 56-13 “Generation of an ESP IPsec Frame with ESN”

### Added Section 60. “Security Module”

### Section 61. “Analog-to-Digital Converter (ADC)”

Updated enhanced resolution value from 12 bits to 14 bits

Renamed “Hold time” to “Transfer time”

Replaced all instances of “PMC PCK” with “GCLK”

Added Section 61.6.6 “Conversion Results Format”, Section 61.7.13 “ADC Last Channel Trigger Mode Register”, Section 61.7.14 “ADC Last Channel Compare Window Register”

Section 61.2 “Embedded Characteristics”: corrected conversion rate

Section 61.6.9 “Comparison Window”: added paragraph about bit SIGNMODE

Section 61.6.14 “Automatic Error Correction”: replaced “GAIN\_ERROR\_SIZE-1” with appropriate value; replaced “Gs-1” with “Gs” in formulas

Section 61.6.14 “Automatic Error Correction”, Section 61.7.27 “Correction Values Register”: replaced “GAIN\_ERROR\_SIZE-1” and “OFFSET\_ERROR\_SIZE-1” with appropriate values

Section 61.7.2 “ADC Mode Register”: updated TRGSEL and TRACKTIM field descriptions

Updated Section 61.7.8 “ADC Last Converted Data Register”

Section 61.7.16 “ADC Extended Mode Register”: added bit SIGNMODE

Updated Section 61.7.18 “ADC Channel Offset Register”

Updated Figure 61-1 “Analog-to-Digital Converter Block Diagram” and Figure 61-7 “Analog Full Scale Ranges in Single-Ended/Differential Applications”

Updated Table 61-5 “Oversampling Digital Output Range Values”

### Section 62. “Electrical Characteristics”

Added:

- Section 62.11 “Analog Comparator Characteristics”

- Section 62.14.1 “Maximum SPI Frequency”

- Section 62.16.1 “Maximum QSPI Frequency”

- Table 62-3 “I/O Switching Frequency”

- Table 62-4 “QSPI I/O Switching Frequency”

- Table 62-21 “PLL UTMI Characteristics”

- Table 62-22 “PLLAUDIO Characteristics”

Updated:

- Table 62-1 “Absolute Maximum Ratings\*\*”

- Table 62-2 “DC Characteristics”

- Table 62-6 “Typical Peripheral Power Consumption by Peripheral in Active Mode” to Table 62-10 “Typical Power Consumption for Backup Mode”

# SAMA5D2 Series

## Revision History

.....continued

### Changes

- Table 62-13 "8 to 24 MHz Crystal Oscillator Characteristics"
  - Table 62-16 "12-MHz RC Oscillator Characteristics" to Table 62-21 "PLL UTMI Characteristics"
  - Table 62-34 "VDDBU Power-On Reset Characteristics" to Table 62-36 "VDDANA Power-On Reset Characteristics"
- Reworked Section 62.9 "USB HS Characteristics"

### Section 64. "Schematic Checklist"

Updated:

- Section 64.16.3 "DDR Layout and Design Considerations"
- Figure 64-1 "1.2V, 1.35V/1.5V, 2V, 2.5V, 3.3V Power Supplies Schematics(1)"
- Table 64-1 "Power Supply Connections"

## 71.8 Revision 11267A

| Issue Date | Changes                             |
|------------|-------------------------------------|
| 10-Sep-15  | Preliminary Datasheet - First issue |
| 25-Feb-15  | Advance Information Datasheet.      |

## Table of Contents

---

|   |    |
|---|----|
| Introduction.....   | 1  |
| Features.....   | 1  |
| 1. Description.....   | 5  |
| 2. Configuration Summary.....                                   | 6  |
| 3. Block Diagram.....   | 7  |
| 4. Signal Description.....                                      | 8  |
| 5. Safety and Security Features.....                            | 15 |
| 5.1. Design for Safety and IEC60730 Class B Certification.....  | 15 |
| 5.2. Design for Security.....                                   | 15 |
| 5.3. Safety and IEC 60730 Features.....                         | 15 |
| 5.4. Security Features.....                                     | 17 |
| 6. Package and Pinout.....                                      | 20 |
| 6.1. Packages.....  | 20 |
| 6.2. Pinouts.....   | 20 |
| 7. Power Considerations.....                                    | 51 |
| 7.1. Power Supplies .....                                       | 51 |
| 7.2. Power-up Considerations.....                               | 51 |
| 7.3. Power-down Considerations.....                             | 53 |
| 7.4. Power Supply Sequencing at Backup Mode Entry and Exit..... | 54 |
| 8. Memories.....  | 57 |
| 8.1. Embedded Memories.....                                     | 58 |
| 8.2. External Memory.....                                       | 58 |
| 9. Event System.....  | 62 |
| 9.1. Real-time Event List.....                                  | 62 |
| 9.2. Real-time Event Mapping.....                               | 62 |
| 10. System Controller.....                                      | 64 |
| 10.1. Power-On Reset.....                                       | 66 |
| 11. Peripherals.....  | 67 |
| 11.1. Peripheral Mapping.....                                   | 67 |
| 11.2. Peripheral Identifiers.....                               | 67 |
| 11.3. Peripheral Signal Multiplexing on I/O Lines.....          | 67 |
| 11.4. Peripheral Clock Types.....                               | 67 |

|   |     |
|---|-----|
| 12. Chip Identifier (CHIPID).....                           | 69  |
| 12.1. Description.....                                      | 69  |
| 12.2. Embedded Characteristics.....                         | 69  |
| 12.3. Register Summary.....                                 | 71  |
| 13. Cortex-A5 Processor (ARM).....                          | 76  |
| 13.1. Reference Documents.....                              | 76  |
| 13.2. Description.....                                      | 76  |
| 13.3. Embedded Characteristics.....                         | 77  |
| 13.4. Block Diagram.....                                    | 77  |
| 13.5. Programmer Model.....                                 | 78  |
| 13.6. Memory Management Unit (MMU) .....                    | 86  |
| 14. L2 Cache Controller (L2CC).....                         | 92  |
| 14.1. Description.....                                      | 92  |
| 14.2. Embedded Characteristics.....                         | 92  |
| 14.3. Product Dependencies.....                             | 92  |
| 14.4. Functional Description.....                           | 92  |
| 14.5. Register Summary.....                                 | 94  |
| 15. Debug and Test Features.....                            | 132 |
| 15.1. Description.....                                      | 132 |
| 15.2. Embedded Characteristics.....                         | 132 |
| 15.3. Debug and Test Block Diagrams.....                    | 133 |
| 15.4. Application Examples.....                             | 134 |
| 15.5. Debug and Test Pin Description.....                   | 136 |
| 15.6. Functional Description.....                           | 136 |

## The Microchip Web Site

---

Microchip provides online support via our web site at <http://www.microchip.com/>. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## Customer Change Notification Service

---

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at <http://www.microchip.com/>. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## Customer Support

---

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://www.microchip.com/support>

## Product Identification System

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

|                    |               |  |
|--------------------|---------------|--|
| Architecture:      | ATSAMA5       | = Arm Cortex-A5 CPU                        |
| Product Group:     | D21, D22, D23 | = 196-ball general-purpose microprocessors |
|                    | D24           | = 256-ball general-purpose microprocessors |
|                    | D28           | = 289-ball general-purpose microprocessors |
| Mask Revision:     | C             |  |
| Package:           | C             | = BGA                                      |
| Temperature Range: | U             | = -40°C to +85°C (Industrial)              |
|                    | N             | = -40°C to +105°C (Extended Industrial)    |
| Carrier Type:      | Blank         | = Standard packaging (tray)                |
|                    | R             | = Tape and Reel                            |

Examples:

- ATSAMAD21C-CUR = ARM Cortex-A5 general- purpose microprocessor, 196-ball, Industrial temperature, BGA Package.

**Note:** Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package

## Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the

operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.

- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

## Legal Notice

---

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

## Trademarks

---

The Microchip name and logo, the Microchip logo, AnyRate, AVR, AVR logo, AVR Freaks, BitCloud, chipKIT, chipKIT logo, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, Heldo, JukeBlox, KeeLoq, Klear, LANCheck, LINK MD, maXStylus, maXTouch, MediaLB, megaAVR, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, Prochip Designer, QTouch, SAM-BA, SpyNIC, SST, SST Logo, SuperFlash, tinyAVR, UNI/O, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

ClockWorks, The Embedded Control Solutions Company, EtherSynch, Hyper Speed Control, HyperLight Load, IntelliMOS, mTouch, Precision Edge, and Quiet-Wire are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, BodyCom, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, EtherGREEN, In-Circuit Serial Programming, ICSP, INICnet, Inter-Chip Connectivity, JitterBlocker, KlearNet, KlearNet logo, memBrain, Mindi, MiWi, motorBench, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICKit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, SAM-ICE, Serial Quad I/O, SMART-I.S., SQI, SuperSwitcher, SuperSwitcher II, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

AMBA, Arm, Arm7, Arm7TDMI, Arm9, Arm11, Artisan, big.LITTLE, Cordio, CoreLink, CoreSight, Cortex, DesignStart, DynamIQ, Jazelle, Keil, Mali, Mbed, Mbed Enabled, NEON, POP, RealView, SecurCore, Socrates, Thumb, TrustZone, ULINK, ULINK2, ULINK-ME, ULINK-PLUS, ULINKpro,  $\mu$ Vision, Versatile are trademarks or registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

## Quality Management System Certified by DNV

---

### ISO/TS 16949

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC<sup>®</sup> MCUs and dsPIC<sup>®</sup> DSCs, KEELOQ<sup>®</sup> code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
