|-------|--------------------------------------------------------------------------------------------------|
| 0     | Number of DATA in Transmit FIFO is above TXFTHRES threshold.                                     |
| 1     | Number of DATA in Transmit FIFO has reached TXFTHRES threshold since the last read of TWIHS_FSR. |

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared on read)

| Value | Description                                                     |
|-------|-----------------------------------------------------------------|
| 0     | Transmit FIFO is not full.                                      |
| 1     | Transmit FIFO has been filled since the last read of TWIHS_FSR. |

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | Transmit FIFO is not empty.                                      |
| 1     | Transmit FIFO has been emptied since the last read of TWIHS_FSR. |

#### 45.7.23 TWIHS FIFO Interrupt Enable Register

**Name:** TWIHS\_FIER  
**Offset:** 0x64  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |         |         |        |       |       |        |       |       |
|--------|---------|---------|--------|-------|-------|--------|-------|-------|
| Bit    | 31      | 30      | 29     | 28    | 27    | 26     | 25    | 24    |
|        |         |         |        |       |       |        |       |       |
| Access |         |         |        |       |       |        |       |       |
| Reset  |         |         |        |       |       |        |       |       |
| Bit    | 23      | 22      | 21     | 20    | 19    | 18     | 17    | 16    |
|        |         |         |        |       |       |        |       |       |
| Access |         |         |        |       |       |        |       |       |
| Reset  |         |         |        |       |       |        |       |       |
| Bit    | 15      | 14      | 13     | 12    | 11    | 10     | 9     | 8     |
|        |         |         |        |       |       |        |       |       |
| Access |         |         |        |       |       |        |       |       |
| Reset  |         |         |        |       |       |        |       |       |

| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |              |    |    |    |    |    |    | WPEN |
| Access |              |    |    |    |    |    |    | R/W  |
| Reset  |              |    |    |    |    |    |    | 0    |

##### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                          |
|----------|--------|------------------------------------------------------------------------------------------------------|
| 0x545749 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

##### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x545749 ("TWI" in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x545749 ("TWI" in ASCII).  |

#### 45.7.27 TWIHS Write Protection Status Register

**Name:** TWIHS\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

|        |              |    |    |    |    |    |    |      |

| Bit    | 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        | WPVSR[23:16] |    |    |    |    |    |    |      |
| Access | R            | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16   |
|        | WPVSR[15:8]  |    |    |    |    |    |    |      |
| Access | R            | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]   |    |    |    |    |    |    |      |
| Access | R            | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |              |    |    |    |    |    |    | WPVS |
| Access |              |    |    |    |    |    |    | R    |
| Reset  |              |    |    |    |    |    |    | 0    |

##### Bits 31:8 – WPVSR[23:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

##### Bit 0 – WPVS Write Protection Violation Status

| Value | Description                                                                                                                                                                                                         |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of the TWIHS_WPSR.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last read of the TWIHS_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## **46. Flexible Serial Communication Controller (FLEXCOM)**

### **46.1 Description**

The Flexible Serial Communication Controller (FLEXCOM) offers several serial communication protocols that are managed by the three submodules USART, SPI, and TWI.

The Universal Synchronous Asynchronous Receiver Transceiver (USART) provides one full-duplex universal synchronous asynchronous serial link. Data frame format is widely programmable (data length, parity, number of stop bits) to support a maximum of standards. The receiver implements parity error, framing error and overrun error detection. The receiver timeout enables handling variable-length frames and the transmitter timeguard facilitates communications with slow remote devices. Multidrop communications are also supported through address bit handling in reception and transmission.

The USART features three test modes: Remote Loopback, Local Loopback and Automatic Echo.

The USART supports specific operating modes providing interfaces on RS485, LIN, and SPI, with ISO7816 T = 0 or T = 1 smart card slots, and infrared transceivers. The hardware handshaking feature enables an out-of-band flow control by automatic management of the pins RTS and CTS.

The USART supports the connection to the DMA Controller, which enables data transfers to the transmitter and from the receiver. The DMAC provides chained buffer management without any intervention of the processor.

The Serial Peripheral Interface (SPI) circuit is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “master” which controls the data flow, while the other devices act as “slaves” which have data shifted into and out by the master. Different CPUs can take turn being masters (multiple master protocol, contrary to single master protocol where one CPU is always the master while all of the others are always slaves). One master can simultaneously shift data into multiple slaves. However, only one slave can drive its output to write data back to the master at any given time.

A slave device is selected when the master asserts its NSS signal. If multiple slave devices exist, the master generates a separate slave select signal for each slave (NPCS).

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI)—This data line supplies the output data from the master shifted into the input(s) of the slave(s).
- Master In Slave Out (MISO)—This data line supplies the output data from a slave to the input of the master. There may be no more than one slave transmitting data during any particular transfer.
- Serial Clock (SPCK)—This control line is driven by the master and regulates the flow of the data bits. The master can transmit data at a variety of baud rates; there is one SPCK pulse for each bit that is transmitted.
- Slave Select (NSS)—This control line allows slaves to be turned on and off by hardware.

The Two-wire Interface (TWI) interconnects components on a unique two-wire bus, made up of one clock line and one data line with speeds of up to 400 kbits per second in Fast mode and up to 3.4 Mbits per second in High-speed Slave mode only, based on a byte-oriented transfer format. It can be used with any Two-wire Interface bus Serial EEPROM and I<sup>2</sup>C-compatible devices, such as a Real-Time Clock (RTC),

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Dot Matrix/Graphic LCD Controller and temperature sensor. The TWI is programmable as a master or a slave with sequential or single-byte access. Multiple master capability is supported.

Arbitration of the bus is performed internally and puts the TWI in Slave mode automatically if the bus arbitration is lost.

A configurable baud rate generator permits the output data rate to be adapted to a wide range of core clock frequencies.

The following table lists the compatibility level of any Two-wire Interface in Master mode and a full I<sup>2</sup>C compatible device.

**Table 46-1. TWI Compatibility with I<sup>2</sup>C Standard**

| I <sup>2</sup> C Standard                    | TWI           |
|----------------------------------------------|---------------|
| Standard Mode Speed (100 kHz)                | Supported     |
| Fast Mode Speed (400 kHz)                    | Supported     |
| High-speed Mode (Slave only, 3.4 MHz)        | Supported     |
| 7- or 10-bit <sup>(1)</sup> Slave Addressing | Supported     |
| Repeated Start (Sr) Condition                | Supported     |
| ACK and NACK Management                      | Supported     |
| Input Filtering                              | Supported     |
| Slope Control                                | Not Supported |
| Clock Stretching                             | Supported     |
| Multi Master Capability                      | Supported     |

Notes: 1. 10-bit support in Master mode only

## 46.2 Embedded Characteristics

### 46.2.1 USART/UART Characteristics

- 32-byte Transmit and Receive FIFOs
- Programmable Baud Rate Generator
- Baud Rate can be Independent of the Processor/Peripheral Clock
- Comparison Function on Received Character
- 5-bit to 9-bit Full-duplex Synchronous or Asynchronous Serial Communications
  - 1, 1.5 or 2 Stop Bits in Asynchronous Mode or 1 or 2 Stop Bits in Synchronous Mode
  - Parity Generation and Error Detection
  - Framing Error Detection, Overrun Error Detection
  - Digital Filter on Receive Line
  - MSB- or LSB-first
  - Optional Break Generation and Detection
  - By 8 or by 16 Oversampling Receiver Frequency
  - Optional Hardware Handshaking RTS-CTS

- Receiver Timeout and Transmitter Timeguard
  - Optional Multidrop Mode with Address Generation and Detection
- RS485 with Driver Control Signal
- ISO7816, T = 0 or T = 1 Protocols for Interfacing with Smart Cards
  - NACK Handling, Error Counter with Repetition and Iteration Limit
- IrDA Modulation and Demodulation
  - Communication at up to 115.2 kbit/s
- SPI Mode
  - MASTER or Slave
  - Serial Clock Programmable Phase and Polarity
  - SPI Serial Clock (SCK) Frequency up to  $f_{\text{peripheral clock}}/6$
- LIN Mode
  - Compliant with LIN 1.3 and LIN 2.0 specifications
  - Master or Slave
  - Processing of Frames with Up to 256 Data Bytes
  - Response Data Length can be Configurable or Defined Automatically by the Identifier
  - Self-synchronization in Slave Node Configuration
  - Automatic Processing and Verification of the “Synch Break” and the “Synch Field”
  - “Synch Break” Detection Even When Partially Superimposed with a Data Byte
  - Automatic Identifier Parity Calculation/Sending and Verification
  - Parity Sending and Verification Can be Disabled
  - Automatic Checksum Calculation/sending and Verification
  - Checksum Sending and Verification Can be Disabled
  - Support Both “Classic” and “Enhanced” Checksum Types
  - Full LIN Error Checking and Reporting
  - Frame Slot Mode: Master Allocates Slots to the Scheduled Frames Automatically
  - Generation of the Wakeup Signal
- Test Modes
  - Remote Loopback, Local Loopback, Automatic Echo
- Supports Connection of:
  - Two DMA Controller (DMAC) Channels
  - Offers Buffer Transfer without Processor Intervention
- Register Write Protection

#### **46.2.2 SPI Characteristics**

- 32-byte Transmit and Receive FIFOs
- Master or Slave Serial Peripheral Bus Interface
  - 8-bit to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delay between consecutive transfers and delay before SPI clock per chip select
  - Programmable delay between chip selects
- Selectable Mode Fault Detection

- Master Mode Can Drive SPCK up to Peripheral Clock
- Master Mode Bit Rate Can Be Independent of the Processor/Peripheral Clock
- Slave Mode Operates on SPCK, Asynchronously with Core and Bus Clock
- Two Chip Selects with External Decoder Support Allow Communication with up to 3 Peripherals
- Communication with Serial External Devices Supported
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - External coprocessors
- Connection to DMA Channel Capabilities, Optimizing Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Register Write Protection

#### **46.2.3 TWI/SMBus Characteristics**

- 16-byte Transmit and Receive FIFOs
- Bit Rate: Up to 400 kbit/s in Fast Mode and 3.4 Mbit/s in High-Speed Mode (Slave Only)
- Bit Rate can be Independent of the Processor/Peripheral Clock
- SMBus Support
- Compatible with Two-wire Interface Serial Memory and I<sup>2</sup>C Compatible Devices<sup>(1)</sup>
- Master and Multi-Master Operation (Standard and Fast Mode Only)
- Slave Mode Operation (Standard, Fast and High-Speed Mode)
- One, Two or Three Bytes for Slave Address
- Sequential Read/Write Operations
- General Call Supported in Slave Mode
- Connection to DMA Controller Channels Optimizes Data Transfers
  - One Channel for the Receiver
  - One Channel for the Transmitter
- Register Write Protection

Note: 1. See table [TWI Compatibility with I<sup>2</sup>C Standard](#) for further details.

## Flexible Serial Communication Controller (FLEXCOM)

### 46.3 Block Diagram

Figure 46-1. FLEXCOM Block Diagram

### 46.4 I/O Lines Description

Table 46-2. I/O Lines Description

| Name        | Description |           |      | Type |
|-------------|-------------|-----------|------|------|
|             | USART/UART  | SPI       | TWI  |      |
| FLEXCOM_IO0 | TXD         | MOSI      | TWD  | I/O  |
| FLEXCOM_IO1 | RXD         | MISO      | TWCK | I/O  |
| FLEXCOM_IO2 | SCK         | SPCK      | —    | I/O  |
| FLEXCOM_IO3 | CTS         | NPCS0/NSS | —    | I/O  |
| FLEXCOM_IO4 | RTS         | NPCS1     | —    | O    |

### 46.5 Product Dependencies

#### 46.5.1 I/O Lines

The pins used for interfacing the FLEXCOM are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the desired FLEXCOM pins to their peripheral function. If I/O lines of the FLEXCOM are not used by the application, they can be used for other purposes by the PIO Controller.

#### **46.5.2 Power Management**

The peripheral clock is not continuously provided to the FLEXCOM. The programmer must first enable the FLEXCOM Clock in the Power Management Controller (PMC) before using the USART or SPI or TWI.

In SleepWalking mode (asynchronous partial wakeup), the PMC must be configured to enable SleepWalking for the FLEXCOM in the Sleepwalking Enable Register (PMC\_SLPWK\_ER). The peripheral clock can be automatically provided to the FLEXCOM, depending on the instructions (requests) provided by the FLEXCOM to the PMC.

#### **46.5.3 Interrupt Sources**

The FLEXCOM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the FLEXCOM interrupt requires the Interrupt Controller to be programmed first.

### **46.6 Register Accesses**

Register accesses support 8-bit, 16-bit and 32-bit accesses, which means that only an 8-bit part of a 32-bit register can be written in one access, for instance. For this the access must be done with the right size at the right address.

8-bit, 16-bit and 32-bit accesses are supported for register accesses. However, a field in a register cannot be partially written (e.g., if a field is bigger than 8 bits, the whole field must be written).

This feature helps avoiding a read-modify-write process if only a small part of the register is to be modified.

### **46.7 USART Functional Description**

#### **46.7.1 Baud Rate Generator**

The baud rate generator provides the bit period clock named “baud rate clock” to both the receiver and the transmitter.

Configuring the USCLKS field in FLEX\_US\_MR selects the baud rate generator clock from one of the following sources:

- the peripheral clock
- a division of the peripheral clock, the divider being product dependent, but generally set to 8
- a fully programmable generic clock (GCLK) provided by PMC and independent of processor/peripheral clock
- the external clock, available on the SCK pin

The baud rate generator is based upon a 16-bit divider, which is programmed with the CD field of the Baud Rate Generator Register (FLEX\_US\_BRGR). If a zero is written to CD, the baud rate generator does not generate any clock. If a one is written to CD, the divider is bypassed and becomes inactive.

If the external SCK clock is selected, the duration of the low and high levels of the signal provided on the SCK pin must be longer than a peripheral clock period. The frequency of the signal provided on SCK must be at least three times lower than peripheral clock in USART mode (field USART\_MODE differs from 0xE or 0xF) or six times lower in SPI mode (field USART\_MODE equals 0xE or 0xF).

If GCLK is selected, the baud rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the USART transfer. The GCLK frequency must be at least three times lower than peripheral clock frequency.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

If GCLK is selected (USCLKS = 2) and the SCK pin is driven (CLKO = 1), the CD field must be greater than 1.

**Figure 46-2. Baud Rate Generator**

### 46.7.1.1 Baud Rate in Asynchronous Mode

If the USART is programmed to operate in Asynchronous mode, the selected clock is first divided by CD, which is field-programmed in FLEX\_US\_BRGR. The resulting clock is provided to the receiver as a sampling clock and then divided by 16 or 8, depending on the programming of FLEX\_US\_MR.OVER.

If OVER is set, the receiver sampling is eight times higher than the baud rate clock. If OVER is cleared, the sampling is performed at 16 times the baud rate clock.

The baud rate is calculated as per the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{(8(2 - \text{OVER})\text{CD})}$$

This gives a maximum baud rate of peripheral clock divided by 8, assuming that peripheral clock is the highest possible clock and that the OVER bit is set.

#### 46.7.1.1.1 Baud Rate Calculation Example

The following table shows calculations of CD to obtain a baud rate at 38,400 bit/s for different source clock frequencies. It also shows the actual resulting baud rate and the error.

**Table 46-3. Baud Rate Example (OVER = 0)**

| Source Clock (MHz) | Expected Baud Rate (bit/s) | Calculation Result | CD | Actual Baud Rate (bit/s) | Error |
|--------------------|----------------------------|--------------------|----|--------------------------|-------|
| 3,686,400          | 38,400                     | 6.00               | 6  | 38,400.00                | 0.00% |
| 4,915,200          | 38,400                     | 8.00               | 8  | 38,400.00                | 0.00% |
| 5,000,000          | 38,400                     | 8.14               | 8  | 39,062.50                | 1.70% |
| 7,372,800          | 38,400                     | 12.00              | 12 | 38,400.00                | 0.00% |
| 8,000,000          | 38,400                     | 13.02              | 13 | 38,461.54                | 0.16% |
| 12,000,000         | 38,400                     | 19.53              | 20 | 37,500.00                | 2.40% |
| 12,288,000         | 38,400                     | 20.00              | 20 | 38,400.00                | 0.00% |
| 14,318,180         | 38,400                     | 23.30              | 23 | 38,908.10                | 1.31% |

| 32,000,000         | 38,400                     | 52.08              | 52 | 38,461.54                | 0.16% |
| 32,768,000         | 38,400                     | 53.33              | 53 | 38,641.51                | 0.63% |
| 33,000,000         | 38,400                     | 53.71              | 54 | 38,194.44                | 0.54% |
| 40,000,000         | 38,400                     | 65.10              | 65 | 38,461.54                | 0.16% |
| 50,000,000         | 38,400                     | 81.38              | 81 | 38,580.25                | 0.47% |

The baud rate is calculated with the following formula:

$$\text{Baud rate} = \text{MCK} / \text{CD} \times 16$$

The baud rate error is calculated with the following formula. It is not recommended to work with an error higher than 5%.

$$\text{Error} = 1 - \left( \frac{\text{Expected Baud Rate}}{\text{Actual Baud Rate}} \right)$$

### 46.7.1.2 Fractional Baud Rate in Asynchronous Mode

The baud rate generator previously defined is subject to the following limitation: the output frequency changes by only integer multiples of the reference frequency. An approach to this problem is to integrate a fractional N clock generator that has a high resolution. The generator architecture is modified to obtain baud rate changes by a fraction of the reference source clock. This fractional part is programmed with the FP field in FLEX\_US\_BRGR. If FP is not 0, the fractional part is activated. The resolution is one eighth of the clock divider. The fractional baud rate is calculated using the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\left( 8(2 - \text{OVER}) \left( \text{CD} + \frac{\text{FP}}{8} \right) \right)}$$

The modified architecture is presented in the following figure.

**Figure 46-3. Fractional Baud Rate Generator**

When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by “selected clock” period from time to time. The duty cycle depends on the value of the CD field.

### 46.7.1.3 Baud Rate in Synchronous Mode or SPI Mode

If the USART is programmed to operate in Synchronous mode, the selected clock is simply divided by the CD field in FLEX\_US\_BRGR:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\text{CD}}$$

In Synchronous mode, if the external clock is selected (USCLKS = 3) and CLKO = 0 (Slave mode), the clock is provided directly by the signal on the USART SCK pin. No division is active. The value written in FLEX\_US\_BRGR has no effect. The external clock frequency must be at least three times lower than the system clock. In Synchronous mode master (USCLKS = 0 or 1, CLKO = 1), the receive part limits the SCK maximum frequency to  $f_{\text{peripheral clock}}/3$  in USART mode, or  $f_{\text{peripheral clock}}/6$  in SPI mode.

When either the external clock SCK or the internal clock divided (peripheral clock/DIV or GCLK) is selected, the value programmed in CD must be even if the user has to ensure a 50:50 mark/space ratio on the SCK pin. If the peripheral clock is selected, the baud rate generator ensures a 50:50 duty cycle on the SCK pin, even if the value programmed in CD is odd.

### 46.7.1.4 Baud Rate in ISO 7816 Mode

The ISO7816 specification defines the bit rate with the following formula:

$$B = \frac{D_i}{F_i} \times f$$

where:

- B is the bit rate
- $D_i$  is the bit rate adjustment factor
- $F_i$  is the clock frequency division factor

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

- $f$  is the ISO7816 clock frequency (Hz)

Di is a binary value encoded on a 4-bit field, named DI, as represented in the following table.

**Table 46-4. Binary and Decimal Values for Di**

|              |      |      |      |      |      |      |      |      |
|--------------|------|------|------|------|------|------|------|------|
| DI field     | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 1000 | 1001 |
| Di (decimal) | 1    | 2    | 4    | 8    | 16   | 32   | 12   | 20   |

Fi is a binary value encoded on a 4-bit field, named FI, as represented in the following table.

**Table 46-5. Binary and Decimal Values for Fi**

|              |      |      |      |      |      |      |      |      |      |      |      |      |
|--------------|------|------|------|------|------|------|------|------|------|------|------|------|
| FI field     | 0000 | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 1001 | 1010 | 1011 | 1100 | 1101 |
| Fi (decimal) | 372  | 372  | 558  | 744  | 1116 | 1488 | 1860 | 512  | 768  | 1024 | 1536 | 2048 |

The following table shows the resulting Fi/Di Ratio, which is the ratio between the ISO7816 clock and the baud rate clock.

**Table 46-6. Possible Values for the Fi/Di Ratio**

|       |       |       |       |       |      |       |       |      |       |      |       |
|-------|-------|-------|-------|-------|------|-------|-------|------|-------|------|-------|
| Fi/Di | 372   | 558   | 744   | 1116  | 1488 | 1806  | 512   | 768  | 1024  | 1536 | 2048  |
| 1     | 372   | 558   | 744   | 1116  | 1488 | 1860  | 512   | 768  | 1024  | 1536 | 2048  |
| 2     | 186   | 279   | 372   | 558   | 744  | 930   | 256   | 384  | 512   | 768  | 1024  |
| 4     | 93    | 139.5 | 186   | 279   | 372  | 465   | 128   | 192  | 256   | 384  | 512   |
| 8     | 46.5  | 69.75 | 93    | 139.5 | 186  | 232.5 | 64    | 96   | 128   | 192  | 256   |
| 16    | 23.25 | 34.87 | 46.5  | 69.75 | 93   | 116.2 | 32    | 48   | 64    | 96   | 128   |
| 32    | 11.62 | 17.43 | 23.25 | 34.87 | 46.5 | 58.13 | 16    | 24   | 32    | 48   | 64    |
| 12    | 31    | 46.5  | 62    | 93    | 124  | 155   | 42.66 | 64   | 85.33 | 128  | 170.6 |
| 20    | 18.6  | 27.9  | 37.2  | 55.8  | 74.4 | 93    | 25.6  | 38.4 | 51.2  | 76.8 | 102.4 |

If the USART is configured in ISO7816 mode, the clock selected by the USCLKS field in FLEX\_US\_MR is first divided by the value programmed in field CD field in FLEX\_US\_BRGR. The resulting clock can be provided to the SCK pin to feed the smart card clock inputs. This means that FLEX\_US\_MR.CLKO can be set.

This clock is then divided by the value programmed in the FI\_DI\_RATIO field in the FI DI Ratio Register (FLEX\_US\_FIDI). This is performed by the Sampling Divider, which performs a division by up to 65535 in ISO7816 mode. The noninteger values of the Fi/Di Ratio are not supported and the user must program the FI\_DI\_RATIO field to a value as close as possible to the expected value.

The FI\_DI\_RATIO field resets to the value 0x174 (372 in decimal) and is the most common divider between the ISO7816 clock and the bit rate ( $Fi = 372$ ,  $Di = 1$ ).

The following figure shows the relation between the Elementary Time Unit, corresponding to a bit time, and the ISO 7816 clock.

**Figure 46-4. Elementary Time Unit (ETU)**

### 46.7.2 Receiver and Transmitter Control

After reset, the receiver is disabled. The user must enable the receiver by setting the RXEN bit in the USART Control Register (FLEX\_US\_CR). However, the receiver registers can be programmed before the receiver clock is enabled.

After reset, the transmitter is disabled. The user must enable it by setting the TXEN bit in FLEX\_US\_CR. However, the transmitter registers can be programmed before being enabled.

The receiver and the transmitter can be enabled together or independently.

At any time, the software can perform a reset on the receiver or the transmitter of the USART by setting the corresponding bit, RSTRX and RSTTX respectively, in FLEX\_US\_CR. The software resets clear the status flag and reset internal state machines but the user interface configuration registers hold the value configured prior to software reset. Regardless of what the receiver or the transmitter is performing, the communication is immediately stopped.

The user can also independently disable the receiver or the transmitter by setting RXDIS and TXDIS respectively in FLEX\_US\_CR. If the receiver is disabled during a character reception, the USART waits until the end of reception of the current character, then the reception is stopped. If the transmitter is disabled while it is operating, the USART waits the end of transmission of both the current character and character being stored in the USART Transmit Holding Register (FLEX\_US\_THR). If a timeguard is programmed, it is handled normally.

### 46.7.3 Synchronous and Asynchronous Modes

#### 46.7.3.1 Transmitter Operations

The transmitter performs the same in both Synchronous and Asynchronous operating modes (SYNC = 0 or SYNC = 1). One start bit, up to 9 data bits, 1 optional parity bit and up to 2 stop bits are successively shifted out on the TXD pin at each falling edge of the programmed serial clock.

The number of data bits is selected by the CHRL field and the MODE9 bit in FLEX\_US\_MR. Nine bits are selected by setting the MODE9 bit regardless of the CHRL field. The parity bit is set according to the PAR field in FLEX\_US\_MR. The even, odd, space, marked or none parity bit can be configured. The MSBF bit in FLEX\_US\_MR configures which data bit is sent first. If written to 1, the most significant bit is sent first. If written to 0, the less significant bit is sent first. The number of stop bits is selected by the NBSTOP field in FLEX\_US\_MR. The 1.5 stop bit is supported in Asynchronous mode only.

**Figure 46-5. Character Transmit**

Example: 8-bit, Parity Enabled One Stop

The characters are sent by writing in FLEX\_US\_THR. The transmitter reports two status bits in the USART Channel Status Register (FLEX\_US\_CSR): TXRDY (Transmitter Ready), which indicates that FLEX\_US\_THR is empty and TXEMPTY, which indicates that all the characters written in FLEX\_US\_THR have been processed. When the current character processing is completed, the last character written in FLEX\_US\_THR is transferred into the shift register of the transmitter and FLEX\_US\_THR is emptied, thus TXRDY rises.

Both TXRDY and TXEMPTY bits are low when the transmitter is disabled. Writing a character in FLEX\_US\_THR while TXRDY is low has no effect and the written character is lost.

**Figure 46-6. Transmitter Status**

### 46.7.3.2 Manchester Encoder

When the Manchester encoder is in use, characters transmitted through the USART are encoded based on biphase Manchester II format. To enable this mode, set the FLEX\_US\_MR.MAN bit to 1. Depending on polarity configuration, a logic level (zero or one), is transmitted as a coded signal one-to-zero or zero-to-one. Thus, a transition always occurs at the midpoint of each bit time. It consumes more bandwidth than the original NRZ signal (2x) but the receiver has more error control since the expected input must show a change at the center of a bit cell. An example of Manchester encoded sequence is: the byte 0xB1 or 10110001 encodes to 10 01 10 10 01 01 01 10, assuming the default polarity of the encoder. The following figure illustrates this coding scheme.

**Figure 46-7. NRZ to Manchester Encoding**

The Manchester encoded character can also be encapsulated by adding both a configurable preamble and a start frame delimiter pattern. Depending on the configuration, the preamble is a training sequence, composed of a predefined pattern with a programmable length from 1 to 15 bit times. If the preamble length is set to 0, the preamble waveform is not generated prior to any character. The preamble pattern is

chosen among the following sequences: ALL\_ONE, ALL\_ZERO, ONE\_ZERO or ZERO\_ONE, writing the FLEX\_US\_MAN.TX\_PP field. The TX\_PL field is used to configure the preamble length. The following figure illustrates and defines the valid patterns. To improve flexibility, the encoding scheme can be configured using the FLEX\_US\_MAN.TX\_MPOL bit. If the TX\_MPOL bit is set to zero (default), a logic zero is encoded with a zero-to-one transition and a logic one is encoded with a one-to-zero transition. If the TX\_MPOL bit is set to one, a logic one is encoded with a one-to-zero transition and a logic zero is encoded with a zero-to-one transition.

**Figure 46-8. Preamble Patterns, Default Polarity Assumed**

A start frame delimiter is to be configured using the FLEX\_US\_MR.ONEBIT bit. It consists of a user-defined pattern that indicates the beginning of a valid data. The following figure illustrates these patterns. If the start frame delimiter, also known as the start bit, is one bit, (ONEBIT = 1), a logic zero is Manchester encoded and indicates that a new character is being sent serially on the line. If the start frame delimiter is a synchronization pattern also referred to as sync (ONEBIT = 0), a sequence of three bit times is sent serially on the line to indicate the start of a new character. The sync waveform is in itself an invalid Manchester waveform as the transition occurs at the middle of the second bit time. Two distinct sync patterns are used: the command sync and the data sync. The command sync has a logic one level for one and a half bit times, then a transition to logic zero for the second one and a half bit times. If the FLEX\_US\_MR.MODSYNC bit is set to 1, the next character is a command. If it is set to 0, the next character is a data. When direct memory access is used, the MODSYNC bit can be immediately updated with a modified character located in memory. To enable this mode, the FLEX\_US\_MR.VAR\_SYNC bit must be set. In this case, the FLEX\_US\_MR.MODSYNC bit is bypassed and the sync configuration is held in the FLEX\_US\_THR.TXSYNH bit. The USART character format is modified and includes sync information.

**Figure 46-9. Start Frame Delimiter**

### 46.7.3.2.1 Drift Compensation

Drift compensation is available only in 16X Oversampling mode. An hardware recovery system allows a larger clock drift. To enable the hardware system, the bit in the FLEX\_US\_MAN register must be set. If the RXD edge is one 16X clock cycle from the expected edge, this is considered as normal jitter and no corrective actions is taken. If the RXD event is between 4 and 2 clock cycles before the expected edge, then the current period is shortened by one clock cycle. If the RXD event is between 2 and 3 clock cycles after the expected edge, then the current period is lengthened by one clock cycle. These intervals are considered to be drift and so corrective actions are automatically taken.

**Figure 46-10. Bit Resynchronization**

### 46.7.3.3 Asynchronous Receiver

If the USART is programmed in Asynchronous operating mode (SYNC = 0), the receiver oversamples the RXD input line. The oversampling is either 16 or 8 times the baud rate clock, depending on the FLEX\_US\_MR.OVER bit.

The receiver samples the RXD line. If the line is sampled during one half of a bit time to 0, a start bit is detected and data, parity and stop bits are successively sampled on the bit rate clock.

If the oversampling is 16 (OVER = 0), a start is detected at the eighth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 16 oversampling clock cycles. If the oversampling is 8 (OVER = 1), a start is detected at the fourth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 8 oversampling clock cycles.

The number of data bits, first bit sent and Parity mode are selected by the same fields and bits as the transmitter, i.e., respectively CHRL, MODE9, MSBF and PAR. For the synchronization mechanism only, the number of stop bits has no effect on the receiver as it considers only one stop bit, regardless of the NBSTOP field, so that resynchronization between the receiver and the transmitter can occur. Moreover, as soon as the stop bit is sampled, the receiver starts looking for a new start bit so that resynchronization can also be accomplished when the transmitter is operating with one stop bit.

The following figures illustrate start detection and character reception when USART operates in Asynchronous mode.

**Figure 46-11. Asynchronous Start Detection**

**Figure 46-12. Asynchronous Character Reception**

Example: 8-bit, Parity Enabled

### 46.7.3.4 Manchester Decoder

When the FLEX\_US\_MR.MAN bit is set, the Manchester decoder is enabled. The decoder performs both preamble and start frame delimiter detection. One input line is dedicated to Manchester encoded input data.

An optional preamble sequence can be defined. Its length is user-defined and totally independent of the transmitter side. Use the FLEX\_US\_MAN.RX\_PL field to configure the length of the preamble sequence. If the length is set to 0, no preamble is detected and the function is disabled. In addition, the polarity of the input stream is programmable with the FLEX\_US\_MAN.RX\_MPOL bit. Depending on the desired application, the preamble pattern matching is to be defined via the FLEX\_US\_MAN.RX\_PP field. See figure [Preamble Patterns, Default Polarity Assumed](#) for available preamble patterns.

Unlike preamble, the start frame delimiter is shared between Manchester Encoder and Decoder. So, if ONEBIT bit = 1, only a zero encoded Manchester can be detected as a valid start frame delimiter. If ONEBIT = 0, only a sync pattern is detected as a valid start frame delimiter. Decoder operates by

detecting transition on incoming stream. If RXD is sampled during one quarter of a bit time to zero, a start bit is detected. See the following figure. The sample pulse rejection mechanism applies.

The FLEX\_US\_MAN.RXIDLEV bit informs the USART of the receiver line idle state value (receiver line inactive). The user must define RXIDLEV to ensure reliable synchronization. By default, RXIDLEV is set to one (receiver line is at level 1 when there is no activity).

**Figure 46-13. Asynchronous Start Bit Detection**

The receiver is activated and starts preamble and frame delimiter detection, sampling the data at one quarter and then three quarters. If a valid preamble pattern or start frame delimiter is detected, the receiver continues decoding with the same synchronization. If the stream does not match a valid pattern or a valid start frame delimiter, the receiver resynchronizes on the next valid edge. The minimum time threshold to estimate the bit value is three quarters of a bit time.

If a valid preamble (if used) followed with a valid start frame delimiter is detected, the incoming stream is decoded into NRZ data and passed to USART for processing. The following figure illustrates Manchester pattern mismatch. When incoming data stream is passed to the USART, the receiver is also able to detect Manchester code violation. A code violation is a lack of transition in the middle of a bit cell. In this case, the MANE flag in FLEX\_US\_CSR is raised. It is cleared by writing a one to FLEX\_US\_CR.RSTSTA. See figure "Manchester Error Flag" below for an example of Manchester error detection during the data phase.

**Figure 46-14. Preamble Pattern Mismatch**

**Figure 46-15. Manchester Error Flag**

When the start frame delimiter is a sync pattern (ONEBIT = 0), both command and data delimiter are supported. If a valid sync is detected, the received character is written as RXCHR field in the Receive Holding Register (FLEX\_US\_RHR) and the RXSYNH is updated. RXCHR is set to 1 when the received character is a command, and it is set to 0 if the received character is a data. This mechanism alleviates and simplifies the direct memory access as the character contains its own sync field in the same register.

As the decoder is setup to be used in Unipolar mode, the first bit of the frame has to be a zero-to-one transition.

### 46.7.3.5 Radio Interface: Manchester Encoded USART Application

This section describes low data rate RF transmission systems and their integration with a Manchester encoded USART. These systems are based on transmitter and receiver ICs that support ASK and FSK modulation schemes.

The goal is to perform full-duplex radio transmission of characters using two different frequency carriers. See configuration in the following figure.

**Figure 46-16. Manchester Encoded Characters RF Transmission**

The USART peripheral is configured as a Manchester encoder/decoder. Looking at the downstream communication channel, Manchester encoded characters are serially sent to the RF transmitter. This may also include a user defined preamble and a start frame delimiter. Mostly, preamble is used in the RF receiver to distinguish between a valid data from a transmitter and signals due to noise. The Manchester stream is then modulated. See the following figure for an example of ASK modulation scheme. When a logic one is sent to the ASK modulator, the power amplifier, referred to as PA, is enabled and transmits an RF signal at downstream frequency. When a logic zero is transmitted, the RF signal is turned off. If the FSK modulator is activated, two different frequencies are used to transmit data. When a logic 1 is sent, the modulator outputs an RF signal at frequency F0 and switches to F1 if the data sent is a 0. See figure "FSK Modulator Output" below.

From the receiver side, another carrier frequency is used. The RF receiver performs a bit check operation examining demodulated data stream. If a valid pattern is detected, the receiver switches to Receiving mode. The demodulated stream is sent to the Manchester decoder. Because of bit checking inside RF IC, the data transferred to the microcontroller is reduced by a user-defined number of bits. The Manchester preamble length is to be defined in accordance with the RF IC configuration.

**Figure 46-17. ASK Modulator Output**

**Figure 46-18. FSK Modulator Output**

### 46.7.3.6 Synchronous Receiver

In Synchronous mode ( $\text{SYNC} = 1$ ), the receiver samples the RXD signal on each rising edge of the baud rate clock. If a low level is detected, it is considered as a start. All data bits, the parity bit and the stop bits are sampled and the receiver waits for the next start bit. Synchronous mode operations provide a high-speed transfer capability.

Configuration fields and bits are the same as in Asynchronous mode.

The following figure illustrates a character reception in Synchronous mode.

**Figure 46-19. Synchronous Mode Character Reception**

Example: 8-bit, Parity Enabled 1 Stop

### 46.7.3.7 Receiver Operations

When a character reception is completed, it is transferred to the Receive Holding Register ( $\text{FLEX\_US\_RHR}$ ) and the  $\text{FLEX\_US\_CSR.RXRDY}$  bit is raised. If a character is completed while the  $\text{RXRDY}$  is set, the Overrun Error ( $\text{OVRE}$ ) bit is set. The last character is transferred into  $\text{FLEX\_US\_RHR}$  and overwrites the previous one. The  $\text{OVRE}$  bit is cleared by writing a one to Reset Status bit  $\text{FLEX\_US\_CR.RSTSTA}$ .

**Figure 46-20. Receiver Status**

### 46.7.3.8 Parity

The USART supports five parity modes that are selected by writing to the FLEX\_US\_MR.PAR field. The PAR field also enables the Multidrop mode (see section [Multidrop Mode](#)). Even and odd parity bit generation and error detection are supported.

If even parity is selected, the parity generator of the transmitter drives the parity bit to 0 if a number of 1s in the character data bit is even, and to 1 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If odd parity is selected, the parity generator of the transmitter drives the parity bit to 1 if a number of 1s in the character data bit is even, and to 0 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If the mark parity is used, the parity generator of the transmitter drives the parity bit to 1 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 0. If the space parity is used, the parity generator of the transmitter drives the parity bit to 0 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 1. If parity is disabled, the transmitter does not generate any parity bit and the receiver does not report any parity error.

The following table shows an example of the parity bit for the character 0x41 (character ASCII "A") depending on the configuration of the USART. Because there are two bits set to 1 in the character value, the parity bit is set to 1 when the parity is odd, or configured to 0 when the parity is even.

**Table 46-7. Parity Bit Examples**

| Character | Hexadecimal | Binary    | Parity Bit | Parity Mode |
|-----------|-------------|-----------|------------|-------------|
| A         | 0x41        | 0100 0001 | 1          | Odd         |
| A         | 0x41        | 0100 0001 | 0          | Even        |
| A         | 0x41        | 0100 0001 | 1          | Mark        |
| A         | 0x41        | 0100 0001 | 0          | Space       |
| A         | 0x41        | 0100 0001 | None       | None        |

When the receiver detects a parity error, it sets the Parity Error bit FLEX\_US\_CSR.PARE. The PARE bit can be cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit. The following figure illustrates the parity bit status setting and clearing.

**Figure 46-21. Parity Error**

### 46.7.3.9 Multidrop Mode

If the value 0x6 or 0x07 is written to the FLEX\_US\_MR.PAR field, the USART runs in Multidrop mode. This mode differentiates the data characters and the address characters. Data are transmitted with the parity bit to 0 and addresses are transmitted with the parity bit to 1.

If the USART is configured in Multidrop mode, the receiver sets the PARE parity error bit when the parity bit is high and the transmitter is able to send a character with the parity bit high when a one is written to the FLEX\_US\_CR.SENDA bit.

To handle parity error, the PARE bit is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

The transmitter sends an address byte (parity bit set) when the FLEX\_US\_CR.SENDA bit is written to 1. In this case, the next byte written to FLEX\_US\_THR is transmitted as an address. Any character written in FLEX\_US\_THR when the SENDA command is not written is transmitted normally with parity to 0.

### 46.7.3.10 Transmitter Timeguard

The timeguard feature enables the USART interface with slow remote devices.

The timeguard function enables the transmitter to insert an idle state on the TXD line between two characters. This idle state actually acts as a long stop bit.

The duration of the idle state is programmed in the TG field of the Transmitter Timeguard Register (FLEX\_US\_TTGR). When this field is written to zero, no timeguard is generated. Otherwise, the transmitter holds a high level on TXD after each transmitted byte during the number of bit periods programmed in TG in addition to the number of stop bits.

As illustrated in the following figure, the behavior of the TXRDY and TXEMPTY status bits is modified by the programming of a timeguard. TXRDY rises only when the start bit of the next character is sent, and thus remains to 0 during the timeguard transmission if a character has been written in FLEX\_US\_THR. TXEMPTY remains low until the timeguard transmission is completed as the timeguard is part of the current character being transmitted.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-22. Timeguard Operations**

The following table indicates the maximum length of a timeguard period that the transmitter can handle in relation to the function of the baud rate.

**Table 46-8. Maximum Timeguard Length Depending on Baud Rate**

| Baud Rate (bit/s) | Bit Time (μs) | Timeguard (ms) |
|-------------------|---------------|----------------|
| 1,200             | 833           | 212.50         |
| 9,600             | 104           | 26.56          |
| 14,400            | 69.4          | 17.71          |
| 19,200            | 52.1          | 13.28          |
| 28,800            | 34.7          | 8.85           |
| 38,400            | 26            | 6.63           |
| 56,000            | 17.9          | 4.55           |
| 57,600            | 17.4          | 4.43           |
| 115,200           | 8.7           | 2.21           |

### 46.7.3.11 Receiver Timeout

The Receiver Timeout provides support in handling variable-length frames. This feature detects an idle condition on the RXD line. When a timeout is detected, the FLEX\_US\_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver an end of frame.

The timeout delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Timeout Register (FLEX\_US\_RTOR). If the TO field is written to 0, the Receiver Timeout is disabled and no timeout is detected. The FLEX\_US\_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 16-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX\_US\_CSR.TIMEOUT bit rises. Then, the user can either:

- Stop the counter clock until a new character is received. This is performed by writing a '1' to FLEX\_US\_CR.STTTO. In this case, the idle state on RXD before a new character is received does not provide a timeout. This prevents having to handle an interrupt before a character is received and enables waiting for the next idle state on RXD after a frame is received.
- Obtain an interrupt while no character is received. This is performed by writing a '1' to FLEX\_US\_CR.RETTO. In this case, the counter starts counting down immediately from the value

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

TO. This generates a periodic interrupt so that a user timeout can be handled, for example when no key is pressed on a keyboard.

The following figure shows the block diagram of the Receiver Timeout feature.

**Figure 46-23. Receiver Timeout Block Diagram**

The following table gives the maximum timeout period for some standard baud rates.

**Table 46-9. Maximum Timeout Period**

| Baud Rate (bit/s) | Bit Time (μs) | Timeout (ms) |
|-------------------|---------------|--------------|
| 600               | 1,667         | 109,225      |
| 1,200             | 833           | 54,613       |
| 2,400             | 417           | 27,306       |
| 4,800             | 208           | 13,653       |
| 9,600             | 104           | 6,827        |
| 14,400            | 69            | 4,551        |
| 19,200            | 52            | 3,413        |
| 28,800            | 35            | 2,276        |
| 38,400            | 26            | 1,704        |
| 56,000            | 18            | 1,170        |
| 57,600            | 17            | 1,138        |
| 200,000           | 5             | 328          |

### 46.7.3.12 Framing Error

The receiver is capable of detecting framing errors. A framing error happens when the stop bit of a received character is detected at level 0. This can occur if the receiver and the transmitter are fully desynchronized.

A framing error is reported on the FLEX\_US\_CSR.FRAME bit. The FRAME bit is asserted in the middle of the stop bit as soon as the framing error is detected. It is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 46-24. Framing Error Status**

#### 46.7.3.13 Transmit Break

The user can request the transmitter to generate a break condition on the TXD line. A break condition drives the TXD line low during at least one complete character. It appears the same as a 0x00 character sent with the parity and the stop bits to 0. However, the transmitter holds the TXD line at least during one character until the user requests the break condition to be removed.

A break is transmitted by setting the FLEX\_US\_CR.STTBRK bit. This can be done at any time, either while the transmitter is empty (no character in either the shift register or in FLEX\_US\_THR) or when a character is being transmitted. If a break is requested while a character is being shifted out, the character is first completed before the TXD line is held low.

Once the Start Break command is requested, further Start Break commands are ignored until the end of the break is completed.

The break condition is removed by setting the FLEX\_US\_CR.STPBRK bit. If the Stop Break command is requested before the end of the minimum break duration (one character, including start, data, parity and stop bits), the transmitter ensures that the break condition completes.

The transmitter considers the break as though it is a character, i.e., the Start Break and Stop Break commands are processed only if the FLEX\_US\_CSR.TXRDY bit = 1 and the start of the break condition clears the TXRDY and TXEMPTY bits as if a character was processed.

Setting both the FLEX\_US\_CR.STTBRK and FLEX\_US\_CR.STPBRK bits can lead to an unpredictable result. All Stop Break commands requested without a previous Start Break command are ignored. A byte written into the Transmit Holding register while a break is pending, but not started, is ignored.

After the break condition, the transmitter returns the TXD line to 1 for a minimum of 12 bit times. Thus, the transmitter ensures that the remote receiver detects correctly the end of break and the start of the next character. If the timeguard is programmed with a value higher than 12, the TXD line is held high for the timeguard period.

After holding the TXD line for this period, the transmitter resumes normal operations.

The following figure illustrates the effect of both the Start Break (STTBRK) and Stop Break (STPBRK) commands on the TXD line.

**Figure 46-25. Break Transmission**

### 46.7.3.14 Receive Break

The receiver detects a break condition when all data, parity and stop bits are low. This corresponds to detecting a framing error with data to 0x00, but FRAME remains low.

When the low stop bit is detected, the receiver asserts the FLEX\_US\_CSR.RXBRK bit. FLEX\_US\_CSR.RXBRK may be cleared by setting the FLEX\_US\_CR.RSTSTA bit.

An end of receive break is detected by a high level for at least 2/16ths of a bit period in Asynchronous operating mode or one sample at high level in Synchronous operating mode. The end of break detection also asserts the RXBRK bit.

### 46.7.3.15 Hardware Handshaking

The USART features a hardware handshaking out-of-band flow control. The RTS and CTS pins are used to connect with the remote device, as shown in the following figure.

**Figure 46-26. Connection with a Remote Device for Hardware Handshaking**

Setting the USART to operate with hardware handshaking is performed by writing the FLEX\_US\_MR.USART\_MODE field to the value 0x2.

The USART behavior when hardware handshaking is enabled is the same as the behavior in standard Synchronous or Asynchronous mode, except that the receiver drives the RTS pin as described below and the level on the CTS pin modifies the behavior of the transmitter as described below. Using this mode requires using the DMAC channel for reception. The transmitter can handle hardware handshaking in any case.

**Figure 46-27. RTS Line Software Control when FLEX\_US\_MR.USART\_MODE = 2**

The following figure shows how the transmitter operates if hardware handshaking is enabled. The CTS pin disables the transmitter. If a character is being processed, the transmitter is disabled only after the completion of the current character and transmission of the next character happens as soon as the pin CTS falls.

**Figure 46-28. Transmitter Behavior when Operating with Hardware Handshaking**

If USART FIFOs are enabled (bit FLEX\_US\_CR.FIFOEN), the RTS pin can be controlled by the USART Receive FIFO thresholds. The RTS pin control through Receive FIFO thresholds can be activated with the FLEX\_US\_FMR.FRTSC bit. Once activated, the RTS pin will be controlled by Receive FIFO thresholds, set to level 1 each time RXFTHRES is reached and set to level '0' each time RXFTHRES2 is reached (and RXFTHRES is not reached).

**Figure 46-29. Receiver Behavior When FIFO Enabled and FRTSC Set to '1'**

**Note:** In this mode, RXFTHRES must be > RXFTHRES2.

### 46.7.4 ISO7816 Mode

The USART features an ISO7816-compatible operating mode. This mode permits interfacing with smart cards and Security Access Modules (SAM) communicating through an ISO7816 link. Both T = 0 and T = 1 protocols defined by the ISO7816 specification are supported.

Setting the USART in ISO7816 mode is performed by writing the FLEX\_US\_MR.USART\_MODE field to the value 0x4 for protocol T = 0 and to the value 0x6 for protocol T = 1.

#### 46.7.4.1 ISO7816 Mode Overview

The ISO7816 is a half-duplex communication on only one bidirectional line. The baud rate is determined by a division of the clock provided to the remote device (see figure in section [Baud Rate Generator](#)).

The USART connects to a smart card as shown in the following figure. The TXD line becomes bidirectional and the baud rate generator feeds the ISO7816 clock on the SCK pin. As the TXD pin becomes bidirectional, its output remains driven by the output of the transmitter but only when the transmitter is active while its input is directed to the input of the receiver. The USART is considered as the master of the communication as it generates the clock.

**Figure 46-30. Connection of a Smart Card to the USART**

When operating in ISO7816, either in T = 0 or T = 1 modes, the character format is partially predefined. The configuration is forced to 8 data bits, and 1 or 2 stop bits, regardless of the values programmed in the CHRL, MODE9 and CHMODE fields. MSBF can be used to transmit LSB or MSB first. The bit INVDATA can be used to transmit in Normal or Inverse mode.

The USART cannot operate concurrently in both Receiver and Transmitter modes as the communication is unidirectional at a time. It has to be configured according to the required mode by enabling or disabling either the receiver or the transmitter as desired. Enabling both the receiver and the transmitter at the same time in ISO7816 mode may lead to unpredictable results.

The ISO7816 specification defines an inverse transmission format. Data bits of the character must be transmitted on the I/O line at their negative value.

#### 46.7.4.2 Protocol T = 0

In T = 0 protocol, a character is made up of 1 start bit, 8 data bits, 1 parity bit and 1 guard time, which lasts two bit times. The transmitter shifts out the bits and does not drive the I/O line during the guard time.

If no parity error is detected, the I/O line remains at 1 during the guard time and the transmitter can continue with the transmission of the next character, as shown in the following figure.

If a parity error is detected by the receiver, it drives the I/O line to 0 during the guard time, as shown in figure "T = 0 Protocol with Parity Error" below. This error bit is also named NACK, for Non Acknowledge. In this case, the character lasts 1 bit time more, as the guard time length is the same and is added to the error bit time which lasts 1 bit time.

When the USART is the receiver and it detects an error, it does not load the erroneous character in the Receive Holding Register (FLEX\_US\_RHR). It appropriately sets the PARE bit in the Status Register (FLEX\_US\_CSR) so that the software can handle the error.

**Figure 46-31. T = 0 Protocol without Parity Error**

**Figure 46-32. T = 0 Protocol with Parity Error**

#### **46.7.4.2.1 Receive Error Counter**

The USART receiver also records the total number of errors. This can be read in the Number of Error (FLEX\_US\_NER) register. The NB\_ERRORS field can record up to 255 errors. Reading FLEX\_US\_NER automatically clears the NB\_ERRORS field.

#### **46.7.4.2.2 Receive NACK Inhibit**

The USART can be configured to inhibit an error. This is done by writing a '1' to FLEX\_US\_MR.INACK. In this case, no error signal is driven on the I/O line even if a parity bit is detected.

Moreover, if INACK = 1, the erroneous received character is stored in the Receive Holding register as if no error occurred, and the RXRDY bit rises.

#### **46.7.4.2.3 Transmit Character Repetition**

When the USART is transmitting a character and gets a NACK, it can automatically repeat the character before moving on to the next one. Repetition is enabled by writing the FLEX\_US\_MR.MAX\_ITERATION field at a value higher than 0. Each character can be transmitted up to eight times: the first transmission plus seven repetitions.

If MAX\_ITERATION does not equal zero, the USART repeats the character as many times as the value loaded in MAX\_ITERATION.

When the USART repetition number reaches MAX\_ITERATION, and the last repeated character is not acknowledged, the FLEX\_US\_CSR.ITER bit is set. If the repetition of the character is acknowledged by the receiver, the repetitions are stopped and the iteration counter is cleared.

The FLEX\_US\_CSR.ITER bit can be cleared by writing the FLEX\_US\_CR.RSTIT bit to 1.

#### **46.7.4.2.4 Disable Successive Receive NACK**

The receiver can limit the number of successive NACKs sent back to the remote transmitter. This is programmed by setting the FLEX\_US\_MR.DSNACK bit. The maximum number of NACKs transmitted is programmed in the MAX\_ITERATION field. As soon as MAX\_ITERATION is reached, no error signal is driven on the I/O line and the FLEX\_US\_CSR.ITER bit is set.

#### **46.7.4.3 Protocol T = 1**

When operating in ISO7816 protocol T = 1, the transmission is similar to an asynchronous format with only one stop bit. The parity is generated when transmitting and checked when receiving. Parity error detection sets the FLEX\_US\_CSR.PARE bit.

#### **46.7.5 IrDA Mode**

The USART features an IrDA mode supplying half-duplex point-to-point wireless communication. It embeds the modulator and demodulator which allows a glueless connection to the infrared transceivers, as shown in the following figure. The modulator and demodulator are compliant with the IrDA specification version 1.1 and support data transfer speeds ranging from 2.4 kbit/s to 115.2 kbit/s.

The USART IrDA mode is enabled by setting the FLEX\_US\_MR.USART\_MODE field to the value 0x8. The IrDA Filter Register (FLEX\_US\_IF) allows configuring the demodulator filter. The USART transmitter and receiver operate in a normal Asynchronous mode and all parameters are accessible. Note that the modulator and the demodulator are activated.

**Figure 46-33. Connection to IrDA Transceivers**

The receiver and the transmitter must be enabled or disabled according to the direction of the transmission to be managed.

To receive IrDA signals, the following needs to be done:

- Disable TX and Enable RX
- Configure the TXD pin as PIO and set it as an output to 0 (to avoid LED transmission). Disable the internal pullup (better for power consumption).
- Receive data

#### 46.7.5.1 IrDA Modulation

For baud rates up to and including 115.2 kbit/s, the RZI modulation scheme is used. “0” is represented by a light pulse of 3/16th of a bit time. Some examples of signal pulse duration are shown in the following table.

**Table 46-10. IrDA Pulse Duration**

| Baud Rate    | Pulse Duration (3/16) |
|--------------|-----------------------|
| 2.4 kbit/s   | 78.13 $\mu$ s         |
| 9.6 kbit/s   | 19.53 $\mu$ s         |
| 19.2 kbit/s  | 9.77 $\mu$ s          |
| 38.4 kbit/s  | 4.88 $\mu$ s          |
| 57.6 kbit/s  | 3.26 $\mu$ s          |
| 115.2 kbit/s | 1.63 $\mu$ s          |

The following figure shows an example of character transmission.

**Figure 46-34. IrDA Modulation**

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.7.5.2 IrDA Baud Rate

The following table gives some examples of CD values, baud rate error and pulse duration. Note that the requirement on the maximum acceptable error of  $\pm 1.87\%$  must be met.

**Table 46-11. IrDA Baud Rate Error**

| Peripheral Clock | Baud Rate (bit/s) | CD  | Baud Rate Error | Pulse Time ( $\mu$ s) |
|------------------|-------------------|-----|-----------------|-----------------------|
| 3,686,400        | 115,200           | 2   | 0.00%           | 1.63                  |
| 20,000,000       | 115,200           | 11  | 1.38%           | 1.63                  |
| 32,768,000       | 115,200           | 18  | 1.25%           | 1.63                  |
| 40,000,000       | 115,200           | 22  | 1.38%           | 1.63                  |
| 3,686,400        | 57,600            | 4   | 0.00%           | 3.26                  |
| 20,000,000       | 57,600            | 22  | 1.38%           | 3.26                  |
| 32,768,000       | 57,600            | 36  | 1.25%           | 3.26                  |
| 40,000,000       | 57,600            | 43  | 0.93%           | 3.26                  |
| 3,686,400        | 38,400            | 6   | 0.00%           | 4.88                  |
| 20,000,000       | 38,400            | 33  | 1.38%           | 4.88                  |
| 32,768,000       | 38,400            | 53  | 0.63%           | 4.88                  |
| 40,000,000       | 38,400            | 65  | 0.16%           | 4.88                  |
| 3,686,400        | 19,200            | 12  | 0.00%           | 9.77                  |
| 20,000,000       | 19,200            | 65  | 0.16%           | 9.77                  |
| 32,768,000       | 19,200            | 107 | 0.31%           | 9.77                  |
| 40,000,000       | 19,200            | 130 | 0.16%           | 9.77                  |
| 3,686,400        | 9,600             | 24  | 0.00%           | 19.53                 |
| 20,000,000       | 9,600             | 130 | 0.16%           | 19.53                 |
| 32,768,000       | 9,600             | 213 | 0.16%           | 19.53                 |
| 40,000,000       | 9,600             | 260 | 0.16%           | 19.53                 |
| 3,686,400        | 2,400             | 96  | 0.00%           | 78.13                 |
| 20,000,000       | 2,400             | 521 | 0.03%           | 78.13                 |
| 32,768,000       | 2,400             | 853 | 0.04%           | 78.13                 |

### 46.7.5.3 IrDA Demodulator

The demodulator is based on the IrDA Receive filter comprised of an 8-bit down counter which is loaded with the value programmed in FLEX\_US\_IF. When a falling edge is detected on the RXD pin, the Filter Counter starts counting down at the peripheral clock speed. If a rising edge is detected on the RXD pin, the counter stops and is reloaded with FLEX\_US\_IF. If no rising edge is detected when the counter reaches 0, the input of the receiver is driven low during one bit time.

The following figure illustrates the operations of the IrDA demodulator.

**Figure 46-35. IrDA Demodulator Operations**

The programmed value in the FLEX\_US\_IF register must always meet the following criteria:

$$t_{\text{peripheral clock}} \times (\text{IRDA\_FILTER} + 3) < 1.41 \mu\text{s}$$

As the IrDA mode uses the same logic as the ISO7816, note that the FLEX\_US\_FIDI.FI\_DI\_RATIO field must be set to a value higher than 0 to make sure IrDA communications operate correctly.

### 46.7.6 RS485 Mode

The USART features the RS485 mode to enable line driver control. While operating in RS485 mode, the USART behaves as though in Asynchronous or Synchronous mode and configuration of all the parameters is possible. The difference is that the RTS pin is driven high when the transmitter is operating. The behavior of the RTS pin is controlled by the TXEMPTY bit. A typical connection of the USART to an RS485 bus is shown in the following figure.

**Figure 46-36. Typical Connection to an RS485 Bus**

The USART is set in RS485 mode by writing the value 0x1 to the FLEX\_US\_MR.USART\_MODE field.

The RTS pin is at a level inverse to the TXEMPTY bit. Significantly, the RTS pin remains high when a timeguard is programmed, so that the line can remain driven after the last character completion. The following figure gives an example of the RTS waveform during a character transmission when the timeguard is enabled.

**Figure 46-37. Example of RTS Drive with Timeguard**

#### 46.7.7 USART Comparison Function on Received Character

The CMP flag in FLEX\_US\_CSR is set when the received character matches the conditions programmed in FLEX\_US\_CMPR. The CMP flag is set as soon as FLEX\_US\_RHR is loaded with the new received character. The CMP flag is cleared by writing a one to FLEX\_US\_CR.RSTSTA.

FLEX\_US\_CMPR can be programmed to provide different comparison methods:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When the FLEX\_US\_CMPR.CMPMODE bit is set to FLAG\_ONLY (value 0), all received data are loaded in FLEX\_US\_RHR and the CMP flag provides the status of the comparison result.

By programming the START\_CONDITION.CMPMODE bit (value 1), the comparison function result triggers the start of the loading of FLEX\_US\_RHR (see the following figure). The trigger condition exists as soon as the received character value matches the condition defined by the programming of VAL1, VAL2 and CMPPAR in FLEX\_US\_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX\_US\_CR.REQCLR bit.

The value programmed in the VAL1 and VAL2 fields must not exceed the maximum value of the received character (see CHRL field in register [46.10.6 FLEX\\_US\\_MR](#)).

**Figure 46-38. Receive Holding Register Management**

CMPMODE = 1, VAL1 = VAL2 = 0x06

### 46.7.8 SPI Mode

The Serial Peripheral Interface (SPI) mode is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “master” which controls the data flow, while the other devices act as “slaves” which have data shifted into and out by the master. Different CPUs can take turns being masters and one master may simultaneously shift data into multiple slaves. (Multiple master protocol is the opposite of single master protocol, where one CPU is always the master while all of the others are always slaves.) However, only one slave may drive its output to write data back to the master at any given time.

A slave device is selected when its NSS signal is asserted by the master. The USART in SPI Master mode can address only one SPI slave because it can generate only one NSS signal.

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI): This data line supplies the output data from the master shifted into the input of the slave.
- Master In Slave Out (MISO): This data line supplies the output data from a slave to the input of the master.
- Serial Clock (SCK): This control line is driven by the master and regulates the flow of the data bits. The master may transmit data at a variety of bit rates. The SCK line cycles once for each bit that is transmitted.
- Slave Select (NSS): This control line allows the master to select or deselect the slave.

#### 46.7.8.1 Modes of Operation

The USART can operate in SPI Master mode or in SPI Slave mode.

Operation in SPI Master mode is programmed by writing 0xE to the FLEX\_US\_MR.USART\_MODE field. In this case, the SPI lines must be connected as described below:

- The MOSI line is driven by the output pin TXD

- The MISO line drives the input pin RXD
- The SCK line is driven by the output pin SCK
- The NSS line is driven by the output pin RTS

Operation in SPI Slave mode is programmed by writing to 0xF the FLEX\_US\_MR.USART\_MODE field. In this case, the SPI lines must be connected as described below:

- The MOSI line drives the input pin RXD
- The MISO line is driven by the output pin TXD
- The SCK line drives the input pin SCK
- The NSS line drives the input pin CTS

In order to avoid an unpredictable behavior, any change of the SPI mode must be followed by a software reset of the transmitter and of the receiver (except the initial configuration after a hardware reset). (See section [Receiver and Transmitter Control](#).)

#### 46.7.8.2 Bit Rate

In SPI mode, the bit rate generator operates in the same way as in USART Synchronous mode. See section [46.7.1.3 Baud Rate in Synchronous Mode or SPI Mode](#). However, some restrictions apply:

In SPI Master mode:

- The external clock SCK must not be selected (USCLKS  $\neq$  0x3), and the FLEX\_US\_MR.CLKO bit must be set in order to generate correctly the serial clock on the SCK pin.
- To ensure a correct behavior of the receiver and the transmitter, the value programmed in CD must be  $\geq 6$ .
- If the divided peripheral clock is selected, the value programmed in CD must be even to ensure a 50:50 mark/space ratio on the SCK pin; this value can be odd if the peripheral clock is selected.

In SPI Slave mode:

- The external clock (SCK) selection is forced regardless of the value of the FLEX\_US\_MR.USCLKS field. Likewise, the value written in FLEX\_US\_BRGR has no effect, because the clock is provided directly by the signal on the USART SCK pin.
- To ensure a correct behavior of the receiver and the transmitter, the external clock (SCK) frequency must be at least six times lower than the system clock.

#### 46.7.8.3 Data Transfer

Up to nine data bits are successively shifted out on the TXD pin at each rising or falling edge (depending of CPOL and CPHA) of the programmed serial clock. There is no Start bit, no Parity bit and no Stop bit.

The number of data bits is selected by the CHRL field and the MODE9 bit in FLEX\_US\_MR. The nine bits are selected by setting the MODE9 bit regardless of the CHRL field. The MSB data bit is always sent first in SPI mode (Master or Slave).

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the FLEX\_US\_MR.CPOL bit. The clock phase is programmed with the CPHA bit. These two parameters determine the edges of the clock signal upon which data are driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are used and fixed in different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Table 46-12. SPI Bus Protocol Mode**

| SPI Bus Protocol Mode | CPOL | CPHA |
|-----------------------|------|------|
| 0                     | 0    | 1    |
| 1                     | 0    | 0    |
| 2                     | 1    | 1    |
| 3                     | 1    | 0    |

**Figure 46-39. SPI Transfer Format (CPHA = 1, 8 bits per transfer)**

**Figure 46-40. SPI Transfer Format (CPHA = 0, 8 bits per transfer)**

### 46.7.8.4 Receiver and Transmitter Control

See section [Receiver and Transmitter Control](#).

#### **46.7.8.5 Character Transmission**

The characters are sent by writing in the Transmit Holding Register (FLEX\_US\_THR). An additional condition for transmitting a character can be added when the USART is configured in SPI Master mode. In the "USART Mode Register (SPI\_MODE)" (FLEX\_US\_MR), the value configured on the WRDBT bit can prevent any character transmission (even if FLEX\_US\_THR has been written) while the receiver side is not ready (character not read). When WRDBT = 0, the character is transmitted whatever the receiver status. If WRDBT = 1, the transmitter waits for the Receive Holding Register (FLEX\_US\_RHR) to be read before transmitting the character (RXRDY flag cleared), thus preventing any overflow (character loss) on the receiver side.

The chip select line is deasserted for a period equivalent to 3 bits between the transmission of two data.

The transmitter reports two status bits in FLEX\_US\_CSR: TXRDY (Transmitter Ready), which indicates that FLEX\_US\_THR is empty and TXEMPTY, which indicates that all the characters written in FLEX\_US\_THR have been processed. When the current character processing is completed, the last character written in FLEX\_US\_THR is transferred into the shift register of the transmitter and FLEX\_US\_THR is emptied, and thus TXRDY rises.

Both the TXRDY and the TXEMPTY bits are low when the transmitter is disabled. Writing a character in FLEX\_US\_THR while TXRDY is low has no effect and the written character is lost.

If the USART is in SPI Slave mode and if a character must be sent while FLEX\_US\_THR is empty, the UNRE (Underrun Error) bit is set. The TXD transmission line stays at high level during all this time. The UNRE bit is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

In SPI Master mode, the slave select line (NSS) is asserted at low level one  $t_{bit}$  ( $t_{bit}$  being the nominal time required to transmit a bit) before the transmission of the MSB bit and released at high level one  $t_{bit}$  after the transmission of the LSB bit. So, the slave select line (NSS) is always released between each character transmission and a minimum delay of three  $t_{bit}$  always inserted. However, in order to address slave devices supporting the CSAAT mode (Chip Select Active After Transfer), the slave select line (NSS) can be forced at low level by writing a one to the FLEX\_US\_CR.RTSEN bit. The slave select line (NSS) can be released at high level only by writing a one to the FLEX\_US\_CR.RTSDIS bit (for example, when all data have been transferred to the slave device).

In SPI Slave mode, the transmitter does not require a falling edge of the slave select line (NSS) to initiate a character transmission but only a low level. However, this low level must be present on the slave select line (NSS) at least one  $t_{bit}$  before the first serial clock cycle corresponding to the MSB bit.

#### **46.7.8.6 Character Reception**

When a character reception is completed, it is transferred to the Receive Holding Register (FLEX\_US\_RHR) and the RXRDY bit in the Status Register (FLEX\_US\_CSR) rises. If a character is completed while RXRDY is set, the OVRE (Overrun Error) bit is set. The last character is transferred into FLEX\_US\_RHR and overwrites the previous one. The OVRE bit is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

To ensure correct behavior of the receiver in SPI Slave mode, the master device sending the frame must ensure a minimum delay of one  $t_{bit}$  between each character transmission. The receiver does not require a falling edge of the slave select line (NSS) to initiate a character reception but only a low level. However, this low level must be present on the slave select line (NSS) at least one  $t_{bit}$  before the first serial clock cycle corresponding to the MSB bit.

#### **46.7.8.7 Receiver Timeout**

Because the receiver bit rate clock is active only during data transfers in SPI mode, a receiver timeout is impossible in this mode, whatever the timeout value is in field FLEX\_US\_RTOR.TO.

#### **46.7.9 LIN Mode**

The LIN mode provides master node and slave node connectivity on a LIN bus.

The LIN (Local Interconnect Network) is a serial communication protocol which efficiently supports the control of mechatronic nodes in distributed automotive applications.

The main properties of the LIN bus are:

- Single master/multiple slaves concept
- Low-cost silicon implementation based on common UART/SCI interface hardware, an equivalent in software, or as a pure state machine.
- Self synchronization without quartz or ceramic resonator in the slave nodes
- Deterministic signal transmission
- Low cost single-wire implementation
- Speed up to 20 kbit/s

LIN provides cost efficient bus communication where the bandwidth and versatility of CAN are not required.

The LIN mode enables processing LIN frames with a minimum of action from the microprocessor.

##### **46.7.9.1 Modes of Operation**

The USART can act either as a LIN master node or as a LIN slave node.

The node configuration is chosen by setting the USART\_MODE field in the USART Mode Register (FLEX\_US\_MR):

- LIN master node (USART\_MODE = 0xA)
- LIN slave node (USART\_MODE = 0xB)

In order to avoid unpredictable behavior, any change of the LIN node configuration must be followed by a software reset of the transmitter and of the receiver (except the initial node configuration after a hardware reset). (See section [46.7.2 Receiver and Transmitter Control](#).)

##### **46.7.9.2 Baud Rate Configuration**

See section [Baud Rate in Asynchronous Mode](#).

- LIN master node: The baud rate is configured in FLEX\_US\_BRGR.
- LIN slave node: The initial baud rate is configured in FLEX\_US\_BRGR. This configuration is automatically copied in the LIN Baud Rate Register (FLEX\_US\_LINBRR) when writing FLEX\_US\_BRGR. After the synchronization procedure, the baud rate is updated in FLEX\_US\_LINBRR.

##### **46.7.9.3 Receiver and Transmitter Control**

See section [46.7.2 Receiver and Transmitter Control](#).

##### **46.7.9.4 Character Transmission**

See section [Transmitter Operations](#).

##### **46.7.9.5 Character Reception**

See section [Receiver Operations](#).

##### **46.7.9.6 Header Transmission (Master Node Configuration)**

All the LIN Frames start with a header which is sent by the master node and consists of a Synch Break Field, Synch Field and Identifier Field.

So in master node configuration, the frame handling starts with the sending of the header.

The header is transmitted as soon as the identifier is written in the LIN Identifier Register (FLEX\_US\_LINIR). At this moment the flag TXRDY falls.

The Break Field, the Synch Field and the Identifier Field are sent automatically one after the other.

The Break Field consists of 13 dominant bits and 1 recessive bit, the Synch Field is the character 0x55 and the Identifier corresponds to the character written in the LIN Identifier Register (FLEX\_US\_LINIR). The Identifier parity bits can be automatically computed and sent (see section [Identifier Parity](#)).

The flag TXRDY rises when the identifier character is transferred into the shift register of the transmitter.

As soon as the Synch Break Field is transmitted, the FLEX\_US\_CSR.LINBK flag bit is set. Likewise, as soon as the Identifier Field is sent, the FLEX\_US\_CSR.LINID flag bit is set. These flags are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 46-41. Header Transmission**

### 46.7.9.7 Header Reception (Slave Node Configuration)

All the LIN frames start with a header which is sent by the master node and consists of a Synch Break Field, Synch Field and Identifier Field.

In slave node configuration, the frame handling starts with the reception of the header.

The USART uses a break detection threshold of 11 nominal bit times at the actual baud rate. At any time, if 11 consecutive recessive bits are detected on the bus, the USART detects a Break Field. As long as a Break Field has not been detected, the USART stays idle and the received data are not taken in account.

When a Break Field has been detected, the FLEX\_US\_CSR.LINBK flag is set and the USART expects the Synch Field character to be 0x55. This field is used to update the actual baud rate in order to remain synchronized (see section [Slave Node Synchronization](#)). If the received Synch character is not 0x55, an Inconsistent Synch Field error is generated (see section [LIN Errors](#)).

After receiving the Synch Field, the USART expects to receive the Identifier Field.

When the Identifier Field has been received, the FLEX\_US\_CSR.LINID flag bit is set. At this moment, the IDCHR field in the LIN Identifier Register (FLEX\_US\_LINIR) is updated with the received character. The Identifier parity bits can be automatically computed and checked (see section [Identifier Parity](#)).

If the header is not entirely received within the time given by the maximum length of the header  $t_{Header\_Maximum}$ , the FLEX\_US\_CSR.LINHTE error flag bit is set.

The flag bits LINID, LINBK and LINHTE are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 46-42. Header Reception**

### 46.7.9.8 Slave Node Synchronization

The synchronization is done only in slave node configuration. The procedure is based on time measurement between the falling edges of the Synch Field. The falling edges are available in distances of 2, 4, 6 and 8 bit times.

**Figure 46-43. Synch Field**

The time measurement is made by a 19-bit counter driven by the sampling clock (see section [Baud Rate Generator](#)).

When the start bit of the Synch Field is detected, the counter is reset. Then during the next eight  $t_{bit}$  of the Synch Field, the counter is incremented. At the end of these eight  $t_{bit}$ , the counter is stopped. At this moment, the 16 most significant bits of the counter (value divided by 8) give the new clock divider (LINCD) and the 3 least significant bits of this value (the remainder) give the new fractional part (LINFP).

Once the Synch Field has been entirely received, the clock divider (LINCD) and the fractional part (LINFP) are updated in the LIN Baud Rate Register (FLEX\_US\_LINBRR) with the computed values, if the Synchronization is not disabled by the SYNCDIS bit in the LIN Mode Register (FLEX\_US\_LINMR).

After reception of the Synch Field:

- If it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance  $FTol\_Unsynch$  ( $\pm 15\%$ ), then the clock divider (LINCD) and the fractional part (LINFP) are not updated, and the FLEX\_US\_CSR.LINSTE error flag bit is set.
- If it appears that the sampled Synch character is not equal to 0x55, then the clock divider (LINCD) and the fractional part (LINFP) are not updated, and the FLEX\_US\_CSR.LINISFE error flag bit is set.

Flags LINSTE and LINISFE are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-44. Slave Node Synchronization**

The synchronization accuracy depends on several parameters:

- The nominal clock frequency ( $f_{Nom}$ ) (the theoretical slave node clock frequency)
- The baud rate
- The oversampling ( $OVER = 0 \Rightarrow 16X$  or  $OVER = 1 \Rightarrow 8X$ )

The following formula is used to compute the deviation of the slave bit rate relative to the master bit rate after synchronization ( $f_{SLAVE}$  is the real slave node clock frequency).

$$\text{Baud rate deviation} = \left( 100 \times \frac{[\alpha \times 8 \times (2 - \text{Over}) + \beta] \times \text{Baud rate}}{8 \times f_{SLAVE}} \right) \%$$

$$\text{Baud rate deviation} = \left( 100 \times \frac{[\alpha \times 8 \times (2 - \text{Over}) + \beta] \times \text{Baud rate}}{8 \times \left( \frac{f_{TOL\_UNSYNCH}}{100} \right) \times f_{Nom}} \right) \%$$

$$-0.5 \leq \alpha \leq +0.5 \quad -1 < \beta < +1$$

$f_{TOL\_UNSYNCH}$  is the deviation of the real slave node clock from the nominal clock frequency. The LIN Standard imposes that it must not exceed  $\pm 15\%$ . The LIN Standard imposes also that for communication between two nodes, their bit rate must not differ by more than  $\pm 2\%$ . This means that the baud rate deviation must not exceed  $\pm 1\%$ .

Therefore, a minimum value for the nominal clock frequency can be computed as follows:

$$f_{Nom}(\min) = \left( 100 \times \frac{[0.5 \times 8 \times (2 - \text{Over}) + 1] \times \text{Baud rate}}{8 \times \left( \frac{-15}{100} + 1 \right) \times 1\%} \right) \text{Hz}$$

Examples:

- Baud rate = 20 kbit/s,  $OVER = 0$  (Oversampling 16X)  $\Rightarrow f_{Nom}(\min) = 2.64 \text{ MHz}$
- Baud rate = 20 kbit/s,  $OVER = 1$  (Oversampling 8X)  $\Rightarrow f_{Nom}(\min) = 1.47 \text{ MHz}$
- Baud rate = 1 kbit/s,  $OVER = 0$  (Oversampling 16X)  $\Rightarrow f_{Nom}(\min) = 132 \text{ kHz}$
- Baud rate = 1 kbit/s,  $OVER = 1$  (Oversampling 8X)  $\Rightarrow f_{Nom}(\min) = 74 \text{ kHz}$

#### 46.7.9.9 Identifier Parity

A protected identifier consists of two subfields: the identifier and the identifier parity. Bits 0 to 5 are assigned to the identifier, and bits 6 and 7 are assigned to the parity.

The USART interface can generate/check these parity bits, but this feature can also be disabled. The user can choose between two modes via the FLEX\_US\_LINMR.PARDIS bit:

- PARDIS = 0:
  - During header transmission, the parity bits are computed and sent with the six least significant bits of the IDCHR field of the LIN Identifier Register (FLEX\_US\_LINIR). Bits 6 and 7 of this register are discarded.
  - During header reception, the parity bits of the identifier are checked. If the parity bits are wrong, an Identifier Parity error occurs (see section [Parity](#)). Only the six least significant bits of the IDCHR field are updated with the received Identifier. Bits 6 and 7 are stuck to 0.
- PARDIS = 1:
  - During header transmission, all the bits of the IDCHR field of the LIN Identifier Register (FLEX\_US\_LINIR) are sent on the bus.
  - During header reception, all the bits of the IDCHR field are updated with the received Identifier.

#### 46.7.9.10 Node Action

Depending on the identifier, the node is affected—or not—by the LIN response. Consequently, after sending or receiving the identifier, the USART must be configured. There are three possible configurations:

- PUBLISH: the node sends the response.
- SUBSCRIBE: the node receives the response.
- IGNORE: the node is not concerned by the response, it does not send and does not receive the response.

This configuration is made by the LIN Node Action (NACT) field in USART LIN Mode Register (FLEX\_US\_LINMR).

Example: a LIN cluster that contains a master and two slaves:

- Data transfer from the master to slave 1 and to slave 2:

NACT(master) = PUBLISH

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = SUBSCRIBE

- Data transfer from the master to slave 1 only:

NACT(master) = PUBLISH

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = IGNORE

- Data transfer from slave 1 to the master:

NACT(master) = SUBSCRIBE

NACT(slave 1) = PUBLISH

NACT(slave 2) = IGNORE

- Data transfer from slave 1 to slave 2:

NACT(master) = IGNORE

NACT(slave 1) = PUBLISH

NACT(slave 2) = SUBSCRIBE

- Data transfer from slave 2 to the master and to slave 1:

NACT(master) = SUBSCRIBE

NACT(slave 1) = SUBSCRIBE

NACT(slave 2) = PUBLISH

### 46.7.9.11 Response Data Length

The LIN response data length is the number of data fields (bytes) of the response excluding the checksum.

The response data length can either be configured by the user or be defined automatically by bits 4 and 5 of the Identifier (compatibility to LIN Specification 1.1). The user can choose between these two modes by the FLEX\_US\_LINMR.DLM bit:

- DLM = 0: The response data length is configured by the user via the FLEX\_US\_LINMR.DLC field. The response data length is equal to (DLC + 1) bytes. DLC can be programmed from 0 to 255, so the response can contain from 1 data byte up to 256 data bytes.
- DLM = 1: The response data length is defined by the Identifier (IDCHR in FLEX\_US\_LINIR) according to the table below. The FLEX\_US\_LINMR.DLC field is discarded. The response can contain 2 or 4 or 8 data bytes.

**Table 46-13. Response Data Length if DLM = 1**

| IDCHR[5] | IDCHR[4] | Response Data Length (bytes) |
|----------|----------|------------------------------|
| 0        | 0        | 2                            |
| 0        | 1        | 2                            |
| 1        | 0        | 4                            |
| 1        | 1        | 8                            |

**Figure 46-45. Response Data Length**

### 46.7.9.12 Checksum

The last field of a frame is the checksum. The checksum contains the inverted 8-bit sum with carry, over all data bytes or all data bytes and the protected identifier. Checksum calculation over the data bytes only is called classic checksum and it is used for communication with LIN 1.3 slaves. Checksum calculation over the data bytes and the protected identifier byte is called enhanced checksum and it is used for communication with LIN 2.0 slaves.

The USART can be configured to:

- Send/Check an Enhanced checksum automatically (CHKDIS = 0 & CHKTYP = 0)
- Send/Check a Classic checksum automatically (CHKDIS = 0 & CHKTYP = 1)
- Not send/check a checksum (CHKDIS = 1)

This configuration is made by the Checksum Type (CHKTYP) and Checksum Disable (CHKDIS) bits of FLEX\_US\_LINMR.

If the checksum feature is disabled, the user can send it manually all the same, by considering the checksum as a normal data byte and by adding 1 to the response data length (see section [Response Data Length](#)).

#### 46.7.9.13 Frame Slot Mode

This mode is useful only for master nodes. It respects the following rule: each frame slot shall be longer than or equal to  $t_{\text{Frame\_Maximum}}$ .

If the Frame Slot mode is enabled (FSDIS = 0) and a frame transfer has been completed, the TXRDY flag is set again only after  $t_{\text{Frame\_Maximum}}$  delay, from the start of frame. So the master node cannot send a new header if the frame slot duration of the previous frame is inferior to  $t_{\text{Frame\_Maximum}}$ .

If the Frame Slot mode is disabled (FSDIS = 1) and a frame transfer has been completed, the TXRDY flag is set again immediately.

The  $t_{\text{Frame\_Maximum}}$  is calculated as follows:

If the Checksum is sent (CHKDIS = 0):

- $t_{\text{Header\_Nominal}} = 34 \times t_{\text{bit}}$
- $t_{\text{Response\_Nominal}} = 10 \times (\text{NData} + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (t_{\text{Header\_Nominal}} + t_{\text{Response\_Nominal}} + 1)^{(1)}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (34 + 10 \times (\text{DLC} + 1 + 1) + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = (77 + 14 \times \text{DLC}) \times t_{\text{bit}}$

If the Checksum is not sent (CHKDIS = 1):

- $t_{\text{Header\_Nominal}} = 34 \times t_{\text{bit}}$
- $t_{\text{Response\_Nominal}} = 10 \times \text{NData} \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (t_{\text{Header\_Nominal}} + t_{\text{Response\_Nominal}} + 1)^{(1)}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (34 + 10 \times (\text{DLC} + 1) + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = (63 + 14 \times \text{DLC}) \times t_{\text{bit}}$

Note: 1. The term “+1” leads to an integer result for  $t_{\text{Frame\_Maximum}}$  (LIN Specification 1.3).

**Figure 46-46. Frame Slot Mode**

### 46.7.9.14 LIN Errors

#### 46.7.9.14.1 Bit Error

This error is generated in master of slave node configuration, when the USART is transmitting and if the transmitted value on the Tx line is different from the value sampled on the Rx line. If a bit error is detected, the transmission is aborted at the next byte border.

This error is reported by the FLEX\_US\_CSR.LINBE flag.

#### 46.7.9.14.2 Inconsistent Synch Field Error

This error is generated in slave node configuration, if the Synch Field character received is other than 0x55.

This error is reported by the FLEX\_US\_CSR.LINISFE flag.

#### 46.7.9.14.3 Identifier Parity Error

This error is generated in slave node configuration, if the parity of the identifier is wrong. This error can be generated only if the parity feature is enabled (PARDIS = 0).

This error is reported by the FLEX\_US\_CSR.LINIPE flag.

#### 46.7.9.14.4 Checksum Error

This error is generated in master of slave node configuration, if the received checksum is wrong. This flag can be set to 1 only if the checksum feature is enabled (CHKDIS = 0).

This error is reported by the FLEX\_US\_CSR.LINCE flag.

#### 46.7.9.14.5 Slave Not Responding Error

This error is generated in master of slave node configuration, when the USART expects a response from another node (NACT = SUBSCRIBE) but no valid message appears on the bus within the time given by the maximum length of the message frame,  $t_{Frame\_Maximum}$  (see section [Frame Slot Mode](#)). This error is disabled if the USART does not expect any message (NACT = PUBLISH or NACT = IGNORE).

This error is reported by the FLEX\_US\_CSR.LINSNRE.

#### 46.7.9.14.6 Synch Tolerance Error

This error is generated in slave node configuration if, after the clock synchronization procedure, it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance FTol\_Unsynch ( $\pm 15\%$ ).

This error is reported by the FLEX\_US\_CSR.LINSTE flag.

### 46.7.9.14.7 Header Timeout Error

This error is generated in slave node configuration, if the Header is not entirely received within the time given by the maximum length of the Header,  $t_{Header\_Maximum}$ .

This error is reported by the FLEX\_US\_CSR.LINHTE flag.

### 46.7.9.15 LIN Frame Handling

#### 46.7.9.15.1 Master Node Configuration

- Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX\_US\_MR.USART\_MODE to select the LIN mode and the master node configuration.
- Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM, FSDIS and DLC in FLEX\_US\_LINMR to configure the frame transfer.
- Check that FLEX\_US\_CSR.TXRDY is set to 1.
- Write FLEX\_US\_LINIR.IDCHR to send the header.

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the USART sends the response.
  - Wait until FLEX\_US\_CSR.TXRDY rises.
  - Write FLEX\_US\_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX\_US\_CSR.RXRDY rises.
  - Read FLEX\_US\_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.

**Figure 46-47. Master Node Configuration, NACT = PUBLISH**

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-48. Master Node Configuration, NACT = SUBSCRIBE**

**Figure 46-49. Master Node Configuration, NACT = IGNORE**

### 46.7.9.15.2 Slave Node Configuration

- Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX\_US\_MR.USART\_MODE to select the LIN mode and the slave node configuration.
- Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
- Wait until FLEX\_US\_CSR.LINID rises.
- Check LINISFE and LINPE errors.
- Read FLEX\_US\_RHR.IDCHR.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM and DLC in FLEX\_US\_LINMR to configure the frame transfer.

**IMPORTANT:** If the NACT configuration for this frame is PUBLISH, FLEX\_US\_LINMR must be written with NACT = PUBLISH even if this field is already correctly configured, in order to set the TXREADY flag and the corresponding write transfer request.

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the LIN controller sends the response.
  - Wait until FLEX\_US\_CSR.TXRDY rises.
  - Write FLEX\_US\_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.

- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX\_US\_CSR.RXRDY rises.
  - Read FLEX\_US\_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.

**Figure 46-50. Slave Node Configuration, NACT = PUBLISH**

**Figure 46-51. Slave Node Configuration, NACT = SUBSCRIBE**

**Figure 46-52. Slave Node Configuration, NACT = IGNORE**

#### 46.7.9.16 LIN Frame Handling with the DMAC

The USART can be used in association with the DMAC in order to transfer data directly into/from the on- and off-chip memories without any processor intervention.

The DMAC uses the trigger flags, TXRDY and RXRDY, to write or read into the USART. The DMAC always writes in the Transmit Holding Register (FLEX\_US\_THR) and it always reads in the Receive

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

Holding Register (FLEX\_US\_RHR). The size of the data written or read by the DMAC in the USART is always a byte.

### 46.7.9.16.1 Master Node Configuration

The user can choose between two DMAC modes by configuring the FLEX\_US\_LINMR.PDCM bit:

- PDCM = 1: The LIN configuration is stored in the WRITE buffer and it is written by the DMAC in the Transmit Holding register FLEX\_US\_THR (instead of the LIN Mode register FLEX\_US\_LINMR). Because the DMAC transfer size is limited to a byte, the transfer is split into two accesses. During the first access, the NACT, PARDIS, CHKDIS, CHKTYP, DLM and FSDIS bits are written. During the second access, the 8-bit DLC field is written.
- PDCM = 0: The LIN configuration is not stored in the WRITE buffer and it must be written by the user in FLEX\_US\_LINMR.

The WRITE buffer also contains the Identifier and the data, if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

**Figure 46-53. Master Node with DMAC (PDCM = 1)**

**Figure 46-54. Master Node with DMAC (PDCM = 0)**

### 46.7.9.16.2 Slave Node Configuration

In this configuration, the DMAC transfers only the data. The identifier must be read by the user in the LIN Identifier Register (FLEX\_US\_LINIR). The LIN mode must be written by the user in FLEX\_US\_LINMR.

The WRITE buffer contains the data if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

**Figure 46-55. Slave Node with DMAC**

### 46.7.9.17 Wakeup Request

Any node in a sleeping LIN cluster may request a wakeup.

In the LIN 2.0 specification, the wakeup request is issued by forcing the bus to the dominant state from 250  $\mu$ s to 5 ms. For this, it is necessary to send the character 0xF0 in order to impose five successive dominant bits. Whatever the baud rate is, this character respects the specified timings.

- Baud rate min = 1 kbit/s  $\rightarrow t_{bit} = 1 \text{ ms} \rightarrow 5 t_{bit} = 5 \text{ ms}$
- Baud rate max = 20 kbit/s  $\rightarrow t_{bit} = 50 \mu\text{s} \rightarrow 5 t_{bit} = 250 \mu\text{s}$

In the LIN 1.3 specification, the wakeup request should be generated with the character 0x80 in order to impose eight successive dominant bits.

Using the FLEX\_US\_LINMR.WKUPTYP bit, the user can choose to send either a LIN 2.0 wakeup request (WKUPTYP = 0) or a LIN 1.3 wakeup request (WKUPTYP = 1).

A wakeup request is transmitted by writing the FLEX\_US\_CR.LINWKUP bit to 1. Once the transfer is completed, the LINTC flag is asserted in the Status Register (FLEX\_US\_CSR). It is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

### 46.7.9.18 Bus Idle Timeout

If the LIN bus is inactive for a certain duration, the slave nodes shall automatically enter in Sleep mode. In the LIN 2.0 specification, this timeout is defined as 4 seconds. In the LIN 1.3 specification, it is defined as 25,000  $t_{bit}$ .

In slave Node configuration, the receiver timeout detects an idle condition on the RXD line. When a timeout is detected, the FLEX\_US\_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver to go into Sleep mode.

The timeout delay period (during which the receiver waits for a new character) is programmed in the FLEX\_US\_RTOR.TO field. If a zero is written to the TO field, the Receiver Timeout is disabled and no timeout is detected. The FLEX\_US\_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 17-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX\_US\_CSR.TIMEOUT bit rises.

If STTTO is performed, the counter clock is stopped until a first character is received.

If RETTO is performed, the counter starts counting down immediately from the value TO.

**Table 46-14. Receiver Timeout Programming**

| LIN Specification | Baud Rate    | Timeout period   | TO     |
|-------------------|--------------|------------------|--------|
| 2.0               | 1,000 bit/s  | 4s               | 4,000  |
|                   | 2,400 bit/s  |                  | 9,600  |
|                   | 9,600 bit/s  |                  | 38,400 |
|                   | 19,200 bit/s |                  | 76,800 |
|                   | 20,000 bit/s |                  | 80,000 |
| 1.3               | —            | 25,000 $t_{bit}$ | 25,000 |

#### 46.7.10 Test Modes

The USART can be programmed to operate in three different test modes. The internal loopback capability allows on-board diagnostics. In Loopback mode, the USART interface pins are disconnected or not and reconfigured for loopback internally or externally.

##### 46.7.10.1 Normal Mode

Normal mode connects the RXD pin on the receiver input and the transmitter output on the TXD pin.

**Figure 46-56. Normal Mode Configuration**

##### 46.7.10.2 Automatic Echo Mode

Automatic Echo mode allows bit-by-bit retransmission. When a bit is received on the RXD pin, it is sent to the TXD pin, as shown in the following figure. Programming the transmitter has no effect on the TXD pin. The RXD pin is still connected to the receiver input, thus the receiver remains active.

**Figure 46-57. Automatic Echo Mode Configuration**

##### 46.7.10.3 Local Loopback Mode

Local Loopback mode connects the output of the transmitter directly to the input of the receiver, as shown in the following figure. The TXD and RXD pins are not used. The RXD pin has no effect on the receiver and the TXD pin is continuously driven high, as in idle state.

**Figure 46-58. Local Loopback Mode Configuration**

#### 46.7.10.4 Remote Loopback Mode

Remote Loopback mode directly connects the RXD pin to the TXD pin, as shown in the following figure. The transmitter and the receiver are disabled and have no effect. This mode allows bit-by-bit retransmission.

**Figure 46-59. Remote Loopback Mode Configuration**

### 46.7.11 USART FIFOs

#### 46.7.11.1 Overview

The USART includes two FIFOs which can be enabled/disabled using FLEX\_US\_CR.FIFOEN/FIFODIS. Both the transmitter and the receiver must be disabled before enabling or disabling the FIFOs, using the FLEX\_US\_CR.TXDIS/RXDIS bits.

Writing FLEX\_US\_CR.FIFOEN to '1' enables a 32-data Transmit FIFO and a 32-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX\_US\_THR/RHR. See sections [USART Single Data Mode](#) and [USART Multiple Data Mode](#).

**Figure 46-60. FIFOs Block Diagram**

### 46.7.11.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX\_US\_THR loads the Transmit FIFO.

The FIFO level is provided in FLEX\_US\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX\_US\_CSR.TXRDY and the data can be successively written in FLEX\_US\_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in FLEX\_US\_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

**Figure 46-61. Sending Data with FIFO Enabled**

### 46.7.11.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX\_US\_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to '1'), the exact number of data can be checked with FLEX\_US\_FLR.RXFL. All the data can be read successively in FLEX\_US\_RHR without checking the RXRDY flag between each access.

**Figure 46-62. Receiving Data with FIFO Enabled**

#### 46.7.11.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_US\_CR.TXFCLR/RXFCLR.

#### 46.7.11.5 TXEMPTY, TXRDY and RXRDY Behavior

FLEX\_US\_CSR.TXEMPTY, FLEX\_US\_CSR.TXRDY and FLEX\_US\_CSR.RXRDY flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure [TXRDY in Single Data Mode and TXRDYM = 0](#).

RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. See figure [RXRDY in Single Data Mode and RXRDYM = 0](#) below.

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the USART FIFO Mode Register (FLEX\_US\_FMR) to reduce the number of accesses to FLEX\_US\_RHR/THR.

However, for some configurations, the following constraints apply:

- If FLEX\_US\_MR.MODE9 is set, FLEX\_US\_FMR.TXRDYM/RXRDYM must be cleared.
- If FLEX\_US\_MR.USART\_MODE is set to either LIN\_MASTER or LIN\_SLAVE, FLEX\_US\_FMR.TXRDYM/RXRDYM must be cleared.

See USART FIFO Mode Register for the FIFO configuration.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-63. TXRDY in Single Data Mode and TXRDYM = 0**

**Figure 46-64. RXRDY in Single Data Mode and RXRDYM = 0**

### 46.7.11.6 USART Single Data Mode

In Single Data mode, only one data is written every time FLEX\_US\_THR is accessed, and only one data is read every time FLEX\_US\_RHR is accessed.

When FLEX\_US\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX\_US\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If FLEX\_US\_MR.MODE9 is set, or if FLEX\_US\_MR.USART\_MODE is set to either LIN\_MASTER or LIN\_SLAVE, the FIFOs must operate in Single Data mode.

See [USART Receive Holding Register \(FLEX\\_US\\_RHR\)](#) and [USART Transmit Holding Register \(FLEX\\_US\\_THR\)](#).

### 46.7.11.6.1 DMAC

The DMAC transfer type must be configured in bytes or halfwords when FIFOs operate in Single Data mode (the same applies when FIFOs are disabled).

#### **46.7.11.7 USART Multiple Data Mode**

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX\_US\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX\_US\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

However, Multiple Data mode cannot be used for the following configurations:

- If FLEX\_US\_MR.MODE9 is set
- If FLEX\_US\_MR.USART\_MODE is set to either LIN\_MASTER or LIN\_SLAVE

In Multiple Data mode, it is possible to write/read up to four data in one FLEX\_US\_THR/FLEX\_US\_RHR access.

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read, if the access is a halfword size register access, then two data are written/read and, finally, if the access is a word-size register access, four data are written/read.

Written/read data are always right-aligned, as described in sections [USART Receive Holding Register \(FIFO Multi Data\)](#) and [USART Transmit Holding Register \(FIFO Multi Data\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX\_US\_THR-byte write accesses
- three FLEX\_US\_THR-halfword write accesses
- one FLEX\_US\_THR word write access and one FLEX\_US\_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX\_US\_RHR-byte read accesses
- three FLEX\_US\_RHR-halfword read accesses
- one FLEX\_US\_RHR-word read access and one FLEX\_US\_RHR-halfword read access

##### **46.7.11.7.1 TXRDY and RXRDY Configuration**

In Multiple Data mode, it is possible to write one or more data in the same FLEX\_US\_THR/FLEX\_US\_RHR access. The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX\_US\_FMR.TXRDYM/RXRDYM.

As an example, if four data are written each time in FLEX\_US\_THR, it is useful to configure the TXRDYM field to the value '2' so that the TXRDY flag is at '1' only when at least four data can be written in the Transmit FIFO.

In the same way, if four data are read each time in FLEX\_US\_RHR, it is useful to configure the RXRDYM field to the value '2' so that the RXRDY flag is at '1' only when at least four unread data are in the Receive FIFO.

##### **46.7.11.7.2 DMAC**

When FIFOs operate in Multiple Data mode, the DMAC transfer type must be configured in byte, halfword or word depending on the FLEX\_US\_FMR.TXRDYM/RXRDYM settings.

#### **46.7.11.8 Transmit FIFO Lock**

- LIN Mode:

If a frame is aborted using the Abort LIN Transmission bit (FLEX\_US\_CR.LINABT), a lock is set on the Transmit FIFO, preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMAC channels, etc., without any risk.

The TXFLOCK bit in the USART FIFO Event Status Register (FLEX\_US\_FESR) is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting FLEX\_US\_CR.TXFLCLR to '1'.

#### **46.7.11.9 FIFO Pointer Error**

A FIFO overflow is reported in FLEX\_US\_FESR.

If the Transmit FIFO is full and a write access is performed on FLEX\_US\_THR, it generates a Transmit FIFO pointer error and sets FLEX\_US\_FESR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX\_US\_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX\_US\_FESR.TXFPTEF is set.

A FIFO underflow is reported in FLEX\_US\_FESR.

In Multiple Data mode, if the number of data read in FLEX\_US\_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX\_US\_FESR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX\_US\_THR/ FLEX\_US\_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a Transmit pointer error occurs, a transmitter reset must be performed using FLEX\_US\_CR.RSTTX. If a Receive pointer error occurs, a receiver reset must be performed using FLEX\_US\_CR.RSTRX.

#### **46.7.11.10 FIFO Thresholds**

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_US\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_US\_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_US\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_US\_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The Receive FIFO threshold 2 can be set using the field FLEX\_US\_FMR.RXFTHRES2. Each time the Receive FIFO level goes from 'above threshold 2' to 'equal to or below threshold 2', the flag FLEX\_US\_FESR.RXFTHF2 is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF, RXFTHF and RXTHF2 flags can be configured to generate an interrupt using FLEX\_US\_FIER and FLEX\_US\_FIDR.

#### **46.7.11.11 FIFO Flags**

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_US\_FIER and FLEX\_US\_FIDR.

FIFO flags state can be read in FLEX\_US\_FESR. They are cleared by writing FLEX\_US\_CR.RSTSTA to '1'.

#### **46.7.12 USART Register Write Protection**

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR\_OPMODE\_USART to enable access to the write protection registers.

To prevent any single software error from corrupting USART behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable) bit in the [USART Write Protection Mode Register \(FLEX\\_US\\_WPMR\)](#).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the [USART Write Protection Status Register \(FLEX\\_US\\_WPSR\)](#) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_US\_WPSR.

The following registers can be write-protected when WPEN is set:

- USART Mode Register
- USART Baud Rate Generator Register
- USART Receiver Timeout Register
- USART Transmitter Timeguard Register
- USART FI DI RATIO Register
- USART IrDA FILTER Register
- USART Manchester Configuration Register
- USART Comparison Register

## **46.8 SPI Functional Description**

### **46.8.1 Modes of Operation**

The SPI operates in Master mode or in Slave mode.

- The SPI operates in Master mode by writing a 1 to the MSTR bit in the SPI Mode Register (FLEX\_SPI\_MR):
  - The pins NPCS0 to NPCS1 are all configured as outputs.
  - The SPCK pin is driven.
  - The MISO line is wired on the receiver input.
  - The MOSI line is driven as an output by the transmitter.
- The SPI operates in Slave mode if the MSTR bit in FLEX\_SPI\_MR is written to 0:
  - The MISO line is driven by the transmitter output.
  - The MOSI line is wired on the receiver input.
  - The SPCK pin is driven by the transmitter to synchronize the receiver.
  - The NPCS0 pin becomes an input, and is used as a slave select signal (NSS).
  - Pin NPCS1 is not driven and can be used for other purposes.

The data transfers are identically programmable for both modes of operation. The bit rate generator is activated only in Master mode.

### 46.8.2 Data Transfer

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the SPI Chip Select Register (FLEX\_SPI\_CSR). The clock phase is programmed with the NCPHA bit. These two parameters determine the edges of the clock signal on which data are driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Consequently, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are connected and require different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

The following table shows the four modes and corresponding parameter settings.

**Table 46-15. SPI Bus Protocol Mode**

| SPI Mode | CPOL | NCPHA | Shift SPCK Edge | Capture SPCK Edge | SPCK Inactive Level |
|----------|------|-------|-----------------|-------------------|---------------------|
| 0        | 0    | 1     | Falling         | Rising            | Low                 |
| 1        | 0    | 0     | Rising          | Falling           | Low                 |
| 2        | 1    | 1     | Rising          | Falling           | High                |
| 3        | 1    | 0     | Falling         | Rising            | High                |

The following figures show examples of data transfers.

**Figure 46-65. SPI Transfer Format (NCPHA = 1, 8 bits per transfer)**

\* Not defined.

**Figure 46-66. SPI Transfer Format (NCPHA = 0, 8 bits per transfer)**

### 46.8.3 Master Mode Operations

When configured in Master mode, the SPI operates on the clock generated by the internal programmable bit rate generator. It fully controls the data transfers to and from the slave(s) connected to the SPI bus. The SPI drives the chip select line to the slave and the serial clock signal (SPCK).

The SPI features two holding registers, the Transmit Data Register (FLEX\_SPI\_TDR) and the Receive Data Register (FLEX\_SPI\_RDR), and a single shift register. The holding registers maintain the data flow at a constant rate.

After enabling the SPI, a data transfer starts when the processor writes to FLEX\_SPI\_TDR. The written data are immediately transferred in the shift register and the transfer on the SPI bus starts. While the data in the shift register is shifted on the MOSI line, the MISO line is sampled and shifted in the shift register. Data cannot be loaded in FLEX\_SPI\_RDR without transmitting data. If there is no data to transmit, a dummy data can be used (FLEX\_SPI\_TDR filled with ones). When the WDRBT bit is set, a new data cannot be transmitted if FLEX\_SPI\_RDR has not been read. If Receiving mode is not required, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the SPI Status Register (FLEX\_SPI\_SR) can be discarded.

Before writing the TDR, the FLEX\_SPI\_MR.PCS field must be set in order to select a slave.

If new data are written in FLEX\_SPI\_TDR during the transfer, it is kept in FLEX\_SPI\_TDR until the current transfer is completed. Then, the received data are transferred from the shift register to FLEX\_SPI\_RDR, the data in FLEX\_SPI\_TDR is loaded in the shift register and a new transfer starts.

As soon as the FLEX\_SPI\_TDR is written, the Transmit Data Register Empty (TDRE) flag in FLEX\_SPI\_SR is cleared. When the data written in FLEX\_SPI\_TDR is loaded into the shift register, the FLEX\_SPI\_SR.TDRE flag is set. The TDRE bit is used to trigger the Transmit DMA channel (see figure below).

The end of transfer is indicated by FLEX\_SPI\_SR.TXEMPTY. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

**Note:**

1. When the SPI is enabled, the TDRE and TXEMPTY flags are set.
2. The TXEMPTY flag alone cannot be used to detect the end of the buffer DMA transfer.

**Figure 46-67. TDRE and TXEMPTY Flag Behavior**

The transfer of received data from the shift register to FLEX\_SPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in FLEX\_SPI\_SR. When the received data are read, the RDRF bit is cleared.

If FLEX\_SPI\_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX\_SPI\_SR is set. As long as this flag is set, data are loaded in FLEX\_SPI\_RDR. The user has to read the status register to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode and a flow chart describing how transfers are handled.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

#### 46.8.3.1 Master Mode Block Diagram

### 46.8.3.2 Master Mode Flowchart

Figure 46-69. Master Mode

The following figure shows the behavior of Transmit Data Register Empty (TDRE), Receive Data Register (RDRF) and Transmission Register Empty (TXEMPTY) status flags within FLEX\_SPI\_SR during an 8-bit data transfer in Fixed mode without the DMAC involved.

**Figure 46-70. Status Register Flags Behavior**

### 46.8.3.3 Clock Generation

The SPI bit rate clock is generated by dividing a source clock which can be the peripheral clock or a programmable clock from the GCLK. The divider can be a value between 1 and 255.

If the SCBR field is programmed to 1 and the clock source is GCLK, the operating bit rate is peripheral clock (refer to the section “Electrical Characteristics” for the SPCK maximum frequency). Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

At reset, SCBR is 0 and the user has to program it to a valid value before performing the first transfer.

The divisor can be defined independently for each chip select, as it has to be programmed in the FLEX\_SPI\_CSR.SCBR field. This allows the SPI to automatically adapt the bit rate for each interfaced peripheral without reprogramming.

If GCLK is selected as source clock (FLEX\_SPI\_MR.BRSRCCLK = 1), the bit rate is independent of the processor/bus clock. Thus, the processor clock can be changed while SPI is enabled. The processor clock frequency changes must be performed only by programming the PMC\_MCKR.PRES field (refer to the section “Power Management Controller” (PMC)). Any other method to modify the processor/bus clock frequency (PLL multiplier, etc.) is forbidden when SPI is enabled.

The peripheral clock frequency must be at least three times higher than GCLK.

### 46.8.3.4 Transfer Delays

The figure below shows a chip select transfer change and consecutive transfers on the same chip select. Three delays can be programmed to modify the transfer waveforms:

- The delay between the chip selects. It is programmable only once for all chip selects by writing the FLEX\_SPI\_MR.DLYBCS field. The SPI slave device deactivation delay is managed through DLYBCS. If there is only one SPI slave device connected to the master, the DLYBCS field does not need to be configured. If several slave devices are connected to a master, DLYBCS must be configured depending on the highest deactivation delay. Refer to the SPI slave device electrical characteristics.

- The delay before SPCK, independently programmable for each chip select by writing the DLYBS field. The SPI slave device activation delay is managed through DLYBS. Refer to the SPI slave device electrical characteristics to define DLYBS.
- The delay between consecutive transfers, independently programmable for each chip select by writing the DLYBCT field. The time required by the SPI slave device to process received data is managed through DLYBCT. This time depends on the SPI slave system activity.

These delays allow the SPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 46-71. Programmable Delays**

### 46.8.3.5 Peripheral Selection

The serial peripherals are selected through the assertion of the NPCS0 to NPCS1 signals. By default, all NPCS signals are high before and after each transfer.

- **Fixed Peripheral Select Mode:** SPI exchanges data with only one peripheral. Fixed Peripheral Select mode is enabled by writing the FLEX\_SPI\_MR.PS bit to zero. In this case, the current peripheral is defined by the FLEX\_SPI\_MR.PCS field, and the FLEX\_SPI\_TDR.PCS field has no effect.
- **Variable Peripheral Select Mode:** Data can be exchanged with more than one peripheral without having to reprogram FLEX\_SPI\_MR.PCS. Variable Peripheral Select Mode is enabled by setting the FLEX\_SPI\_MR.PS bit to one. The FLEX\_SPI\_TDR.PCS field is used to select the current peripheral. This means that the peripheral selection can be defined for each new data. The value must be written in a single access to FLEX\_SPI\_TDR in the following format:

[xxxxxxx(7-bit) + LASTXFER(1-bit)<sup>(1)</sup> + xxxx(4-bit) + PCS (4-bit) + TD (8 to 16-bit data)]  
 with LASTXFER at 0 or 1 depending on the CSAAT bit, and PCS equal to the chip select to assert, as defined in section [SPI Transmit Data Register \(FLEX\\_SPI\\_TDR\)](#).

Note: 1. Optional

The CSAAT, LASTXFER and CSNAAT bits are discussed in section [Peripheral Deselection with DMA](#).

If LASTXFER is used, the command must be issued after writing the last character. Instead of LASTXFER, the user can use the SPIDIS command. After the end of the DMA transfer, it is necessary to wait for the TXEMPTY flag and then write SPIDIS into the SPI Control Register (FLEX\_SPI\_CR). This does not change the configuration register values). The NPCS is disabled after the last character transfer. Then, another DMA transfer can be started if the FLEX\_SPI\_CR.SPIEN bit has previously been written.

#### **46.8.3.6 SPI Direct Access Memory Controller (DMAC)**

In both Fixed and Variable modes, the Direct Memory Access Controller (DMAC) can be used to reduce processor overhead.

The fixed peripheral selection allows buffer transfers with a single peripheral. Using the DMAC is an optimal means, as the size of the data transfer between the memory and the SPI is either 8 bits or 16 bits. However, if the peripheral selection is modified, FLEX\_SPI\_MR must be reprogrammed.

The variable peripheral selection allows buffer transfers with multiple peripherals without reprogramming FLEX\_SPI\_MR. Data written in FLEX\_SPI\_TDR is 32 bits wide and defines the real data to be transmitted and the destination peripheral. Using the DMAC in this mode requires 32-bit wide buffers, with the data in the LSBs and the PCS and LASTXFER fields in the MSBs. However, the SPI still controls the number of bits (8 to 16) to be transferred through MISO and MOSI lines with the chip select configuration registers. This is not the optimal means in terms of memory size for the buffers, but it provides a very effective means to exchange data with several peripherals without any intervention of the processor.

#### **46.8.3.7 Peripheral Chip Select Decoding**

The user can program the SPI to operate with up to 3 slave peripherals by decoding the two chip select lines, NPCS0 to NPCS1 with an external decoder/demultiplexer (see the following figure). This can be enabled by setting the FLEX\_SPI\_MR.PCSDEC bit.

When operating without decoding, the SPI makes sure that in any case only one chip select line is activated, i.e., one NPCS line driven low at a time. If two bits are defined low in a PCS field, only the lowest numbered chip select is driven low.

When operating with decoding, the SPI directly outputs the value defined by the PCS field on the NPCS lines of either FLEX\_SPI\_MR or FLEX\_SPI\_TDR (depending on PS).

As the SPI sets a default value of 0x3 on the chip select lines (i.e., all chip select lines at 1) when not processing any transfer, only 3 peripherals can be decoded.

The SPI has only two Chip Select registers. As a result, when external decoding is activated, each NPCS chip select defines the characteristics of up to two peripherals. As an example, FLEX\_SPI\_CRSD0 defines the characteristics of the externally decoded peripherals 0 to 1, corresponding to the PCS values 0x0 to 0x1. Consequently, the user has to make sure to connect compatible peripherals on the decoded chip select lines 0 to 1 and 2. The following figure shows this type of implementation.

If the CSAAT bit is used, with or without the DMAC, the mode fault detection for NPCS0 line must be disabled. This is not needed for all other chip select lines since mode fault detection is only on NPCS0.

**Figure 46-72. Chip Select Decoding Application Block Diagram: Single Master/Multiple Slave Implementation**

#### 46.8.3.8 Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, FLEX\_SPI\_TDR is loaded by the processor, the TDRE flag rises as soon as the content of FLEX\_SPI\_TDR is transferred into the internal shift register. When this flag is detected high, FLEX\_SPI\_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted between the two transfers. But depending on the application software handling the SPI status register flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload FLEX\_SPI\_TDR in time to keep the chip select active (low). A null DLYBCT value (delay between consecutive transfers) in FLEX\_SPI\_CSR, gives even less time for the processor to reload FLEX\_SPI\_TDR. With some SPI slave peripherals, if the chip select line must remain active (low) during a full set of transfers, communication errors can occur.

To facilitate interfacing with such devices, the Chip Select registers [CSR0...CSR1] can be programmed with the Chip Select Active After Transfer (CSAAT) bit to 1. This allows the chip select lines to remain in their current state (low = active) until a transfer to another chip select is required. Even if FLEX\_SPI\_TDR is not reloaded, the chip select remains active. To de-assert the chip select line at the end of the transfer, the Last Transfer (LASTXFER) bit in FLEX\_SPI\_CR must be set after writing the last data to transmit into FLEX\_SPI\_TDR.

#### 46.8.3.9 Peripheral Deselection with DMA

DMA provides faster reloads of FLEX\_SPI\_TDR compared to software. However, depending on the system activity, it is not guaranteed that FLEX\_SPI\_TDR is written with the next data before the end of the current transfer. Consequently, a data can be lost by the deassertion of the NPCS line for SPI slave peripherals requiring the chip select line to remain active between two transfers. The only way to guarantee a safe transfer in this case is the use of the CSAAT and LASTXFER bits.

When the CSAAT bit is cleared, the NPCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the TDRE flag rises as soon as the content of FLEX\_SPI\_TDR is transferred into the internal shift register. When this flag is detected, FLEX\_SPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted between the two transfers. This can lead to difficulties to interface with some serial peripherals requiring the chip select

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

to be deasserted after each transfer. To facilitate interfacing with such devices, FLEX\_SPI\_CSR can be programmed with the Chip Select Not Active After Transfer (CSNAAT) bit to 1. This allows the chip select lines to be deasserted systematically during a time “DLYBCS” (the value of the CSNAAT bit is processed only if the CSAAT bit is cleared for the same chip select).

The following figure shows different peripheral deselection cases and the effect of the CSAAT and CSNAAT bits.

**Figure 46-73. Peripheral Deselection**

### 46.8.3.10 Mode Fault Detection

The SPI has the capability to operate in multi-master environment. Consequently, the NPCS0/NSS line must be monitored. If one of the masters on the SPI bus is currently transmitting, the NPCS0/NSS line is low and the SPI must not transmit a data. A mode fault is detected when the SPI is programmed in Master mode and a low level is driven by an external master on the NPCS0/NSS signal. In multi-master environment, NPCS0, MOSI, MISO and SPCK pins must be configured in open drain (through the PIO controller). When a mode fault is detected, the FLEX\_SPI\_SR.MODF bit is set until FLEX\_SPI\_SR is

read and the SPI is automatically disabled until it is re-enabled by writing the FLEX\_SPI\_CR.SPIEN bit to 1.

By default, the mode fault detection is enabled. The user can disable it by setting the FLEX\_SPI\_MR.MODFDIS bit.

#### **46.8.4 SPI Slave Mode**

When operating in Slave mode, the SPI processes data bits on the clock provided on the SPI clock pin (SPCK).

The SPI waits until NSS goes active before receiving the serial clock from an external master. When NSS falls, the clock is validated and the data are loaded in FLEX\_SPI\_RDR according to the configuration value of the FLEX\_SPI\_CSR0.BITS field. These bits are processed following a phase and a polarity defined respectively by the FLEX\_SPI\_CSR0.NCPHA and FLEX\_SPI\_CSR0.CPOL bits. Note that the BITS field, CPOL bit and NCPHA bit of the other Chip Select registers have no effect when the SPI is programmed in Slave mode.

The bits are shifted out on the MISO line and sampled on the MOSI line.

**Note:** For more information on the BITS field, see also the note below the FLEX\_SPI\_CSRx register bitmap in section [SPI Chip Select Register](#)

When all bits are processed, the received data are transferred in FLEX\_SPI\_RDR and the RDRF bit rises. If FLEX\_SPI\_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX\_SPI\_SR is set. As long as this flag is set, data are loaded in FLEX\_SPI\_RDR. The user must read FLEX\_SPI\_SR to clear the OVRES bit.

When a transfer starts, the data shifted out is the data present in the shift register. If no data has been written in FLEX\_SPI\_TDR, the last data received is transferred. If no data has been received since the last reset, all bits are transmitted low, as the shift register resets to 0.

When a first data is written in FLEX\_SPI\_TDR, it is transferred immediately in the shift register and the TDRE flag rises. If new data is written, it remains in FLEX\_SPI\_TDR until a transfer occurs, i.e., NSS falls and there is a valid clock on the SPCK pin. When the transfer occurs, the last data written in FLEX\_SPI\_TDR is transferred in the shift register and the TDRE flag rises. This enables frequent updates of critical variables with single transfers.

Then, a new data is loaded in the shift register from FLEX\_SPI\_TDR. If no character is ready to be transmitted, i.e., no character has been written in FLEX\_SPI\_TDR since the last load from FLEX\_SPI\_TDR to the shift register, FLEX\_SPI\_TDR is retransmitted. In this case the Underrun Error Status Flag (UNDES) is set in FLEX\_SPI\_SR.

If NSS rises between two characters, it must be kept high for two MCK clock periods or more and the next SPCK capture edge must not occur less than four MCK periods after NSS rise.

The following figure shows a block diagram of the SPI when operating in Slave mode.

**Figure 46-74. Slave Mode Functional Block Diagram**

### 46.8.5 SPI Comparison Function on Received Character

The comparison is only relevant for SPI Slave mode (MSTR = 0 in FLEX\_US\_MR).

The effect of a comparison match changes if the system is in Wait or Active mode.

In Wait mode, if asynchronous partial wakeup is enabled, a system wakeup is performed (see section [46.8.6 SPI Asynchronous and Partial Wake-up \(SleepWalking\)](#)).

In Active mode, the CMP flag in FLEX\_SPI\_SR is raised. It is set when the received character matches the conditions programmed in the SPI Comparison Register (FLEX\_SPI\_CMPR). The CMP flag is set as soon as FLEX\_SPI\_RDR is loaded with the new received character. The CMP flag is cleared by reading FLEX\_SPI\_SR.

The SPI Comparison Register can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When FLEX\_SPI\_MR.CMPMODE is cleared, all received data is loaded in FLEX\_SPI\_RDR and the CMP flag provides the status of the comparison result.

By setting the CMPMODE bit, the comparison result triggers the start of FLEX\_SPI\_RDR loading (see the figure below). The trigger condition exists as soon as the received character value matches the conditions defined by VAL1 and VAL2 in FLEX\_SPI\_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX\_SPI\_CR.REQCLR bit.

The value programmed in VAL1 and VAL2 fields must not exceed the maximum value of the received character (see BITS field in SPI Chip Select Register (FLEX\_SPI\_CSR)).

**Figure 46-75. Receive Data Register Management**

CMPMODE = 1, VAL1 = VAL2 = 0x06

### 46.8.6 SPI Asynchronous and Partial Wake-up (SleepWalking)

This operating mode is a means of data pre-processing that qualifies an incoming event, thus allowing the SPI to decide whether or not to wake up the system. Asynchronous and partial wake-up is mainly used when the system is in Wait mode (refer to the section “Power Management Controller” (PMC) for further details). It can also be enabled when the system is fully running.

Asynchronous and partial wake-up can be used only when SPI is configured in Slave mode (FLEX\_SPI\_MR.MSTR is cleared).

The maximum SPI clock (SPCK) frequency that can be provided by the SPI master is bounded by the peripheral clock frequency. The SPCK frequency must be lower than or equal to the peripheral clock. The NSS line must be deasserted by the SPI master between two characters. The NSS deassertion duration time must be greater than or equal to six peripheral clock periods. The time between the assertion of NSS line (falling edge) and the first edge of the SPI clock must be higher than 15  $\mu$ s.

The FLEX\_SPI\_RDR register must be read before enabling the asynchronous and partial wake-up.

When asynchronous and partial wake-up is enabled for the SPI (refer to the section “Power Management Controller” (PMC)), the PMC decodes a clock request from the SPI. The request is generated as soon as there is a falling edge on the NSS line as this may indicate the beginning of a frame. If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the SPI.

The SPI processes the received frame and compares the received character with VAL1 and VAL2 in FLEX\_SPI\_CMPR (section [FLEX\\_SPI\\_CMPR](#)).

The SPI instructs the PMC to disable the peripheral clock if the received character value does not meet the conditions defined by VAL1 and VAL2 fields in FLEX\_SPI\_CMPR (see [Figure 46-76](#)).

If the received character value meets the conditions, the SPI instructs the PMC to exit the system from Wait mode (see [Figure 46-77](#)).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

The VAL1 and VAL2 fields can be programmed to provide different comparison methods and thus matching conditions.

- If VAL1 equals VAL2, then the comparison is performed on a single value and the wake-up is triggered if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 wakes up the system.
- If VAL1 is strictly higher than VAL2, the wake-up is triggered if any received character equals VAL1 or VAL2.
- If VAL1 = 0 and VAL2 = 65535, the wake-up is triggered as soon as a character is received.

If the processor and peripherals are running, the SPI can be configured in Asynchronous and Partial Wake-up mode by enabling the PMC\_SLPWK\_ER (refer to the section “Power Management Controller” (PMC)). When activity is detected on the receive line, the SPI requests the clock from the PMC and the comparison is performed. If there is a comparison match, the SPI continues to request the clock. If there is no match, the clock is switched off for the SPI only, until a new activity is detected.

The CMPMODE configuration has no effect when Asynchronous and Partial Wake-up mode is enabled for the SPI (refer to PMC\_SLPWK\_ER in the section “Power Management Controller” (PMC)).

When the system is in Active mode and the SPI enters Asynchronous and Partial Wake-up mode, the flag RDRF must be programmed as the unique source of the SPI interrupt.

When the system exits Wait mode as the result of a matching condition, the RDRF flag is used to determine if the SPI is the source for the exit from Wait mode.

**Figure 46-76. Asynchronous Wake-up Use Case Example**

Case with VAL1 = VAL2 = 0x55

**Figure 46-77. Asynchronous Event Generating Only Partial Wake-up**

Case with VAL1 = VAL2 = 0x55

### 46.8.7 SPI FIFOs

#### 46.8.7.1 Overview

The SPI includes two FIFOs which can be enabled/disabled using the FLEX\_SPI\_CR.FIFOEN/FIFODIS. The SPI module must be disabled before enabling or disabling the SPI FIFOs (FLEX\_SPI\_CR.SPIDIS).

Writing FLEX\_SPI\_CR.FIFOEN to '1' enables a FIFO\_DEPTH-data Transmit FIFO and a FIFO\_DEPTH-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX\_SPI\_TDR/RDR. See sections [SPI Single Data Mode](#) and [SPI Multiple Data Mode](#).

**Figure 46-78. FIFOs Block Diagram**

#### 46.8.7.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX\_SPI\_TDR loads the Transmit FIFO.

The FIFO level is provided in FLEX\_SPI\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX\_SPI\_SR.TDRE and the data can be successively written in FLEX\_SPI\_TDR.

If the FIFO cannot accept the data due to insufficient space, wait for the TDRE flag to be set before writing the data in FLEX\_SPI\_TDR.

When the space in the FIFO allows only a portion of the data to be written, the TDRE flag must be monitored before writing the remaining data.

**Figure 46-79. Sending Data with FIFO Enabled**

### 46.8.7.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX\_SPI\_RDR access reads the FIFO.

When data are present in the Receive FIFO (RDRF flag set to '1'), the exact number of data can be checked with FLEX\_SPI\_FLR.RXFL. All the data can be read successively in FLEX\_SPI\_RDR without checking the RDRF flag between each access.

**Figure 46-80. Receiving Data with FIFO Enabled**

#### 46.8.7.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_SPI\_CR.TXFCLR/RXFCLR.

#### 46.8.7.5 TXEMPTY, TDRE and RDRF Behavior

FLEX\_SPI\_SR.TXEMPTY, FLEX\_SPI\_SR.TDRE and FLEX\_SPI\_SR.RDRF flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TDRE indicates if a data can be written in the Transmit FIFO. Thus the TDRE flag is set as long as the Transmit FIFO can accept new data. See figure [TDRE in Single Data Mode and TXRDYM = 0](#).

RDRF indicates if an unread data is present in the Receive FIFO. Thus the RDRF flag is set as soon as one unread data is in the Receive FIFO. See figure [RDRF in Single Data Mode and RXRDYM = 0](#).

TDRE and RDRF behavior can be modified using the TXRDYM and RXRDYM fields in the SPI FIFO Mode Register (FLEX\_SPI\_FMR) to reduce the number of accesses to FLEX\_SPI\_TDR/RDR. However, for some configurations, the following constraints apply:

- When the Variable Peripheral Select mode is used (FLEX\_SPI\_MR.PS=1), TXRDYM/RXRDYM must be cleared.
- In Master mode (FLEX\_SPI\_MR.MSTR=1), RXRDYM must be cleared.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See SPI FIFO Mode Register ([FLEX\\_SPI\\_FMR](#)) for the FIFO configuration.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-81. TDRE in Single Data Mode and TXRDYM = 0**

**Figure 46-82. RDRF in Single Data Mode and RXRDYM = 0**

### 46.8.7.6 SPI Single Data Mode

In Single Data mode, only one data is written every time FLEX\_SPI\_TDR is accessed, and only one data is read every time FLEX\_SPI\_RDR is accessed.

When FLEX\_SPI\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX\_SPI\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If Master mode is used (FLEX\_SPI\_MR.MSTR=1), the Receive FIFO must operate in Single Data mode.

If Variable Peripheral Select mode is used (FLEX\_SPI\_MR.PS=1), the Transmit FIFO must operate in Single Data mode.

See sections [SPI Transmit Data Register](#) and [SPI Receive Data Register](#).

#### 46.8.7.6.1 DMAC

When FIFOs operate in Single Data mode, the DMAC transfer type must be configured either in bytes, halfwords or words depending on FLEX\_SPI\_MR.PS bit value and FLEX\_SPI\_CSRx.BITS field value.

The same applies when FIFOs are disabled.

#### 46.8.7.7 SPI Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX\_SPI\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX\_SPI\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

Multiple data can be read from the Receive FIFO only in Slave mode (FLEX\_SPI\_MR.MSTR=0).

The Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0 and when FLEX\_SPI\_MR.PS=0.

In Multiple Data mode, up to two data can be written in one FLEX\_SPI\_TDR write access. It is also possible to read up to four data in one FLEX\_SPI\_RDR access if FLEX\_SPI\_CSRx.BITS is configured to '0' (8-bit data size) and up to two data if FLEX\_SPI\_CSRx.BITS is configured to a value other than '0' (more than 8-bit data size).

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a word-size register access, then up to four data are read and up to two data are written.

Written/read data are always right-aligned, as described in sections [SPI Receive Data Register \(FIFO Multiple Data, 8-bit\)](#), [SPI Receive Data Register \(FIFO Multiple Data, 16-bit\)](#) and [SPI Transmit Data Register \(FIFO Multiple Data, 8- to 16-bit\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX\_SPI\_TDR-byte write accesses
- three FLEX\_SPI\_TDR-halfword write accesses

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX\_SPI\_RDR-byte read accesses
- three FLEX\_SPI\_RDR-halfword read accesses
- one FLEX\_SPI\_RDR-word read access and one FLEX\_SPI\_RDR-halfword read access

#### 46.8.7.7.1 TDRE and RDRF Configuration

In Multiple Data mode, it is possible to write one or more data in the same FLEX\_SPI\_TDR/RDR access. The TDRE flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX\_SPI\_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in FLEX\_SPI\_TDR, it is useful to configure the TXRDYM field to the value '1' so that the TDRE flag is at '1' only when at least two data can be written in the Transmit FIFO.

Similarly, if four data are read each time in FLEX\_SPI\_RDR, it is useful to configure the RXRDYM field to the value '2' so that the RDRF flag is at '1' only when at least four unread data are in the Receive FIFO.

#### **46.8.7.7.2 DMAC**

It is mandatory to configure DMAC channel size (byte, halfword or word) according to FLEX\_SPI\_FMR.TXRDYM/RXRDYM configuration. See section [SPI Multiple Data Mode](#) for constraints.

#### **46.8.7.8 FIFO Pointer Error**

A FIFO overflow is reported in FLEX\_SPI\_SR.

If the Transmit FIFO is full and a write access is performed on FLEX\_SPI\_TDR, it generates a Transmit FIFO pointer error and sets FLEX\_SPI\_SR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX\_SPI\_TDR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX\_SPI\_SR.TXFPTEF is set.

A FIFO underflow is reported in FLEX\_SPI\_SR.

In Multiple Data mode, if the number of data read in FLEX\_SPI\_RDR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX\_SPI\_SR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX\_SPI\_TDR/ SPI\_RDR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a pointer error occurs, a software reset must be performed using FLEX\_SPI\_CR.SWRST (configuration will be lost).

#### **46.8.7.9 FIFO Thresholds**

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_SPI\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_SPI\_SR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_SPI\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_SPI\_SR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX\_SPI\_IER and FLEX\_SPI\_IDR.

#### **46.8.7.10 FIFO Flags**

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_SPI\_IER and FLEX\_SPI\_IDR.

FIFO flags state can be read in FLEX\_SPI\_SR. They are cleared when FLEX\_SPI\_SR is read.

#### 46.8.8 SPI Register Write Protection

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR\_OPMODE\_SPI to enable access to the write protection registers.

To prevent any single software error from corrupting SPI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the SPI Write Protection Mode Register (FLEX\_SPI\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the SPI Write Protection Status Register (FLEX\_SPI\_WPSR) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_SPI\_WPSR.

The following registers can be write-protected when WPEN is set:

- SPI Mode Register
- SPI Chip Select Register
- SPI Comparison Register

The following registers can be write-protected when WPITEN is set:

- SPI Interrupt Enable Register
- SPI Interrupt Disable Register

The following register can be write-protected when WPCREN is set:

- SPI Control Register

### 46.9 TWI Functional Description

#### 46.9.1 Transfer Format

The data put on the TWD line must be 8 bits long. Data are transferred MSB first; each byte must be followed by an acknowledgement. The number of bytes per transfer is unlimited (see figure below).

**Figure 46-83. Transfer Format**

Each transfer begins with a START condition and terminates with a STOP condition (see figure below).

- A high-to-low transition on the TWD line while TWCK is high defines the START condition.
- A low-to-high transition on the TWD line while TWCK is high defines a STOP condition.

**Figure 46-84. START and STOP Conditions**

### 46.9.2 Modes of Operation

The TWI has different modes of operation:

- Master Transmitter mode (Standard and Fast modes only)
- Master Receiver mode (Standard and Fast modes only)
- Multi-master Transmitter mode (Standard and Fast modes only)
- Multi-master Receiver mode (Standard and Fast modes only)
- Slave Transmitter mode (Standard, Fast and High-speed modes)
- Slave Receiver mode (Standard, Fast and High-speed modes)

These modes are described in the following sections.

### 46.9.3 Master Mode

#### 46.9.3.1 Definition

The master is the device that starts a transfer, generates a clock and stops it. This operating mode is not available if High-speed mode is selected.

#### 46.9.3.2 Programming Master Mode

The following fields must be programmed before entering Master mode:

1. DADR (+ IADRSZ + IADR if a 10-bit device is addressed): The device address is used to access slave devices in Read or Write mode.
2. CWGR + CKDIV + CHDIV + CLDIV: Clock waveform.
3. SVDIS: Disables Slave mode.
4. MSEN: Enables Master mode.

**Note:** If the TWI is already in Master mode, the device address (DADR) can be configured without disabling the Master mode.

#### 46.9.3.3 Transfer Speed/Bit Rate

The TWI speed is defined in FLEX\_TWI\_CWGR. The TWI bit rate can be based either on the peripheral clock if the BRSRCCLK bit value is 0 or on a programmable clock source provided by the GCLK if the BRSRCCLK bit value is 1.

If BRSRCCLK = 1, the bit rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the TWI transfer rate.

The GCLK frequency must be at least three times lower than the peripheral clock frequency.

#### 46.9.3.4 Master Transmitter Mode

This operating mode is not available if High-speed mode is selected.

After the master initiates a START condition when writing into the Transmit Holding register FLEX\_TWI\_THR, it sends a 7-bit slave address, configured in the Master Mode Register (DADR in FLEX\_TWI\_MMR), to notify the slave device. The bit following the slave address indicates the transfer direction, 0 in this case (FLEX\_TWI\_MMR.MREAD = 0).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

The TWI transfers require the slave to acknowledge each received byte. During the acknowledge clock pulse (ninth pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. If the slave does not acknowledge the byte, then the Not Acknowledge flag (NACK) is set in the TWI Status Register (FLEX\_TWI\_SR) of the master and a STOP condition is sent. Alternatively, if the FLEX\_TWI\_MMR.NOAP bit is set, no stop condition will be sent and a START or STOP condition must be triggered manually through the FLEX\_TWI\_CR.START or FLEX\_TWI\_CR.STOP bit once the software is ready for the transmission of the condition. The NACK flag must be cleared by reading the TWI Status Register (FLEX\_TWI\_SR) before the next write into the TWI Transmit Holding Register (FLEX\_TWI\_THR). As with the other status bits, an interrupt can be generated if enabled in the interrupt enable Register (FLEX\_TWI\_IER). If the slave acknowledges the byte, the data written in FLEX\_TWI\_THR is then shifted in the internal shifter and transferred. When an acknowledge is detected, the TXRDY bit is set until a new write in FLEX\_TWI\_THR.

TXRDY is used as transmit ready for the DMA transmit channel.

**Note:** To clear the TXRDY flag in Master mode, write the FLEX\_TWI\_CR.MSDIS bit to 1, then write the FLEX\_TWI\_CR.MSEN bit to 1.

While no new data is written in FLEX\_TWI\_THR, the serial clock line is tied low. When new data is written in FLEX\_TWI\_THR, the SCL is released and the data is sent. To generate a STOP event, the STOP command must be performed by writing in the STOP field of the TWI Control Register (FLEX\_TWI\_CR).

After a master write transfer, the Serial Clock line is stretched (tied low) while no new data is written in FLEX\_TWI\_THR or until a STOP command is performed.

See the following figures.

**Figure 46-85. Master Write with One Data Byte**

**Figure 46-86. Master Write with Multiple Data Bytes**

**Figure 46-87. Master Write with One Byte Internal Address and Multiple Data Bytes**

### 46.9.3.5 Master Receiver Mode

Master Receiver mode is not available if High-speed mode is selected.

The read sequence begins by setting the START bit. After the start condition has been sent, the master sends a 7-bit slave address to notify the slave device. The bit following the slave address indicates the transfer direction, 1 in this case (FLEX\_TWI\_MMR.MREAD = 1). During the acknowledge clock pulse (9th pulse), the master releases the data line (HIGH), enabling the slave to pull it down in order to generate the acknowledge. The master polls the data line during this clock pulse and sets the FLEX\_TWI\_SR.NACK bit if the slave does not acknowledge the byte.

If an acknowledge is received, the master is then ready to receive data from the slave. After data has been received, the master sends an acknowledge condition to notify the slave that the data has been received except for the last data (see figure "Master Read with One Data Byte" below). When the FLEX\_TWI\_SR.RXRDY bit is set, a character has been received in the Receive Holding Register (FLEX\_TWI\_RHR). The RXRDY bit is reset when reading FLEX\_TWI\_RHR.

When a single data byte read is performed, with or without internal address (IADR), the START and STOP bits must be set at the same time. See figure "Master Read with One Data Byte" below. When a multiple data byte read is performed, with or without internal address (IADR), the STOP bit must be set after the next-to-last data received (same condition applies for START bit to generate a repeated start).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

See figure "Master Read with Multiple Data Bytes" below. For internal address usage, see section [Internal Address](#).

If FLEX\_TWI\_RHR is full (RXRDY high) and the master is receiving data, the serial clock line will be tied low before receiving the last bit of the data and until FLEX\_TWI\_RHR is read. Once FLEX\_TWI\_RHR is read, the master will stop stretching the serial clock line and end the data reception. See figure "Master Read Clock Stretching with Multiple Data Bytes" below.

**WARNING** When receiving multiple bytes in Master Read mode, if the next-to-last access is not read (the RXRDY flag remains high), the last access will not be completed until FLEX\_TWI\_RHR is read. The last access stops on the next-to-last bit (clock stretching). When FLEX\_TWI\_RHR is read there is only half a bit period to send the STOP bit (or START bit) command, else another read access might occur (spurious access).

A possible workaround is to set the STOP bit (or START bit) before reading FLEX\_TWI\_RHR on the next-to-last access (within IT handler).

**Figure 46-88. Master Read with One Data Byte**

**Figure 46-89. Master Read with Multiple Data Bytes**

**Figure 46-90. Master Read Clock Stretching with Multiple Data Bytes**

RXRDY is used as receive ready trigger event for the DMA receive channel.

### 46.9.3.6 Internal Address

The TWI interface can perform transfers with 7-bit slave address devices and with 10-bit slave address devices.

#### 46.9.3.6.1 7-bit Slave Addressing

When addressing 7-bit slave devices, the internal address bytes are used to perform random address (read or write) accesses to reach one or more data bytes, e.g., within a memory page location in a serial memory. When performing read operations with an internal address, the TWI performs a write operation to set the internal address into the slave device, and then switch to Master Receiver mode. Note that the second start condition (after sending the IADR) is sometimes called “repeated start” (Sr) in I<sup>2</sup>C fully-compatible devices. See figure [Master Read with One, Two or Three Bytes Internal Address and One Data Byte](#).

See figures [Master Write with One, Two or Three Bytes Internal Address and One Data Byte](#) and [Internal Address Usage](#) for the master write operation with internal address.

The three internal address bytes are configurable through the Master Mode Register (FLEX\_TWI\_MMR).

If the slave device supports only a 7-bit address, i.e., no internal address, IADRSZ must be configured to 0.

The abbreviations listed below are used in the following figures:

|      |                 |
|------|-----------------|
| S    | Start           |
| Sr   | Repeated Start  |
| P    | Stop            |
| W    | Write           |
| R    | Read            |
| A    | Acknowledge     |
| N    | Not Acknowledge |
| DADR | Device Address  |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

|      |                  |
|------|------------------|
| IADR | Internal Address |
|------|------------------|

**Figure 46-91. Master Write with One, Two or Three Bytes Internal Address and One Data Byte**

**Figure 46-92. Master Read with One, Two or Three Bytes Internal Address and One Data Byte**

### 46.9.3.6.2 10-bit Slave Addressing

For a slave address higher than seven bits, the user must configure the address size (IADRSZ) and set the other slave address bits in the Internal Address Register (FLEX\_TWI\_IADR). The two remaining internal address bytes, IADR[15:8] and IADR[23:16], can be used the same way as in 7-bit slave addressing.

Example: Address a 10-bit device (10-bit device address is b1 b2 b3 b4 b5 b6 b7 b8 b9 b10)

1. Program IADRSZ = 1
2. Program DADR with 1 1 1 1 0 b1 b2 (b1 is the MSB of the 10-bit address, b2, etc.)
3. Program FLEX\_TWI\_IADR with b3 b4 b5 b6 b7 b8 b9 b10 (b10 is the LSB of the 10-bit address)

The following figure shows a byte write to a TWI EEPROM. This demonstrates the use of internal addresses to access the device.

**Figure 46-93. Internal Address Usage**

### 46.9.3.7 Repeated Start

In addition to Internal Address mode, repeated start (Sr) can be generated manually by writing the START bit at the end of a transfer instead of the STOP bit. In such case the parameters of the next transfer (direction, SADR, etc.) will need to be set before writing the START bit at the end of the previous transfer.

See section [Read/Write Flowcharts](#).

### 46.9.3.8 Bus Clear Command

The TWI interface can perform a Bus Clear Command:

1. Configure the Master mode (DADR, CKDIV, etc).
2. Start the transfer by setting the FLEX\_TWI\_CR.CLEAR bit.

**Note:** If an alternative command is used (ACMEN bit = 1), the DATAL field must be cleared.

#### 46.9.3.9 SMBus Mode

SMBus mode is enabled when the FLEX\_TWI\_CR.SMBEN bit is written to one. SMBus mode operation is similar to I<sup>2</sup>C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX\_TWI\_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
4. A set of addresses has been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX\_TWI\_CR appropriately.

##### 46.9.3.9.1 Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX\_TWI\_CR.PECEN bit to one enables automatic PEC handling in the current transfer. Transfers with and without PEC can freely be intermixed in the same system, since some slaves may not support PEC. The PEC LFSR is always updated on every bit transmitted or received, so that PEC handling on combined transfers will be correct.

In Master Transmitter mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave will return an ACK to the master. If the PEC values differ, data was corrupted, and the slave will return a NACK value. Some slaves may not be able to check the received PEC in time to return a NACK if an error occurred. In this case, the slave should always return an ACK after the PEC byte, and some other mechanism must be implemented to verify that the transmission was received correctly.

In Master Receiver mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the FLEX\_TWI\_SR.PECERR bit is set. In Master Receiver mode, the PEC byte is always followed by a NACK transmitted by the master, since it is the last byte in the transfer.

In combined transfers, the PECRQ bit should only be set in the last of the combined transfers. If Alternative Command mode is enabled, only the NPEC bit should be set.

Consider the following transfer:

S, ADR+W, COMMAND\_BYTE, ACK, SR, ADR+R, DATA\_BYTE, ACK, PEC\_BYTE, NACK, P

See section [Read/Write Flowcharts](#) for detailed flowcharts.

##### 46.9.3.9.2 Timeouts

The FLEX\_TWI\_SMBTR.TLOWS/TLOWM fields configure the SMBus timeout values. If a timeout occurs, the master transmits a STOP condition and leaves the bus. Furthermore, the FLEX\_TWI\_SR.TOUT bit is set.

##### 46.9.3.10 SMBus Quick Command (Master Mode Only)

The TWI interface can perform a quick command:

1. Configure the Master mode (DADR, CKDIV, etc).

2. Write the FLEX\_TWI\_MMR.MREAD bit at the value of the one-bit command to be sent.
3. Start the transfer by setting the FLEX\_TWI\_CR.QUICK bit.

**Note:** If an alternative command is used (ACMEN bit = 1), the DATAL field must be cleared.

**Figure 46-94. SMBus Quick Command**

#### 46.9.3.11 Alternative Command

Another way to configure the transfer is to enable the Alternative Command mode with the ACMEN bit of the TWI Control Register.

In this mode, the transfer is configured through the TWI Alternative Command Register. It is possible to define a simple read or write transfer or a combined transfer with a repeated start.

In order to set a simple transfer, the DATAL field and the DIR field of the TWI Alternative Command Register must be filled accordingly and the NDATAL field must be cleared. To begin the transfer, either set the START bit in the TWI Control Register in case of a read transfer, or write the TWI Transmit Holding Register in case of a write transfer.

For a combined transfer linked by a repeated start, the NDATAL field must be filled with the length of the second transfer and NDIR with the corresponding direction.

The PEC and NPEC bits are used to set a PEC field. In the case of a single transfer with PEC, the PEC bit must be set. In the case of a combined transfer, the NPEC bit must be set.

**Note:** If the Alternative Command mode is used, the TWIHS\_MMR.IADRSZ field must be set to 0.

See [Read/Write Flowcharts](#) for detailed flowcharts.

#### 46.9.3.12 Handling Errors in Alternative Command

In case of NACK generated by a slave device or SMBus timeout error, the TWI stops immediately the frame, but the DMA transfer may still be active. To prevent a new frame to be restarted with the remaining DMA data (transmit), the TWI prevents any start of frame until the FLEX\_TWI\_SR.LOCK flag is cleared.

The FLEX\_TWI\_SR.LOCK bit indicates the state of the TWI (locked or not locked).

When the TWI is locked, no transfer can begin until the LOCK is cleared using the FLEX\_TWI\_CR.LOCKCLR bit and until the error flags are cleared reading FLEX\_TWI\_SR.

In case of error, FLEX\_TWI\_THR may have been loaded with a new data. The FLEX\_TWI\_CR.THRCLR bit can be used to flush FLEX\_TWI\_THR. If the THRCLR bit is set, the TXRDY and TXCOMP flags are set.

#### 46.9.3.13 Read/Write Flowcharts

The flowcharts shown in this section provide examples for read and write operations. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable Register (FLEX\_TWI\_IER) be configured first.

### 46.9.4 Multi-Master Mode

#### 46.9.4.1 Definition

In Multi-Master mode, more than one master may handle the bus at the same time without data corruption by using arbitration.

Arbitration starts as soon as two or more masters place information on the bus at the same time, and stops (arbitration is lost) for the master that intends to send a logical one while the other master sends a logical zero.

As soon as arbitration is lost by a master, it stops sending data and listens to the bus in order to detect a STOP. When the STOP is detected, the master that has lost arbitration may put its data on the bus by respecting arbitration.

Arbitration is illustrated in figure "Arbitration Cases" below.

#### **46.9.4.2 Different Multi-Master Modes**

Two Multi-Master modes may be distinguished:

- TWI as Master Only—TWI is considered as a master only and will never be addressed.
- TWI as Master or Slave—TWI may be either a master or a slave and may be addressed.

**Note:** Arbitration is supported in both Multi-Master modes.

##### **46.9.4.2.1 TWI as Master Only**

In this mode, the TWI is considered as a master only (MSEN is always at one) and must be driven like a master with the ARBLST (ARBitration Lost) flag in addition.

If arbitration is lost (ARBLST = 1), the user must reinitiate the data transfer.

If the user starts a transfer (ex.: DADR + START + W + Write in THR) and if the bus is busy, the TWI automatically waits for a STOP condition on the bus to initiate the transfer (see figure "User Sends Data While the Bus is Busy" below).

**Note:** The state of the bus (busy or free) is not indicated in the user interface.

##### **46.9.4.2.2 TWI as Master or Slave**

The automatic reversal from master to slave is not supported in case of a lost arbitration.

Then, in the case where TWI may be either a master or a slave, the user must manage the pseudo Multi-Master mode described in the steps below:

1. Program the TWI in Slave mode (SADR + MSDIS + SVEN) and perform a slave access (if TWI is addressed).
2. If the TWI has to be set in Master mode, wait until TXCOMP flag is at 1.
3. Program the Master mode (DADR + SVDIS + MSEN) and start the transfer (ex: START + Write in THR).
4. As soon as the Master mode is enabled, the TWI scans the bus in order to detect if it is busy or free. When the bus is considered as free, the TWI initiates the transfer.
5. As soon as the transfer is initiated and until a STOP condition is sent, the arbitration becomes relevant and the user must monitor the ARBLST flag.
6. If the arbitration is lost (ARBLST = 1), the user must program the TWI in Slave mode in case the master that won the arbitration needs to access the TWI.
7. If the TWI has to be set in Slave mode, wait until TXCOMP flag is at 1 and then program the Slave mode.

**Note:** In case the arbitration is lost and the TWI is addressed, the TWI will not acknowledge even if it is programmed in Slave mode as soon as ARBLST = 1. Then the master must repeat SADR.

**Figure 46-109. User Sends Data While the Bus is Busy**

**Figure 46-110. Arbitration Cases**

The flowchart shown in the following figure gives an example of read and write operations in Multi-Master mode.

**Figure 46-111. Multi-Master Mode**

## 46.9.5 Slave Mode

### 46.9.5.1 Definition

Slave mode is defined as a mode where the device receives the clock and the address from another device called the master.

In this mode, the device never initiates and never completes the transmission (START, REPEATED\_START and STOP conditions are always provided by the master).

#### 46.9.5.2 Programming Slave Mode

The following fields must be programmed before entering Slave mode:

1. FLEX\_TWI\_SMR.SADR: The slave device address is used in order to be accessed by master devices in Read or Write mode.
2. (Optional) FLEX\_TWI\_SMR.MASK can be set to mask some SADR address bits and thus allow multiple address matching.
3. FLEX\_TWI\_CR.MSDIS: Disables the Master mode.
4. FLEX\_TWI\_CR.SVEN: Enables the Slave mode.

As the device receives the clock, values written in FLEX\_TWI\_CWGR are not processed.

#### 46.9.5.3 Receiving Data

After a START or repeated START condition is detected, and if the address sent by the master matches the slave address programmed in the SADR (Slave Address) field, the SVACC (Slave Access) flag is set and SVREAD (Slave Read) indicates the direction of the transfer.

SVACC remains high until a STOP condition or a repeated START is detected. When such a condition is detected, EOSACC (End Of Slave Access) flag is set.

##### 46.9.5.3.1 Read Sequence

In the case of a read sequence (SVREAD is high), the TWI transfers data written in FLEX\_TWI\_THR (TWI Transmit Holding Register) until a STOP condition or a REPEATED\_START + an address different from SADR is detected. Note that at the end of the read sequence TXCOMP (Transmission Complete) flag is set and SVACC is reset.

As soon as data is written in FLEX\_TWI\_THR, the TXRDY (Transmit Holding Register Ready) flag is reset, and it is set when the internal shifter is empty and the sent data acknowledged or not. If the data is not acknowledged, the NACK flag is set.

Note that a STOP or a repeated START always follows a NACK.

See figure "Read Access Ordered by a Master" below.

**Note:** To clear the TXRDY flag in Slave mode, write the FLEX\_TWI\_CR.SVDIS bit to 1, then write the FLEX\_TWI\_CR.SVEN bit to 1.

##### 46.9.5.3.2 Write Sequence

In the case of a write sequence (SVREAD is low), the RXRDY (Receive Holding Register Ready) flag is set as soon as a character has been received in FLEX\_TWI\_RHR (TWI Receive Holding Register). RXRDY is reset when reading FLEX\_TWI\_RHR.

TWI continues receiving data until a STOP condition or a REPEATED\_START + an address different from SADR is detected. Note that at the end of the write sequence TXCOMP flag is set and SVACC reset.

See figure "Write Access Ordered by a Master" below.

##### 46.9.5.3.3 Clock Stretching Sequence

If FLEX\_TWI\_THR or FLEX\_TWI\_RHR is not written/read in time, the TWI performs a clock stretching.

Clock stretching information is given by the SCLWS (Clock Wait State) bit.

See figures "Clock Stretching in Read Mode" and "Clock Stretching in Write Mode" below.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Note:** Clock stretching can be disabled by configuring the FLEX\_TWI\_SMR.SCLWSDIS bit. In that case, UNRE and OVRE flags will indicate underrun (when FLEX\_TWI\_THR is not filled on time) or overrun (when FLEX\_TWI\_RHR is not read on time).

### 46.9.5.3.4 General Call

In the case where a GENERAL CALL is performed, the GACC (General Call Access) flag is set.

After GACC is set, it is up to the user to interpret the meaning of the GENERAL CALL and to decode the new address programming sequence.

See figure "Master Performs a General Call" below.

### 46.9.5.4 Data Transfer

#### 46.9.5.4.1 Read Operation

The Read mode is defined as a data requirement from the master.

After a START or a REPEATED START condition is detected, the decoding of the address starts. If the slave address (SADR) is decoded, SVACC is set and SVREAD indicates the direction of the transfer.

Until a STOP or REPEATED START condition is detected, TWI continues sending data loaded in FLEX\_TWI\_THR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the read operation.

**Figure 46-112. Read Access Ordered by a Master**

**Note:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. TXRDY is reset when data has been transmitted from FLEX\_TWI\_THR to the internal shifter and set when this data has been acknowledged or non acknowledged.

#### 46.9.5.4.2 Write Operation

The Write mode is defined as a data transmission from the master.

After a START or a REPEATED START, the decoding of the address starts. If the slave address is decoded, SVACC is set and SVREAD indicates the direction of the transfer (SVREAD is low in this case).

Until a STOP or REPEATED START condition is detected, TWI stores the received data in FLEX\_TWI\_RHR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the write operation.

**Figure 46-113. Write Access Ordered by a Master**

**Note:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. RXRDY is set when data has been transmitted from the internal shifter to FLEX\_TWI\_RHR, and reset when this data is read.

#### 46.9.5.4.3 General Call

The general call is performed in order to change the address of the slave.

If a GENERAL CALL is detected, GACC is set.

After the detection of general call, it is up to the user to decode the commands which follow.

In case of a WRITE command, the user has to decode the programming sequence and program a new SADR if the programming sequence matches.

The following figure describes the general call access.

**Figure 46-114. Master Performs a General Call**

**Note:** This method enables to create a user-specific programming sequence by choosing the number of programming bytes. The programming sequence has to be provided to the master.

#### 46.9.5.4.4 Clock Stretching

In both Read and Write modes, it may happen that the FLEX\_TWI\_THR/FLEX\_TWI\_RHR buffer is not filled/emptied before the transmission/reception of a new character. In this case, to avoid sending/receiving undesired data, a clock stretching mechanism is implemented.

**Note:** Clock stretching can be disabled by setting the FLEX\_TWI\_SMR.SCLWSDIS bit. In that case, the UNRE and OVRE flags indicate an underrun (when FLEX\_TWI\_THR is not filled on time) or an overrun (when FLEX\_TWI\_RHR is not read on time).

##### — Clock Stretching in Read Mode

The clock is tied low if the internal shifter is empty and if a STOP or REPEATED START condition was not detected. It is tied low until the internal shifter is loaded.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

The following figure describes clock stretching in Read mode.

**Figure 46-115. Clock Stretching in Read Mode**

**Note:**

1. TXRDY is reset when data has been written in FLEX\_TWI\_THR to the internal shifter, and set when this data has been acknowledged or non acknowledged.
2. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.
3. SCLWS is automatically set when the clock stretching mechanism is started.

**— Clock Stretching in Write Mode**

The clock is tied low if the internal shifter and FLEX\_TWI\_RHR are full. If a STOP or REPEATED\_START condition was not detected, it is tied low until FLEX\_TWI\_RHR is read.

The following figure describes the clock stretching in Write mode.

**Figure 46-116. Clock Stretching in Write Mode**

**Note:**

1. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

2. SCLWS is automatically set when the clock stretching mechanism is started and automatically reset when the mechanism is finished.

### 46.9.5.4.5 Reversal after a Repeated Start

#### — Reversal of Read to Write

The master initiates the communication by a read command and finishes it by a write command.

The following figure describes the repeated start and the reversal from Read mode to Write mode.

**Figure 46-117. Repeated Start and Reversal from Read Mode to Write Mode**

Note:

1. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.

#### — Reversal of Write to Read

The master initiates the communication by a write command and finishes it by a read command.

The following figure describes the repeated start and the reversal from Write mode to Read mode.

**Figure 46-118. Repeated Start and Reversal from Write Mode to Read Mode**

Notes:

1. In this case, if FLEX\_TWI\_THR has not been written at the end of the read command, the clock is automatically stretched before the ACK.
2. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.

### 46.9.5.4.6 SMBus Mode

SMBus mode is enabled when the FLEX\_TWI\_CR.SMEN bit is written to one. SMBus mode operation is similar to I<sup>2</sup>C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX\_TWI\_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).

4. A set of addresses have been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX\_TWI\_CR appropriately.

— **Packet Error Checking**

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX\_TWI\_CR.PECEN bit to one will send/check the FLEX\_TWI\_ACR.PEC field in the current transfer. The PEC generator is always updated on every bit transmitted or received, so that PEC handling on following linked transfers will be correct.

In Slave Receiver mode, the master calculates a PEC value and transmits it to the slave after all data bytes have been transmitted. Upon reception of this PEC byte, the slave will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the slave will return an ACK to the master. If the PEC values differ, data was corrupted, and the slave will return a NACK value. The FLEX\_TWI\_SR.PECERR bit is set automatically if a PEC error occurred.

In Slave Transmitter mode, the slave calculates a PEC value and transmits it to the master after all data bytes have been transmitted. Upon reception of this PEC byte, the master will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the master must take appropriate action.

See section [Slave Read/Write Flowcharts](#) for detailed flowcharts.

— **Timeouts**

The TWI SMBus Timing Register (FLEX\_TWI\_SMBTR) configures the SMBus timeout values. If a timeout occurs, the slave will leave the bus. Furthermore, the FLEX\_TWI\_SR.TOUT bit is set.

#### **46.9.5.5 High-Speed Slave Mode**

High-speed mode is enabled when the FLEX\_TWI\_CR.HSEN bit is written to one. Furthermore, the analog pad filter must be enabled, the FLEX\_TWI\_FILTR.PADFEN bit must be written to one and the FLEX\_TWI\_FILTR.FILT bit must be cleared. TWI High-speed mode operation is similar to TWI operation with the following exceptions:

1. A master code is received first at normal speed before entering High-speed mode period.
2. When TWI High-speed mode is active, clock stretching is only allowed after acknowledge (ACK), not-acknowledge (NACK), START (S) or repeated START (Sr) (as a consequence, OVF may happen).

TWI High-speed mode allows transfers of up to 3.4 Mbit/s.

The TWI slave in High-speed mode requires that the peripheral clock runs at a minimum of 14 MHz if slave clock stretching is enabled (SCLWSDIS bit at '0'). If slave clock stretching is disabled (SCLWSDIS bit at '1'), the peripheral clock must run at a minimum of 11 MHz (assuming the system has no latency).

**Note:**

1. When slave clock stretching is disabled, FLEX\_TWI\_RHR must always be read before receiving the next data (MASTER write frame). It is strongly recommended to use either the polling method on the FLEX\_TWI\_SR.RXRDY flag, or the DMA. If the receive is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid receive overrun.
2. When slave clock stretching is disabled, FLEX\_TWI\_THR must be filled with the first data to send before the beginning of the frame (MASTER read frame). It is strongly recommended to use either the polling method on the FLEX\_TWI\_SR.TXRDY flag, or the DMA. If the transmit is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid transmit underrun.

### 46.9.5.5.1 Read/Write Operation

A TWI high-speed frame always begins with the following sequence:

1. START condition (S)
2. Master Code (0000 1XXX)
3. Not-acknowledge (NACK)

When the TWI is programmed in Slave mode and TWI High-speed mode is activated, master code matching is activated and internal timings are set to match the TWI High-speed mode requirements.

**Figure 46-119. High-Speed Mode Read/Write**

### 46.9.5.5.2 Usage

TWI High-speed mode usage is the same as the standard TWI (see section [Read/Write Flowcharts](#)).

### 46.9.5.6 Alternative Command

In Slave mode, the Alternative Command mode is used when the SMBus mode is enabled to send or check the PEC byte.

The Alternative Command mode is enabled by setting the ACMEN bit of the TWIHS Control Register, and the transfer is configured in TWIHS\_ACR.

For a combined transfer with PEC, only the NPEC bit in TWIHS\_ACR must be set as the PEC byte is sent once at the end of the frame.

See section [Slave Read/Write Flowcharts](#) for detailed flowcharts.

### 46.9.5.7 TWI Asynchronous and Partial Wakeup (SleepWalking)

The TWI module includes an asynchronous start condition detector, it is capable of waking the device up from a Sleep mode upon an address match (and optionally an additional data match), including Sleep modes where the TWI peripheral clock is stopped.

The FLEX\_TWI\_RHR register must be read prior to enable the asynchronous and partial wakeup.

After detecting the START condition on the bus, the TWI will stretch TWCK until the TWI peripheral clock has started. The time required for starting the TWI peripheral depends on which Sleep mode the device is in. After the TWI peripheral clock has started, the TWI releases its TWCK stretching and receives one byte of data (slave address) on the bus. At this time, only a limited part of the device, including the TWI module, receives a clock, thus saving power. If the address phase causes a TWIS address match (and optionally if the first data byte causes data match as well), the entire device is wakened and normal TWI address matching actions are performed. Normal TWI transfer then follows. If the TWI module is not addressed (or if the optional data match fails), the TWI peripheral clock is automatically stopped and the device returns to its original Sleep mode.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

The TWI module has the capability to match on more than one address. The FLEX\_TWI\_SMR.SADR1EN/SADR2EN/SADR3EN bits enable address matching on additional addresses which can be configured through the FLEX\_TWI\_SWMR.SADR1/SADR2/SADR3 fields. The SleepWalking matching process can be extended to the first received data byte if the FLEX\_TWI\_SMR.DATAMEN bit is set. In that case, a complete matching includes address matching and first received data matching. The FLEX\_TWI\_SWMR.DATAM field can be used to configure the data to match on the first received byte.

When the system is in Active mode and the TWI enters asynchronous partial Wakeup mode, the flag SVACC must be programmed as the unique source of the TWI interrupt and the data match comparison must be disabled.

When the system exits Wait mode as the result of a matching condition, the SVACC flag is used to determine if the TWI is the source of the exit from Wait mode.

**Figure 46-120. Address Match and Data Matching Disabled**

**Figure 46-121. Address Does Not Match and Data Matching Disabled**

**Figure 46-122. Address and Data Match (Data Matching Enabled)**

**Figure 46-123. Address Matches and Data Do Not Match (Data Matching Enabled)**

#### 46.9.5.8 Slave Read/Write Flowcharts

The flowchart shown in the following figure gives an example of read and write operations in Slave mode. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable Register (FLEX\_TWI\_IER) be configured first.

**Figure 46-124. Read/Write in Slave Mode**

### Figure 46-125. Read/Write in Slave Mode with SMBus PEC

**Figure 46-126. Read/Write in Slave Mode with SMBus PEC and Alternative Command Mode**

## 46.9.6 TWI FIFOs

### 46.9.6.1 Overview

The TWI includes two FIFOs which can be enabled/disabled using FLEX\_TWI\_CR.FIFOEN/FIFODIS. Both Master and Slave modes must be disabled before enabling or disabling the FIFOs (FLEX\_TWI\_CR.MSDIS/SVDIS).

Writing FLEX\_TWI\_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to FLEX\_TWI\_THR/RHR, depending on FLEX\_TWI\_FMR.TXRDYM/RXRDYM settings.

**Figure 46-127. FIFOs Block Diagram**

#### 46.9.6.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX\_TWI\_THR loads the Transmit FIFO.

The Transmit FIFO level is provided in FLEX\_TWI\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX\_TWI\_SR.TXRDY and the data can be successively written in FLEX\_TWI\_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in FLEX\_TWI\_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

See figures [Sending Data with FIFO Enabled in Master Mode](#) and [Sending/Receiving Data with FIFO Enabled in Slave Mode](#).

### Figure 46-128. Sending Data with FIFO Enabled in Master Mode

### 46.9.6.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX\_TWI\_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to '1'), the exact number of data can be checked with FLEX\_TWI\_FLR.RXFL. All the data can be read successively in FLEX\_TWI\_RHR without checking the FLEX\_TWI\_SR.RXRDY flag between each access.

See figures [Receiving Data with FIFO Enabled in Master Mode](#) and [Sending/Receiving Data with FIFO Enabled in Slave Mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Figure 46-129. Receiving Data with FIFO Enabled in Master Mode**

### 46.9.6.4 Sending/Receiving with FIFO Enabled in Slave Mode

See sections [Sending Data with FIFO Enabled](#) and [Receiving Data with FIFO Enabled](#) for details.

**Figure 46-130. Sending/Receiving Data with FIFO Enabled in Slave Mode**

#### 46.9.6.5 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_TWI\_CR.TXFCLR/RXFCLR.

#### 46.9.6.6 TXRDY and RXRDY Behavior

FLEX\_TWI\_SR.TXRDY/RXRDY flags display a specific behavior when FIFOs are enabled.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure [TXRDY Behavior when TXRDYM = 0 in Master mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. Refer to figure [RXRDY Behavior when RXRDYM = 0 in Master and Slave modes](#).

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the TWI FIFO Mode Register (FLEX\_TWI\_FMR) to reduce the number of accesses to FLEX\_TWI\_THR/RHR.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See TWI FIFO Mode Register for the FIFO configuration.

**Figure 46-131. TXRDY Behavior when TXRDYM = 0 in Master Mode**

**Figure 46-132. RXRDY Behavior when RXRDYM = 0 in Master and Slave Modes**

**Figure 46-133. TXRDY Behavior when TXRDYM = 0 in Slave Mode**

### 46.9.6.7 TWI Single Data Mode

In Single Data mode, only one data is written every time FLEX\_TWI\_THR is accessed, and only one data is read every time FLEX\_TWI\_RHR is accessed.

When FLEX\_TWI\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When FLEX\_TWI\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

See sections [TWI Transmit Holding Register](#) and [TWI Receive Holding Register](#).

### 46.9.6.8 TWI Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When FLEX\_TWI\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When FLEX\_TWI\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

In Multiple Data mode, it is possible to write/read up to four data in one FLEX\_TWI\_THR/ FLEX\_TWI\_RHR register access.

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a wordsize register access, then up to four data are read and up to two data are written.

Written/Read data are always right-aligned, as described in sections [TWI Receive Holding Register \(FIFO Enabled\)](#) and [TWI Transmit Holding Register \(FIFO Enabled\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX\_TWI\_THR-byte write accesses
- three FLEX\_TWI\_THR-halfword write accesses
- one FLEX\_TWI\_THR-word write access and one FLEX\_TWI\_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX\_TWI\_RHR-byte read accesses
- three FLEX\_TWI\_RHR-halfword read accesses
- one FLEX\_TWI\_RHR-word read access and one FLEX\_TWI\_RHR-halfword read access

#### **46.9.6.8.1 TXRDY and RXRDY Configuration**

In Multiple Data mode, it is possible to write one or more data in the same FLEX\_TWI\_THR/FLEX\_TWI\_RHR access. The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX\_TWI\_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in FLEX\_TWI\_THR, it is useful to configure the TXRDYM field to the value '1' so that the TXRDY flag is at '1' only when at least two data can be written in the Transmit FIFO.

In the same way, if four data are read each time in FLEX\_TWI\_RHR, it is useful to configure the RXRDYM field to the value '2' so that the RXRDY flag is at '1' only when at least four unread data are in the Receive FIFO.

#### **46.9.6.8.2 DMAC**

When FIFOs operate in Multiple Data mode, the DMAC transfer type must be configured in byte, halfword or word depending on the FLEX\_TWI\_FMR.TXRDYM/RXRDYM settings.

#### **46.9.6.9 Transmit FIFO Lock**

If a frame is terminated early due to a not-acknowledge error (NACK flag), SMBus timeout error (TOUT flag) or master code acknowledge error (MACK flag), a lock is set on the Transmit FIFO preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMAC channels, etc., without any risk.

FLEX\_TWI\_SR.LOCK is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting FLEX\_TWI\_CR.TXFLCLR to '1'.

#### **46.9.6.10 FIFO Pointer Error**

A FIFO overflow is reported in FLEX\_TWI\_FSR.

If the Transmit FIFO is full and a write access is performed on FLEX\_TWI\_THR, it generates a Transmit FIFO pointer error and sets FLEX\_TWI\_FSR.TXFPTEF.

In Multiple Data mode, if the number of data written in FLEX\_TWI\_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and FLEX\_TWI\_FSR.TXFPTEF is set.

A FIFO underflow is reported in FLEX\_TWI\_FSR.

In Multiple Data mode, if the number of data read in FLEX\_TWI\_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and FLEX\_TWI\_FSR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in FLEX\_TWI\_THR/FLEX\_TWI\_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a Transmit or Receive pointer error occurs, a software reset must be performed using FLEX\_TWI\_CR.SWRST. Note that issuing a software while transmitting might leave a slave in an unknown state holding the TWD line. In such case, a Bus Clear Command will allow to make the slave release the TWD line (the first frame sent afterwards might not be received properly by the slave).

#### **46.9.6.11 FIFO Thresholds**

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_TWI\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_TWI\_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_TWI\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_TWI\_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX\_TWI\_FIER and FLEX\_TWI\_FIDR.

#### **46.9.6.12 FIFO Flags**

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_TWI\_FIER and FLEX\_TWI\_FIDR.

FIFO flags state can be read in FLEX\_TWI\_FSR. They are cleared when FLEX\_TWI\_FSR is read.

#### **46.9.7 TWI Comparison Function on Received Character**

The comparison function differs if the asynchronous partial wakeup (Sleepwalking) is enabled or not.

If asynchronous partial wakeup is disabled (refer to the section "Power Management Controller" (PMC)), the TWI has the capability to extend the address matching on up to three slave addresses. The FLEX\_TWI\_SMR.SADR1EN/SADR2EN/SADR3EN bits enable address matching on additional addresses which can be configured through the FLEX\_TWI\_SWMR.SADR1/SADR2/SADR3 fields. The DATAMEN bit has no effect.

The SVACC bit is set when there is a comparison match with the received slave address.

#### **46.9.8 TWI Register Write Protection**

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR\_OPMODE\_TWI to enable access to the write protection registers.

To prevent any single software error from corrupting TWI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the TWI Write Protection Mode Register (FLEX\_TWI\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the TWI Write Protection Status Register (FLEX\_TWI\_WPSR) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_TWI\_WPSR.

The following register(s) can be write-protected when WPEN is set:

- TWI Slave Mode Register
- TWI Clock Waveform Generator Register
- TWI SMBus Timing Register
- TWI SleepWalking Matching Register
- TWI FIFO Mode Register

The following register(s) can be write-protected when WPITEN is set:

- TWI Interrupt Enable Register

# **SAMA5D2 Series**

## **Flexible Serial Communication Controller (FLEXCOM)**

---

- TWI Interrupt Disable Register

The following register(s) can be write-protected when WPCREN is set:

- TWI Control Register

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10 Register Summary

| Offset                | Name                     | Bit Pos. |              |          |             |         |                 |                    |             |         |

| Reset  | –     | –    | –     | –    | –     | –     |   |   |

#### Bit 31 – FIFODIS FIFO Disable

| Value | Description                              |
|-------|------------------------------------------|
| 0     | No effect.                               |
| 1     | Disables the Transmit and Receive FIFOs. |

#### Bit 30 – FIFOEN FIFO Enable

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No effect.                              |
| 1     | Enables the Transmit and Receive FIFOs. |

#### Bit 28 – REQCLR Request to Clear the Comparison Trigger

#### Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR

| Value | Description                    |
|-------|--------------------------------|
| 0     | No effect.                     |
| 1     | Clears the Transmit FIFO Lock. |

#### Bit 25 – RXFCLR Receive FIFO Clear

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Empties the Receive FIFO. |

**Bit 24 – TXFCLR** Transmit FIFO Clear

| Value | Description                |
|-------|----------------------------|
| 0     | No effect.                 |
| 1     | Empties the Transmit FIFO. |

**Bit 21 – LINWKUP** Send LIN Wakeup Signal

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Sends a wakeup signal on the LIN bus. |

**Bit 20 – LINABT** Abort LIN Transmission

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | Aborts the current LIN transmission. |

**Bit 19 – RTSDIS** Request to Send Disable

| Value | Description                                                                                                                  |
|-------|------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                   |
| 1     | Drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 0. |

**Bit 18 – RTSEN** Request to Send Enable

| Value | Description                                                                                                                  |
|-------|------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                   |
| 1     | Drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 0. |

**Bit 15 – RETTO** Start Timeout Immediately

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect                            |
| 1     | Immediately restarts timeout period. |

**Bit 14 – RSTNACK** Reset Non Acknowledge

| Value | Description              |
|-------|--------------------------|
| 0     | No effect                |
| 1     | Resets FLEX_US_CSR.NACK. |

**Bit 13 – RSTIT** Reset Iterations

| Value | Description |
|-------|-------------|
| 0     | No effect.  |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 1     | Resets FLEX_US_CSR.ITER. No effect if the ISO7816 is not enabled. |

### Bit 12 – SENDA Send Address

| Value | Description                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                          |
| 1     | In Multidrop mode only, the next character written to FLEX_US_THR is sent with the address bit set. |

### Bit 11 – STTTO Clear TIMEOUT Flag and Start Timeout After Next Character Received

| Value | Description                                                                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                        |
| 1     | Starts waiting for a character before clocking the timeout counter. Immediately disables a timeout period in progress. Resets the FLEX_US_CSR.TIMEOUT status bit. |

### Bit 10 – STPBRK Stop Break

| Value | Description                                                                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                            |
| 1     | Stops transmission of the break after a minimum of one character length and transmits a high level during 12-bit periods. No effect if no break is being transmitted. |

### Bit 9 – STTBRK Start Break

| Value | Description                                                                                                                                                                          |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                           |
| 1     | Starts transmission of a break after the characters present in FLEX_US_THR and the Transmit Shift Register have been transmitted. No effect if a break is already being transmitted. |

### Bit 8 – RSTSTA Reset Status Bits

| Value | Description                                                                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                         |
| 1     | Resets the PARE, FRAME, OVRE, MANE, LINBE, LINISFE, LINIPE, LINC, LINSNRE, LINSTE, LINHTE, LINID, LINTC, LINBK, CMP and RXBRK in FLEX_US_CSR status bits, as well as the TXFEF, TXFFF, TXFTHF, RXFEF, RXFFF, RXFTHF, TXFPTEF, RXFPTEF in FLEX_US_FESR status bits. |

### Bit 7 – TXDIS Transmitter Disable

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Disables the transmitter. |

### Bit 6 – TXEN Transmitter Enable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | Enables the transmitter if TXDIS is 0. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 5 – RXDIS Receiver Disable

| Value | Description            |
|-------|------------------------|
| 0     | No effect.             |
| 1     | Disables the receiver. |

### Bit 4 – RXEN Receiver Enable

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | Enables the receiver, if RXDIS is 0. |

### Bit 3 – RSTTX Reset Transmitter

| Value | Description             |
|-------|-------------------------|
| 0     | No effect.              |
| 1     | Resets the transmitter. |

### Bit 2 – RSTRX Reset Receiver

| Value | Description          |
|-------|----------------------|
| 0     | No effect.           |
| 1     | Resets the receiver. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.5 USART Control Register (SPI\_MODE)

**Name:** FLEX\_US\_CR (SPI\_MODE)  
**Offset:** 0x200  
**Reset:** –  
**Property:** Write-only

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the [USART Mode Register](#).

|        |       |      |       |      |       |       |    |        |
|--------|-------|------|-------|------|-------|-------|----|--------|
| Bit    | 31    | 30   | 29    | 28   | 27    | 26    | 25 | 24     |
|        |       |      |       |      |       |       |    |        |
| Access |       |      |       |      |       |       |    |        |
| Reset  |       |      |       |      |       |       |    |        |
| Bit    | 23    | 22   | 21    | 20   | 19    | 18    | 17 | 16     |
|        |       |      |       |      | RCS   | FCS   |    |        |
| Access |       |      |       |      | W     | W     |    |        |
| Reset  |       |      |       |      | –     | –     |    |        |
| Bit    | 15    | 14   | 13    | 12   | 11    | 10    | 9  | 8      |
|        |       |      |       |      |       |       |    | RSTSTA |
| Access |       |      |       |      |       |       |    | W      |
| Reset  |       |      |       |      |       |       |    | –      |
| Bit    | 7     | 6    | 5     | 4    | 3     | 2     | 1  | 0      |
|        | TXDIS | TXEN | RXDIS | RXEN | RSTTX | RSTRX |    |        |
| Access | W     | W    | W     | W    | W     | W     |    |        |
| Reset  | –     | –    | –     | –    | –     | –     |    |        |

#### Bit 19 – RCS Release SPI Chip Select

Applicable if USART operates in SPI Master mode (USART\_MODE = 0xE):

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | Releases the Slave Select Line NSS (RTS pin). |

#### Bit 18 – FCS Force SPI Chip Select

Applicable if USART operates in SPI Master mode (USART\_MODE = 0xE):

| Value | Description                                                                                                                                                                              |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                               |
| 1     | Forces the Slave Select Line NSS (RTS pin) to 0, even if USART is not transmitting, in order to address SPI slave devices supporting the CSAAT mode (Chip Select Active After Transfer). |

#### Bit 8 – RSTSTA Reset Status Bits

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | Resets the FLEX_US_CSR.OVRE/UNRE status bits. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 7 – TXDIS Transmitter Disable

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Disables the transmitter. |

### Bit 6 – TXEN Transmitter Enable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | Enables the transmitter if TXDIS is 0. |

### Bit 5 – RXDIS Receiver Disable

| Value | Description            |
|-------|------------------------|
| 0     | No effect.             |
| 1     | Disables the receiver. |

### Bit 4 – RXEN Receiver Enable

| Value | Description                          |
|-------|--------------------------------------|
| 0     | No effect.                           |
| 1     | Enables the receiver, if RXDIS is 0. |

### Bit 3 – RSTTX Reset Transmitter

| Value | Description             |
|-------|-------------------------|
| 0     | No effect.              |
| 1     | Resets the transmitter. |

### Bit 2 – RSTRX Reset Receiver

| Value | Description          |
|-------|----------------------|
| 0     | No effect.           |
| 1     | Resets the receiver. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.6 USART Mode Register

**Name:** FLEX\_US\_MR  
**Offset:** 0x204  
**Reset:** –  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).  
 For SPI configuration, see section [USART Mode Register \(SPI\\_MODE\)](#).

|        |             |          |             |        |      |                    |       |      |
|--------|-------------|----------|-------------|--------|------|--------------------|-------|------|

| Access | R/W         | R/W      | R/W         | R/W    | R/W  | R/W                | R/W   | R/W  |
| Reset  | –           | –        | –           | –      | –    | –                  | –     | –    |
| Bit    | 15          | 14       | 13          | 12     | 11   | 10                 | 9     | 8    |
|        | CHMODE[1:0] |          | NBSTOP[1:0] |        |      | PAR[2:0]           |       | SYNC |
| Access | R/W         | R/W      | R/W         | R/W    | R/W  | R/W                | R/W   | R/W  |
| Reset  | –           | –        | –           | –      | –    | –                  | –     | –    |
| Bit    | 7           | 6        | 5           | 4      | 3    | 2                  | 1     | 0    |
|        | CHRL[1:0]   |          | USCLKS[1:0] |        |      | USART_MODE[3:0]    |       |      |
| Access | R/W         | R/W      | R/W         | R/W    | R/W  | R/W                | R/W   | R/W  |
| Reset  | –           | –        | –           | –      | –    | –                  | –     | –    |

#### Bit 31 – ONEBIT Start Frame Delimiter Selector

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | Start frame delimiter is COMMAND or DATA SYNC. |
| 1     | Start frame delimiter is one bit.              |

#### Bit 30 – MODSYNC Manchester Synchronization Mode

| Value | Description                                      |
|-------|--------------------------------------------------|
| 0     | The Manchester start bit is a 0 to 1 transition  |
| 1     | The Manchester start bit is a 1 to 0 transition. |

#### Bit 29 – MAN Manchester Encoder/Decoder Enable

| Value | Description                              |
|-------|------------------------------------------|
| 0     | Manchester encoder/decoder are disabled. |
| 1     | Manchester encoder/decoder are enabled.  |

#### Bit 28 – FILTER Receive Line Filter

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                                          |
|-------|------------------------------------------------------------------------------------------------------|
| 0     | The USART does not filter the receive line.                                                          |
| 1     | The USART filters the receive line using a three-sample filter (1/16-bit clock) (2 over 3 majority). |

**Bits 26:24 – MAX\_ITERATION[2:0]** Maximum Number of Automatic Iterations

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 0–7   | Defines the maximum number of iterations in mode ISO7816, protocol T = 0. |

**Bit 23 – INVDATA** Inverted Data

| Value | Description                                                                                                                                                                                                                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The data field transmitted on TXD line is the same as the one written in FLEX_US_THR or the content read in FLEX_US_RHR is the same as RXD line. Normal mode of operation.                                                                                                                                                                         |
| 1     | The data field transmitted on TXD line is inverted (voltage polarity only) compared to the value written in FLEX_US_THR or the content read in FLEX_US_RHR is inverted compared to what is received on RXD line (or ISO7816 IO line). Inverted mode of operation, useful for contactless card application. To be used with configuration bit MSBF. |

**Bit 22 – VAR\_SYNC** Variable Synchronization of Command/Data Sync Start Frame Delimiter

| Value | Description                                                                          |
|-------|--------------------------------------------------------------------------------------|
| 0     | User defined configuration of command or data sync field depending on MODSYNC value. |
| 1     | The sync field is updated when a character is written into FLEX_US_THR.              |

**Bit 21 – DSNACK** Disable Successive NACK

The MAX\_ITERATION field must be cleared if DSNACK is cleared.

| Value | Description                                                                                                                                                                                                                                              |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NACK is sent on the ISO line as soon as a parity error occurs in the received character (unless INACK is set).                                                                                                                                           |
| 1     | Successive parity errors are counted up to the value specified in the MAX_ITERATION field. These parity errors generate a NACK on the ISO line. As soon as this value is reached, no additional NACK is sent on the ISO line. The flag ITER is asserted. |

**Bit 20 – INACK** Inhibit Non Acknowledge

| Value | Description                |
|-------|----------------------------|
| 0     | The NACK is generated.     |
| 1     | The NACK is not generated. |

**Bit 19 – OVER** Oversampling Mode

| Value | Description       |
|-------|-------------------|
| 0     | 16x Oversampling. |
| 1     | 8x Oversampling.  |

**Bit 18 – CLKO** Clock Output Select

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                                                              |
|-------|--------------------------------------------------------------------------------------------------------------------------|
| 0     | The USART does not drive the SCK pin (Synchronous Slave mode or Asynchronous mode with external baud rate clock source). |
| 1     | The USART drives the SCK pin if USCLKS does not select the external clock SCK (USART Synchronous Master mode).           |

### Bit 17 – MODE9 9-bit Character Length

| Value | Description                    |
|-------|--------------------------------|
| 0     | CHRL defines character length. |
| 1     | 9-bit character length.        |

### Bit 16 – MSBF Bit Order

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | Least significant bit is sent/received first. |
| 1     | Most significant bit is sent/received first.  |

### Bits 15:14 – CHMODE[1:0] Channel Mode

| Value | Name            | Description                                                            |
|-------|-----------------|------------------------------------------------------------------------|
| 0     | NORMAL          | Normal mode                                                            |
| 1     | AUTOMATIC       | Automatic Echo. Receiver input is connected to the TXD pin.            |
| 2     | LOCAL_LOOPBACK  | Local Loopback. Transmitter output is connected to the Receiver Input. |
| 3     | REMOTE_LOOPBACK | Remote Loopback. RXD pin is internally connected to the TXD pin.       |

### Bits 13:12 – NBSTOP[1:0] Number of Stop Bits

| Value | Name    | Description                                    |
|-------|---------|------------------------------------------------|
| 0     | 1_BIT   | 1 stop bit                                     |
| 1     | 1_5_BIT | 1.5 stop bit (SYNC = 0) or reserved (SYNC = 1) |
| 2     | 2_BIT   | 2 stop bits                                    |

### Bits 11:9 – PAR[2:0] Parity Type

| Value | Name      | Description                |
|-------|-----------|----------------------------|
| 0     | EVEN      | Even parity                |
| 1     | ODD       | Odd parity                 |
| 2     | SPACE     | Parity forced to 0 (Space) |
| 3     | MARK      | Parity forced to 1 (Mark)  |
| 4     | NO        | No parity                  |
| 6     | MULTIDROP | Multidrop mode             |

### Bit 8 – SYNC Synchronous Mode Select

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | USART operates in Asynchronous mode (UART). |
| 1     | USART operates in Synchronous mode.         |

### Bits 7:6 – CHRL[1:0] Character Length

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Name  | Description                |
|-------|-------|----------------------------|
| 0     | 5_BIT | Character length is 5 bits |
| 1     | 6_BIT | Character length is 6 bits |
| 2     | 7_BIT | Character length is 7 bits |
| 3     | 8_BIT | Character length is 8 bits |

### Bits 5:4 – USCLKS[1:0] Clock Selection

| Value | Name | Description                                                                                              |
|-------|------|----------------------------------------------------------------------------------------------------------|
| 0     | MCK  | Peripheral clock is selected                                                                             |
| 1     | DIV  | Peripheral clock divided (DIV = 8) is selected                                                           |
| 2     | GCLK | PMC generic clock is selected. If the SCK pin is driven (CLKO = 1), the CD field must be greater than 1. |
| 3     | SCK  | External pin SCK is selected                                                                             |

### Bits 3:0 – USART\_MODE[3:0] USART Mode of Operation

| Value | Name             | Description                                                        |
|-------|------------------|--------------------------------------------------------------------|
| 0x0   | NORMAL           | Normal mode                                                        |
| 0x1   | RS485            | RS485                                                              |
| 0x2   | HW_HANDSHAKING   | Hardware handshaking                                               |
| 0x3   | MODEM            | Modem                                                              |
| 0x4   | IS07816_T_0      | IS07816 Protocol: T = 0                                            |
| 0x6   | IS07816_T_1      | IS07816 Protocol: T = 1                                            |
| 0x8   | IRDA             | IrDA                                                               |
| 0x9   | LON              | LON                                                                |
| 0xA   | LIN_MASTER       | LIN Master mode                                                    |
| 0xB   | LIN_SLAVE        | LIN Slave mode                                                     |
| 0xC   | DATA16BIT_MASTER | 16-bit data master                                                 |
| 0xD   | DATA16BIT_SLAVE  | 16-bit data slave                                                  |
| 0xE   | SPI_MASTER       | SPI Master mode (CLKO must be written to 1 and USCLKS = 0, 1 or 2) |
| 0xF   | SPI_SLAVE        | SPI Slave mode                                                     |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.7 USART Mode Register (SPI\_MODE)

**Name:** FLEX\_US\_MR (SPI\_MODE)  
**Offset:** 0x204  
**Reset:** –  
**Property:** Read/Write

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |             |     |             |       |                 |     |     |      |
|--------|-------------|-----|-------------|-------|-----------------|-----|-----|------|
| Bit    | 31          | 30  | 29          | 28    | 27              | 26  | 25  | 24   |
|        |             |     |             |       |                 |     |     |      |
| Access |             |     |             |       |                 |     |     |      |
| Reset  |             |     |             |       |                 |     |     |      |
| Bit    | 23          | 22  | 21          | 20    | 19              | 18  | 17  | 16   |
|        |             |     |             | WRDBT |                 |     |     | CPOL |
| Access |             |     |             | R/W   |                 |     |     | R/W  |
| Reset  |             |     |             | –     |                 |     |     | –    |
| Bit    | 15          | 14  | 13          | 12    | 11              | 10  | 9   | 8    |
|        | CHMODE[1:0] |     |             |       |                 |     |     | CPHA |
| Access | R/W         | R/W |             |       |                 |     |     | R/W  |
| Reset  | 0           | –   |             |       |                 |     |     | –    |
| Bit    | 7           | 6   | 5           | 4     | 3               | 2   | 1   | 0    |
|        | CHRL[1:0]   |     | USCLKS[1:0] |       | USART_MODE[3:0] |     |     |      |
| Access | R/W         | R/W | R/W         | R/W   | R/W             | R/W | R/W | R/W  |
| Reset  | 0           | –   | 0           | –     | 0               | 0   | 0   | –    |

#### Bit 20 – WRDBT Wait Read Data Before Transfer

| Value | Description                                                                                                                               |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The character transmission starts as soon as a character is written into FLEX_US_THR (assuming TXRDY was set).                            |
| 1     | The character transmission starts when a character is written and only if RXRDY flag is cleared (Receive Holding Register has been read). |

#### Bit 16 – CPOL SPI Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with CPHA to produce the required clock/data relationship between master and slave devices.

Applicable if USART operates in SPI mode (slave or master, USART\_MODE = 0xE or 0xF):

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | The inactive state value of SPCK is logic level zero. |
| 1     | The inactive state value of SPCK is logic level one.  |

#### Bits 15:14 – CHMODE[1:0] Channel Mode

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Name   | Description |
|-------|--------|-------------|
| 0     | NORMAL | Normal mode |

### Bit 8 – CPHA SPI Clock Phase

CPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

Applicable if USART operates in SPI mode (USART\_MODE = 0xE or 0xF):

| Value | Description                                                                              |
|-------|------------------------------------------------------------------------------------------|
| 0     | Data are changed on the leading edge of SPCK and captured on the following edge of SPCK. |
| 1     | Data are captured on the leading edge of SPCK and changed on the following edge of SPCK. |

### Bits 7:6 – CHRL[1:0] Character Length

| Value | Name  | Description                |
|-------|-------|----------------------------|
| 3     | 8_BIT | Character length is 8 bits |

### Bits 5:4 – USCLKS[1:0] Clock Selection

| Value | Name | Description                                   |
|-------|------|-----------------------------------------------|
| 0     | MCK  | Peripheral clock is selected                  |
| 1     | DIV  | Peripheral clock Divided (DIV= 8) is selected |
| 2     | GCLK | A PMC generic clock is selected               |
| 3     | SCK  | External pin SCK is selected                  |

### Bits 3:0 – USART\_MODE[3:0] USART Mode of Operation

| Value | Name       | Description |
|-------|------------|-------------|
| 0xE   | SPI_MASTER | SPI master  |
| 0xF   | SPI_SLAVE  | SPI slave   |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.8 USART Interrupt Enable Register

**Name:** FLEX\_US\_IER  
**Offset:** 0x208  
**Reset:** –  
**Property:** Write-only

For SPI-specific configurations, see [USART Interrupt Enable Register \(SPI\\_MODE\)](#).

For LIN-specific configurations, see [USART Interrupt Enable Register \(LIN\\_MODE\)](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

|        |    |    |    |    |    |    |    |      |
|--------|----|----|----|----|----|----|----|------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24   |
|        |    |    |    |    |    |    |    | MANE |
| Access |    |    |    |    |    |    |    | W    |
| Reset  |    |    |    |    |    |    |    | –    |

|        |    |     |    |    |       |    |    |    |
|--------|----|-----|----|----|-------|----|----|----|
| Bit    | 23 | 22  | 21 | 20 | 19    | 18 | 17 | 16 |
|        |    | CMP |    |    | CTSIC |    |    |    |
| Access |    | W   |    |    | W     |    |    |    |
| Reset  |    | –   |    |    | –     |    |    |    |

|        |    |    |      |    |    |      |         |         |
|--------|----|----|------|----|----|------|---------|---------|
| Bit    | 15 | 14 | 13   | 12 | 11 | 10   | 9       | 8       |
|        |    |    | NACK |    |    | ITER | TXEMPTY | TIMEOUT |
| Access |    |    | W    |    |    | W    | W       | W       |
| Reset  |    |    | –    |    |    | –    | –       | –       |

|        |      |       |      |   |   |       |       |       |
|--------|------|-------|------|---|---|-------|-------|-------|
| Bit    | 7    | 6     | 5    | 4 | 3 | 2     | 1     | 0     |
|        | PARE | FRAME | OVRE |   |   | RXBRK | TXRDY | RXRDY |
| Access | W    | W     | W    |   |   | W     | W     | W     |
| Reset  | –    | –     | –    |   |   | –     | –     | –     |

**Bit 24 – MANE** Manchester Error Interrupt Enable

**Bit 22 – CMP** Comparison Interrupt Enable

**Bit 19 – CTSIC** Clear to Send Input Change Interrupt Enable

**Bit 13 – NACK** Non Acknowledge Interrupt Enable

**Bit 10 – ITER** Max number of Repetitions Reached Interrupt Enable

**Bit 9 – TXEMPTY** TXEMPTY Interrupt Enable

**Bit 8 – TIMEOUT** Timeout Interrupt Enable

**Bit 7 – PARE** Parity Error Interrupt Enable

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

**Bit 6 – FRAME** Framing Error Interrupt Enable

**Bit 5 – OVRE** Overrun Error Interrupt Enable

**Bit 2 – RXBRK** Receiver Break Interrupt Enable

**Bit 1 – TXRDY** TXRDY Interrupt Enable

**Bit 0 – RXRDY** RXRDY Interrupt Enable

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.9 USART Interrupt Enable Register (SPI\_MODE)

**Name:** FLEX\_US\_IER (SPI\_MODE)  
**Offset:** 0x208  
**Reset:** –  
**Property:** Write-only

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the [USART Mode Register](#).

This register can only be written if the WPITEN bit is cleared in the [USART Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |     |    |    |      |    |    |    |

**Bit 22 – CMP** Comparison Interrupt Enable

**Bit 19 – NSSE** NSS Line (Driving CTS Pin) Rising or Falling Edge Event

**Bit 10 – UNRE** SPI Underrun Error Interrupt Enable

**Bit 9 – TXEMPTY** TXEMPTY Interrupt Enable

**Bit 5 – OVRE** Overrun Error Interrupt Enable

**Bit 1 – TXRDY** TXRDY Interrupt Enable

**Bit 0 – RXRDY** RXRDY Interrupt Enable

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.10 USART Interrupt Enable Register (LIN\_MODE)

**Name:** FLEX\_US\_IER (LIN\_MODE)  
**Offset:** 0x208  
**Reset:** –  
**Property:** Write-only

This configuration is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

This register can only be written if the WPITEN bit is cleared in the [USART Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

|        |        |        |         |       |       |         |         |         |
|--------|--------|--------|---------|-------|-------|---------|---------|---------|
| Bit    | 31     | 30     | 29      | 28    | 27    | 26      | 25      | 24      |
|        | LINHTC | LINSTE | LINSNRE | LINCE | LINPE | LINISFE | LINBE   |         |
| Access | W      | W      | W       | W     | W     | W       | W       |         |

### 46.10.11 USART Interrupt Disable Register

**Name:** FLEX\_US\_IDR  
**Offset:** 0x20C  
**Reset:** –  
**Property:** Write-only

For SPI-specific configurations, see [USART Interrupt Disable Register \(SPI\\_MODE\)](#).

For LIN-specific configurations, see [USART Interrupt Disable Register \(LIN\\_MODE\)](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Disables the corresponding interrupt.

|        |    |    |    |    |    |    |    |      |
|--------|----|----|----|----|----|----|----|------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24   |

### 46.10.12 USART Interrupt Disable Register (SPI\_MODE)

**Name:** FLEX\_US\_IDR (SPI\_MODE)  
**Offset:** 0x20C  
**Reset:** –  
**Property:** Write-only

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the [USART Mode Register](#).

This register can only be written if the WPITEN bit is cleared in the [USART Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Disables the corresponding interrupt.

|        |    |    |    |    |    |    |    |    |

#### Bit 24 – MANE Manchester Error

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | No Manchester error has been detected since the last RSTSTA command was issued.           |
| 1     | At least one Manchester error has been detected since the last RSTSTA command was issued. |

#### Bit 23 – CTS Image of CTS Input

| Value | Description               |
|-------|---------------------------|
| 0     | CTS input is driven low.  |
| 1     | CTS input is driven high. |

#### Bit 22 – CMP Comparison Status

| Value | Description                                                                                                                                       |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No received character matched the comparison criteria programmed in VAL1, VAL2 fields and CMPPAR bit in since the last RSTSTA command was issued. |
| 1     | A received character matched the comparison criteria since the last RSTSTA command was issued.                                                    |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 19 – CTSIC Clear to Send Input Change Flag

| Value | Description                                                                                    |
|-------|------------------------------------------------------------------------------------------------|
| 0     | No input change has been detected on the CTS pin since the last read of FLEX_US_CSR.           |
| 1     | At least one input change has been detected on the CTS pin since the last read of FLEX_US_CSR. |

### Bit 13 – NACK Non Acknowledge Interrupt

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | Non acknowledge has not been detected since the last RSTNACK.          |
| 1     | At least one non acknowledge has been detected since the last RSTNACK. |

### Bit 10 – ITER Max Number of Repetitions Reached

| Value | Description                                                                                 |
|-------|---------------------------------------------------------------------------------------------|
| 0     | Maximum number of repetitions has not been reached since the last RSTIT command was issued. |
| 1     | Maximum number of repetitions has been reached since the last RSTIT command was issued.     |

### Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX\_US\_THR)

| Value | Description                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------|
| 0     | There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled. |
| 1     | There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.                                |

### Bit 8 – TIMEOUT Receiver Timeout

| Value | Description                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------|
| 0     | There has not been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0. |
| 1     | There has been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO).                                  |

### Bit 7 – PARE Parity Error

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | No parity error has been detected since the last RSTSTA command was issued.           |
| 1     | At least one parity error has been detected since the last RSTSTA command was issued. |

### Bit 6 – FRAME Framing Error

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | No stop bit has been detected low since the last RSTSTA command was issued.           |
| 1     | At least one stop bit has been detected low since the last RSTSTA command was issued. |

### Bit 5 – OVRE Overrun Error

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | No overrun error has occurred since the last RSTSTA command was issued.           |
| 1     | At least one overrun error has occurred since the last RSTSTA command was issued. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 2 – RXBRK Break Received/End of Break

| Value | Description                                                                          |
|-------|--------------------------------------------------------------------------------------|
| 0     | No break received or end of break detected since the last RSTSTA command was issued. |
| 1     | Break received or end of break detected since the last RSTSTA command was issued.    |

### Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX\_US\_THR)

When FIFOs are disabled:

0: A character in FLEX\_US\_THR is waiting to be transferred to the Transmit Shift Register, or an STTBK command has been requested, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.

1: There is no character in FLEX\_US\_THR.

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFO enabled is illustrated in [46.7.11.5 TXEMPTY, TXRDY and RXRDY Behavior](#).

### Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX\_US\_RHR)

When FIFOs are disabled:

0: No complete character has been received since the last read of FLEX\_US\_RHR or the receiver is disabled. If characters were received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.

1: At least one complete character has been received and FLEX\_US\_RHR has not yet been read.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read

1: At least one unread data is in the Receive FIFO

RXRDY behavior with FIFO enabled is illustrated in [46.7.11.5 TXEMPTY, TXRDY and RXRDY Behavior](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.18 USART Channel Status Register (SPI\_MODE)

**Name:** FLEX\_US\_CSR (SPI\_MODE)  
**Offset:** 0x214  
**Reset:** –  
**Property:** Read-only

This configuration is relevant only if USART\_MODE = 0xE or 0xF in the [USART Mode Register](#).

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |     |     |    |    |      |    |    |    |

|        | NSS | CMP |    |    | NSSE |    |    |    |
| Access | R   | R   |    |    | R    |    |    |    |
| Reset  | –   | –   |    |    | –    |    |    |    |

|        |    |    |    |    |    |      |         |   |
|--------|----|----|----|----|----|------|---------|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10   | 9       | 8 |
|        |    |    |    |    |    | UNRE | TXEMPTY |   |
| Access |    |    |    |    |    | R    | R       |   |
| Reset  |    |    |    |    |    | –    | –       |   |

|        |   |   |      |   |   |   |       |       |
|--------|---|---|------|---|---|---|-------|-------|
| Bit    | 7 | 6 | 5    | 4 | 3 | 2 | 1     | 0     |
|        |   |   | OVRE |   |   |   | TXRDY | RXRDY |
| Access |   |   | R    |   |   |   | R     | R     |
| Reset  |   |   | –    |   |   |   | –     | –     |

#### Bit 23 – NSS Image of NSS Line

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | NSS line is driven low (if NSSE = 1, falling edge occurred on NSS line). |
| 1     | NSS line is driven high (if NSSE = 1, rising edge occurred on NSS line). |

#### Bit 22 – CMP Comparison Match

| Value | Description                                                                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No received character matched the comparison criteria programmed in VAL1, VAL2 fields and CMPPAR bit in FLEX_US_CMPPR since the last RSTSTA command was issued. |
| 1     | A received character matched the comparison criteria since the last RSTSTA command was issued.                                                                  |

#### Bit 19 – NSSE NSS Line (Driving CTS Pin) Rising or Falling Edge Event (cleared on read)

| Value | Description                                                                                    |
|-------|------------------------------------------------------------------------------------------------|
| 0     | No NSS line event has been detected since the last read of FLEX_US_CSR.                        |
| 1     | A rising or falling edge has been detected on the NSS line since the last read of FLEX_US_CSR. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 10 – UNRE Underrun Error

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | No SPI underrun error has occurred since the last RSTSTA command was issued.           |
| 1     | At least one SPI underrun error has occurred since the last RSTSTA command was issued. |

### Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX\_US\_THR)

| Value | Description                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------|
| 0     | There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled. |
| 1     | There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.                                |

### Bit 5 – OVRE Overrun Error

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | No overrun error has occurred since the last RSTSTA command was issued.           |
| 1     | At least one overrun error has occurred since the last RSTSTA command was issued. |

### Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX\_US\_THR)

| Value | Description                                                                                                                                                                     |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1. |
| 1     | There is no character in FLEX_US_THR.                                                                                                                                           |

### Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX\_US\_RHR)

| Value | Description                                                                                                                                                                                                                |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled. |
| 1     | At least one complete character has been received and FLEX_US_RHR has not yet been read.                                                                                                                                   |

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.19 USART Channel Status Register (LIN\_MODE)

**Name:** FLEX\_US\_CSR (LIN\_MODE)  
**Offset:** 0x214  
**Reset:** –  
**Property:** Read-only

This configuration is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

|        |       |        |         |       |        |         |       |    |
|--------|-------|--------|---------|-------|--------|---------|-------|----|
| Bit    | 31    | 30     | 29      | 28    | 27     | 26      | 25    | 24 |

#### Bit 31 – LINHT LIN Header Timeout Error

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | No LIN header timeout error has been detected since the last RSTSTA command was issued. |
| 1     | A LIN header timeout error has been detected since the last RSTSTA command was issued.  |

#### Bit 30 – LINSTE LIN Synch Tolerance Error

| Value | Description                                                                              |
|-------|------------------------------------------------------------------------------------------|
| 0     | No LIN synch tolerance error has been detected since the last RSTSTA command was issued. |
| 1     | A LIN synch tolerance error has been detected since the last RSTSTA command was issued.  |

#### Bit 29 – LINSNRE LIN Slave Not Responding Error

| Value | Description                                                                                   |
|-------|-----------------------------------------------------------------------------------------------|
| 0     | No LIN slave not responding error has been detected since the last RSTSTA command was issued. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                                  |
|-------|----------------------------------------------------------------------------------------------|
| 1     | A LIN slave not responding error has been detected since the last RSTSTA command was issued. |

### Bit 28 – LINC Error LIN Checksum Error

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | No LIN checksum error has been detected since the last RSTSTA command was issued. |
| 1     | A LIN checksum error has been detected since the last RSTSTA command was issued.  |

### Bit 27 – LINIPE LIN Identifier Parity Error

| Value | Description                                                                                |
|-------|--------------------------------------------------------------------------------------------|
| 0     | No LIN identifier parity error has been detected since the last RSTSTA command was issued. |
| 1     | A LIN identifier parity error has been detected since the last RSTSTA command was issued.  |

### Bit 26 – LINISFE LIN Inconsistent Synch Field Error

| Value | Description                                                                                                                                  |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No LIN inconsistent synch field error has been detected since the last RSTSTA                                                                |
| 1     | The USART is configured as a slave node and a LIN Inconsistent synch field error has been detected since the last RSTSTA command was issued. |

### Bit 25 – LINBE LIN Bit Error

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | No bit error has been detected since the last RSTSTA command was issued. |
| 1     | A bit error has been detected since the last RSTSTA command was issued.  |

### Bit 23 – LINBLS LIN Bus Line Status

| Value | Description               |
|-------|---------------------------|
| 0     | LIN bus line is set to 0. |
| 1     | LIN bus line is set to 1. |

### Bit 15 – LINTC LIN Transfer Completed

| Value | Description                                                                 |
|-------|-----------------------------------------------------------------------------|
| 0     | The USART is idle or a LIN transfer is ongoing.                             |
| 1     | A LIN transfer has been completed since the last RSTSTA command was issued. |

### Bit 14 – LINID LIN Identifier Sent or LIN Identifier Received

If USART operates in LIN Master mode (USART\_MODE = 0xA):

0: No LIN identifier has been sent since the last RSTSTA command was issued.

1: At least one LIN identifier has been sent since the last RSTSTA command was issued.

If USART operates in LIN Slave mode (USART\_MODE = 0xB):

0: No LIN identifier has been received since the last RSTSTA command was issued.

1: At least one LIN identifier has been received since the last RSTSTA.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 13 – LINBK LIN Break Sent or LIN Break Received

Applicable if USART operates in LIN Master mode (USART\_MODE = 0xA):

0: No LIN break has been sent since the last RSTSTA command was issued.

1: At least one LIN break has been sent since the last RSTSTA.

If USART operates in LIN Slave mode (USART\_MODE = 0xB):

0: No LIN break has received sent since the last RSTSTA command was issued.

1: At least one LIN break has been received since the last RSTSTA command was issued.

### Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX\_US\_THR)

| Value | Description                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------|
| 0     | There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled. |
| 1     | There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.                                |

### Bit 8 – TIMEOUT Receiver Timeout

| Value | Description                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------|
| 0     | There has not been a timeout since the last start timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0. |
| 1     | There has been a timeout since the last start timeout command (FLEX_US_CR.STTTO).                                  |

### Bit 7 – PARE Parity Error

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | No parity error has been detected since the last RSTSTA command was issued.           |
| 1     | At least one parity error has been detected since the last RSTSTA command was issued. |

### Bit 6 – FRAME Framing Error

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | No stop bit has been detected low since the last RSTSTA command was issued.           |
| 1     | At least one stop bit has been detected low since the last RSTSTA command was issued. |

### Bit 5 – OVRE Overrun Error

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | No overrun error has occurred since the last RSTSTA command was issued.           |
| 1     | At least one overrun error has occurred since the last RSTSTA command was issued. |

### Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX\_US\_THR)

| Value | Description                                                                                                                                                                     |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1. |
| 1     | There is no character in FLEX_US_THR.                                                                                                                                           |

### Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX\_US\_RHR)

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                                                                                                                                                                |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled. |
| 1     | At least one complete character has been received and FLEX_US_RHR has not yet been read.                                                                                                                                   |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.20 USART Receive Holding Register

**Name:** FLEX\_US\_RHR  
**Offset:** 0x218  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.RXRDYM = 0, see [46.7.11.6 USART Single Data Mode](#) for details.

|        |            |    |    |    |    |    |    |            |
|--------|------------|----|----|----|----|----|----|------------|
| Bit    | 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24         |
|        |            |    |    |    |    |    |    |            |
| Access |            |    |    |    |    |    |    |            |
| Reset  |            |    |    |    |    |    |    |            |
| Bit    | 23         | 22 | 21 | 20 | 19 | 18 | 17 | 16         |
|        |            |    |    |    |    |    |    |            |
| Access |            |    |    |    |    |    |    |            |
| Reset  |            |    |    |    |    |    |    |            |
| Bit    | 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8          |
|        | RXSYNH     |    |    |    |    |    |    | RXCHR[8:8] |
| Access | R          |    |    |    |    |    |    | R          |
| Reset  | 0          |    |    |    |    |    |    | 0          |
| Bit    | 7          | 6  | 5  | 4  | 3  | 2  | 1  | 0          |
|        | RXCHR[7:0] |    |    |    |    |    |    |            |
| Access | R          | R  | R  | R  | R  | R  | R  | R          |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0          |

#### Bit 15 – RXSYNH Received Sync

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Last character received is a data.    |
| 1     | Last character received is a command. |

#### Bits 8:0 – RXCHR[8:0] Received Character

Last character received if RXRDY is set.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.21 USART Receive Holding Register (FIFO Multi Data)

**Name:** FLEX\_US\_RHR (FIFO\_MULTI\_DATA)  
**Offset:** 0x218  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.RXRDYM > 0, see [46.7.11.7 USART Multiple Data Mode](#) for details.

|        |             |    |    |    |    |    |    |    |

|        | RXCHR3[7:0] |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 23          | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | RXCHR2[7:0] |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | RXCHR1[7:0] |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | RXCHR0[7:0] |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 0:7, 8:15, 16:23, 24:31 – RXCHR<sub>x</sub>** Received Character  
 First unread character in the Receive FIFO if RXRDY is set.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.22 USART Transmit Holding Register

**Name:** FLEX\_US\_THR  
**Offset:** 0x21C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.TXRDY = 0, see [46.7.11.6 USART Single Data Mode](#) for details.

|        |            |    |    |    |    |    |    |            |

| Bit    | 7          | 6  | 5  | 4  | 3  | 2  | 1  | 0          |
|        | TXCHR[7:0] |    |    |    |    |    |    |            |
| Access | W          | W  | W  | W  | W  | W  | W  | W          |
| Reset  | –          | –  | –  | –  | –  | –  | –  | –          |

**Bit 15 – TXSYNH** Sync Field to be Transmitted

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | The next character sent is encoded as a data. Start frame delimiter is DATA SYNC.       |
| 1     | The next character sent is encoded as a command. Start frame delimiter is COMMAND SYNC. |

**Bits 8:0 – TXCHR[8:0]** Character to be Transmitted

The next character to be transmitted after the current character if TXRDY is not set.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.23 USART Transmit Holding Register (FIFO Multi Data)

**Name:** FLEX\_US\_THR (FIFO\_MULTI\_DATA)  
**Offset:** 0x21C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit) and FLEX\_US\_FMR.TXRDY > 0, see [46.7.11.7 USART Multiple Data Mode](#) for details.

|        |             |    |    |    |    |    |    |    |

| Reset  | 0        | 0   | 0   | 0   | 0   | 0   | 0       | 0   |

#### Bits 18:16 – FP[2:0] Fractional Part

When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by “selected clock” period from time to time. The duty cycle depends on the value of the CD field.

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | Fractional divider is disabled.                    |
| 1–7   | Baud rate resolution, defined by $FP \times 1/8$ . |

#### Bits 15:0 – CD[15:0] Clock Divider

| CD | USART_MODE ≠ ISO7816 |          | USART_MODE =<br>ISO7816 |                                                             |
|----|----------------------|----------|-------------------------|-------------------------------------------------------------|
|    | SYNC = 0             |          |                         | SYNC = 1<br><br>or<br>USART_MODE = SPI<br>(master or Slave) |
|    | OVER = 0             | OVER = 1 |                         |                                                             |

# SAMA5D2 Series

| Access |                |    |    |    |    |    |    |    |
| Reset  |                |    |    |    |    |    |    |    |
| Bit    | 7              | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | NB_ERRORS[7:0] |    |    |    |    |    |    |    |
| Access | R              | R  | R  | R  | R  | R  | R  | R  |
| Reset  | –              | –  | –  | –  | –  | –  | –  | –  |

#### Bits 7:0 – NB\_ERRORS[7:0] Number of Errors

Total number of errors that occurred during an ISO7816 transfer. This register automatically clears when read.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.29 USART IrDA FILTER Register

**Name:** FLEX\_US\_IF  
**Offset:** 0x24C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x8 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |                  |     |     |     |     |     |     |     |
|--------|------------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31               | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |                  |     |     |     |     |     |     |     |
| Access |                  |     |     |     |     |     |     |     |
| Reset  |                  |     |     |     |     |     |     |     |
| Bit    | 23               | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        |                  |     |     |     |     |     |     |     |
| Access |                  |     |     |     |     |     |     |     |
| Reset  |                  |     |     |     |     |     |     |     |
| Bit    | 15               | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        |                  |     |     |     |     |     |     |     |
| Access |                  |     |     |     |     |     |     |     |
| Reset  |                  |     |     |     |     |     |     |     |
| Bit    | 7                | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | IRDA_FILTER[7:0] |     |     |     |     |     |     |     |
| Access | R/W              | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0                | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 7:0 – IRDA\_FILTER[7:0] IrDA Filter

The IRDA\_FILTER value must be defined to meet the following criteria:

$$t_{\text{peripheral clock}} \times (\text{IRDA\_FILTER} + 3) < 1.41 \mu\text{s}$$

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.30 USART Manchester Configuration Register

**Name:** FLEX\_US\_MAN  
**Offset:** 0x250  
**Reset:** 0xB0011004  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

|        |         |       |     |         |    |    |            |     |
|--------|---------|-------|-----|---------|----|----|------------|-----|
| Bit    | 31      | 30    | 29  | 28      | 27 | 26 | 25         | 24  |
|        | RXIDLEV | DRIFT | ONE | RX_MPOL |    |    | RX_PP[1:0] |     |
| Access | R/W     | R/W   | R/W | R/W     |    |    | R/W        | R/W |
| Reset  | 1       | 0     | 1   | 1       |    |    | 0          | 0   |

|        |    |    |    |    |            |     |     |     |

| Bit    | 23 | 22 | 21 | 20 | 19         | 18  | 17  | 16  |
|        |    |    |    |    | RX_PL[3:0] |     |     |     |
| Access |    |    |    |    | R/W        | R/W | R/W | R/W |
| Reset  |    |    |    |    | 0          | 0   | 0   | 1   |

|        |    |    |    |         |    |    |            |     |
|--------|----|----|----|---------|----|----|------------|-----|
| Bit    | 15 | 14 | 13 | 12      | 11 | 10 | 9          | 8   |
|        |    |    |    | TX_MPOL |    |    | TX_PP[1:0] |     |
| Access |    |    |    | R/W     |    |    | R/W        | R/W |
| Reset  |    |    |    | 1       |    |    | 0          | 0   |

|        |   |   |   |   |            |     |     |     |
|--------|---|---|---|---|------------|-----|-----|-----|
| Bit    | 7 | 6 | 5 | 4 | 3          | 2   | 1   | 0   |
|        |   |   |   |   | TX_PL[3:0] |     |     |     |
| Access |   |   |   |   | R/W        | R/W | R/W | R/W |
| Reset  |   |   |   |   | 0          | 1   | 0   | 0   |

#### Bit 31 – RXIDLEV Receiver Idle Value

| Value | Description                    |
|-------|--------------------------------|
| 0     | Receiver line idle value is 0. |
| 1     | Receiver line idle value is 1. |

#### Bit 30 – DRIFT Drift Compensation

| Value | Description                                                                 |
|-------|-----------------------------------------------------------------------------|
| 0     | The USART cannot recover from an important clock drift.                     |
| 1     | The USART can recover from clock drift. The 16X Clock mode must be enabled. |

#### Bit 29 – ONE Must Be Set to 1

Bit 29 must always be set to 1 when programming the FLEX\_US\_MAN register.

#### Bit 28 – RX\_MPOL Receiver Manchester Polarity

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 0     | Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 1     | Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition. |

### Bits 25:24 – RX\_PP[1:0] Receiver Preamble Pattern detected

The following values assume that RX\_MPOL field is not set:

| Value | Name     | Description                        |
|-------|----------|------------------------------------|
| 0     | ALL_ONE  | The preamble is composed of '1's.  |
| 1     | ALL_ZERO | The preamble is composed of '0's.  |
| 2     | ZERO_ONE | The preamble is composed of '01's. |
| 3     | ONE_ZERO | The preamble is composed of '10's. |

### Bits 19:16 – RX\_PL[3:0] Receiver Preamble Length

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | The receiver preamble pattern detection is disabled. |
| 1–15  | The detected preamble length is RX_PL × Bit Period.  |

### Bit 12 – TX\_MPOL Transmitter Manchester Polarity

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 0     | Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition. |
| 1     | Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition. |

### Bits 9:8 – TX\_PP[1:0] Transmitter Preamble Pattern

The following values assume that TX\_MPOL field is not set:

| Value | Name     | Description                        |
|-------|----------|------------------------------------|
| 0     | ALL_ONE  | The preamble is composed of '1's.  |
| 1     | ALL_ZERO | The preamble is composed of '0's.  |
| 2     | ZERO_ONE | The preamble is composed of '01's. |
| 3     | ONE_ZERO | The preamble is composed of '10's. |

### Bits 3:0 – TX\_PL[3:0] Transmitter Preamble Length

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 0     | The transmitter preamble pattern generation is disabled. |
| 1–15  | The preamble length is TX_PL × Bit Period.               |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.31 USART LIN Mode Register

**Name:** FLEX\_US\_LINMR  
**Offset:** 0x254  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

|        |          |       |     |        |        |        |           |      |
|--------|----------|-------|-----|--------|--------|--------|-----------|------|
| Bit    | 31       | 30    | 29  | 28     | 27     | 26     | 25        | 24   |
|        |          |       |     |        |        |        |           |      |
| Access |          |       |     |        |        |        |           |      |
| Reset  |          |       |     |        |        |        |           |      |
| Bit    | 23       | 22    | 21  | 20     | 19     | 18     | 17        | 16   |
|        |          |       |     |        |        |        | SYNCDIS   | PDCM |
| Access |          |       |     |        |        |        | R/W       | R/W  |
| Reset  |          |       |     |        |        |        | 0         | 0    |
| Bit    | 15       | 14    | 13  | 12     | 11     | 10     | 9         | 8    |
|        | DLC[7:0] |       |     |        |        |        |           |      |
| Access | R/W      | R/W   | R/W | R/W    | R/W    | R/W    | R/W       | R/W  |
| Reset  | 0        | 0     | 0   | 0      | 0      | 0      | 0         | 0    |
| Bit    | 7        | 6     | 5   | 4      | 3      | 2      | 1         | 0    |
|        | WКУPTYP  | FSDIS | DLM | CHKTYP | CHKDIS | PARDIS | NACT[1:0] |      |
| Access | R/W      | R/W   | R/W | R/W    | R/W    | R/W    | R/W       | R/W  |
| Reset  | 0        | 0     | 0   | 0      | 0      | 0      | 0         | 0    |

#### Bit 17 – SYNCDIS Synchronization Disable

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | The synchronization procedure is performed in LIN slave node configuration.     |
| 1     | The synchronization procedure is not performed in LIN slave node configuration. |

#### Bit 16 – PDCM DMAC Mode

| Value | Description                                                                       |
|-------|-----------------------------------------------------------------------------------|
| 0     | The LIN mode register FLEX_US_LINMR is not written by the DMAC.                   |
| 1     | The LIN mode register FLEX_US_LINMR (excepting that flag) is written by the DMAC. |

#### Bits 15:8 – DLC[7:0] Data Length Control

| Value | Description                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------|
| 0–255 | Defines the response data length if DLM = 0, in that case the response data length is equal to DLC+1 bytes. |

#### Bit 7 – WKUPTYP Wake-up Signal Type

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | Setting the LINWKUP bit in the control register sends a LIN 2.0 wake-up signal. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 1     | Setting the LINWKUP bit in the control register sends a LIN 1.3 wake-up signal. |

### Bit 6 – FSDIS Frame Slot Mode Disable

| Value | Description                      |
|-------|----------------------------------|
| 0     | The Frame Slot mode is enabled.  |
| 1     | The Frame Slot mode is disabled. |

### Bit 5 – DLM Data Length Mode

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 0     | The response data length is defined by the DLC field of this register.                           |
| 1     | The response data length is defined by the bits 5 and 6 of the identifier (FLEX_US_LINIR.IDCHR). |

### Bit 4 – CHKTYP Checksum Type

| Value | Description                 |
|-------|-----------------------------|
| 0     | LIN 2.0 “enhanced” checksum |
| 1     | LIN 1.3 “classic” checksum  |

### Bit 3 – CHKDIS Checksum Disable

| Value | Description                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | In master node configuration, the checksum is computed and sent automatically. In slave node configuration, the checksum is checked automatically. |
| 1     | Whatever the node configuration is, the checksum is not computed/sent and it is not checked.                                                       |

### Bit 2 – PARDIS Parity Disable

| Value | Description                                                                                                                                                               |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | In master node configuration, the identifier parity is computed and sent automatically. In master node and slave node configuration, the parity is checked automatically. |
| 1     | Whatever the node configuration is, the Identifier parity is not computed/sent and it is not checked.                                                                     |

### Bits 1:0 – NACT[1:0] LIN Node Action

Values which are not listed in the table must be considered as “reserved”.

| Value | Name      | Description                                                    |
|-------|-----------|----------------------------------------------------------------|
| 0     | PUBLISH   | The USART transmits the response.                              |
| 1     | SUBSCRIBE | The USART receives the response.                               |
| 2     | IGNORE    | The USART does not transmit and does not receive the response. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.32 USART LIN Identifier Register

**Name:** FLEX\_US\_LINIR  
**Offset:** 0x258  
**Reset:** 0x00000000  
**Property:** Read/Write

Write is possible only in LIN master node configuration.

This register is relevant only if USART\_MODE = 0xA or 0xB in [USART Mode Register](#).

|        |            |       |       |       |       |       |       |       |
|--------|------------|-------|-------|-------|-------|-------|-------|-------|
| Bit    | 31         | 30    | 29    | 28    | 27    | 26    | 25    | 24    |
|        |            |       |       |       |       |       |       |       |
| Access |            |       |       |       |       |       |       |       |
| Reset  |            |       |       |       |       |       |       |       |
| Bit    | 23         | 22    | 21    | 20    | 19    | 18    | 17    | 16    |
|        |            |       |       |       |       |       |       |       |

#### Bits 7:0 – IDCHR[7:0] Identifier Character

If USART\_MODE = 0xA (master node configuration):

- IDCHR is Read/Write and its value is the identifier character to be transmitted.

If USART\_MODE = 0xB (slave node configuration):

- IDCHR is Read-only and its value is the last identifier character that has been received.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.33 USART LIN Baud Rate Register

**Name:** FLEX\_US\_LINBRR  
**Offset:** 0x25C  
**Reset:** 0x00000000  
**Property:** Read-only

This register is relevant only if USART\_MODE = 0xA or 0xB in [USART Mode Register](#).

Returns the baud rate value after the synchronization process completion.

|        |    | CMPPAR |    | CMPMODE |    |    |   | VAL1[8:8] |
| Access |    | R/W    |    | R/W     |    |    |   | R/W       |
| Reset  |    | 0      |    | 0       |    |    |   | 0         |

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | VAL1[7:0] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 24:16 – VAL2[8:0]** Second Comparison Value for Received Character

| Value | Description                                                                                                                               |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 0–511 | The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_US_CSR.CMP flag. |

**Bit 14 – CMPPAR** Compare Parity

| Value | Description                                                                                                                   |
|-------|-------------------------------------------------------------------------------------------------------------------------------|
| 0     | The parity is not checked and a bad parity cannot prevent from waking up the system.                                          |
| 1     | The parity is checked and a matching condition on data can be cancelled by an error on parity bit, so no wakeup is performed. |

**Bit 12 – CMPMODE** Comparison Mode

| Value | Name            | Description                                                        |
|-------|-----------------|--------------------------------------------------------------------|
| 0     | FLAG_ONLY       | Any character is received and comparison function drives CMP flag. |
| 1     | START_CONDITION | Comparison condition must be met to start reception.               |
| 2     | FILTER          | Comparison must be met to receive the current data only            |

**Bits 8:0 – VAL1[8:0]** First Comparison Value for Received Character

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                                                                               |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 0-511 | The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_US_CSR.CMP flag. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.35 USART FIFO Mode Register

**Name:** FLEX\_US\_FMR  
**Offset:** 0x2A0  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |       |    | TXFTHRES[5:0]  |     |     |     |             |     |
| Access |       |    | R/W            | R/W | R/W | R/W | R/W         | R/W |
| Reset  |       |    | 0              | 0   | 0   | 0   | 0           | 0   |
| Bit    | 7     | 6  | 5              | 4   | 3   | 2   | 1           | 0   |
|        | FRTSC |    | RXRDYM[1:0]    |     |     |     | TXRDYM[1:0] |     |
| Access | R/W   |    | R/W            | R/W |     |     | R/W         | R/W |
| Reset  | 0     |    | 0              | 0   |     |     | 0           | 0   |

#### Bits 29:24 – RXFTHRES2[5:0] Receive FIFO Threshold 2

| Value | Description                                                                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–32  | Defines the Receive FIFO threshold 2 value (number of data). The FLEX_US_FESR.RXFTHF2 flag will be set when Receive FIFO goes from “above” threshold state to “equal to or below” threshold state. |

#### Bits 21:16 – RXFTHRES[5:0] Receive FIFO Threshold

| Value | Description                                                                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–32  | Defines the Receive FIFO threshold value (number of data). The FLEX_US_FESR.RXFTHF flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

#### Bits 13:8 – TXFTHRES[5:0] Transmit FIFO Threshold

| Value | Description                                                                                                                                                                                       |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–32  | Defines the Transmit FIFO threshold value (number of data). The FLEX_US_FESR.TXFTHF flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

**Bit 7 – FRTSC** FIFO RTS Pin Control enable (Hardware Handshaking mode only)

See [Hardware Handshaking](#) for details.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | RTS pin is not controlled by Receive FIFO thresholds. |
| 1     | RTS pin is controlled by Receive FIFO thresholds.     |

**Bits 5:4 – RXRDYM[1:0]** Receiver Ready Mode

If FIFOs are enabled, the FLEX\_US\_CSR.RXRDY flag behaves as follows.

| Value | Name      | Description                                                                        |
|-------|-----------|------------------------------------------------------------------------------------|
| 0     | ONE_DATA  | RXRDY will be at level '1' when at least one unread data is in the Receive FIFO.   |
| 1     | TWO_DATA  | RXRDY will be at level '1' when at least two unread data are in the Receive FIFO.  |
| 2     | FOUR_DATA | RXRDY will be at level '1' when at least four unread data are in the Receive FIFO. |

**Bits 1:0 – TXRDYM[1:0]** Transmitter Ready Mode

If FIFOs are enabled, the FLEX\_US\_CSR.TXRDY flag behaves as follows.

| Value | Name      | Description                                                                            |
|-------|-----------|----------------------------------------------------------------------------------------|
| 0     | ONE_DATA  | TXRDY will be at level '1' when at least one data can be written in the Transmit FIFO  |
| 1     | TWO_DATA  | TXRDY will be at level '1' when at least two data can be written in the Transmit FIFO  |
| 2     | FOUR_DATA | TXRDY will be at level '1' when at least four data can be written in the Transmit FIFO |

| Reset  | 0       | 0       | 0      | 0     | 0     | 0      | 0       | 0       |

**Bit 9 – RXFTHF2** Receive FIFO Threshold Flag 2 (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------|
| 0     | Number of unread data in Receive FIFO is above RXFTHRES threshold.                                              |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES2 threshold since the last RSTSTA command was issued. |

**Bit 8 – TXFLOCK** Transmit FIFO Lock

| Value | Description                      |
|-------|----------------------------------|
| 0     | The Transmit FIFO is not locked. |
| 1     | The Transmit FIFO is locked.     |

**Bit 7 – RXFPTEF** Receive FIFO Pointer Error Flag

See [46.7.11.9 FIFO Pointer Error](#) for details.

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | No Receive FIFO pointer occurred.                            |
| 1     | Receive FIFO pointer error occurred. Receiver must be reset. |

**Bit 6 – TXFPTEF** Transmit FIFO Pointer Error Flag

See [46.7.11.9 FIFO Pointer Error](#) for details.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | No Transmit FIFO pointer occurred.                               |
| 1     | Transmit FIFO pointer error occurred. Transceiver must be reset. |

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------|
| 0     | Number of unread data in Receive FIFO is below RXFTHRES threshold.                                             |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last RSTSTA command was issued. |

**Bit 4 – RXFFF** Receive FIFO Full Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | Receive FIFO is not empty.                                             |
| 1     | Receive FIFO has been filled since the last RSTSTA command was issued. |

**Bit 3 – RXFEF** Receive FIFO Empty Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | Receive FIFO is not empty.                                              |
| 1     | Receive FIFO has been emptied since the last RSTSTA command was issued. |

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                                                              |
|-------|----------------------------------------------------------------------------------------------------------|
| 0     | Number of data in Transmit FIFO is above TXFTHRES threshold.                                             |
| 1     | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last RSTSTA command was issued. |

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | Transmit FIFO is not full.                                              |
| 1     | Transmit FIFO has been filled since the last RSTSTA command was issued. |

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | Transmit FIFO is not empty.                                              |
| 1     | Transmit FIFO has been emptied since the last RSTSTA command was issued. |

|----------|--------|-------------------------------------------------------------------------------|
| 0x555341 | PASSWD | Writing any other value in this field aborts the write operation of bit WPEN. |
| 1        |        | Always reads as 0.                                                            |

#### Bit 0 – WPEN Write Protection Enable

See [USART Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on configuration registers if WPKEY corresponds to 0x555341 ("USA" in ASCII). |
| 1     | Enables the write protection on configuration registers if WPKEY corresponds to 0x555341 ("USA" in ASCII).  |

|        | WPVSR[7:0]  |    |    |    |    |    |    |      |
| Access | R           | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |             |    |    |    |    |    |    | WPVS |
| Access |             |    |    |    |    |    |    | R    |
| Reset  |             |    |    |    |    |    |    | 0    |

#### Bits 23:8 – WPVSR[15:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protection Violation Status

| Value | Description                                                                                                                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of FLEX_US_WPSR.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last read of FLEX_US_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.43 SPI Control Register

**Name:** FLEX\_SPI\_CR  
**Offset:** 0x400  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [SPI Write Protection Mode Register](#).

|        |         |        |    |    |    |    |    |          |
|--------|---------|--------|----|----|----|----|----|----------|

| Reset  | –     |   |   |   |   |   | –      | –     |

#### Bit 31 – FIFODIS FIFO Disable

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No effect.                              |
| 1     | Disables the Transmit and Receive FIFOs |

#### Bit 30 – FIFOEN FIFO Enable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | Enables the Transmit and Receive FIFOs |

#### Bit 24 – LASTXFER Last Transfer

See [Peripheral Selection](#) for more details.

| Value | Description                                                                                                                                                                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                     |
| 1     | The current NPCS will be de-asserted after the character written in TD has been transferred. When CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 17 – RXFCLR Receive FIFO Clear

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Empties the Receive FIFO. |

### Bit 16 – TXFCLR Transmit FIFO Clear

| Value | Description                |
|-------|----------------------------|
| 0     | No effect.                 |
| 1     | Empties the Transmit FIFO. |

### Bit 12 – REQCLR Request to Clear the Comparison Trigger

SleepWalking enabled:

0: No effect.

1: Clears the potential clock request currently issued by SPI, thus the potential system wakeup is cancelled.

SleepWalking disabled:

0: No effect.

1: Restarts the comparison trigger to enable FLEX\_SPI\_RDR loading.

### Bit 7 – SWRST SPI Software Reset

The SPI is in Slave mode after software reset.

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | No effect.                                                                             |
| 1     | Resets the SPI. A software-triggered hardware reset of the SPI interface is performed. |

### Bit 1 – SPIDIS SPI Disable

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if the FLEX\_US\_THR is loaded.

All pins are set in Input mode after completion of the transmission in progress, if any.

| Value | Description       |
|-------|-------------------|
| 0     | No effect.        |
| 1     | Disables the SPI. |

### Bit 0 – SPIEN SPI Enable

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | Enables the SPI to transfer and receive data. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.44 SPI Mode Register

**Name:** FLEX\_SPI\_MR  
**Offset:** 0x404  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

|        |             |     |       |         |          |        |          |      |
|--------|-------------|-----|-------|---------|----------|--------|----------|------|
| Bit    | 31          | 30  | 29    | 28      | 27       | 26     | 25       | 24   |
|        | DLYBCS[7:0] |     |       |         |          |        |          |      |
| Access | R/W         | R/W | R/W   | R/W     | R/W      | R/W    | R/W      | R/W  |
| Reset  | 0           | 0   | 0     | 0       | 0        | 0      | 0        | 0    |
| Bit    | 23          | 22  | 21    | 20      | 19       | 18     | 17       | 16   |
|        |             |     |       |         |          |        | PCS[1:0] |      |
| Access |             |     |       |         |          |        | R/W      | R/W  |
| Reset  |             |     |       |         |          |        | 0        | 0    |
| Bit    | 15          | 14  | 13    | 12      | 11       | 10     | 9        | 8    |
|        |             |     |       | CMPMODE |          |        |          |      |
| Access |             |     |       | R/W     |          |        |          |      |
| Reset  |             |     |       | 0       |          |        |          |      |
| Bit    | 7           | 6   | 5     | 4       | 3        | 2      | 1        | 0    |
|        | LLB         |     | WDRBT | MODFDIS | BRSRCCLK | PCSDEC | PS       | MSTR |
| Access | R/W         |     | R/W   | R/W     | R/W      | R/W    | R/W      | R/W  |
| Reset  | 0           |     | 0     | 0       | 0        | 0      | 0        | 0    |

#### Bits 31:24 – DLYBCS[7:0] Delay Between Chip Selects

This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time guarantees nonoverlapping chip selects and solves bus contentions in case of peripherals having long data float times.

If DLYBCS is  $\leq 6$ , six peripheral clock periods are inserted by default.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $\text{DLYBCS} = \text{Delay Between Chip Selects} \times f_{\text{peripheral clock}}$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $\text{DLYBCS} = \text{Delay Between Chip Selects} \times f_{\text{GCLK}}$

#### Bits 17:16 – PCS[1:0] Peripheral Chip Select

This field is only used if fixed peripheral select is active (PS = 0).

If PCSDEC = 0:

PCS = x0 NPCS[1:0] = 10

PCS = 01 NPCS[1:0] = 01

PCS = 11 forbidden (no peripheral is selected)

(x = don't care)

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

If PCSDEC = 1:

NPCS[1:0] output signals = PCS

### Bit 12 – CMPMODE Comparison Mode

| Value | Name            | Description                                                                                         |
|-------|-----------------|-----------------------------------------------------------------------------------------------------|
| 0     | FLAG_ONLY       | Any character is received and comparison function drives CMP flag.                                  |
| 1     | START_CONDITION | Comparison condition must be met to start reception of all incoming characters until REQCLR is set. |

### Bit 7 – LLB Local Loopback Enable

LLB controls the local loopback on the data shift register for testing in Master mode only (MISO is internally connected on MOSI).

| Value | Description                   |
|-------|-------------------------------|
| 0     | Local loopback path disabled. |
| 1     | Local loopback path enabled.  |

### Bit 5 – WDRBT Wait Data Read Before Transfer

| Value | Description                                                                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No Effect. In Master mode, a transfer can be initiated regardless of the FLEX_SPI_RDR state.                                                               |
| 1     | In Master mode, a transfer can start only if FLEX_SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception. |

### Bit 4 – MODFDIS Mode Fault Detection

| Value | Description                       |
|-------|-----------------------------------|
| 0     | Mode fault detection is enabled.  |
| 1     | Mode fault detection is disabled. |

### Bit 3 – BRSRCCLK Bit Rate Source Clock

If the bit BRSRCCLK = 1, the FLEX\_US\_CSRx.SCBR field must be programmed with a value greater than 1.

| Value | Name       | Description                                                                                                              |
|-------|------------|--------------------------------------------------------------------------------------------------------------------------|
| 0     | PERIPH_CLK | The peripheral clock is the source clock for the bit rate generation.                                                    |
| 1     | GCLK       | GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock. |

### Bit 2 – PCSDEC Chip Select Decode

When PCSDEC equals one, up to 3 Chip Select signals can be generated with the two NPCS lines using an external 2- to 4-bit decoder. The Chip Select registers define the characteristics of the 3 chip selects, with the following rules:

FLEX\_SPI\_CSR0 defines peripheral chip select signals 0 to 1.

FLEX\_SPI\_CSR1 defines peripheral chip select signal 2.

| Value | Description                                                     |
|-------|-----------------------------------------------------------------|
| 0     | The chip selects are directly connected to a peripheral device. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 1     | The two NPCS chip select lines are connected to a 2- to 4-bit decoder. |

### Bit 1 – PS Peripheral Select

| Value | Description                |
|-------|----------------------------|
| 0     | Fixed Peripheral Select    |
| 1     | Variable Peripheral Select |

### Bit 0 – MSTR Master/Slave Mode

| Value | Description            |
|-------|------------------------|
| 0     | SPI is in Slave mode.  |
| 1     | SPI is in Master mode. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.45 SPI Receive Data Register

**Name:** FLEX\_SPI\_RDR  
**Offset:** 0x408  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.RXRDYM = 0, see [SPI Single Data Mode](#) for details.

|        |          |    |    |    |    |          |    |    |
|--------|----------|----|----|----|----|----------|----|----|
| Bit    | 31       | 30 | 29 | 28 | 27 | 26       | 25 | 24 |
|        |          |    |    |    |    |          |    |    |

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

In Master mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.

**Note:** When using Variable Peripheral Select mode (FLEX\_SPI\_MR.PS = 1), it is mandatory to set the FLEX\_SPI\_MR.WDRBT bit to 1 if the PCS field must be processed in FLEX\_SPI\_RDR.

#### Bits 15:0 – RD[15:0] Receive Data

Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.46 SPI Receive Data Register (FIFO Multiple Data, 8-bit)

**Name:** FLEX\_SPI\_RDR (FIFO\_MULTI\_DATA\_8)  
**Offset:** 0x408  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.RXRDYM > 0, see [SPI Multiple Data Mode](#) for details.

#### Bit 24 – LASTXFER Last Transfer

This field is only used if variable peripheral select is active (FLEX\_SPI\_MR.PS = 1).

| Value | Description                                                                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                         |
| 1     | The current NPCS is de-asserted after the transfer of the character written in TD. When FLEX_SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

This field is only used if variable peripheral select is active (FLEX\_SPI\_MR.PS = 1).

If FLEX\_SPI\_MR.PCSDEC = 0:

PCS = x0 NPCS[1:0] = 10

PCS = 01 NPCS[1:0] = 01

PCS = 11 forbidden (no peripheral is selected)

(x = don't care)

If FLEX\_SPI\_MR.PCSDEC = 1:

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

NPCS[1:0] output signals = PCS

### **Bits 15:0 – TD[15:0]** Transmit Data

Data to be transmitted by the SPI Interface is stored in this register. Information to be transmitted must be written to the transmit data register in a right-justified format.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.49 SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit)

**Name:** FLEX\_SPI\_TDR (FIFO\_MULTI\_DATA)  
**Offset:** 0x40C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.TXRDYM > 0, see Section 1.8.7.7 “SPI Multiple Data Mode” for details.

#### Bit 31 – RXFPTEF Receive FIFO Pointer Error Flag

See [46.8.7.8 FIFO Pointer Error](#) for details.

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | No Receive FIFO pointer occurred                            |
| 1     | Receive FIFO pointer error occurred. Receiver must be reset |

#### Bit 30 – TXFPTEF Transmit FIFO Pointer Error Flag

See [46.8.7.8 FIFO Pointer Error](#) for details.

| Value | Description                                                     |
|-------|-----------------------------------------------------------------|
| 0     | No Transmit FIFO pointer occurred                               |
| 1     | Transmit FIFO pointer error occurred. Transceiver must be reset |

#### Bit 29 – RXFTHF Receive FIFO Threshold Flag

| Value | Description                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared.                                               |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES threshold (changing states from “below threshold” to “equal to or above threshold”). |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 28 – RXFFF Receive FIFO Full Flag

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 0     | Receive FIFO is not empty or RXFE flag has been cleared.                  |
| 1     | Receive FIFO has been filled (changing states from “not full” to “full”). |

### Bit 27 – RXFEF Receive FIFO Empty Flag

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | Receive FIFO is not empty or RXFE flag has been cleared.                     |
| 1     | Receive FIFO has been emptied (changing states from “not empty” to “empty”). |

### Bit 26 – TXFTHF Transmit FIFO Threshold Flag (cleared on read)

| Value | Description                                                                                        |
|-------|----------------------------------------------------------------------------------------------------|
| 0     | Number of data in Transmit FIFO is above TXFTHRES threshold.                                       |
| 1     | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_SPI_SR. |

### Bit 25 – TXFFF Transmit FIFO Full Flag (cleared on read)

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | Transmit FIFO is not full or TXFF flag has been cleared.          |
| 1     | Transmit FIFO has been filled since the last read of FLEX_SPI_SR. |

### Bit 24 – TXFEF Transmit FIFO Empty Flag (cleared on read)

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | Transmit FIFO is not empty.                                        |
| 1     | Transmit FIFO has been emptied since the last read of FLEX_SPI_SR. |

### Bit 16 – SPIENS SPI Enable Status

| Value | Description      |
|-------|------------------|
| 0     | SPI is disabled. |
| 1     | SPI is enabled.  |

### Bit 11 – CMP Comparison Status (cleared on read)

| Value | Description                                                                                                                                   |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in FLEX_SPI_CMPR since the last read of FLEX_SPI_SR. |
| 1     | A received character matched the comparison criteria since the last read of FLEX_SPI_SR.                                                      |

### Bit 10 – UNDES Underrun Error Status (Slave mode only) (cleared on read)

| Value | Description                                                                                          |
|-------|------------------------------------------------------------------------------------------------------|
| 0     | No underrun has been detected since the last read of FLEX_SPI_SR.                                    |
| 1     | A transfer starts whereas no data has been loaded in FLEX_SPI_TDR, cleared when FLEX_SPI_SR is read. |

### Bit 9 – TXEMPTY Transmission Registers Empty (cleared by writing FLEX\_SPI\_TDR)

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                                                                           |
|-------|---------------------------------------------------------------------------------------------------------------------------------------|
| 0     | As soon as data is written in FLEX_SPI_TDR.                                                                                           |
| 1     | FLEX_SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay. |

**Bit 8 – NSSR** NSS Rising (cleared on read)

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | No rising edge detected on NSS pin since the last read of FLEX_SPI_SR. |
| 1     | A rising edge occurred on NSS pin since the last read of FLEX_SPI_SR.  |

**Bit 3 – OVRES** Overrun Error Status (cleared on read)

An overrun occurs when FLEX\_SPI\_RDR is loaded at least twice from the shift register since the last read of FLEX\_SPI\_RDR.

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | No overrun has been detected since the last read of FLEX_SPI_SR. |
| 1     | An overrun has occurred since the last read of FLEX_SPI_SR.      |

**Bit 2 – MODF** Mode Fault Error (cleared on read)

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | No mode fault has been detected since the last read of FLEX_SPI_SR. |
| 1     | A mode fault occurred since the last read of FLEX_SPI_SR.           |

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing FLEX\_SPI\_TDR)

When FIFOs are disabled:

0: Data has been written to FLEX\_SPI\_TDR and not yet transferred to the internal shift register.

1: The last data written to FLEX\_SPI\_TDR has been transferred to the internal shift register.

TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.

When FIFOs are enabled:

0: Transmit FIFO cannot accept more data.

1: Transmit FIFO can accept data; one or more data can be written according to TXRDYM field configuration.

TDRE behavior with FIFOs enabled is illustrated in [46.8.7.5 TXEMPTY, TDRE and RDRF Behavior](#).

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading FLEX\_SPI\_RDR)

When FIFOs are disabled:

0: No data has been received since the last read of FLEX\_SPI\_RDR.

1: Data has been received and the received data has been transferred from the internal shift register to FLEX\_SPI\_RDR since the last read of FLEX\_SPI\_RDR.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RDRF behavior with FIFOs enabled is illustrated in [46.8.7.5 TXEMPTY, TDRE and RDRF Behavior](#).

### 46.10.52 SPI Interrupt Disable Register

**Name:** FLEX\_SPI\_IDR  
**Offset:** 0x418  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [SPI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |         |         |        |       |       |        |         |       |

### 46.10.54 SPI Chip Select Register

**Name:** FLEX\_SPI\_CSRx  
**Offset:** 0x0430 + x\*0x04 [x=0..1]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

FLEX\_SPI\_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

|        |             |     |     |     |       |        |       |      |

#### Bits 31:24 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}} / 32$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{GCLK}} / 32$

#### Bits 23:16 – DLYBS[7:0] Delay Before SPCK

This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.

When DLYBS = 0, the delay is half the SPCK clock period.

Otherwise, the following equations determine the delay:

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $DLYBS = \text{Delay Before SPCK} \times f_{\text{peripheral clock}}$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $DLYBS = \text{Delay Before SPCK} \times f_{GCLK}$

### Bits 15:8 – SCBR[7:0] Serial Clock Bit Rate

In Master mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by the bit BRSRCCLK. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $SCBR = f_{\text{peripheral clock}} / \text{SPCK Bit Rate}$

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $SCBR = f_{GCLK} / \text{SPCK Bit Rate}$

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

If BRSRCCLK = 1 in FLEX\_SPI\_MR, SCBR must be programmed with a value greater than 1.

At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.

**Note:** If one of the FLEX\_SPI\_CSRx.SCBR fields is set to 1, the other FLEX\_SPI\_CSRx.SCBR fields must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

### Bits 7:4 – BITS[3:0] Bits Per Transfer

See [Note](#).

The BITS field determines the number of data bits transferred. Reserved values should not be used.

| Value | Name     | Description          |
|-------|----------|----------------------|
| 0     | 8_BIT    | 8 bits for transfer  |
| 1     | 9_BIT    | 9 bits for transfer  |
| 2     | 10_BIT   | 10 bits for transfer |
| 3     | 11_BIT   | 11 bits for transfer |
| 4     | 12_BIT   | 12 bits for transfer |
| 5     | 13_BIT   | 13 bits for transfer |
| 6     | 14_BIT   | 14 bits for transfer |
| 7     | 15_BIT   | 15 bits for transfer |
| 8     | 16_BIT   | 16 bits for transfer |
| 9–15  | Reserved |                      |

### Bit 3 – CSAAT Chip Select Active After Transfer

| Value | Description                                                                                                                                                   |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The Peripheral Chip Select Line rises as soon as the last transfer is achieved.                                                                               |
| 1     | The Peripheral Chip Select does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select. |

### Bit 2 – CSNAAT Chip Select Not Active After Transfer (Ignored if CSAAT = 1)

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $\frac{DLYBCS}{f_{\text{peripheral clock}}}$  (if DLYBCS ≠ 0)

If FLEX\_SPI\_MR.BRSRCCLK = 1:  $\frac{DLYBCS}{f_{GCLK}}$

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

If DLYBCS < 6, a minimum of six periods is introduced.

| Value | Description                                                                                                                                                                                 |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The Peripheral Chip Select does not rise between two transfers if the FLEX_SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same Chip Select. |
| 1     | The Peripheral Chip Select rises systematically after each transfer performed on the same slave. It remains inactive after the end of transfer for a minimal duration of:                   |

### Bit 1 – NCPHA Clock Phase

NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

| Value | Description                                                                              |
|-------|------------------------------------------------------------------------------------------|
| 0     | Data are changed on the leading edge of SPCK and captured on the following edge of SPCK. |
| 1     | Data are captured on the leading edge of SPCK and changed on the following edge of SPCK. |

### Bit 0 – CPOL Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between master and slave devices.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | The inactive state value of SPCK is logic level zero. |
| 1     | The inactive state value of SPCK is logic level one.  |

#### Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

| Value | Description                                                                                                                                                                                   |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–32  | Defines the Receive FIFO threshold value (number of data). The FLEX_SPI_SR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

#### Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

| Value | Description                                                                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–32  | Defines the Transmit FIFO threshold value (number of data). The FLEX_SPI_SR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

#### Bits 5:4 – RXRDYM[1:0] Receive Data Register Full Mode

If FIFOs are enabled, the FLEX\_SPI\_SR.RDRF flag behaves as follows.

| Value | Name     | Description                                                                     |
|-------|----------|---------------------------------------------------------------------------------|
| 0     | ONE_DATA | RDRF will be at level ‘1’ when at least one unread data is in the Receive FIFO. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Name      | Description                                                                                                                                                                                            |
|-------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1     | TWO_DATA  | RDRF will be at level '1' when at least two unread data are in the Receive FIFO.<br><br>Cannot be used when FLEX_SPI_MR.MSTR =1, or if FLEX_SPI_MR.PS =1.                                              |
| 2     | FOUR_DATA | RDRF will be at level '1' when at least four unread data are in the Receive FIFO.<br><br>Cannot be used when FLEX_SPI_CSRx.BITS is greater than 0, or if FLEX_SPI_MR.MSTR =1, or if FLEX_SPI_MR.PS =1. |

**Bits 1:0 – TXRDYM[1:0]** Transmit Data Register Empty Mode  
If FIFOs are enabled, the FLEX\_SPI\_SR.TDRE flag behaves as follows.

| Value | Name     | Description                                                                                                                       |
|-------|----------|-----------------------------------------------------------------------------------------------------------------------------------|
| 0     | ONE_DATA | TDRE will be at level '1' when at least one data can be written in the Transmit FIFO.                                             |
| 1     | TWO_DATA | TDRE will be at level '1' when at least two data can be written in the Transmit FIFO.<br><br>Cannot be used if FLEX_SPI_MR.PS =1. |

| Access |              |    |    |    |    | R/W    | R/W    | R/W  |
| Reset  |              |    |    |    |    | 0      | 0      | 0    |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                                                 |
|----------|--------|-----------------------------------------------------------------------------------------------------------------------------|
| 0x535049 | PASSWD | Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN.<br><br>Always reads as 0. |

#### Bit 2 – WPCREN Write Protection Control Enable

| Value | Description                                                                                          |
|-------|------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on control register if WPKEY corresponds to 0x535049 ("SPI" in ASCII). |
| 1     | Enables the write protection on control register if WPKEY corresponds to 0x535049 ("SPI" in ASCII).  |

#### Bit 1 – WPITEN Write Protection Interrupt Enable

| Value | Description                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------|
| 0     | Disables the write protection on interrupt registers if WPKEY corresponds to 0x535049 ("SPI" in ASCII). |
| 1     | Enables the write protection on interrupt registers if WPKEY corresponds to 0x535049 ("SPI" in ASCII).  |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

**Bit 0 – WPEN** Write Protection Enable

See [46.8.8 SPI Register Write Protection](#) for the list of registers that can be write-protected.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII).  |

# SAMA5D2 Series

| Reset  |   |   |   |   |   |   |   | 0    |

#### Bits 15:8 – WPVSR[7:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protection Violation Status

| Value | Description                                                                                                                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protect violation has occurred since the last read of FLEX_SPI_WPSR.                                                                                                                                   |
| 1     | A write protect violation has occurred since the last read of FLEX_SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.60 TWI Control Register

**Name:** FLEX\_TWI\_CR  
**Offset:** 0x600  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [TWI Write Protection Mode Register](#).

#### Bit 29 – FIFODIS FIFO Disable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | Disable the Transmit and Receive FIFOs |

#### Bit 28 – FIFOEN FIFO Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Enable the Transmit and Receive FIFOs |

#### Bit 26 – LOCKCLR Lock Clear

| Value | Description             |
|-------|-------------------------|
| 0     | No effect.              |
| 1     | Clear the TWI FSM lock. |

#### Bit 24 – THRCLR Transmit Holding Register Clear

| Value | Description |
|-------|-------------|
| 0     | No effect.  |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 1     | Clear the Transmit Holding Register and set TXRDY, TXCOMP flags. |

**Bit 17 – ACMDIS** Alternative Command Mode Disable

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | Alternative Command mode disabled. |

**Bit 16 – ACMEN** Alternative Command Mode Enable

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No effect.                        |
| 1     | Alternative Command mode enabled. |

**Bit 15 – CLEAR** Bus CLEAR Command

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | No effect.                                           |
| 1     | If Master mode is enabled, send a bus clear command. |

**Bit 14 – PECRQ** PEC Request

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No effect.                                |
| 1     | A PEC check or transmission is requested. |

**Bit 13 – PECDIS** Packet Error Checking Disable

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No effect.                                     |
| 1     | SMBus PEC (CRC) generation and check disabled. |

**Bit 12 – PECEN** Packet Error Checking Enable

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | SMBus PEC (CRC) generation and check enabled. |

**Bit 11 – SMBDIS** SMBus Mode Disabled

| Value | Description          |
|-------|----------------------|
| 0     | No effect.           |
| 1     | SMBus mode disabled. |

**Bit 10 – SMBEN** SMBus Mode Enabled

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | If SMBDIS = 0, SMBus mode enabled. |

**Bit 9 – HSDIS** TWI High-Speed Mode Disabled

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | High-speed mode disabled. |

**Bit 8 – HSEN** TWI High-Speed Mode Enabled

| Value | Description              |
|-------|--------------------------|
| 0     | No effect.               |
| 1     | High-speed mode enabled. |

**Bit 7 – SWRST** Software Reset

| Value | Description                   |
|-------|-------------------------------|
| 0     | No effect.                    |
| 1     | Equivalent to a system reset. |

**Bit 6 – QUICK** SMBus Quick Command

| Value | Description                                                |
|-------|------------------------------------------------------------|
| 0     | No effect.                                                 |
| 1     | If Master mode is enabled, an SMBus Quick Command is sent. |

**Bit 5 – SVDIS** TWI Slave Mode Disabled

| Value | Description                                                                                                                                                                                                                           |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                            |
| 1     | Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling. |

**Bit 4 – SVEN** TWI Slave Mode Enabled

Switching from Master to Slave mode is only permitted when TXCOMP = 1.

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | No effect.                                           |
| 1     | Enables the Slave mode (SVDIS must be written to 0). |

**Bit 3 – MSDIS** TWI Master Mode Disabled

| Value | Description                                                                                                                                                                                                                                                         |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                          |
| 1     | The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling. |

**Bit 2 – MSEN** TWI Master Mode Enabled

Switching from Slave to Master mode is only permitted when TXCOMP = 1.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | No effect.                                            |
| 1     | Enables the Master mode (MSDIS must be written to 0). |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 1 – STOP Send a STOP Condition

| Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 1     | STOP condition is sent just after completing the current byte transmission in Master Read mode. <ul style="list-style-type: none"><li>– In single data byte master read, both START and STOP must be set.</li><li>– In multiple data bytes master read, the STOP must be set after the last data received but one.</li><li>– In Master Read mode, if a NACK bit is received, the STOP is automatically performed.</li><li>– In master data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li></ul> |

### Bit 0 – START Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (FLEX\_TWI\_THR).

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                          |
| 1     | A frame beginning with a START bit is transmitted according to the features defined in the TWI Master Mode Register (FLEX_TWI_MMR). |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.61 TWI Control Register (FIFO\_ENABLED)

**Name:** FLEX\_TWI\_CR (FIFO\_ENABLED)  
**Offset:** 0x600  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit), see [46.9.6.8 TWI Multiple Data Mode](#) for details.

This register can only be written if the WPCREN bit is cleared in the [TWI Write Protection Mode Register](#).

#### Bit 29 – FIFODIS FIFO Disable

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No effect.                              |
| 1     | Disable the Transmit and Receive FIFOs. |

#### Bit 28 – FIFOEN FIFO Enable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | Enable the Transmit and Receive FIFOs. |

#### Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR

| Value | Description                    |
|-------|--------------------------------|
| 0     | No effect.                     |
| 1     | Clears the Transmit FIFO Lock. |

#### Bit 25 – RXFCLR Receive FIFO Clear

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Empties the Receive FIFO. |

### Bit 24 – TXFCLR Transmit FIFO Clear

| Value | Description                |
|-------|----------------------------|
| 0     | No effect.                 |
| 1     | Empties the Transmit FIFO. |

### Bit 17 – ACMDIS Alternative Command Mode Disable

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | Alternative Command mode disabled. |

### Bit 16 – ACMEN Alternative Command Mode Enable

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No effect.                        |
| 1     | Alternative Command mode enabled. |

### Bit 15 – CLEAR Bus CLEAR Command

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | No effect.                                           |
| 1     | If Master mode is enabled, send a bus clear command. |

### Bit 14 – PECRQ PEC Request

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No effect.                                |
| 1     | A PEC check or transmission is requested. |

### Bit 13 – PECDIS Packet Error Checking Disable

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No effect.                                     |
| 1     | SMBus PEC (CRC) generation and check disabled. |

### Bit 12 – PECEN Packet Error Checking Enable

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | SMBus PEC (CRC) generation and check enabled. |

### Bit 11 – SMBDIS SMBus Mode Disabled

| Value | Description          |
|-------|----------------------|
| 0     | No effect.           |
| 1     | SMBus mode disabled. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 10 – SMBEN SMBus Mode Enabled

| Value | Description                        |
|-------|------------------------------------|
| 0     | No effect.                         |
| 1     | If SMBDIS = 0, SMBus mode enabled. |

### Bit 9 – HSDIS TWI High-Speed Mode Disabled

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | High-speed mode disabled. |

### Bit 8 – HSEN TWI High-Speed Mode Enabled

| Value | Description              |
|-------|--------------------------|
| 0     | No effect.               |
| 1     | High-speed mode enabled. |

### Bit 7 – SWRST Software Reset

| Value | Description                   |
|-------|-------------------------------|
| 0     | No effect.                    |
| 1     | Equivalent to a system reset. |

### Bit 6 – QUICK SMBus Quick Command

| Value | Description                                               |
|-------|-----------------------------------------------------------|
| 0     | No effect.                                                |
| 1     | If Master mode is enabled, a SMBus Quick Command is sent. |

### Bit 5 – SVDIS TWI Slave Mode Disabled

| Value | Description                                                                                                                                                                                                                           |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                            |
| 1     | Slave mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling. |

### Bit 4 – SVEN TWI Slave Mode Enabled

Switching from Master to Slave mode is only permitted when TXCOMP = 1.

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | No effect.                                           |
| 1     | Enables the Slave mode (SVDIS must be written to 0). |

### Bit 3 – MSDIS TWI Master Mode Disabled

| Value | Description                                                                                                                                                                                                                                                                 |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                                  |
| 1     | The Master mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in the case of a write operation. In a read operation, the character being transferred must be completely received before disabling. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 2 – MSEN TWI Master Mode Enabled

Switching from Slave to Master mode is only permitted when TXCOMP = 1.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | No effect.                                            |
| 1     | Enables the Master mode (MSDIS must be written to 0). |

### Bit 1 – STOP Send a STOP Condition

| Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 1     | STOP condition is sent just after completing the current byte transmission in Master Read mode. <ul style="list-style-type: none"><li>– In single data byte master read, both START and STOP must be set.</li><li>– In multiple data bytes master read, the STOP must be set after the last data received but one.</li><li>– In Master Read mode, if a NACK bit is received, the STOP is automatically performed.</li><li>– In master data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li></ul> |

### Bit 0 – START Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a slave. When configured in Master mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding Register (FLEX\_TWI\_THR).

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                          |
| 1     | A frame beginning with a START bit is transmitted according to the features defined in the TWI Master Mode Register (FLEX_TWI_MMR). |

**Bit 24 – NOAP** No Auto-Stop On NACK Error

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | A stop condition is sent automatically upon Not-Acknowledge error detection. |
| 1     | No automatic action is performed upon Not-Acknowledge error detection.       |

**Bits 22:16 – DADR[6:0]** Device Address

The device address is used to access slave devices in Read or Write mode. Those bits are only used in Master mode.

**Bit 12 – MREAD** Master Read Direction

| Value | Description             |
|-------|-------------------------|
| 0     | Master write direction. |
| 1     | Master read direction.  |

**Bits 9:8 – IADRSZ[1:0]** Internal Device Address Size

| Value | Name   | Description                      |
|-------|--------|----------------------------------|
| 0     | NONE   | No internal device address       |
| 1     | 1_BYTE | One-byte internal device address |
| 2     | 2_BYTE | Two-byte internal device address |

#### Bit 31 – DATAMEN Data Matching Enable

| Value | Description                                       |
|-------|---------------------------------------------------|
| 0     | Data matching on first received data is disabled. |
| 1     | Data matching on first received data is enabled.  |

#### Bit 30 – SADR3EN Slave Address 3 Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Slave address 3 matching is disabled. |
| 1     | Slave address 3 matching is enabled.  |

#### Bit 29 – SADR2EN Slave Address 2 Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Slave address 2 matching is disabled. |
| 1     | Slave address 2 matching is enabled.  |

#### Bit 28 – SADR1EN Slave Address 1 Enable

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Slave address 1 matching is disabled. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                          |
|-------|--------------------------------------|
| 1     | Slave address 1 matching is enabled. |

### Bits 22:16 – SADR[6:0] Slave Address

The slave device address is used in Slave mode in order to be accessed by master devices in Read or Write mode.

SADR must be programmed before enabling the Slave mode or after a general call. Writes at other times have no effect.

### Bits 14:8 – MASK[6:0] Slave Address Mask

A mask can be applied on the slave device address in Slave mode in order to allow multiple address answer. For each bit of the MASK field set to one, the corresponding SADR bit will be masked.

If the MASK field is set to 0, no mask is applied to the SADR field.

### Bit 6 – SCLWSDIS Clock Wait State Disable

| Value | Description                                                                                |
|-------|--------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                 |
| 1     | Clock stretching disabled in Slave mode, OVRE and UNRE will indicate overrun and underrun. |

### Bit 4 – SADAT Slave Address Treated as Data

| Value | Description                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------|
| 0     | Slave address is handled normally (will not trig RXRDY flag and will not fill FLEX_TWI_RHR upon reception).     |
| 1     | Slave address is handled as data field, RXRDY will be set and FLEX_TWI_RHR filled upon slave address reception. |

### Bit 3 – SMHH SMBus Host Header

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | Acknowledge of the SMBus Host Header disabled. |
| 1     | Acknowledge of the SMBus Host Header enabled.  |

### Bit 2 – SMDA SMBus Default Address

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | Acknowledge of the SMBus Default Address disabled. |
| 1     | Acknowledge of the SMBus Default Address enabled.  |

### Bit 0 – NACKEN Slave Receiver Data Phase NACK Enable

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | Normal value to be returned in the ACK cycle of the data phase in Slave Receiver mode. |
| 1     | NACK value to be returned in the ACK cycle of the data phase in Slave Receiver mode.   |

# SAMA5D2 Series

| Access |            |     | R/W       | R/W      | R/W | R/W        | R/W | R/W |
| Reset  |            |     | 0         | 0        | 0   | 0          | 0   | 0   |
| Bit    | 23         | 22  | 21        | 20       | 19  | 18         | 17  | 16  |
|        |            |     |           | BRSRCCLK |     | CKDIV[2:0] |     |     |
| Access |            |     |           | R/W      |     | R/W        | R/W | R/W |
| Reset  |            |     |           | 0        |     | 0          | 0   | 0   |
| Bit    | 15         | 14  | 13        | 12       | 11  | 10         | 9   | 8   |
|        | CHDIV[7:0] |     |           |          |     |            |     |     |
| Access | R/W        | R/W | R/W       | R/W      | R/W | R/W        | R/W | R/W |
| Reset  | 0          | 0   | 0         | 0        | 0   | 0          | 0   | 0   |
| Bit    | 7          | 6   | 5         | 4        | 3   | 2          | 1   | 0   |
|        | CLDIV[7:0] |     |           |          |     |            |     |     |
| Access | R/W        | R/W | R/W       | R/W      | R/W | R/W        | R/W | R/W |
| Reset  | 0          | 0   | 0         | 0        | 0   | 0          | 0   | 0   |

#### Bits 29:24 – HOLD[5:0] TWD Hold Time Versus TWCK Falling

If High-speed mode is selected TWD is internally modified on the TWCK falling edge to meet the I<sup>2</sup>C specified maximum hold time, else if High-speed mode is not configured TWD is kept unchanged after TWCK falling edge for a period of  $(HOLD + 3) \times t_{\text{peripheral clock}}$ .

#### Bit 20 – BRSRCCLK Bit Rate Source Clock

| Value | Name       | Description                                                                                                              |
|-------|------------|--------------------------------------------------------------------------------------------------------------------------|
| 0     | PERIPH_CLK | The peripheral clock is the source clock for the bit rate generation.                                                    |
| 1     | GCLK       | GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock. |

#### Bits 18:16 – CKDIV[2:0] Clock Divider

The CKDIV is used to increase both SCL high and low periods.

#### Bits 15:8 – CHDIV[7:0] Clock High Divider

The SCL high period is defined as follows:

If BRSRCCLK = 0:  $CHDIV = ((t_{\text{high}} / t_{\text{peripheral clock}}) - 3) / 2^{CKDIV}$

If BRSRCCLK = 1:  $CHDIV = (t_{\text{high}} / t_{\text{ext\_ck}}) / 2^{CKDIV}$

**Bits 7:0 – CLDIV[7:0]** Clock Low Divider

The SCL low period is defined as follows:

If BRSRCCLK = 0:  $CLDIV = ((t_{low} / t_{\text{peripheral clock}}) - 3) / 2^{CKDIV}$

If BRSRCCLK = 1:  $CLDIV = (t_{low} / t_{\text{ext\_ck}}) / 2^{CKDIV}$

| Bit    | 7    | 6    | 5    | 4     | 3      | 2     | 1     | 0      |
|        | UNRE | OVRE | GACC | SVACC | SVREAD | TXRDY | RXRDY | TXCOMP |
| Access | R    | R    | R    | R     | R      | R     | R     | R      |
| Reset  | 0    | 0    | 0    | 0     | 1      | 0     | 0     | 1      |

#### Bit 26 – SR Start Repeated

| Value | Description                                                                |
|-------|----------------------------------------------------------------------------|
| 0     | No repeated start has been detected since last FLEX_TWI_SR read.           |
| 1     | At least one repeated start has been detected since last FLEX_TWI_SR read. |

#### Bit 25 – SDA SDA Line Value

| Value | Description                    |
|-------|--------------------------------|
| 0     | SDA line sampled value is '0'. |
| 1     | SDA line sampled value is '1'. |

#### Bit 24 – SCL SCL Line Value

| Value | Description                    |
|-------|--------------------------------|
| 0     | SCL line sampled value is '0'. |
| 1     | SCL line sampled value is '1'. |

#### Bit 23 – LOCK TWI Lock Due to Frame Errors

| Value | Description            |
|-------|------------------------|
| 0     | The TWI is not locked. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 1     | The TWI is locked due to frame errors (see <a href="#">46.9.3.12 Handling Errors in Alternative Command</a> and <a href="#">46.9.6 TWI FIFOs</a> ). |

**Bit 21 – SMBHHM** SMBus Host Header Address Match (cleared on read)

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No SMBus Host Header Address received.    |
| 1     | A SMBus Host Header Address was received. |

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No SMBus Default Address received.    |
| 1     | A SMBus Default Address was received. |

**Bit 19 – PECERR** PEC Error (cleared on read)

| Value | Description                  |
|-------|------------------------------|
| 0     | No SMBus PEC error occurred. |
| 1     | A SMBus PEC error occurred.  |

**Bit 18 – TOUT** Timeout Error (cleared on read)

| Value | Description                |
|-------|----------------------------|
| 0     | No SMBus timeout occurred. |
| 1     | SMBus timeout occurred.    |

**Bit 16 – MACK** Master Code Acknowledge (cleared on read)  
MACK used in Slave mode:

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No master code has been received. |
| 1     | A master code has been received.  |

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)

This bit is only used in Slave mode.

EOSACC behavior can be seen in figures [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | A slave access is being performing.                                                               |
| 1     | The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset. |

**Bit 10 – SCLWS** Clock Wait State

This bit is only used in Slave mode.

SCLWS behavior can be seen in figures [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                                                                                |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The clock is not stretched.                                                                                                                |
| 1     | The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character. |

### Bit 9 – ARBLST Arbitration Lost (cleared on read)

This bit is only used in Master mode.

| Value | Description                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------|
| 0     | Arbitration won.                                                                                                      |
| 1     | Arbitration lost. Another master of the TWI bus has won the multi-master arbitration. TXCOMP is set at the same time. |

### Bit 8 – NACK Not Acknowledged (cleared on read)

NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWI slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set, the user must not fill FLEX\_TWI\_THR even if TXRDY is set, because it means that the master will stop the data transfer or reinitiate it..

Note that in Slave Write mode, all data are acknowledged by the TWI.

### Bit 7 – UNRE Underrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | FLEX_TWI_THR has been filled on time.     |
| 1     | FLEX_TWI_THR has not been filled on time. |

### Bit 6 – OVRE Overrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description                                                                                        |
|-------|----------------------------------------------------------------------------------------------------|
| 0     | FLEX_TWI_RHR has not been loaded while RXRDY was set.                                              |
| 1     | FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set. |

### Bit 5 – GACC General Call Access (cleared on read)

This bit is only used in Slave mode.

GACC behavior can be seen in figure [Master Performs a General Call](#).

| Value | Description                        |
|-------|------------------------------------|
| 0     | No general call has been detected. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                                                                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1     | A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes. |

### Bit 4 – SVACC Slave Access

This bit is only used in Slave mode.

SVACC behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                                                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.                                                  |
| 1     | Indicates that the address decoding sequence has matched (a master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected. |

### Bit 3 – SVREAD Slave Read

This bit is only used in Slave mode. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | Indicates that a write access is performed by a master. |
| 1     | Indicates that a read access is performed by a master.  |

### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX\_TWI\_THR)

TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX\_TWI\_THR.

1: As soon as a data byte is transferred from FLEX\_TWI\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Master mode can be seen in figures [Master Write with One Data Byte](#), [Master Write with Multiple Data Bytes](#) and [Master Write with One Byte Internal Address and Multiple Data Bytes](#).

TXRDY used in Slave mode:

0: As soon as data is written in FLEX\_TWI\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX\_TWI\_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX\_TWI\_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in figures [Read Access Ordered by a Master](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFOs enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 1 – RXRDY** Receive Holding Register Ready (cleared when reading FLEX\_TWI\_RHR)

When FIFOs are disabled:

0: No character has been received since the last FLEX\_TWI\_RHR read operation.

1: A byte has been received in FLEX\_TWI\_RHR since the last read.

RXRDY behavior in Master mode can be seen in figure [Master Read with Multiple Data Bytes](#).

RXRDY behavior in Slave mode can be seen in figures [Write Access Ordered by a Master](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing FLEX\_TWI\_THR)

TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both the holding register and the internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in figures [Master Write with One Byte Internal Address and Multiple Data Bytes](#) and [Master Read with Multiple Data Bytes](#).

TXCOMP used in Slave mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in figures [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### 46.10.67 TWI Status Register (FIFO ENABLED)

**Name:** FLEX\_TWI\_SR (FIFO\_ENABLED)  
**Offset:** 0x620  
**Reset:** 0x0300F009  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit), see [TWI Multiple Data Mode](#) for details.

|        |    |    |    |    |    |    |     |     |

#### Bit 26 – SR Start Repeated

| Value | Description                                                                |
|-------|----------------------------------------------------------------------------|
| 0     | No repeated start has been detected since last FLEX_TWI_SR read.           |
| 1     | At least one repeated start has been detected since last FLEX_TWI_SR read. |

#### Bit 25 – SDA SDA Line Value

| Value | Description                    |
|-------|--------------------------------|
| 0     | SDA line sampled value is '0'. |
| 1     | SDA line sampled value is '1'. |

#### Bit 24 – SCL SCL Line Value

| Value | Description                    |
|-------|--------------------------------|
| 0     | SCL line sampled value is '0'. |
| 1     | SCL line sampled value is '1'. |

#### Bit 23 – TXFLOCK Transmit FIFO Lock

| Value | Description                      |
|-------|----------------------------------|
| 0     | The Transmit FIFO is not locked. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                  |
|-------|------------------------------|
| 1     | The Transmit FIFO is locked. |

**Bit 21 – SMBHMM** SMBus Host Header Address Match (cleared on read)

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No SMBus Host Header Address received.    |
| 1     | A SMBus Host Header Address was received. |

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No SMBus Default Address received.    |
| 1     | A SMBus Default Address was received. |

**Bit 19 – PECERR** PEC Error (cleared on read)

| Value | Description                  |
|-------|------------------------------|
| 0     | No SMBus PEC error occurred. |
| 1     | A SMBus PEC error occurred.  |

**Bit 18 – TOUT** Timeout Error (cleared on read)

| Value | Description                |
|-------|----------------------------|
| 0     | No SMBus timeout occurred. |
| 1     | SMBus timeout occurred.    |

**Bit 16 – MACK** Master Code Acknowledge (cleared on read)

MACK used in Slave mode:

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No master code has been received. |
| 1     | A master code has been received.  |

**Bit 11 – EOSACC** End Of Slave Access (cleared on read)

This bit is only used in Slave mode.

EOSACC behavior can be seen in figures [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | A Slave Access is being performed.                                                                |
| 1     | The Slave Access is finished. End Of Slave Access is automatically set as soon as SVACC is reset. |

**Bit 10 – SCLWS** Clock Wait State

This bit is only used in Slave mode.

SCLWS behavior can be seen in figures [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

| Value | Description                 |
|-------|-----------------------------|
| 0     | The clock is not stretched. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                                                                                                |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 1     | The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character. |

### Bit 9 – ARBLST Arbitration Lost (cleared on read)

This bit is only used in Master mode.

| Value | Description                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------|
| 0     | Arbitration won.                                                                                                      |
| 1     | Arbitration lost. Another master of the TWI bus has won the multi-master arbitration. TXCOMP is set at the same time. |

### Bit 8 – NACK Not Acknowledged (cleared on read)

NACK used in Master mode:

0: Each data byte has been correctly received by the far-end side TWI slave component.

1: A data or address byte has not been acknowledged by the slave component. Set at the same time as TXCOMP.

NACK used in Slave Read mode:

0: Each data byte has been correctly received by the master.

1: In Read mode, a data byte has not been acknowledged by the master. When NACK is set the user must not fill FLEX\_TWI\_THR even if TXRDY is set, because it means that the master will stop the data transfer or re initiate it.

Note that in Slave Write mode all data are acknowledged by the TWI.

### Bit 7 – UNRE Underrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | FLEX_TWI_THR has been filled on time.     |
| 1     | FLEX_TWI_THR has not been filled on time. |

### Bit 6 – OVRE Overrun Error (cleared on read)

This bit is only used in Slave mode if clock stretching is disabled.

| Value | Description                                                                                        |
|-------|----------------------------------------------------------------------------------------------------|
| 0     | FLEX_TWI_RHR has not been loaded while RXRDY was set.                                              |
| 1     | FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set. |

### Bit 5 – GACC General Call Access (cleared on read)

This bit is only used in Slave mode.

GACC behavior can be seen in figure [Master Performs a General Call](#).

| Value | Description                                                                                                                                                                                             |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No general call has been detected.                                                                                                                                                                      |
| 1     | A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes. |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

### Bit 4 – SVACC Slave Access

This bit is only used in Slave mode.

SVACC behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                                                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.                                                  |
| 1     | Indicates that the address decoding sequence has matched (a master has sent SADR). SVACC remains high until a NACK or a STOP condition is detected. |

### Bit 3 – SVREAD Slave Read

This bit is only used in Slave mode. When SVACC is low (no slave access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures [Read Access Ordered by a Master](#), [Write Access Ordered by a Master](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | Indicates that a write access is performed by a master. |
| 1     | Indicates that a read access is performed by a master.  |

### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX\_TWI\_THR)

TXRDY used in Master mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX\_TWI\_THR.

1: As soon as a data byte is transferred from FLEX\_TWI\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Master mode can be seen in figures [Master Write with One Data Byte](#), [Master Write with Multiple Data Bytes](#) and [Master Write with One Byte Internal Address and Multiple Data Bytes](#).

TXRDY used in Slave mode:

0: As soon as data is written in FLEX\_TWI\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX\_TWI\_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX\_TWI\_THR to avoid losing it.

TXRDY behavior in Slave mode can be seen in figures [Read Access Ordered by a Master](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

---

TXRDY behavior with FIFOs enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 1 – RXRDY** Receive Holding Register Ready (cleared when reading FLEX\_TWI\_RHR)

When FIFOs are disabled:

0: No character has been received since the last FLEX\_TWI\_RHR read operation.

1: A byte has been received in FLEX\_TWI\_RHR since the last read.

RXRDY behavior in Master mode can be seen in figure [Master Read with Multiple Data Bytes](#).

RXRDY behavior in Slave mode can be seen in figures [Write Access Ordered by a Master](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in [TXRDY and RXRDY Behavior](#).

**Bit 0 – TXCOMP** Transmission Completed (cleared by writing FLEX\_TWI\_THR)

TXCOMP used in Master mode:

0: During the length of the current frame.

1: When both holding register and internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Master mode can be seen in figures [Master Write with One Byte Internal Address and Multiple Data Bytes](#) and [Master Read with Multiple Data Bytes](#).

TXCOMP used in Slave mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Slave mode can be seen in figures [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

### 46.10.68 TWI Interrupt Enable Register

**Name:** FLEX\_TWI\_IER  
**Offset:** 0x624  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TWI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|

### 46.10.69 TWI Interrupt Disable Register

**Name:** FLEX\_TWI\_IDR  
**Offset:** 0x628  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TWI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |    |    |    |    |    |    |    |    |

#### Bits 31:24 – THMAX[7:0] Clock High Maximum Cycles

Clock cycles in clock high maximum count. Prescaled by PRESC. Used for bus free detection. Used to time THIGH:MAX.

#### Bits 23:16 – TLOWM[7:0] Master Clock Stretch Maximum Cycles

| Value | Description                                                                                     |
|-------|-------------------------------------------------------------------------------------------------|
| 0     | TLOW:MEXT timeout check disabled.                                                               |
| 1–255 | Clock cycles in master maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:MEXT. |

#### Bits 15:8 – TLOWS[7:0] Slave Clock Stretch Maximum Cycles

| Value | Description                                                                                    |
|-------|------------------------------------------------------------------------------------------------|
| 0     | TLOW:SEXT timeout check disabled.                                                              |
| 1–255 | Clock cycles in slave maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:SEXT. |

#### Bits 3:0 – PRESC[3:0] SMBus Clock Prescaler

Used to specify how to prescale the TLOWS, TLOWM and THMAX counters in SMBTR. Counters are prescaled according to the following formula:  $PRESC = \text{Log}(fMCK / f_{\text{Prescaled}}) / \text{Log}(2) - 1$

| Value | Description                                |
|-------|--------------------------------------------|
| 0     | The next transfer does not use a PEC byte. |
| 1     | The next transfer uses a PEC byte.         |

#### Bit 24 – NDIR Next Transfer Direction

| Value | Description      |
|-------|------------------|
| 0     | Write direction. |
| 1     | Read direction.  |

#### Bits 23:16 – NDATAL[7:0] Next Data Length

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 0     | No data to send (see <a href="#">46.9.3.11 Alternative Command</a> ). |
| 1–255 | Number of bytes to send for the next transfer.                        |

#### Bit 9 – PEC PEC Request (SMBus Mode only)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | The transfer does not use a PEC byte. |
| 1     | The transfer uses a PEC byte.         |

#### Bits 10:8 – THRES[2:0] Digital Filter Threshold

| Value | Description                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------|
| 0     | No filtering applied on TWI inputs.                                                                             |
| 1–7   | Maximum pulse width of spikes which will be suppressed by the input filter, defined in peripheral clock cycles. |

#### Bit 2 – PADFCFG PAD Filter Config

Refer to the section “Electrical Characteristics” for filter configuration details.

#### Bit 1 – PADFEN PAD Filter Enable

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 0     | PAD analog filter is disabled.                                                                   |
| 1     | PAD analog filter is enabled. (The analog filter must be enabled if High-speed mode is enabled.) |

#### Bit 0 – FILT RX Digital Filter

TWI digital input filtering follows a majority decision based on three samples from SDA/SCL lines at peripheral clock frequency.

#### Bits 31:24 – DATAM[7:0] Data Match

The TWI module will extend the SleepWalking matching process to the first received data comparing it with DATAM if DATAMEN bit is enabled.

#### Bits 22:16 – SADR3[6:0] Slave Address 3

Slave address 3. The TWI module will match on this additional address if SADR3EN bit is enabled.

#### Bits 14:8 – SADR2[6:0] Slave Address 2

Slave address 2. The TWI module will match on this additional address if SADR2EN bit is enabled.

#### Bits 6:0 – SADR1[6:0] Slave Address 1

Slave address 1. The TWI module will match on this additional address if SADR1EN bit is enabled.

| Reset  |    |    | 0             | 0   |     |     | 0           | 0   |

#### Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

| Value | Description                                                                                                                                                                                    |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–16  | Defines the Receive FIFO threshold value (number of data). The FLEX_TWI_FSR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state. |

#### Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

| Value | Description                                                                                                                                                                                      |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–16  | Defines the Transmit FIFO threshold value (number of data). The FLEX_TWI_FSR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state. |

#### Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode

If FIFOs are enabled, the FLEX\_TWI\_SR.RXRDY flag behaves as follows.

| Value | Name     | Description                                                                     |
|-------|----------|---------------------------------------------------------------------------------|
| 0     | ONE_DATA | RXRDY will be at level ‘1’ when at least one unread data is in the Receive FIFO |

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Name      | Description                                                                       |
|-------|-----------|-----------------------------------------------------------------------------------|
| 1     | TWO_DATA  | RXRDY will be at level '1' when at least two unread data are in the Receive FIFO  |
| 2     | FOUR_DATA | RXRDY will be at level '1' when at least four unread data are in the Receive FIFO |

### Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode

If FIFOs are enabled, the FLEX\_TWI\_SR.TXRDY flag behaves as follows.

| Value | Name      | Description                                                                            |
|-------|-----------|----------------------------------------------------------------------------------------|
| 0     | ONE_DATA  | TXRDY will be at level '1' when at least one data can be written in the Transmit FIFO  |
| 1     | TWO_DATA  | TXRDY will be at level '1' when at least two data can be written in the Transmit FIFO  |
| 2     | FOUR_DATA | TXRDY will be at level '1' when at least four data can be written in the Transmit FIFO |

| Bit    | 7       | 6       | 5      | 4     | 3     | 2      | 1     | 0     |
|        | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | R       | R       | R      | R     | R     | R      | R     | R     |
| Reset  | 0       | 0       | 0      | 0     | 0     | 0      | 0     | 0     |

#### Bit 7 – RXFPTEF Receive FIFO Pointer Error Flag

See [46.9.6.10 FIFO Pointer Error](#) for details.

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | No Receive FIFO pointer occurred.                            |
| 1     | Receive FIFO pointer error occurred. Receiver must be reset. |

#### Bit 6 – TXFPTEF Transmit FIFO Pointer Error Flag

See [46.9.6.10 FIFO Pointer Error](#) for details.

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | No Transmit FIFO pointer occurred.                               |
| 1     | Transmit FIFO pointer error occurred. Transceiver must be reset. |

#### Bit 5 – RXFTHF Receive FIFO Threshold Flag

| Value | Description                                                                                               |
|-------|-----------------------------------------------------------------------------------------------------------|
| 0     | Number of unread data in Receive FIFO is below RXFTHRES threshold.                                        |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last read of FLEX_TWI_FSR. |

#### Bit 4 – RXFFF Receive FIFO Full Flag

# SAMA5D2 Series

## Flexible Serial Communication Controller (FLEXCOM)

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | Receive FIFO is not empty.                                        |
| 1     | Receive FIFO has been filled since the last read of FLEX_TWI_FSR. |

**Bit 3 – RXFEF** Receive FIFO Empty Flag

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | Receive FIFO is not empty.                                         |
| 1     | Receive FIFO has been emptied since the last read of FLEX_TWI_FSR. |

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared on read)

| Value | Description                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------|
| 0     | Number of data in Transmit FIFO is above TXFTHRES threshold.                                        |
| 1     | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_TWI_FSR. |

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared on read)

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | Transmit FIFO is not full.                                         |
| 1     | Transmit FIFO has been filled since the last read of FLEX_TWI_FSR. |

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared on read)

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | Transmit FIFO is not empty.                                         |
| 1     | Transmit FIFO has been emptied since the last read of FLEX_TWI_FSR. |

| Bit    | 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8    |
|        | WPVSR[7:0]   |    |    |    |    |    |    |      |
| Access | R            | R  | R  | R  | R  | R  | R  | R    |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0    |
| Bit    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|        |              |    |    |    |    |    |    | WPVS |
| Access |              |    |    |    |    |    |    | R    |
| Reset  |              |    |    |    |    |    |    | 0    |

#### Bits 31:8 – WPVSR[23:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protect Violation Status

| Value | Description                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR.                                                                                                                                   |
| 1     | A Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

#### 47. Universal Asynchronous Receiver Transmitter (UART)

## 47.1 Description

The Universal Asynchronous Receiver Transmitter (UART) features a two-pin UART that can be used for communication and trace purposes and offers an ideal medium for in-situ programming solutions.

Moreover, the association with a DMA controller permits packet handling for these tasks with processor time reduced to a minimum.

## 47.2 Embedded Characteristics

- Two-pin UART
  - Independent Receiver and Transmitter with a Common Programmable Baud Rate Generator
  - Baud Rate can be Driven by Processor-Independent Generic Source Clock
  - Even, Odd, Mark or Space Parity Generation
  - Parity, Framing and Overrun Error Detection
  - Automatic Echo, Local Loopback and Remote Loopback Channel Modes
  - Digital Filter on Receive Line
  - Interrupt Generation
  - Support for Two DMA Channels with Connection to Receiver and Transmitter
  - Supports Asynchronous Partial Wake-up on Receive Line Activity (SleepWalking)
  - Comparison Function on Received Character
  - Receiver Time-out
  - Register Write Protection

### 47.3 Block Diagram

### Figure 47-1. UART Block Diagram

### Table 47-1. UART Pin Description

| Pin Name | Description        | Type   |
|----------|--------------------|--------|
| URXD     | UART Receive Data  | Input  |
| UTXD     | UART Trasnmit Data | Output |

## **47.4 Product Dependencies**

### **47.4.1 I/O Lines**

The UART pins are multiplexed with PIO lines. The user must first configure the corresponding PIO Controller to enable I/O line operations of the UART.

### **47.4.2 Power Management**

The UART clock can be controlled through the Power Management Controller (PMC). In this case, the user must first configure the PMC to enable the UART clock. Usually, the peripheral identifier used for this purpose is 1.

In SleepWalking mode (asynchronous partial wake-up), the PMC must be configured to enable SleepWalking for the UART in the Sleepwalking Enable Register (PMC\_SLPWK\_ER). Depending on the instructions (requests) provided by the UART to the PMC, the system clock may or may not be automatically provided to the UART.

### **47.4.3 Interrupt Sources**

The UART interrupt line is connected to one of the interrupt sources of the Interrupt Controller. Interrupt handling requires programming of the Interrupt Controller before configuring the UART.

## **47.5 Functional Description**

The UART operates in Asynchronous mode only and supports only 8-bit character handling (with parity). It has no clock pin.

The UART is made up of a receiver and a transmitter that operate independently, and a common baud rate generator. Receiver timeout and transmitter time guard are not implemented. However, all the implemented features are compatible with those of a standard USART.

### **47.5.1 Baud Rate Generator**

The baud rate generator provides the bit period clock named baud rate clock to both the receiver and the transmitter.

The baud rate clock is the peripheral clock divided by 16 times the clock divisor (CD) value written in the Baud Rate Generator register (UART\_BRGR). If UART\_BRGR is set to 0, the baud rate clock is disabled and the UART remains inactive. The maximum allowable baud rate is peripheral clock or GCLK divided by 16. The minimum allowable baud rate is peripheral clock divided by (16 x 65536). The clock source driving the baud rate generator (peripheral clock or GCLK) can be selected by writing the bit BRSRCK in UART\_MR.

If GCLK is selected, the baud rate is independent of the processor/bus clock. Thus the processor clock can be changed while UART is enabled. The processor clock frequency changes must be performed only by programming the field PRES in PMC\_MCKR (refer to "Power Management Controller (PMC)"). Other methods to modify the processor/bus clock frequency (PLL multiplier, etc.) are forbidden when UART is enabled.

The peripheral clock frequency must be at least three times higher than GCLK.

**Figure 47-2. Baud Rate Generator**

## 47.5.2 Receiver

### 47.5.2.1 Receiver Reset, Enable and Disable

After device reset, the UART receiver is disabled and must be enabled before being used. The receiver can be enabled by writing the Control Register (UART\_CR) with the bit RXEN at 1. At this command, the receiver starts looking for a start bit.

The programmer can disable the receiver by writing UART\_CR with the bit RXDIS at 1. If the receiver is waiting for a start bit, it is immediately stopped. However, if the receiver has already detected a start bit and is receiving the data, it waits for the stop bit before actually stopping its operation.

The receiver can be put in reset state by writing UART\_CR with the bit RSTRX at 1. In this case, the receiver immediately stops its current operations and is disabled, whatever its current state. If RSTRX is applied when data is being processed, this data is lost.

### 47.5.2.2 Start Detection and Data Sampling

The UART only supports asynchronous operations, and this affects only its receiver. The UART receiver detects the start of a received character by sampling the URXD signal until it detects a valid start bit. A low level (space) on URXD is interpreted as a valid start bit if it is detected for more than seven cycles of the sampling clock, which is 16 times the baud rate. Hence, a space that is longer than 7/16 of the bit period is detected as a valid start bit. A space which is 7/16 of a bit period or shorter is ignored and the receiver continues to wait for a valid start bit.

When a valid start bit has been detected, the receiver samples the URXD at the theoretical midpoint of each bit. It is assumed that each bit lasts 16 cycles of the sampling clock (1-bit period) so the bit sampling point is eight cycles (0.5-bit period) after the start of the bit. The first sampling point is therefore 24 cycles (1.5-bit periods) after detecting the falling edge of the start bit.

Each subsequent bit is sampled 16 cycles (1-bit period) after the previous one.

**Figure 47-3. Start Bit Detection**

**Figure 47-4. Character Reception**

Example: 8-bit, parity enabled 1 stop

### 47.5.2.3 Receiver Ready

When a complete character is received, it is transferred to the Receive Holding Register (UART\_RHR) and the RXRDY status bit in the Status Register (UART\_SR) is set. The bit RXRDY is automatically cleared when UART\_RHR is read.

**Figure 47-5. Receiver Ready**

### 47.5.2.4 Receiver Overrun

The OVRE status bit in UART\_SR is set if UART\_RHR has not been read by the software (or the DMA Controller) since the last transfer, the RXRDY bit is still set and a new character is received. OVRE is cleared when the software writes a 1 to the bit RSTSTA (Reset Status) in UART\_CR.

**Figure 47-6. Receiver Overrun**

### 47.5.2.5 Parity Error

Each time a character is received, the receiver calculates the parity of the received data bits, in accordance with the field PAR in the Mode Register (UART\_MR). It then compares the result with the received parity bit. If different, the parity error bit PARE in UART\_SR is set at the same time RXRDY is set. The parity bit is cleared when UART\_CR is written with the bit RSTSTA (Reset Status) at 1. If a new character is received before the reset status command is written, the PARE bit remains at 1.

**Figure 47-7. Parity Error**

### 47.5.2.6 Receiver Framing Error

When a start bit is detected, it generates a character reception when all the data bits have been sampled. The stop bit is also sampled and when it is detected at 0, the FRAME (Framing Error) bit in UART\_SR is set at the same time the RXRDY bit is set. The FRAME bit remains high until the Control Register (UART\_CR) is written with the bit RSTSTA at 1.

**Figure 47-8. Receiver Framing Error**

### 47.5.2.7 Receiver Digital Filter

The UART embeds a digital filter on the receive line. It is disabled by default and can be enabled by writing a logical 1 in the FILTER bit of UART\_MR. When enabled, the receive line is sampled using the 16x bit clock and a three-sample filter (majority 2 over 3) determines the value of the line.

### 47.5.2.8 Receiver Time-out

The Receiver Time-out provides support in handling variable-length frames. This feature detects an idle condition on the URXD line. When a time-out is detected, the bit TIMEOUT in the UART\_SR rises and can generate an interrupt, thus indicating to the driver an end of frame.

The time-out delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Time-out register (UART\_RTOR). If the TO field is written to 0, the Receiver Time-out is disabled and no time-out is detected. The TIMEOUT bit in the UART\_SR remains at 0. Otherwise, the receiver loads an 8-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the TIMEOUT bit UART\_SR rises. Then, the user can either:

- stop the counter clock until a new character is received. This is performed by writing a one to the STTTO (start Time-out) bit in the UART\_CR. In this case, the idle state on URXD before a new character is received does not provide a time-out. This prevents having to handle an interrupt before a character is received and allows waiting for the next idle state on URXD after a frame is received, or
- obtain an interrupt while no character is received. This is performed by writing a one to the RETTO (Reload and Start Time-out) bit in the UART\_CR. If RETTO is performed, the counter starts counting down immediately from the TO value. This enables generation of a periodic interrupt so that a user time-out can be handled, for example when no key is pressed on a keyboard.

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

If STTTO is performed, the counter clock is stopped until a first character is received. The idle state on URXD before the start of the frame does not provide a time-out. This prevents having to obtain a periodic interrupt and enables a wait of the end of frame when the idle state on URXD is detected.

If RETTO is performed, the counter starts counting down immediately from the TO value. This enables generation of a periodic interrupt so that a user time-out can be handled, for example when no key is pressed on a keyboard.

The figure below shows the block diagram of the Receiver Time-out feature.

**Figure 47-9. Receiver Time-out Block Diagram**

The table below gives the maximum time-out period for some standard baud rates.

**Table 47-2. Maximum Time-out Period**

| Baud Rate (bit/s) | Bit Time (μs) | Time-out (μs) |
|-------------------|---------------|---------------|
| 600               | 1,667         | 425,085       |
| 1,200             | 833           | 212,415       |
| 2,400             | 417           | 106,335       |
| 4,800             | 208           | 53,040        |
| 9,600             | 104           | 26,520        |
| 14,400            | 69            | 17,595        |
| 19,200            | 52            | 13,260        |
| 28,800            | 35            | 8,925         |
| 38,400            | 26            | 6,630         |
| 56,000            | 18            | 4,590         |
| 57,600            | 17            | 4,335         |
| 200,000           | 5             | 1,275         |

### 47.5.3 Transmitter

#### 47.5.3.1 Transmitter Reset, Enable and Disable

After device reset, the UART transmitter is disabled and must be enabled before being used. The transmitter is enabled by writing UART\_CR with the bit TXEN at 1. From this command, the transmitter waits for a character to be written in the Transmit Holding Register (UART\_THR) before actually starting the transmission.

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

The programmer can disable the transmitter by writing UART\_CR with the bit TXDIS at 1. If the transmitter is not operating, it is immediately stopped. However, if a character is being processed into the internal shift register and/or a character has been written in the UART\_THR, the characters are completed before the transmitter is actually stopped.

The programmer can also put the transmitter in its reset state by writing the UART\_CR with the bit RSTTX at 1. This immediately stops the transmitter, whether or not it is processing characters.

### 47.5.3.2 Transmit Format

The UART transmitter drives the pin UTXD at the baud rate clock speed. The line is driven depending on the format defined in UART\_MR and the data stored in the internal shift register. One start bit at level 0, then the 8 data bits, from the lowest to the highest bit, one optional parity bit and one stop bit at 1 are consecutively shifted out as shown in the following figure. The field PARE in UART\_MR defines whether or not a parity bit is shifted out. When a parity bit is enabled, it can be selected between an odd parity, an even parity, or a fixed space or mark bit.

**Figure 47-10. Character Transmission**

### 47.5.3.3 Transmitter Control

When the transmitter is enabled, the bit TXRDY (Transmitter Ready) is set in UART\_SR. The transmission starts when the programmer writes in the UART\_THR, and after the written character is transferred from UART\_THR to the internal shift register. The TXRDY bit remains high until a second character is written in UART\_THR. As soon as the first character is completed, the last character written in UART\_THR is transferred into the internal shift register and TXRDY rises again, showing that the holding register is empty.

When both the internal shift register and UART\_THR are empty, i.e., all the characters written in UART\_THR have been processed, the TXEMPTY bit rises after the last stop bit has been completed.

**Figure 47-11. Transmitter Control**

### 47.5.4 DMA Support

Both the receiver and the transmitter of the UART are connected to a DMA Controller (DMAC) channel.

The DMA Controller channels are programmed via registers that are mapped within the DMAC user interface.

### 47.5.5 Comparison Function on Received Character

When a comparison is performed on a received character, the result of the comparison is reported on the CMP flag in UART\_SR when UART\_RHR is loaded with the new received character. The CMP flag is cleared by writing a one to the RSTSTA bit in UART\_CR.

UART\_CMPR (see [UART Comparison Register](#)) can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if either received character equals VAL1 or VAL2.

By programming the CMPMODE bit to 1, the comparison function result triggers the start of the loading of UART\_RHR (see the figure below). The trigger condition occurs as soon as the received character value matches the condition defined by the programming of VAL1, VAL2 and CMPPAR in UART\_CMPR. The comparison trigger event can be restarted by writing a one to the REQCLR bit in UART\_CR.

**Figure 47-12. Receive Holding Register Management**

CMPMODE = 1, VAL1 = VAL2 = 0x06

### 47.5.6 Asynchronous and Partial Wake-up (SleepWalking)

Asynchronous and partial wake-up (SleepWalking) is a means of data pre-processing that qualifies an incoming event, thus allowing the UART to decide whether or not to wake up the system. SleepWalking is used primarily when the system is in Wait mode (refer to section “Power Management Controller (PMC)”) but can also be enabled when the system is fully running.

No access must be performed in the UART between the enable of asynchronous partial wake-up and the wake-up performed by the UART.

If the system is in Wait mode and asynchronous and partial wake-up is enabled, the maximum baud rate that can be achieved equals 19200.

If the system is running or in Sleep mode, the maximum baud rate that can be achieved equals 115200 or higher. This limit is bounded by the peripheral clock frequency divided by 16.

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

---

The UART\_RHR must be read before enabling asynchronous and partial wake-up.

When SleepWalking is enabled for the UART (refer to section "Power Management Controller (PMC)"), the PMC decodes a clock request from the UART. The request is generated as soon as there is a falling edge on the URXD line as this may indicate the beginning of a start bit. If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the UART.

As soon as the clock is provided by the PMC, the UART processes the received frame and compares the received character with VAL1 and VAL2 in UART\_CMPR ([UART Comparison Register](#)).

The UART instructs the PMC to disable the clock if the received character value does not meet the conditions defined by VAL1 and VAL2 fields in UART\_CMPR (see [Asynchronous Event Generating Only Partial Wake-up](#)).

If the received character value meets the conditions, the UART instructs the PMC to exit the full system from Wait mode (see [Asynchronous Wake-up Use Case Examples](#)).

The VAL1 and VAL2 fields can be programmed to provide different comparison methods and thus matching conditions.

- If VAL1 equals VAL2, then the comparison is performed on a single value and the wake-up is triggered if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 wakes up the system.
- If VAL1 is strictly higher than VAL2, then the wake-up is triggered if the received character equals VAL1 or VAL2.
- If VAL1 = 0 and VAL2 = 255, the wake-up is triggered as soon as a character is received.

The matching condition can be configured to include the parity bit (CMPPAR in UART\_CMPR). Thus, if the received data matches the comparison condition defined by VAL1 and VAL2 but a parity error is encountered, the matching condition is cancelled and the UART instructs the PMC to disable the clock (see [Asynchronous Event Generating Only Partial Wake-up](#)).

If the processor and peripherals are running, the UART can be configured in Asynchronous and partial wake-up mode by enabling the PMC\_SLPWK\_ER (refer to "Power Management Controller (PMC)"). When activity is detected on the receive line, the UART requests the clock from the PMC and the comparison is performed. If there is a comparison match, the UART continues to request the clock. If there is no match, the clock is switched off for the UART only, until a new activity is detected.

The CMPMODE configuration has no effect when Asynchronous and Partial Wake-up mode is enabled for the UART (refer to PMC\_SLPWK\_ER in "Power Management Controller (PMC)").

When the system is kept in active/running mode and the UART enters Asynchronous and Partial Wake-up mode, the flag CMP must be programmed as the unique source of the UART interrupt.

When the system exits Wait mode as the result of a matching condition, the RXRDY flag is used to determine if the UART is the source of exit.

**Note:** If the SleepWalking function is enabled on the UART, a divide by 8 of the peripheral clock versus the bus clock is not possible. Other dividers can be used with no constraints.

### 47.5.7 Register Write Protection

To prevent any single software error from corrupting UART behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [UART Write Protection Mode Register](#) (UART\_WPMR).

The following registers can be write-protected:

- [UART Mode Register](#)
- [UART Baud Rate Generator Register](#)
- [UART Comparison Register](#)
- [UART Receiver Time-out Register](#)

### 47.5.8 Test Modes

The UART supports three test modes. These modes of operation are programmed by using the CHMODE field in UART\_MR.

The Automatic Echo mode allows a bit-by-bit retransmission. When a bit is received on the URXD line, it is sent to the UTXD line. The transmitter operates normally, but has no effect on the UTXD line.

The Local Loopback mode allows the transmitted characters to be received. UTXD and URXD pins are not used and the output of the transmitter is internally connected to the input of the receiver. The URXD pin level has no effect and the UTXD line is held high, as in idle state.

The Remote Loopback mode directly connects the URXD pin to the UTXD line. The transmitter and the receiver are disabled and have no effect. This mode allows a bit-by-bit retransmission.

| Access | W     | W    | W     | W      | W     | W     |    |        |
| Reset  | –     | –    | –     | –      | –     | –     |    |        |

#### Bit 12 – REQCLR Request Clear

- SleepWalking enabled:

0: No effect.

1: Bit REQCLR clears the potential clock request currently issued by UART, thus the potential system wake-up is cancelled.

- SleepWalking disabled:

0: No effect.

1: Bit REQCLR restarts the comparison trigger to enable receive holding register loading.

#### Bit 11 – STTTO Start Time-out

| Value | Description                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                 |
| 1     | Starts waiting for a character before clocking the time-out counter. Resets status bit TIMEOUT in UART_SR. |

#### Bit 10 – RETTO Rearm Time-out

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

| Value | Description        |
|-------|--------------------|
| 0     | No effect.         |
| 1     | Restarts time-out. |

### Bit 8 – RSTSTA Reset Status

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | No effect.                                                       |
| 1     | Resets the status bits PARE, FRAME, CMP and OVRE in the UART_SR. |

### Bit 7 – TXDIS Transmitter Disable

| Value | Description                                                                                                                                                                                            |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                             |
| 1     | The transmitter is disabled. If a character is being processed and a character has been written in the UART_THR and RSTTX is not set, both characters are completed before the transmitter is stopped. |

### Bit 6 – TXEN Transmitter Enable

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No effect.                                |
| 1     | The transmitter is enabled if TXDIS is 0. |

### Bit 5 – RXDIS Receiver Disable

| Value | Description                                                                                                                                  |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                   |
| 1     | The receiver is disabled. If a character is being processed and RSTRX is not set, the character is completed before the receiver is stopped. |

### Bit 4 – RXEN Receiver Enable

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No effect.                             |
| 1     | The receiver is enabled if RXDIS is 0. |

### Bit 3 – RSTTX Reset Transmitter

| Value | Description                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                     |
| 1     | The transmitter logic is reset and disabled. If a character is being transmitted, the transmission is aborted. |

### Bit 2 – RSTRX Reset Receiver

| Value | Description                                                                                           |
|-------|-------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                            |
| 1     | The receiver logic is reset and disabled. If a character is being received, the reception is aborted. |

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### 47.6.2 UART Mode Register

**Name:** UART\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |             |     |    |         |     |          |     |    |

| Bit    | 31          | 30  | 29 | 28      | 27  | 26       | 25  | 24 |
|        |             |     |    |         |     |          |     |    |
| Access |             |     |    |         |     |          |     |    |
| Reset  |             |     |    |         |     |          |     |    |
| Bit    | 23          | 22  | 21 | 20      | 19  | 18       | 17  | 16 |
|        |             |     |    |         |     |          |     |    |
| Access |             |     |    |         |     |          |     |    |
| Reset  |             |     |    |         |     |          |     |    |
| Bit    | 15          | 14  | 13 | 12      | 11  | 10       | 9   | 8  |
|        | CHMODE[1:0] |     |    | BRSRCCK |     | PAR[2:0] |     |    |
| Access | R/W         | R/W |    | R/W     | R/W | R/W      | R/W |    |
| Reset  | 0           | 0   |    | 0       | 0   | 0        | 0   |    |
| Bit    | 7           | 6   | 5  | 4       | 3   | 2        | 1   | 0  |
|        |             |     |    | FILTER  |     |          |     |    |
| Access |             |     |    | R/W     |     |          |     |    |
| Reset  |             |     |    | 0       |     |          |     |    |

#### Bits 15:14 – CHMODE[1:0] Channel Mode

| Value | Name            | Description     |
|-------|-----------------|-----------------|
| 0     | NORMAL          | Normal mode     |
| 1     | AUTOMATIC       | Automatic echo  |
| 2     | LOCAL_LOOPBACK  | Local loopback  |
| 3     | REMOTE_LOOPBACK | Remote loopback |

#### Bit 12 – BRSRCCK Baud Rate Source Clock

0 (PERIPH\_CLK): The baud rate is driven by the peripheral clock

1 (GCLK): The baud rate is driven by a PMC-programmable clock GCLK (refer to section "Power Management Controller (PMC)").

#### Bits 11:9 – PAR[2:0] Parity Type

| Value | Name  | Description               |
|-------|-------|---------------------------|
| 0     | EVEN  | Even Parity               |
| 1     | ODD   | Odd Parity                |
| 2     | SPACE | Space: parity forced to 0 |
| 3     | MARK  | Mark: parity forced to 1  |
| 4     | NO    | No parity                 |

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

---

### **Bit 4 – FILTER** Receiver Digital Filter

0 (DISABLED): UART does not filter the receive line.

1 (ENABLED): UART filters the receive line using a three-sample filter (16x-bit clock) (2 over 3 majority).

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### 47.6.3 UART Interrupt Enable Register

**Name:** UART\_IER  
**Offset:** 0x08  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |      |       |      |    |    |    |         |         |
|--------|------|-------|------|----|----|----|---------|---------|
| Bit    | 31   | 30    | 29   | 28 | 27 | 26 | 25      | 24      |
|        |      |       |      |    |    |    |         |         |
| Access |      |       |      |    |    |    |         |         |
| Reset  |      |       |      |    |    |    |         |         |
| Bit    | 23   | 22    | 21   | 20 | 19 | 18 | 17      | 16      |
|        |      |       |      |    |    |    |         |         |
| Access |      |       |      |    |    |    |         |         |
| Reset  |      |       |      |    |    |    |         |         |
| Bit    | 15   | 14    | 13   | 12 | 11 | 10 | 9       | 8       |
|        | CMP  |       |      |    |    |    | TXEMPTY | TIMEOUT |
| Access | W    |       |      |    |    |    | W       | W       |
| Reset  | –    |       |      |    |    |    | –       | –       |
| Bit    | 7    | 6     | 5    | 4  | 3  | 2  | 1       | 0       |
|        | PARE | FRAME | OVRE |    |    |    | TXRDY   | RXRDY   |
| Access | W    | W     | W    |    |    |    | W       | W       |
| Reset  | –    | –     | –    |    |    |    | –       | –       |

**Bit 15 – CMP** Enable Comparison Interrupt

**Bit 9 – TXEMPTY** Enable TXEMPTY Interrupt

**Bit 8 – TIMEOUT** Enable Time-out Interrupt

**Bit 7 – PARE** Enable Parity Error Interrupt

**Bit 6 – FRAME** Enable Framing Error Interrupt

**Bit 5 – OVRE** Enable Overrun Error Interrupt

**Bit 1 – TXRDY** Enable TXRDY Interrupt

**Bit 0 – RXRDY** Enable RXRDY Interrupt

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### 47.6.4 UART Interrupt Disable Register

**Name:** UART\_IDR  
**Offset:** 0x0C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

**Bit 15 – CMP** Disable Comparison Interrupt

**Bit 9 – TXEMPTY** Disable TXEMPTY Interrupt

**Bit 8 – TIMEOUT** Disable Time-out Interrupt

**Bit 7 – PARE** Disable Parity Error Interrupt

**Bit 6 – FRAME** Disable Framing Error Interrupt

**Bit 5 – OVRE** Disable Overrun Error Interrupt

**Bit 1 – TXRDY** Disable TXRDY Interrupt

**Bit 0 – RXRDY** Disable RXRDY Interrupt

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### 47.6.5 UART Interrupt Mask Register

**Name:** UART\_IMR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

|        |      |       |      |    |    |    |         |         |
|--------|------|-------|------|----|----|----|---------|---------|
| Bit    | 31   | 30    | 29   | 28 | 27 | 26 | 25      | 24      |
|        |      |       |      |    |    |    |         |         |
| Access |      |       |      |    |    |    |         |         |

## Universal Asynchronous Receiver Transmitter (UART)

### 47.6.6 UART Status Register

**Name:** UART\_SR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read-only

|        |      |       |      |    |    |    |         |         |
|--------|------|-------|------|----|----|----|---------|---------|
| Bit    | 31   | 30    | 29   | 28 | 27 | 26 | 25      | 24      |
|        |      |       |      |    |    |    |         |         |
| Access |      |       |      |    |    |    |         |         |
| Reset  |      |       |      |    |    |    |         |         |
| Bit    | 23   | 22    | 21   | 20 | 19 | 18 | 17      | 16      |
|        |      |       |      |    |    |    |         |         |
| Access |      |       |      |    |    |    |         |         |
| Reset  |      |       |      |    |    |    |         |         |
| Bit    | 15   | 14    | 13   | 12 | 11 | 10 | 9       | 8       |
|        | CMP  |       |      |    |    |    | TXEMPTY | TIMEOUT |
| Access | R    |       |      |    |    |    | R       | R       |
| Reset  | 0    |       |      |    |    |    | 0       | 0       |
| Bit    | 7    | 6     | 5    | 4  | 3  | 2  | 1       | 0       |
|        | PARE | FRAME | OVRE |    |    |    | TXRDY   | RXRDY   |
| Access | R    | R     | R    |    |    |    | R       | R       |
| Reset  | 0    | 0     | 0    |    |    |    | 0       | 0       |

#### Bit 15 – CMP Comparison Match

| Value | Description                                                                                                                    |
|-------|--------------------------------------------------------------------------------------------------------------------------------|
| 0     | No received character matches the comparison criteria programmed in VAL1, VAL2 fields and in CMPPAR bit since the last RSTSTA. |
| 1     | The received character matches the comparison criteria.                                                                        |

#### Bit 9 – TXEMPTY Transmitter Empty

| Value | Description                                                                                                         |
|-------|---------------------------------------------------------------------------------------------------------------------|
| 0     | There are characters in UART_THR, or characters being processed by the transmitter, or the transmitter is disabled. |
| 1     | There are no characters in UART_THR and there are no characters being processed by the transmitter.                 |

#### Bit 8 – TIMEOUT Receiver Time-out

| Value | Description                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------|
| 0     | There has not been a time-out since the last Start Time-out command (STTTO in UART_CR) or the Time-out Register is 0. |
| 1     | There has been a time-out since the last Start Time-out command (STTTO in UART_CR).                                   |

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### Bit 7 – PARE Parity Error

| Value | Description                                                   |
|-------|---------------------------------------------------------------|
| 0     | No parity error has occurred since the last RSTSTA.           |
| 1     | At least one parity error has occurred since the last RSTSTA. |

### Bit 6 – FRAME Framing Error

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | No framing error has occurred since the last RSTSTA.           |
| 1     | At least one framing error has occurred since the last RSTSTA. |

### Bit 5 – OVRE Overrun Error

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | No overrun error has occurred since the last RSTSTA.           |
| 1     | At least one overrun error has occurred since the last RSTSTA. |

### Bit 1 – TXRDY Transmitter Ready

| Value | Description                                                                                                                      |
|-------|----------------------------------------------------------------------------------------------------------------------------------|
| 0     | A character has been written to UART_THR and not yet transferred to the internal shift register, or the transmitter is disabled. |
| 1     | There is no character written to UART_THR not yet transferred to the internal shift register.                                    |

### Bit 0 – RXRDY Receiver Ready

| Value | Description                                                                                      |
|-------|--------------------------------------------------------------------------------------------------|
| 0     | No character has been received since the last read of the UART_RHR, or the receiver is disabled. |
| 1     | At least one complete character has been received, transferred to UART_RHR and not yet read.     |

# SAMA5D2 Series

## Universal Asynchronous Receiver Transmitter (UART)

### 47.6.7 UART Receiver Holding Register

**Name:** UART\_RHR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

|        |            |    |    |    |    |    |    |    |

**Bits 23:16 – VAL2[7:0]** Second Comparison Value for Received Character

| Value | Description                                                                                                                                                                                                                                                   |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0-255 | The received character must be lower or equal to the value of VAL2 and higher or equal to VAL1 to set CMP flag in UART_SR. If asynchronous partial wake-up (SleepWalking) is enabled in PMC_SLPWK_ER, the UART requests a system wake-up if condition is met. |

**Bit 14 – CMPPAR** Compare Parity

| Value | Description                                                                                                                    |
|-------|--------------------------------------------------------------------------------------------------------------------------------|
| 0     | The parity is not checked and a bad parity cannot prevent from waking up the system.                                           |
| 1     | The parity is checked and a matching condition on data can be cancelled by an error on parity bit, so no wake-up is performed. |

**Bit 12 – CMPMODE** Comparison Mode

| Value | Name            | Description                                                        |
|-------|-----------------|--------------------------------------------------------------------|
| 0     | FLAG_ONLY       | Any character is received and comparison function drives CMP flag. |
| 1     | START_CONDITION | Comparison condition must be met to start reception.               |

**Bits 7:0 – VAL1[7:0]** First Comparison Value for Received Character

| Value    | Name   | Description                                                                          |
|----------|--------|--------------------------------------------------------------------------------------|
| 0x554152 | PASSWD | Writing any other value in this field aborts the write operation. Always reads as 0. |

#### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be protected.

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x554152 (UART in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x554152 (UART in ASCII).  |

## 48. Serial Peripheral Interface (SPI)

### 48.1 Description

The Serial Peripheral Interface (SPI) circuit is a synchronous serial data link that provides communication with external devices in Master or Slave mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “master” which controls the data flow, while the other devices act as “slaves” which have data shifted into and out by the master. Different CPUs can take turn being masters (multiple master protocol, contrary to single master protocol where one CPU is always the master while all of the others are always slaves). One master can simultaneously shift data into multiple slaves. However, only one slave can drive its output to write data back to the master at any given time.

A slave device is selected when the master asserts its NSS signal. If multiple slave devices exist, the master generates a separate slave select signal for each slave (NPCS).

The SPI system consists of two data lines and two control lines:

- Master Out Slave In (MOSI)—This data line supplies the output data from the master shifted into the input(s) of the slave(s).
- Master In Slave Out (MISO)—This data line supplies the output data from a slave to the input of the master. There may be no more than one slave transmitting data during any particular transfer.
- Serial Clock (SPCK)—This control line is driven by the master and regulates the flow of the data bits. The master can transmit data at a variety of baud rates; there is one SPCK pulse for each bit that is transmitted.
- Slave Select (NSS)—This control line allows slaves to be turned on and off by hardware.

### 48.2 Embedded Characteristics

- Master or Slave Serial Peripheral Bus Interface
  - 8-bit to 16-bit programmable data length per chip select
  - Programmable phase and polarity per chip select
  - Programmable transfer delay between consecutive transfers and delay before SPI clock per chip select
  - Programmable delay between chip selects
  - Selectable mode fault detection
- Master Mode can Drive SPCK up to Peripheral Clock
- 16-data Transmit and Receive FIFOs
- Master Mode Bit Rate can be Independent of the Processor/Peripheral Clock
- Slave Mode Operates on SPCK, Asynchronously with Core and Bus Clock
- Four Chip Selects with External Decoder Support Allow Communication with up to 15 Peripherals
- Communication with Serial External Devices Supported
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - External coprocessors

- Connection to DMA Channel Capabilities, Optimizing Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Register Write Protection

### 48.3 Block Diagram

Figure 48-1. Block Diagram

### 48.4 Application Block Diagram

Figure 48-2. Application Block Diagram: Single Master/Multiple Slave Implementation

## 48.5 Signal Description

**Table 48-1. Signal Description**

| Pin Name    | Pin Description                     | Type   |        |
|-------------|-------------------------------------|--------|--------|
|             |                                     | Master | Slave  |
| MISO        | Master In Slave Out                 | Input  | Output |
| MOSI        | Master Out Slave In                 | Output | Input  |
| SPCK        | Serial Clock                        | Output | Input  |
| NPCS1–NPCS3 | Peripheral Chip Selects             | Output | Unused |
| NPCS0/NSS   | Peripheral Chip Select/Slave Select | Output | Input  |

## 48.6 Product Dependencies

### 48.6.1 I/O Lines

The pins used for interfacing the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the SPI pins to their peripheral functions.

### 48.6.2 Power Management

The SPI can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the SPI clock.

### 48.6.3 Interrupt

The SPI interface has an interrupt line connected to the interrupt controller. Handling the SPI interrupt requires programming the interrupt controller before configuring the SPI.

### 48.6.4 Direct Memory Access Controller (DMAC)

The SPI interface can be used in conjunction with the DMAC in order to reduce processor overhead. For a full description of the DMAC, refer to the relevant section.

## 48.7 Functional Description

### 48.7.1 Modes of Operation

The SPI operates in Master mode or in Slave mode.

- The SPI operates in Master mode by setting the MSTR bit in the SPI Mode Register (SPI\_MR):
  - Pins NPCS0 to NPCS3 are all configured as outputs
  - The SPCK pin is driven
  - The MISO line is wired on the receiver input
  - The MOSI line is driven as an output by the transmitter.
- The SPI operates in Slave mode if the MSTR bit in SPI\_MR is written to '0':
  - The MISO line is driven by the transmitter output
  - The MOSI line is wired on the receiver input

- The SPCK pin is driven by the transmitter to synchronize the receiver.
- The NPCS0 pin becomes an input, and is used as a slave select signal (NSS)
- The NPCS1 to NPCS3 pins are not driven and can be used for other purposes.

The data transfers are identically programmable for both modes of operation. The baud rate generator is activated only in Master mode.

### 48.7.2 Data Transfer

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the SPI Chip Select registers (SPI\_CSRx). The clock phase is programmed with the NCPHA bit. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Consequently, a master/slave pair must use the same parameter pair values to communicate. If multiple slaves are connected and require different configurations, the master must reconfigure itself each time it needs to communicate with a different slave.

The table below shows the four modes and corresponding parameter settings.

**Table 48-2. SPI Bus Protocol Modes**

| SPI Mode | CPOL | NCPHA | Shift SPCK Edge | Capture SPCK Edge | SPCK Inactive Level |
|----------|------|-------|-----------------|-------------------|---------------------|
| 0        | 0    | 1     | Falling         | Rising            | Low                 |
| 1        | 0    | 0     | Rising          | Falling           | Low                 |
| 2        | 1    | 1     | Rising          | Falling           | High                |
| 3        | 1    | 0     | Falling         | Rising            | High                |

The following figures show examples of data transfers.

**Figure 48-3. SPI Transfer Format (NCPHA = 1, 8 bits per transfer)**

\* Not defined.

**Figure 48-4. SPI Transfer Format (NCPHA = 0, 8 bits per transfer)**

### 48.7.3 Master Mode Operations

When configured in Master mode, the SPI operates on the clock generated by the internal programmable baud rate generator. It fully controls the data transfers to and from the slave(s) connected to the SPI bus. The SPI drives the chip select line to the slave and the serial clock signal (SPCK).

The SPI features two holding registers, the Transmit Data Register (SPI\_TDR) and the Receive Data Register (SPI\_RDR), and a single shift register. The holding registers maintain the data flow at a constant rate.

After enabling the SPI, a data transfer starts when the processor writes to SPI\_TDR. The written data is immediately transferred into the internal shift register and the transfer on the SPI bus starts. While the data in the shift register is shifted on the MOSI line, the MISO line is sampled and shifted into the shift register. Data cannot be loaded in SPI\_RDR without transmitting data. If there is no data to transmit, dummy data can be used (SPI\_TDR filled with ones). If SPI\_MR.WDRBT is set, transmission can occur only if SPI\_RDR has been read. If Receiving mode is not required, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the SPI Status register (SPI\_SR) can be discarded.

Before writing SPI\_TDR, SPI\_MR.PCS must be set in order to select a slave.

If new data is written in SPI\_TDR during the transfer, it is kept in SPI\_TDR until the current transfer is completed. Then, the received data is transferred from the shift register to SPI\_RDR, the data in SPI\_TDR is loaded in the shift register and a new transfer starts.

As soon as SPI\_TDR is written, the Transmit Data Register Empty (TDRE) flag in SPI\_SR is cleared. When the data written in SPI\_TDR is loaded into the shift register, TDRE in SPI\_SR is set. The TDRE flag is used to trigger the Transmit DMA channel.

See the figure below.

The end of transfer is indicated by the TXEMPTY flag in SPI\_SR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

**Note:** When the SPI is enabled, the TDRE and TXEMPTY flags are set.

**Figure 48-5. TDRE and TXEMPTY Flag Behavior**

The transfer of received data from the internal shift register to SPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in SPI\_SR. When the received data is read, SPI\_SR.RDRF is cleared.

If SPI\_RDR has not been read before new data is received, the Overrun Error (OVRES) flag in SPI\_SR is set. As long as this flag is set, data is loaded in SPI\_RDR. The user has to read SPI\_SR to clear OVRES.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode and a flow chart describing how transfers are handled.

### 48.7.3.1 Master Mode Block Diagram

Figure 48-6. Master Mode Block Diagram

### 48.7.3.2 Master Mode Flow Diagram

### Figure 48-7. Master Mode Flow Diagram

The figure below shows the behavior of Transmit Data Register Empty (TDRE), Receive Data Register (RDRF) and Transmission Register Empty (TXEMPTY) status flags within SPI\_SR during an 8-bit data transfer in Fixed mode without the DMA involved.

**Figure 48-8. Status Register Flags Behavior**

### 48.7.3.3 Clock Generation

The SPI Baud rate clock is generated by dividing the peripheral clock by a value between 1 and 255.

If SPI\_CSRx.SCBR is programmed to 1, the operating baud rate is peripheral clock (refer to the section “Electrical Characteristics” for the SPCK maximum frequency). Triggering a transfer while SPI\_CSRx.SCBR is at 0 can lead to unpredictable results.

At reset, SPI\_CSRx.SCBR=0 and the user has to program it to a valid value before performing the first transfer.

The divisor can be defined independently for each chip select, as it has to be programmed in SPI\_CSRx.SCBR. This allows the SPI to automatically adapt the baud rate for each interfaced peripheral without reprogramming.

### 48.7.3.4 Transfer Delays

The following figure shows a chip select transfer change and consecutive transfers on the same chip select. Three delays can be programmed to modify the transfer waveforms:

- Delay between the chip selects—programmable only once for all chip selects by writing field SPI\_MR.DLYBCS. The SPI slave device deactivation delay is managed through DLYBCS. If there is only one SPI slave device connected to the master, DLYBCS does not need to be configured. If several slave devices are connected to a master, DLYBCS must be configured depending on the highest deactivation delay. Refer to details on the SPI slave device in the section “Electrical Characteristics”.
- Delay before SPCK—programmable for each chip select by writing SPI\_CSRx.DLYBS. The SPI slave device activation delay is managed through DLYBS. Refer to details on the SPI slave device in the section “Electrical Characteristics” to define DLYBS.

- Delay between consecutive transfers—independently programmable for each chip select by writing SPI\_CSRx.DLYBCT. The time required by the SPI slave device to process received data is managed through DLYBCT. This time depends on the SPI slave system activity.

These delays allow the SPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 48-9. Programmable Delays**

### 48.7.3.5 Peripheral Selection

The serial peripherals are selected through the assertion of the NPCS0 to NPCS3 signals. By default, all NPCS signals are high before and after each transfer.

- Fixed Peripheral Select Mode: SPI exchanges data with only one peripheral. Fixed Peripheral Select mode is enabled by clearing SPI\_MR.PS. In this case, the current peripheral is defined by SPI\_MR.PCS. SPI\_TDR.PCS has no effect.
- Variable Peripheral Select Mode: Data can be exchanged with more than one peripheral without having to reprogram SPI\_MR.PCS. Variable Peripheral Select mode is enabled by setting SPI\_MR.PS. SPI\_TDR.PCS is used to select the current peripheral. This means that the peripheral selection can be defined for each new data. The value must be written in a single access to SPI\_TDR in the following format:  
[xxxxxxx(7-bit) + LASTXFER(1-bit)<sup>(1)</sup> + xxxx(4-bit) + PCS (4-bit) + TD (8- to 16-bit data)]

with LASTXFER at 0 or 1 depending on the CSAAT bit, and PCS equal to the chip select to assert, as defined in section [SPI Transmit Data Register](#).

**Note:**

1. Optional

For details on CSAAT, LASTXFER and CSNAAT, see section [Peripheral Deselection with another DMA](#).

If LASTXFER is used, the command must be issued after writing the last character. Instead of LASTXFER, the user can use the SPIDIS command. After the end of the DMA transfer, it is necessary to wait for the TXEMPTY flag and then write SPIDIS into the SPI Control Register (SPI\_CR). This does not change the configuration register values). The NPCS is disabled after the last character transfer. Then, another DMA transfer can be started if SPI\_CR.SPIEN has previously been written.

### 48.7.3.6 SPI Direct Access Memory Controller (DMAC)

In both Fixed and Variable modes, the Direct Memory Access Controller (DMAC) can be used to reduce processor overhead.

The fixed peripheral selection allows buffer transfers with a single peripheral. Using the DMAC is an optimal means, as the size of the data transfer between the memory and the SPI is either 8 bits or 16 bits. However, if the peripheral selection is modified, SPI\_MR must be reprogrammed.

The variable peripheral selection allows buffer transfers with multiple peripherals without reprogramming SPI\_MR. Data written in SPI\_TDR is 32 bits wide and defines the real data to be transmitted and the destination peripheral. Using the DMAC in this mode requires 32-bit wide buffers, with the data in the LSBs and the PCS and LASTXFER fields in the MSBs. However, the SPI still controls the number of bits (8 to 16) to be transferred through MISO and MOSI lines with the chip select configuration registers. This is not the optimal means in terms of memory size for the buffers, but it provides a very effective means to exchange data with several peripherals without any intervention of the processor.

### 48.7.3.7 Peripheral Chip Select Decoding

The user can program the SPI to operate with up to 15 slave peripherals by decoding the four chip select lines, NPCS0 to NPCS3 with an external decoder/demultiplexer (see figure below). This can be enabled by setting SPI\_MR.PCSDEC.

When operating without decoding, the SPI makes sure that in any case only one chip select line is activated, i.e., one NPCS line driven low at a time. If two bits are defined low in a PCS field, only the lowest numbered chip select is driven low.

When operating with decoding, the SPI directly outputs the value defined by the PCS field on the NPCS lines of either SPI\_MR or SPI\_TDR (depending on PS).

As the SPI sets a default value of 0xF on the chip select lines (i.e., all chip select lines at 1) when not processing any transfer, only 15 peripherals can be decoded.

The SPI has four chip select registers (SPI\_CSR0...SPI\_CSR3). As a result, when external decoding is activated, each NPCS chip select defines the characteristics of up to four peripherals. As an example, SPI\_CSR0 defines the characteristics of the externally decoded peripherals 0 to 3, corresponding to the PCS values 0x0 to 0x3. Consequently, the user has to make sure to connect compatible peripherals on the decoded chip select lines 0 to 3, 4 to 7, 8 to 11 and 12 to 14. The following figure shows this type of implementation.

If SPI\_CSRx.CSAAT bit is used, with or without the DMAC, the Mode Fault detection for NPCS0 line must be disabled. This is not needed for all other chip select lines since Mode Fault detection is only on NPCS0.

**Figure 48-10. Chip Select Decoding Application Block Diagram: Single Master/Multiple Slave Implementation**

#### 48.7.3.8 Peripheral Deselection without DMA

During a transfer of more than one unit of data on a chip select without the DMA, SPI\_TDR is loaded by the processor, the TDRE flag rises as soon as the content of SPI\_TDR is transferred into the internal shift register. When this flag is detected high, SPI\_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the chip select is not deasserted between the two transfers. But depending on the application software handling the SPI status register flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload SPI\_TDR in time to keep the chip select active (low). A null DLYBCT value (delay between consecutive transfers) in SPI\_CSR, gives even less time for the processor to reload SPI\_TDR. With some SPI slave peripherals, if the chip select line must remain active (low) during a full set of transfers, communication errors can occur.

To facilitate interfacing with such devices, the chip select registers [SPI\_CSR0...SPI\_CSR3] can be programmed with the Chip Select Active After Transfer (CSAAT) bit at 1. This allows the chip select lines to remain in their current state (low = active) until a transfer to another chip select is required. Even if SPI\_TDR is not reloaded, the chip select remains active. To deassert the chip select line at the end of the transfer, the Last Transfer (LASTXFER) bit in SPI\_CR must be set after writing the last data to transmit into SPI\_TDR.

#### 48.7.3.9 Peripheral Deselection with DMA

DMA provides faster reloads of SPI\_TDR compared to software. However, depending on the system activity, it is not guaranteed that SPI\_TDR is written with the next data before the end of the current transfer. Consequently, data can be lost by the deassertion of the NPCS line for SPI slave peripherals requiring the chip select line to remain active between two transfers. The only way to guarantee a safe transfer in this case is the use of the CSAAT and LASTXFER bits.

When the CSAAT bit is configured to 0, the NPCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a chip select, the TDRE flag rises as soon as the content of SPI\_TDR is transferred into the internal shift register. When this flag is detected, SPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the chip select is not deasserted between the two

transfers. This can lead to difficulties to interface with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, SPI\_CSR can be programmed with the Chip Select Not Active After Transfer (CSNAAT) bit at 1. This allows the chip select lines to be deasserted systematically during a time “DLYBCS” (the value of the CSNAAT bit is processed only if the CSAAT bit is configured to 0 for the same chip select).

The following figure shows different peripheral deselection cases and the effect of the CSAAT and CSNAAT bits.

**Figure 48-11. Peripheral Deselection**

### 48.7.3.10 Mode Fault Detection

The SPI has the capability to operate in multimaster environment. Consequently, the NPCS0/NSS line must be monitored. If one of the masters on the SPI bus is currently transmitting, the NPCS0/NSS line is low and the SPI must not transmit any data. A mode fault is detected when the SPI is programmed in Master mode and a low level is driven by an external master on the NPCS0/NSS signal. In multimaster

environment, NPCS0, MOSI, MISO and SPCK pins must be configured in open drain (through the PIO controller). When a mode fault is detected, SPI\_SR.MODF bit is set until SPI\_SR is read and the SPI is automatically disabled until it is reenabled by setting SPI\_CR.SPIEN bit.

By default, the mode fault detection is enabled. The user can disable it by setting SPI\_MR.MODFDIS bit.

#### **48.7.4 SPI Slave Mode**

When operating in Slave mode, the SPI processes data bits on the clock provided on the SPI clock pin (SPCK).

The SPI waits until NSS goes active before receiving the serial clock from an external master. When NSS falls, the clock is validated and the data is loaded in SPI\_RDR depending on the configuration of SPI\_CSR0.BITS. These bits are processed following a phase and a polarity defined respectively by the NCPHA and CPOL bits in SPI\_CSR0. Note that the fields BITS, CPOL and NCPHA of the other chip select registers (SPI\_CSR1...SPI\_CSR3) have no effect when the SPI is programmed in Slave mode.

The bits are shifted out on the MISO line and sampled on the MOSI line.

**Note:** For more information on SPI\_CSRx.BITS, see the note in section [SPI Chip Select Register](#).

When all bits are processed, the received data is transferred in SPI\_RDR and the RDRF bit rises. If SPI\_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in SPI\_SR is set. As long as this flag is set, data is loaded in SPI\_RDR. The user must read SPI\_SR to clear the OVRES bit.

When a transfer starts, the data shifted out is the data present in the internal shift register. If no data has been written in SPI\_TDR, the last data received is transferred. If no data has been received since the last reset, all bits are transmitted low, as the internal shift register resets to 0.

When a first data is written in SPI\_TDR, it is transferred immediately in the internal shift register and the TDRE flag rises. If new data is written, it remains in SPI\_TDR until a transfer occurs, i.e., NSS falls and there is a valid clock on the SPCK pin. When the transfer occurs, the last data written in SPI\_TDR is transferred in the internal shift register and the TDRE flag rises. This enables frequent updates of critical variables with single transfers.

Then, new data is loaded in the internal shift register from SPI\_TDR. If no character is ready to be transmitted, i.e., no character has been written in SPI\_TDR since the last load from SPI\_TDR to the internal shift register, SPI\_TDR is retransmitted. In this case the Underrun Error Status Flag (UNDES) is set in SPI\_SR.

If NSS rises between two characters, it must be kept high for two MCK clock periods or more and the next SPCK capture edge must not occur less than four MCK periods after NSS rise.

The following figure shows a block diagram of the SPI when operating in Slave mode.

**Figure 48-12. Slave Mode Functional Block Diagram**

#### 48.7.5 SPI Comparison Function on Received Character

The comparison is only relevant for SPI Slave mode (SPI\_MR.MSTR=0).

The effect of a comparison match changes if the system is in Wait or Active mode.

In Wait mode, if asynchronous partial wakeup is enabled, a system wakeup is performed (see section [SPI Asynchronous and Partial Wakeup \(SleepWalking\)](#)).

In Active mode, the CMP flag in SPI\_SR is raised. It is set when the received character matches the conditions programmed in the SPI Comparison Register (SPI\_CMPR). The CMP flag is set as soon as SPI\_RDR is loaded with the new received character. The CMP flag is cleared by reading SPI\_SR.

SPI\_CMPR (see section [SPI Comparison Register](#)) can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When SPI\_MR.CMPMODE is cleared, all received data is loaded in SPI\_RDR and the CMP flag provides the status of the comparison result.

By setting SPI\_MR.CMPMODE, the comparison result triggers the start of SPI\_RDR loading (see the following figure). The trigger condition exists as soon as the received character value matches the conditions defined by VAL1 and VAL2 in SPI\_CMPR. The comparison trigger event is restarted by setting SPI\_CR.REQCLR if SleepWalking is disabled.

The value programmed in VAL1 and VAL2 fields must not exceed the maximum value of the received character (see SPI\_CSR0.BITS).

**Figure 48-13. Receive Data Register Management**

CMPMODE = 1, VAL1 = VAL2 = 0x06

#### 48.7.6 SPI Asynchronous and Partial Wakeup (SleepWalking)

This operating mode is a means of data preprocessing that qualifies an incoming event, thus allowing the SPI to decide whether or not to wake up the system. Asynchronous and partial wakeup is mainly used when the system is in Wait mode (refer to the section “Power Management Controller (PMC)” for further details). It can also be enabled when the system is fully running.

Asynchronous and partial wakeup can be used only when SPI is configured in Slave mode (SPI\_MR.MSTR is cleared).

The maximum SPI clock (SPCK) frequency that can be provided by the SPI master is bounded by the peripheral clock frequency. The SPCK frequency must be lower than or equal to the peripheral clock. The NSS line must be deasserted by the SPI master between two characters. The NSS deassertion duration time must be greater than or equal to six peripheral clock periods. The time between the assertion of NSS line (falling edge) and the first edge of the SPI clock must be higher than 5  $\mu$ s.

SPI\_RDR must be read before enabling the asynchronous and partial wakeup.

When asynchronous and partial wakeup is enabled for the SPI (refer to the section “Power Management Controller (PMC)” ), the PMC decodes a clock request from the SPI. The request is generated as soon as there is a falling edge on the NSS line as this may indicate the beginning of a frame. If the system is in Wait mode (processor and peripheral clocks switched off), the PMC restarts the fast RC oscillator and provides the clock only to the SPI.

The SPI processes the received frame and compares the received character with SPI\_CMPR.VAL1 and SPI\_CMPR.VAL2 (see section [SPI Comparison Register](#)).

The SPI instructs the PMC to disable the peripheral clock if the received character value does not meet the conditions defined by SPI\_CMPR.VAL1 and SPI\_CMPR.VAL2 (see figure [Asynchronous Event Generating Only Partial Wakeup](#)).

If the received character value meets the conditions, the SPI instructs the PMC to exit the system from Wait mode (see figure [Asynchronous Wakeup Use Case Example](#)).

The VAL1 and VAL2 fields can be programmed to provide different comparison methods and thus matching conditions.

- If VAL1 = VAL2, then the comparison is performed on a single value and the wakeup is triggered if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 wakes up the system.
- If VAL1 is strictly higher than VAL2, the wakeup is triggered if any received character equals VAL1 or VAL2.
- If VAL1 = 0 and VAL2 = 65535, the wakeup is triggered as soon as a character is received.

If the processor and peripherals are running, the SPI can be configured in Asynchronous and Partial Wakeup mode by enabling the PMC\_SLPWK\_ER (refer to the section “Power Management Controller (PMC)”). When activity is detected on the receive line, the SPI requests the clock from the PMC and the comparison is performed. If there is a comparison match, the SPI continues to request the clock. If there is no match, the clock is switched off for the SPI only, until a new activity is detected.

The CMPMODE configuration has no effect when Asynchronous and Partial Wakeup mode is enabled for the SPI (refer to PMC\_SLPWK\_ER in the section “Power Management Controller (PMC)”).

When the system is in Active mode and the SPI enters Asynchronous and Partial Wakeup mode, the flag RDRF must be programmed as the unique source of the SPI interrupt.

When the system exits Wait mode as the result of a matching condition, the RDRF flag is used to determine if the SPI is the source for the exit from Wait mode.

**Figure 48-14. Asynchronous Wakeup Use Case Example**

Case with VAL1 = VAL2 = 0x55

**Figure 48-15. Asynchronous Event Generating Only Partial Wakeup**

Case with VAL1 = VAL2 = 0x55

### 48.7.7 FIFOs

#### 48.7.7.1 Overview

The SPI includes two FIFOs which can be enabled/disabled using SPI\_CR.FIFOEN/FIFODIS. The SPI must be disabled (SPI\_CR.SPIDIS) before enabling or disabling the SPI FIFOs.

Writing SPI\_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

It is possible to write or to read single or multiple data in the same access to SPI\_TDR/RDR. Refer to sections [Single Data Mode](#) and [Multiple Data Mode](#).

**Figure 48-16. FIFOs Block Diagram**

#### 48.7.7.2 Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to SPI\_TDR loads the Transmit FIFO.

The FIFO level is provided in SPI\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor SPI\_SR.TDRE and the data can be successively written in SPI\_TDR.

If the FIFO cannot accept the data due to insufficient space, wait for the TDRE flag to be set before writing the data in SPI\_TDR.

When the space in the FIFO allows only a portion of the data to be written, the TDRE flag must be monitored before writing the remaining data.

**Figure 48-17. Sending Data with FIFO**

### 48.7.7.3 Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, SPI\_RDR access reads the FIFO.

When data are present in the Receive FIFO (RDRF flag set to '1'), the exact number of data can be checked with SPI\_FLR.RXFL. All the data can be read successively in SPI\_RDR without checking the RDRF flag between each access.

**Figure 48-18. Receiving Data with FIFO**

#### 48.7.7.4 Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using SPI\_CR.TXFCLR/RXFCLR.

#### 48.7.7.5 TXEMPTY, TDRE and RDRF Behavior

SPI\_SR.TXEMPTY, SPI\_SR.TDRE and SPI\_SR.RDRF flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TDRE indicates if a data can be written in the Transmit FIFO. Thus the TDRE flag is set as long as the Transmit FIFO can accept new data. Refer to figure [TDRE in Single Data Mode and TXRDYM=0](#).

RDRF indicates if an unread data is present in the Receive FIFO. Thus the RDRF flag is set as soon as one unread data is in the Receive FIFO. Refer to figure [RDRF in Single Data Mode and RXRDYM=0](#).

TDRE and RDRF behavior can be modified using the TXRDYM and RXRDYM fields in the SPI FIFO Mode Register (SPI\_FMR) to reduce the number of accesses to SPI\_TDR/RDR. However, for some configurations, the following constraints apply:

- When the Variable Peripheral Select mode is used (SPI\_MR.PS=1), SPI\_FMR.TXRDYM/RXRDYM must be cleared.
- In Master mode (SPI\_MR.MSTR=1), SPI\_FMR.RXRDYM must be cleared.

As an example, in Master mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See section [SPI FIFO Mode Register](#) for the FIFO configuration.

**Figure 48-19. TDRE in Single Data Mode and TXRDYM=0**

**Figure 48-20. RDRF in Single Data Mode and RXRDYM=0**

### 48.7.7.6 Single Data Mode

In Single Data mode, only one data is written every time SPI\_TDR is accessed, and only one data is read every time SPI\_RDR is accessed.

When SPI\_FMR.TXRDYM = 0, the Transmit FIFO operates in Single Data mode.

When SPI\_FMR.RXRDYM = 0, the Receive FIFO operates in Single Data mode.

If Master mode is used (SPI\_MR.MSTR=1), the Receive FIFO must operate in Single Data mode.

If Variable Peripheral Select mode is used (SPI\_MR.PS=1), the Transmit FIFO must operate in Single Data mode.

See sections [SPI Transmit Data Register](#) and [SPI Receive Data Register](#).

#### 48.7.7.6.1 DMAC

When FIFOs operate in Single Data mode, the DMAC transfer type must be configured either in bytes, halfwords or words depending on SPI\_MR.PS bit value and SPI\_CSRx.BITS field value.

The same conditions for transfer type apply when FIFOs are disabled.

#### 48.7.7.7 Multiple Data Mode

Multiple Data mode minimizes the number of accesses by concatenating the data to send/read in one access.

When SPI\_FMR.TXRDYM > 0, the Transmit FIFO operates in Multiple Data mode.

When SPI\_FMR.RXRDYM > 0, the Receive FIFO operates in Multiple Data mode.

Multiple data can be read from the Receive FIFO only in Slave mode (SPI\_MR.MSTR=0).

The Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0 and when SPI\_MR.PS=0.

In Multiple Data mode, up to two data can be written in one SPI\_TDR write access. It is also possible to read up to four data in one SPI\_RDR access if SPI\_CSRx.BITS is configured to '0' (8-bit data size) and up to two data if SPI\_CSRx.BITS is configured to a value other than '0' (more than 8-bit data size).

The number of data to write/read is defined by the size of the register access. If the access is a byte-size register access, only one data is written/read. If the access is a halfword size register access, then up to two data are read and only one data is written. Lastly, if the access is a word-size register access, then up to four data are read and up to two data are written.

Written/read data are always right-aligned, as described in sections [SPI Receive Data Register \(FIFO Multiple Data, 8-bit\)](#), [SPI Receive Data Register \(FIFO Multiple Data, 16-bit\)](#) and [SPI Transmit Data Register \(FIFO Multiple Data, 8 to 16-bit\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six SPI\_TDR-byte write accesses
- three SPI\_TDR-halfword write accesses

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six SPI\_RDR-byte read accesses
- three SPI\_RDR-halfword read accesses
- one SPI\_RDR-word read access and one SPI\_RDR-halfword read access

#### 48.7.7.7.1 TDRE and RDRF Configuration

In Multiple Data mode, it is possible to write one or more data in the same SPI\_TDR/SPI\_RDR access.

The TDRE flag indicates if one or more data can be written in the FIFO depending on the configuration of SPI\_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in SPI\_TDR, it is useful to configure the TXRDYM field to the value '1' so that the TDRE flag is at '1' only when at least two data can be written in the Transmit FIFO.

Similarly, if four data are read each time in SPI\_RDR, it is useful to configure the RXRDYM field to the value '2' so that the RDRF flag is at '1' only when at least four unread data are in the Receive FIFO.

#### **48.7.7.7.2 DMAC**

It is mandatory to configure DMAC channel size (byte, halfword or word) according to FLEX\_SPI\_FMR.TXRDYM/RXRDYM configuration. See section [Multiple Data Mode](#) for constraints.

#### **48.7.7.8 FIFO Pointer Error**

A FIFO overflow is reported in SPI\_SR.

If the Transmit FIFO is full and a write access is performed on SPI\_TDR, it generates a Transmit FIFO pointer error and sets SPI\_SR.TXFPTEF.

In Multiple Data mode, if the number of data written in SPI\_TDR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO pointer error is generated and SPI\_SR.TXFPTEF is set.

A FIFO underflow is reported in SPI\_SR.

In Multiple Data mode, if the number of data read in SPI\_RDR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO pointer error is generated and SPI\_SR.RXFPTEF is set.

No pointer error occurs if the FIFO state/level is checked before writing/reading in SPI\_TDR/SPI\_RDR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When a pointer error occurs, other FIFO flags may not behave as expected; their states should be ignored.

If a pointer error occurs, a software reset must be performed using SPI\_CR.SWRST (configuration will be lost).

#### **48.7.7.9 FIFO Thresholds**

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using SPI\_FMR.TXFTHRES. Each time the Transmit FIFO goes from the 'above threshold' to the 'equal or below threshold' state, SPI\_SR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using SPI\_FMR.RXFTHRES. Each time the Receive FIFO goes from the 'below threshold' to the 'equal or above threshold' state, SPI\_SR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using SPI\_IER and SPI\_IDR.

#### **48.7.7.10 FIFO Flags**

FIFOs come with a set of flags which can be configured to generate interrupts through SPI\_IER and SPI\_IDR.

FIFO flags state can be read in SPI\_SR. They are cleared when SPI\_SR is read.

### 48.7.8 Register Write Protection

To prevent any single software error from corrupting SPI behavior, certain registers in the address space can be write-protected in the [SPI Write Protection Mode Register](#) (SPI\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [SPI Write Protection Status Register](#) (SPI\_WPSR) is set and the WPVSR field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading SPI\_WPSR.

The following registers are write-protected when WPEN is set in SPI\_WPMR:

- [SPI Mode Register](#)
- [SPI Chip Select Register](#)

# SAMA5D2 Series

## Serial Peripheral Interface (SPI)

### 48.8 Register Summary

| Offset | Name                            | Bit Pos. |             |         |        |         |          |        |         |          |  |
|--------|---------------------------------|----------|-------------|---------|--------|---------|----------|--------|---------|----------|--|
| 0x00   | SPI_CR                          | 7:0      | SWRST       |         |        |         |          |        | SPIDIS  | SPIEN    |  |
|        |                                 | 15:8     |             |         |        | REQCLR  |          |        |         |          |  |
|        |                                 | 23:16    |             |         |        |         |          |        | RXFCLR  | TXFCLR   |  |

| Bit    | 7     | 6 | 5 | 4 | 3 | 2 | 1      | 0     |
|        | SWRST |   |   |   |   |   | SPIDIS | SPIEN |
| Access | W     |   |   |   |   |   | W      | W     |
| Reset  | –     |   |   |   |   |   | –      | –     |

#### Bit 31 – FIFODIS FIFO Disable

| Value | Description                              |
|-------|------------------------------------------|
| 0     | No effect.                               |
| 1     | Disables the Transmit and Receive FIFOs. |

#### Bit 30 – FIFOEN FIFO Enable

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No effect.                              |
| 1     | Enables the Transmit and Receive FIFOs. |

#### Bit 24 – LASTXFER Last Transfer

Refer to section [Peripheral Selection](#) for more details.

| Value | Description                                                                                                                                                                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                                                                                                                                                                                        |
| 1     | The current NPCS is deasserted after the character written in TD has been transferred. When SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

#### Bit 17 – RXFCLR Receive FIFO Clear

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Empties the Receive FIFO. |

### Bit 16 – TXFCLR Transmit FIFO Clear

| Value | Description                |
|-------|----------------------------|
| 0     | No effect.                 |
| 1     | Empties the Transmit FIFO. |

### Bit 12 – REQCLR Request to Clear the Comparison Trigger

SleepWalking enabled:

0: No effect.

1: Clears the potential clock request currently issued by SPI, thus the potential system wakeup is cancelled.

SleepWalking disabled:

0: No effect.

1: Restarts the comparison trigger to enable SPI\_RDR loading.

### Bit 7 – SWRST SPI Software Reset

The SPI is in Slave mode after software reset.

| Value | Description                                                                           |
|-------|---------------------------------------------------------------------------------------|
| 0     | No effect.                                                                            |
| 1     | Reset the SPI. A software-triggered hardware reset of the SPI interface is performed. |

### Bit 1 – SPIDIS SPI Disable

All pins are set in Input mode after completion of the transmission in progress, if any.

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if SPI\_THR is loaded.

If both SPIEN and SPIDIS are equal to one when SPI\_CR is written, the SPI is disabled.

| Value | Description       |
|-------|-------------------|
| 0     | No effect.        |
| 1     | Disables the SPI. |

### Bit 0 – SPIEN SPI Enable

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No effect.                                    |
| 1     | Enables the SPI to transfer and receive data. |

#### 48.8.2 SPI Mode Register

**Name:** SPI\_MR  
**Offset:** 0x04  
**Reset:** 0x0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

|        |             |     |       |         |          |        |     |         |
|--------|-------------|-----|-------|---------|----------|--------|-----|---------|
| Bit    | 31          | 30  | 29    | 28      | 27       | 26     | 25  | 24      |
|        | DLYBCS[7:0] |     |       |         |          |        |     |         |
| Access | R/W         | R/W | R/W   | R/W     | R/W      | R/W    | R/W | R/W     |
| Reset  | 0           | 0   | 0     | 0       | 0        | 0      | 0   | 0       |
| Bit    | 23          | 22  | 21    | 20      | 19       | 18     | 17  | 16      |
|        | PCS[3:0]    |     |       |         |          |        |     |         |
| Access |             |     |       |         | R/W      | R/W    | R/W | R/W     |
| Reset  |             |     |       |         | 0        | 0      | 0   | 0       |
| Bit    | 15          | 14  | 13    | 12      | 11       | 10     | 9   | 8       |
|        |             |     |       | CMPMODE |          |        |     | LSBHALF |
| Access |             |     |       | R/W     |          |        |     | R/W     |
| Reset  |             |     |       | 0       |          |        |     | 0       |
| Bit    | 7           | 6   | 5     | 4       | 3        | 2      | 1   | 0       |
|        | LLB         |     | WDRBT | MODFDIS | BRSRCCLK | PCSDEC | PS  | MSTR    |
| Access | R/W         |     | R/W   | R/W     | R/W      | R/W    | R/W | R/W     |
| Reset  | 0           |     | 0     | 0       | 0        | 0      | 0   | 0       |

##### Bits 31:24 – DLYBCS[7:0] Delay Between Chip Selects

This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time guarantees nonoverlapping chip selects and solves bus contentions in case of peripherals having long data float times.

If DLYBCS is lower than 6, six peripheral clock periods are inserted by default.

Otherwise, the following equations determine the delay:

If BRSRCCLK = 0:

$$\text{Delay Between Chip Selects} = \frac{\text{DLYBCS}}{f_{\text{peripheral clock}}}$$

If BRSRCCLK = 1:

$$\text{Delay Between Chip Selects} = \frac{\text{DLYBCS}}{f_{\text{GCLK}}}$$

##### Bits 19:16 – PCS[3:0] Peripheral Chip Select

This field is only used if fixed peripheral select is active (PS = 0).

If SPI\_MR.PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110

PCS = xx01 NPCS[3:0] = 1101

PCS = x011 NPCS[3:0] = 1011

PCS = 0111 NPCS[3:0] = 0111

PCS = 1111 forbidden (no peripheral is selected)

(x = don't care)

If SPI\_MR.PCSDEC = 1:

NPCS[3:0] output signals = PCS.

### Bit 12 – CMPMODE Comparison Mode

| Value | Name            | Description                                                                                         |
|-------|-----------------|-----------------------------------------------------------------------------------------------------|
| 0     | FLAG_ONLY       | Any character is received and comparison function drives CMP flag.                                  |
| 1     | START_CONDITION | Comparison condition must be met to start reception of all incoming characters until REQCLR is set. |

### Bit 8 – LSBHALF LSB Timing Selection

| Value | Description                                                                                                                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | To be used only if SPI slave LSB timing is 100% compliant with SPI standard (LSB duration is a full bit time). This value gives the better margin for SPI slave response delay (less than 1 SPCK clock cycle). |
| 1     | To be selected if the SPI slave LSB timing does not behave as the SPI standard (not triggered by NPCS deassertion in mode), the slave response delay is limited to less than 1/2 SPCK cycle.                   |

### Bit 7 – LLB Local Loopback Enable

LLB controls the local loopback on the data shift register for testing in Master mode only (MISO is internally connected on MOSI).

| Value | Description                   |
|-------|-------------------------------|
| 0     | Local loopback path disabled. |
| 1     | Local loopback path enabled.  |

### Bit 5 – WDRBT Wait Data Read Before Transfer

| Value | Description                                                                                                                                           |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No Effect. In Master mode, a transfer can be initiated regardless of SPI_RDR state.                                                                   |
| 1     | In Master mode, a transfer can start only if SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception. |

### Bit 4 – MODFDIS Mode Fault Detection

| Value | Description                   |
|-------|-------------------------------|
| 0     | Mode fault detection enabled  |
| 1     | Mode fault detection disabled |

**Bit 3 – BRSRCCLK** Bit Rate Source Clock

If bit BRSRCCLK = 1, the SCBR field in SPI\_CSRx must be programmed with a value greater than 1.

0 (PERIPH\_CLK): The peripheral clock is the source clock for the bit rate generation.

1 (GCLK): PMC GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

**Bit 2 – PCSDEC** Chip Select Decode

When PCSDEC = 1, up to 15 chip select signals can be generated with the four NPCS lines using an external 4-bit to 16-bit decoder. The chip select registers define the characteristics of the 15 chip selects, with the following rules:

SPI\_CSR0 defines peripheral chip select signals 0 to 3.

SPI\_CSR1 defines peripheral chip select signals 4 to 7.

SPI\_CSR2 defines peripheral chip select signals 8 to 11.

SPI\_CSR3 defines peripheral chip select signals 12 to 14.

| Value | Description                                                                 |
|-------|-----------------------------------------------------------------------------|
| 0     | The chip select lines are directly connected to a peripheral device.        |
| 1     | The four NPCS chip select lines are connected to a 4-bit to 16-bit decoder. |

**Bit 1 – PS** Peripheral Select

| Value | Description                |
|-------|----------------------------|
| 0     | Fixed Peripheral Select    |
| 1     | Variable Peripheral Select |

**Bit 0 – MSTR** Master/Slave Mode

| Value | Description           |
|-------|-----------------------|
| 0     | SPI is in Slave mode  |
| 1     | SPI is in Master mode |

### 48.8.3 SPI Receive Data Register

**Name:** SPI\_RDR  
**Offset:** 0x08  
**Reset:** 0x0  
**Property:** Read-only

|        |          |    |    |    |          |    |    |    |
|--------|----------|----|----|----|----------|----|----|----|
| Bit    | 31       | 30 | 29 | 28 | 27       | 26 | 25 | 24 |
|        |          |    |    |    |          |    |    |    |
| Access |          |    |    |    |          |    |    |    |
| Reset  |          |    |    |    |          |    |    |    |
| Bit    | 23       | 22 | 21 | 20 | 19       | 18 | 17 | 16 |
|        |          |    |    |    | PCS[3:0] |    |    |    |
| Access |          |    |    |    | R        | R  | R  | R  |
| Reset  |          |    |    |    | 0        | 0  | 0  | 0  |
| Bit    | 15       | 14 | 13 | 12 | 11       | 10 | 9  | 8  |
|        | RD[15:8] |    |    |    |          |    |    |    |
| Access | R        | R  | R  | R  | R        | R  | R  | R  |
| Reset  | 0        | 0  | 0  | 0  | 0        | 0  | 0  | 0  |
| Bit    | 7        | 6  | 5  | 4  | 3        | 2  | 1  | 0  |
|        | RD[7:0]  |    |    |    |          |    |    |    |
| Access | R        | R  | R  | R  | R        | R  | R  | R  |
| Reset  | 0        | 0  | 0  | 0  | 0        | 0  | 0  | 0  |

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

In Master mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.

When using Variable Peripheral Select mode (PS = 1 in SPI\_MR), it is mandatory to set SPI\_MR.WDRBT bit if the PCS field must be processed in SPI\_RDR.

#### Bits 15:0 – RD[15:0] Receive Data

Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

### 48.8.4 SPI Receive Data Register (FIFO Multiple Data, 8-bit)

**Name:** SPI\_RDR (FIFO\_MULTI\_DATA\_8)  
**Offset:** 0x08  
**Reset:** 0x0  
**Property:** Read-only

If FIFO is enabled (FIFOEN bit in SPI\_CR), refer to section [Multiple Data Mode](#).

#### Bits 0:7, 8:15, 16:23, 24:31 – RDx Receive Data

First unread data in the Receive FIFO. Data received by the SPI interface is stored in this register in a right-justified format. Unused bits are read as zero.

### 48.8.5 SPI Receive Data Register (FIFO Multiple Data, 16-bit)

**Name:** SPI\_RDR (FIFO\_MULTI\_DATA\_16)  
**Offset:** 0x08  
**Reset:** 0x0  
**Property:** Read-only

If FIFO is enabled (FIFOEN bit in SPI\_CR), refer to section [Multiple Data Mode](#).

|        |           |    |    |    |    |    |    |    |

| Reset  | –       | – | – | – | – | – | – | – |

#### Bit 24 – LASTXFER Last Transfer

This field is only used if variable peripheral select is active (SPI\_MR.PS = 1).

| Value | Description                                                                                                                                                                                                                                                  |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect                                                                                                                                                                                                                                                    |
| 1     | The current NPCS is deasserted after the transfer of the character written in TD. When SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed. |

#### Bits 19:16 – PCS[3:0] Peripheral Chip Select

This field is only used if variable peripheral select is active (SPI\_MR.PS = 1).

If SPI\_MR.PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110

PCS = xx01 NPCS[3:0] = 1101

PCS = x011 NPCS[3:0] = 1011

PCS = 0111 NPCS[3:0] = 0111

PCS = 1111 forbidden (no peripheral is selected)

(x = don't care)

If SPI\_MR.PCSDEC = 1:

NPCS[3:0] output signals = PCS.

**Bits 15:0 – TD[15:0]** Transmit Data

Data to be transmitted by the SPI interface is stored in this register. Information to be transmitted must be written to this register in a right-justified format.

### 48.8.7 SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit)

**Name:** SPI\_TDR (FIFO\_MULTI\_DATA)  
**Offset:** 0x0C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FIFOEN bit in SPI\_CR), refer to section [Multiple Data Mode](#).

|        |           |    |    |    |    |    |    |    |

|        |    |    |    |    | CMP | UNDES | TXEMPTY | NSSR |
| Access |    |    |    |    | R   | R     | R       | R    |
| Reset  |    |    |    |    | 0   | 0     | 0       | 0    |

|        |   |   |   |   |       |      |      |      |
|--------|---|---|---|---|-------|------|------|------|
| Bit    | 7 | 6 | 5 | 4 | 3     | 2    | 1    | 0    |
|        |   |   |   |   | OVRES | MODF | TDRE | RDRF |
| Access |   |   |   |   | R     | R    | R    | R    |
| Reset  |   |   |   |   | 0     | 0    | 0    | 0    |

#### Bit 31 – RXFPTEF Receive FIFO Pointer Error Flag

See [FIFO Pointer Error](#) for details.

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | No Receive FIFO pointer occurred.                            |
| 1     | Receive FIFO pointer error occurred. Receiver must be reset. |

#### Bit 30 – TXFPTEF Transmit FIFO Pointer Error Flag

See [FIFO Pointer Error](#) for details.

| Value | Description                                                      |
|-------|------------------------------------------------------------------|
| 0     | No Transmit FIFO pointer occurred.                               |
| 1     | Transmit FIFO pointer error occurred. Transceiver must be reset. |

#### Bit 29 – RXFTHF Receive FIFO Threshold Flag

| Value | Description                                                                                                                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared.                                               |
| 1     | Number of unread data in Receive FIFO has reached RXFTHRES threshold (coming from “below threshold” state to “equal or above threshold” state). |

### Bit 28 – RXFFF Receive FIFO Full Flag

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | Receive FIFO is not empty or RXFE flag has been cleared.                     |
| 1     | Receive FIFO has become full (coming from “not full” state to “full” state). |

### Bit 27 – RXFEF Receive FIFO Empty Flag

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | Receive FIFO is not empty or RXFE flag has been cleared.                        |
| 1     | Receive FIFO has become empty (coming from “not empty” state to “empty” state). |

### Bit 26 – TXFTHF Transmit FIFO Threshold Flag (cleared on read)

| Value | Description                                                                                   |
|-------|-----------------------------------------------------------------------------------------------|
| 0     | Number of data in Transmit FIFO is above TXFTHRES threshold.                                  |
| 1     | Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of SPI_SR. |

### Bit 25 – TXFFF Transmit FIFO Full Flag (cleared on read)

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | Transmit FIFO is not full or TXFF flag has been cleared.     |
| 1     | Transmit FIFO has been filled since the last read of SPI_SR. |

### Bit 24 – TXFEF Transmit FIFO Empty Flag (cleared on read)

| Value | Description                                                   |
|-------|---------------------------------------------------------------|
| 0     | Transmit FIFO is not empty.                                   |
| 1     | Transmit FIFO has been emptied since the last read of SPI_SR. |

### Bit 16 – SPIENS SPI Enable Status

| Value | Description      |
|-------|------------------|
| 0     | SPI is disabled. |
| 1     | SPI is enabled.  |

### Bit 11 – CMP Comparison Status (cleared on read)

| Value | Description                                                                                                                         |
|-------|-------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in SPI_CMPR since the last read of SPI_SR. |
| 1     | A received character matched the comparison criteria since the last read of SPI_SR.                                                 |

### Bit 10 – UNDES Underrun Error Status (Slave mode only) (cleared on read)

| Value | Description                                                   |
|-------|---------------------------------------------------------------|
| 0     | No underrun has been detected since the last read of SPI_SR.  |
| 1     | A transfer starts whereas no data has been loaded in SPI_TDR. |

### Bit 9 – TXEMPTY Transmission Registers Empty (cleared by writing SPI\_TDR)

| Value | Description                                                                                                                      |
|-------|----------------------------------------------------------------------------------------------------------------------------------|
| 0     | As soon as data is written in SPI_TDR.                                                                                           |
| 1     | SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay. |

**Bit 8 – NSSR** NSS Rising (cleared on read)

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No rising edge detected on NSS pin since the last read of SPI_SR. |
| 1     | A rising edge occurred on NSS pin since the last read of SPI_SR.  |

**Bit 3 – OVRES** Overrun Error Status (cleared on read)

An overrun occurs when SPI\_RDR is loaded at least twice from the internal shift register since the last read of SPI\_RDR.

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | No overrun has been detected since the last read of SPI_SR. |
| 1     | An overrun has occurred since the last read of SPI_SR.      |

**Bit 2 – MODF** Mode Fault Error (cleared on read)

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | No mode fault has been detected since the last read of SPI_SR. |
| 1     | A mode fault occurred since the last read of SPI_SR.           |

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing SPI\_TDR)

When FIFOs are disabled:

0: Data has been written to SPI\_TDR and not yet transferred to the internal shift register.

1: The last data written in SPI\_TDR has been transferred to the internal shift register.

TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TDRE behavior with FIFOs enabled is illustrated in section [TXEMPTY, TDRE and RDRF Behavior](#).

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading SPI\_RDR)

When FIFOs are disabled:

0: No data has been received since the last read of SPI\_RDR.

1: Data has been received and the received data has been transferred from the internal shift register to SPI\_RDR since the last read of SPI\_RDR.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RDRF behavior with FIFOs enabled is illustrated in section [TXEMPTY, TDRE and RDRF Behavior](#).

#### 48.8.9 SPI Interrupt Enable Register

**Name:** SPI\_IER  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |         |         |        |       |       |        |       |       |
|--------|---------|---------|--------|-------|-------|--------|-------|-------|
| Bit    | 31      | 30      | 29     | 28    | 27    | 26     | 25    | 24    |
|        | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | W       | W       | W      | W     | W     | W      | W     | W     |
| Reset  | –       | –       | –      | –     | –     | –      | –     | –     |

|        |    |    |    |    |    |    |    |    |

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Enable

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Enable

**Bit 29 – RXFTHF** RXFTHF Interrupt Enable

**Bit 28 – RXFFF** RXFFF Interrupt Enable

**Bit 27 – RXFEF** RXFEF Interrupt Enable

**Bit 26 – TXFTHF** TXFTHF Interrupt Enable

**Bit 25 – TXFFF** TXFFF Interrupt Enable

**Bit 24 – TXFEF** TXFEF Interrupt Enable

**Bit 11 – CMP** Comparison Interrupt Enable

**Bit 10 – UNDES** Underrun Error Interrupt Enable

**Bit 9 – TXEMPTY** Transmission Registers Empty Enable

**Bit 8 – NSSR** NSS Rising Interrupt Enable

**Bit 3 – OVRES** Overrun Error Interrupt Enable

**Bit 2 – MODF** Mode Fault Error Interrupt Enable

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Enable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Enable

#### 48.8.10 SPI Interrupt Disable Register

**Name:** SPI\_IDR  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |         |         |        |       |       |        |         |       |
|--------|---------|---------|--------|-------|-------|--------|---------|-------|
| Bit    | 31      | 30      | 29     | 28    | 27    | 26     | 25      | 24    |
|        | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF   | TXFEF |
| Access | W       | W       | W      | W     | W     | W      | W       | W     |

| Reset  |         |         |        |       | –     | –      | –       | –     |

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Disable

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Disable

**Bit 29 – RXFTHF** RXFTHF Interrupt Disable

**Bit 28 – RXFFF** RXFFF Interrupt Disable

**Bit 27 – RXFEF** RXFEF Interrupt Disable

**Bit 26 – TXFTHF** TXFTHF Interrupt Disable

**Bit 25 – TXFFF** TXFFF Interrupt Disable

**Bit 24 – TXFEF** TXFEF Interrupt Disable

**Bit 11 – CMP** Comparison Interrupt Disable

**Bit 10 – UNDES** Underrun Error Interrupt Disable

**Bit 9 – TXEMPTY** Transmission Registers Empty Disable

**Bit 8 – NSSR** NSS Rising Interrupt Disable

**Bit 3 – OVRES** Overrun Error Interrupt Disable

**Bit 2 – MODF** Mode Fault Error Interrupt Disable

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Disable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Disable

#### 48.8.11 SPI Interrupt Mask Register

**Name:** SPI\_IMR  
**Offset:** 0x1C  
**Reset:** 0x0  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

| Bit    | 31      | 30      | 29     | 28    | 27    | 26     | 25    | 24    |
|--------|---------|---------|--------|-------|-------|--------|-------|-------|
|        | RXFPTEF | TXFPTEF | RXFTHF | RXFFF | RXFEF | TXFTHF | TXFFF | TXFEF |
| Access | R       | R       | R      | R     | R     | R      | R     | R     |
| Reset  | 0       | 0       | 0      | 0     | 0     | 0      | 0     | 0     |

| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|--------|----|----|----|----|----|----|----|----|
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

| Bit    | 15 | 14 | 13 | 12 | 11  | 10    | 9       | 8    |
|--------|----|----|----|----|-----|-------|---------|------|
|        |    |    |    |    | CMP | UNDES | TXEMPTY | NSSR |
| Access |    |    |    |    | R   | R     | R       | R    |
| Reset  |    |    |    |    | 0   | 0     | 0       | 0    |

| Bit    | 7 | 6 | 5 | 4 | 3     | 2    | 1    | 0    |
|--------|---|---|---|---|-------|------|------|------|
|        |   |   |   |   | OVRES | MODF | TDRE | RDRF |
| Access |   |   |   |   | R     | R    | R    | R    |
| Reset  |   |   |   |   | 0     | 0    | 0    | 0    |

**Bit 31 – RXFPTEF** RXFPTEF Interrupt Mask

**Bit 30 – TXFPTEF** TXFPTEF Interrupt Mask

**Bit 29 – RXFTHF** RXFTHF Interrupt Mask

**Bit 28 – RXFFF** RXFFF Interrupt Mask

**Bit 27 – RXFEF** RXFEF Interrupt Mask

**Bit 26 – TXFTHF** TXFTHF Interrupt Mask

**Bit 25 – TXFFF** TXFFF Interrupt Mask

**Bit 24 – TXFEF** TXFEF Interrupt Mask

**Bit 11 – CMP** Comparison Interrupt Mask

**Bit 10 – UNDES** Underrun Error Interrupt Mask

**Bit 9 – TXEMPTY** Transmission Registers Empty Mask

**Bit 8 – NSSR** NSS Rising Interrupt Mask

**Bit 3 – OVRES** Overrun Error Interrupt Mask

**Bit 2 – MODF** Mode Fault Error Interrupt Mask

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

### 48.8.12 SPI Chip Select Register

**Name:** SPI\_CSRx  
**Offset:** 0x30 + x\*0x04 [x=0..3]  
**Reset:** 0  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

SPI\_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

| Bit    | 31          | 30  | 29  | 28  | 27    | 26     | 25    | 24   |
|--------|-------------|-----|-----|-----|-------|--------|-------|------|
|        | DLYBCT[7:0] |     |     |     |       |        |       |      |
| Access | R/W         | R/W | R/W | R/W | R/W   | R/W    | R/W   | R/W  |
| Reset  | 0           | 0   | 0   | 0   | 0     | 0      | 0     | 0    |
| Bit    | 23          | 22  | 21  | 20  | 19    | 18     | 17    | 16   |
|        | DLYBS[7:0]  |     |     |     |       |        |       |      |
| Access | R/W         | R/W | R/W | R/W | R/W   | R/W    | R/W   | R/W  |
| Reset  | 0           | 0   | 0   | 0   | 0     | 0      | 0     | 0    |
| Bit    | 15          | 14  | 13  | 12  | 11    | 10     | 9     | 8    |
|        | SCBR[7:0]   |     |     |     |       |        |       |      |
| Access | R/W         | R/W | R/W | R/W | R/W   | R/W    | R/W   | R/W  |
| Reset  | 0           | 0   | 0   | 0   | 0     | 0      | 0     | 0    |
| Bit    | 7           | 6   | 5   | 4   | 3     | 2      | 1     | 0    |
|        | BITS[3:0]   |     |     |     | CSAAT | CSNAAT | NCPHA | CPOL |
| Access | R/W         | R/W | R/W | R/W | R/W   | R/W    | R/W   | R/W  |
| Reset  | 0           | 0   | 0   | 0   | 0     | 0      | 0     | 0    |

#### Bits 31:24 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.

Otherwise, the following equations determine the delay:

If SPI\_MR.BRSRCCLK = 0:  $\text{DLYBCT} = \text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}} / 32$

If SPI\_MR.BRSRCCLK = 1:  $\text{DLYBCT} = \text{Delay Between Consecutive Transfers} \times f_{\text{CLK}} / 32$

#### Bits 23:16 – DLYBS[7:0] Delay Before SPCK

This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.

When DLYBS = 0, the delay is half the SPCK clock period.

Otherwise, the following equations determine the delay:

If SPI\_MR.BRSRCCLK = 0:  $DLYBS = \text{Delay Before SPCK} \times f_{\text{peripheral clock}}$

If SPI\_MR.BRSRCCLK = 1:  $DLYBS = \text{Delay Before SPCK} \times f_{\text{GCLK}}$

### Bits 15:8 – SCBR[7:0] Serial Clock Bit Rate

In Master mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by SPI\_MR.BRSRCCLK bit. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:

If SPI\_MR.BRSRCCLK = 0:  $SCBR = f_{\text{peripheral clock}} / \text{SPCK Bit Rate}$

If SPI\_MR.BRSRCCLK = 1:  $SCBR = f_{\text{GCLK}} / \text{SPCK Bit Rate}$

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

If SPI\_MR.BRSRCCLK = 1, SCBR must be programmed with a value greater than 1.

At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.

**Note:** If one of the SCBR fields in SPI\_CSRx is set to 1, the other SCBR fields in SPI\_CSRx must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

### Bits 7:4 – BITS[3:0] Bits Per Transfer

(See Note under the register table in [SPI Chip Select Register](#).)

The BITS field determines the number of data bits transferred. Reserved values should not be used.

| Value | Name   | Description          |
|-------|--------|----------------------|
| 0     | 8_BIT  | 8 bits for transfer  |
| 1     | 9_BIT  | 9 bits for transfer  |
| 2     | 10_BIT | 10 bits for transfer |
| 3     | 11_BIT | 11 bits for transfer |
| 4     | 12_BIT | 12 bits for transfer |
| 5     | 13_BIT | 13 bits for transfer |
| 6     | 14_BIT | 14 bits for transfer |
| 7     | 15_BIT | 15 bits for transfer |
| 8     | 16_BIT | 16 bits for transfer |
| 9     | –      | Reserved             |
| 10    | –      | Reserved             |
| 11    | –      | Reserved             |
| 12    | –      | Reserved             |
| 13    | –      | Reserved             |
| 14    | –      | Reserved             |
| 15    | –      | Reserved             |

### Bit 3 – CSAAT Chip Select Active After Transfer

| Value | Description                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The Peripheral Chip Select Line rises as soon as the last transfer is achieved.                                                                                    |
| 1     | The Peripheral Chip Select Line does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select. |

### Bit 2 – CSNAAT Chip Select Not Active After Transfer (ignored if CSAAT = 1)

| Value | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The Peripheral Chip Select Line does not rise between two transfers if SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same chip select.                                                                                                                                                                                                                           |
| 1     | <p>The Peripheral Chip Select Line rises systematically after each transfer performed on the same slave. It remains inactive after the end of transfer for a minimal duration of:</p> <p>If SPI_MR.BRSRCCLK = 0:</p> $\frac{DLYBCS}{f_{\text{peripheral clock}}}$ <p>If SPI_MR.BRSRCCLK = 1:</p> $\frac{DLYBCS}{f_{\text{GCLK}}}$ <p>If field DLYBCS is lower than 6, a minimum of six periods is introduced.</p> |

### Bit 1 – NCPHA Clock Phase

NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | Data is changed on the leading edge of SPCK and captured on the following edge of SPCK. |
| 1     | Data is captured on the leading edge of SPCK and changed on the following edge of SPCK. |

### Bit 0 – CPOL Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between master and slave devices.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | The inactive state value of SPCK is logic level zero. |
| 1     | The inactive state value of SPCK is logic level one.  |

#### 48.8.13 SPI FIFO Mode Register

**Name:** SPI\_FMR  
**Offset:** 0x40  
**Reset:** 0x0  
**Property:** Read/Write

| Bit    | 7  | 6  | 5             | 4   | 3   | 2   | 1           | 0   |
|        |    |    | RXRDYM[1:0]   |     |     |     | TXRDYM[1:0] |     |
| Access |    |    | R/W           | R/W |     |     | R/W         | R/W |
| Reset  |    |    | 0             | 0   |     |     | 0           | 0   |

##### Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

| Value | Description                                                                                                                                                                      |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–16  | Defines the Receive FIFO threshold value (number of data). SPI_SR.RXFTH will be set when the Receive FIFO goes from “below” threshold state to “equal or above” threshold state. |

##### Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

| Value | Description                                                                                                                                                                        |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–16  | Defines the Transmit FIFO threshold value (number of data). SPI_SR.TXFTH will be set when the Transmit FIFO goes from “above” threshold state to “equal or below” threshold state. |

##### Bits 5:4 – RXRDYM[1:0] Receive Data Register Full Mode

If FIFOs are enabled, the SPI\_SR.RDRF flag behaves as follows:

| Value | Name     | Description                                                                     |
|-------|----------|---------------------------------------------------------------------------------|
| 0     | ONE_DATA | RDRF will be at level ‘1’ when at least one unread data is in the Receive FIFO. |

# SAMA5D2 Series

## Serial Peripheral Interface (SPI)

| Value | Name      | Description                                                                                                                                                                             |
|-------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1     | TWO_DATA  | RDRF will be at level '1' when at least two unread data are in the Receive FIFO.<br><br>Cannot be used when SPI_MR.MSTR =1, or if SPI_MR.PS =1.                                         |
| 2     | FOUR_DATA | RDRF will be at level '1' when at least four unread data are in the Receive FIFO.<br><br>Cannot be used when SPI_CSRx.BITS is greater than 0, or if SPI_MR.MSTR =1, or if SPI_MR.PS =1. |

**Bits 1:0 – TXRDYM[1:0]** Transmit Data Register Empty Mode  
If FIFOs are enabled, the SPI\_SR.TDRE flag behaves as follows:

| Value | Name     | Description                                                                                                                  |
|-------|----------|------------------------------------------------------------------------------------------------------------------------------|
| 0     | ONE_DATA | TDRE will be at level '1' when at least one data can be written in the Transmit FIFO.                                        |
| 1     | TWO_DATA | TDRE will be at level '1' when at least two data can be written in the Transmit FIFO.<br><br>Cannot be used if SPI_MR.PS =1. |

### 48.8.14 SPI FIFO Level Register

**Name:** SPI\_FLR  
**Offset:** 0x44  
**Reset:** 0x0  
**Property:** Read-only

|        |    |    |           |    |    |    |    |    |

| Bit    | 31 | 30 | 29        | 28 | 27 | 26 | 25 | 24 |
|        |    |    |           |    |    |    |    |    |
| Access |    |    |           |    |    |    |    |    |
| Reset  |    |    |           |    |    |    |    |    |
| Bit    | 23 | 22 | 21        | 20 | 19 | 18 | 17 | 16 |
|        |    |    | RXFL[5:0] |    |    |    |    |    |
| Access |    |    | R         | R  | R  | R  | R  | R  |
| Reset  |    |    | 0         | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15 | 14 | 13        | 12 | 11 | 10 | 9  | 8  |
|        |    |    |           |    |    |    |    |    |
| Access |    |    |           |    |    |    |    |    |
| Reset  |    |    |           |    |    |    |    |    |
| Bit    | 7  | 6  | 5         | 4  | 3  | 2  | 1  | 0  |
|        |    |    | TXFL[5:0] |    |    |    |    |    |
| Access |    |    | R         | R  | R  | R  | R  | R  |
| Reset  |    |    | 0         | 0  | 0  | 0  | 0  | 0  |

#### Bits 21:16 – RXFL[5:0] Receive FIFO Level

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 0     | There is no unread data in the Receive FIFO.             |
| 1-16  | Indicates the number of unread data in the Receive FIFO. |

#### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | There is no data in the Transmit FIFO.             |
| 1-16  | Indicates the number of data in the Transmit FIFO. |

### 48.8.15 SPI Comparison Register

**Name:** SPI\_CMPR  
**Offset:** 0x48  
**Reset:** 0x0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

|        |            |     |     |     |     |     |     |     |
|--------|------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31         | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | VAL2[15:8] |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23         | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | VAL2[7:0]  |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15         | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | VAL1[15:8] |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7          | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | VAL1[7:0]  |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:16 – VAL2[15:0]** Second Comparison Value for Received Character

| Value   | Description                                                                                                                                                                                                                                                |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–65535 | The received character must be lower or equal to the value of VAL2 and higher or equal to VAL1 to set CMP flag in SPI_CSR. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if condition is met. |

**Bits 15:0 – VAL1[15:0]** First Comparison Value for Received Character

| Value   | Description                                                                                                                                                                                                                                                   |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0–65535 | The received character must be higher or equal to the value of VAL1 and lower or equal to VAL2 to set CMP flag in SPI_SR. If asynchronous partial wakeup (SleepWalking) is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if the condition is met. |

#### 48.8.16 SPI Write Protection Mode Register

**Name:** SPI\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x0  
**Property:** Read/Write

See section [Register Write Protection](#) for the list of registers that can be write-protected.

|        |              |     |     |     |     |     |     |      |

| Bit    | 15           | 14  | 13  | 12  | 11  | 10  | 9   | 8    |
|        | WPKEY[7:0]   |     |     |     |     |     |     |      |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W  |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0    |
| Bit    | 7            | 6   | 5   | 4   | 3   | 2   | 1   | 0    |
|        |              |     |     |     |     |     |     | WPEN |
| Access |              |     |     |     |     |     |     | R/W  |
| Reset  |              |     |     |     |     |     |     | 0    |

##### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                       |
|----------|--------|-----------------------------------------------------------------------------------|
| 0x535049 | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. |
| 9        |        | Always reads as 0.                                                                |

##### Bit 0 – WPEN Write Protection Enable

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII) |
| 1     | Enables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII)  |

### 48.8.17 SPI Write Protection Status Register

**Name:** SPI\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x0  
**Property:** Read-only

|        |            |    |    |    |    |    |    |      |
|--------|------------|----|----|----|----|----|----|------|

#### Bits 15:8 – WPVSR[7:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protection Violation Status

| Value | Description                                                                                                                                                                                                   |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of SPI_WPSR.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last read of SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## 49. Quad Serial Peripheral Interface (QSPI)

### 49.1 Description

The Quad Serial Peripheral Interface (QSPI) is a synchronous serial data link that provides communication with external devices in Master mode.

The QSPI can be used in SPI mode to interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors, or in Serial Memory mode to interface to serial Flash memories.

The QSPI allows the system to execute code directly from a serial Flash memory (XIP) without code shadowing to RAM. The serial Flash memory mapping is seen in the system as other memories such as ROM, SRAM, DRAM, embedded Flash memory, etc.

With the support of the Quad SPI protocol, the QSPI allows the system to use high-performance serial Flash memories which are small and inexpensive, in place of larger and more expensive parallel Flash memories.

**Note:** Stacked devices with a rollover in the memory address space at each die boundary are not supported.

### 49.2 Embedded Characteristics

- Master SPI Interface
  - Programmable clock phase and clock polarity
  - Programmable transfer delays between consecutive transfers, between clock and data, between deactivation and activation of chip select
- SPI Mode
  - Interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - 8-bit/16-bit/32-bit programmable data length
- Serial Memory Mode
  - Interface to serial Flash memories operating in Single-bit SPI, Dual SPI and Quad SPI
  - Interface to serial Flash Memories operating in Single Data Rate Mode
  - Supports “Execute In Place” (XIP)— code execution by the system directly from a serial Flash memory
  - Flexible instruction register for compatibility with all serial Flash memories
  - 32-bit address mode (default is 24-bit address) to support serial Flash memories larger than 128 Mbits
  - Continuous read mode
  - Scrambling/unscrambling “On-The-Fly”
- Connection to DMA Channel Capabilities Optimizes Data Transfers
  - One channel for the receiver, one channel for the transmitter
- Register Write Protection

## 49.3 Block Diagram

Figure 49-1. Block Diagram

## 49.4 Signal Description

Table 49-1. Signal Description

| Pin Name                      | Pin Description                   | Type                  |
|-------------------------------|-----------------------------------|-----------------------|
| QSCK                          | Serial Clock                      | Output                |
| MOSI (QIO0) <sup>(1)(2)</sup> | Data Output (Data Input Output 0) | Output (Input/Output) |
| MISO (QIO1) <sup>(1)(2)</sup> | Data Input (Data Input Output 1)  | Input (Input/Output)  |
| QIO2 <sup>(3)</sup>           | Data Input Output 2               | Input/Output          |
| QIO3 <sup>(3)</sup>           | Data Input Output 3               | Input/Output          |
| QCS                           | Peripheral Chip Select            | Output                |

**Note:**

1. MOSI and MISO are used for single-bit SPI operation.
2. QIO0–QIO1 are used for Dual SPI operation.
3. QIO0–QIO3 are used for Quad SPI operation.

## 49.5 Product Dependencies

### 49.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the QSPI pins to their peripheral functions.

### 49.5.2 Power Management

The QSPI may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the QSPI clock.

### 49.5.3 Interrupt Sources

The QSPI has an interrupt line connected to the Interrupt Controller. Handling the QSPI interrupt requires programming the interrupt controller before configuring the QSPI.

### 49.5.4 Direct Memory Access Controller (DMA)

The QSPI can be used in conjunction with the Direct Memory Access Controller (DMA) in order to reduce processor overhead. For a full description of the DMA, refer to the section “DMA Controller (XDMAC)”.

## 49.6 Functional Description

### 49.6.1 Serial Clock Baud Rate

The QSPI baud rate clock is generated by dividing the peripheral clock by a value between 1 and 256.

### 49.6.2 Serial Clock Phase and Polarity

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the QSPI Serial Clock register (QSPI\_SCR). The CPHA bit in the QSPI\_SCR programs the clock phase. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, the interfaced slave must use the same parameter values to communicate.

The table below shows the four modes and corresponding parameter settings.

**Table 49-2. QSPI Bus Clock Modes**

| QSPI Clock Mode | QSPI_SCR.CPOL | QSPI_SCR.CPHA | Shift QSCK Edge | Capture QSCK Edge | QSCK Inactive Level |
|-----------------|---------------|---------------|-----------------|-------------------|---------------------|
| 0               | 0             | 0             | Falling         | Falling           | Low                 |
| 1               | 0             | 1             | Rising          | Rising            | Low                 |
| 2               | 1             | 0             | Rising          | Rising            | High                |
| 3               | 1             | 1             | Falling         | Falling           | High                |

The following figures show examples of data transfers.

**Figure 49-2. QSPI Transfer Format (QSPI\_SCR.CPHA = 0, 8 bits per transfer)**

\* Not defined, but normally MSB of previous character received.

**Figure 49-3. QSPI Transfer Format (QSPI\_SCR.CPHA = 1, 8 bits per transfer)**

\* Not defined but normally LSB of previous character transmitted.

### 49.6.3 Transfer Delays

The figure below shows several consecutive transfers while the chip select is active. Three delays can be programmed to modify the transfer waveforms:

- The delay between the deactivation and the activation of QCS, programmed by writing QSPI\_MR.DLYCS. Allows to adjust the minimum time of QCS at high level.
- The delay before QSCK, programmed by writing QSPI\_SR.DLYBS. Allows the start of QSCK to be delayed after the chip select has been asserted.

- The delay between consecutive transfers, programmed by writing QSPI\_MR.DLYBCT. Allows insertion of a delay between two consecutive transfers. In Serial Memory mode, this delay is not programmable and DLYBCT is ignored. In this mode, DLYBCT must be written to '0'.

These delays allow the QSPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 49-4. Programmable Delays**

#### 49.6.4 QSPI SPI Mode

In SPI mode, the QSPI acts as a standard SPI Master.

To activate this mode, QSPI\_MR.SMM must be written to '0' in QSPI\_MR.

##### 49.6.4.1 SPI Mode Operations

The QSPI in standard SPI mode operates on the clock generated by the internal programmable baud rate generator. It fully controls the data transfers to and from the slave connected to the SPI bus. The QSPI drives the chip select line to the slave (QCS) and the serial clock signal (QSCK).

The QSPI features two holding registers, the Transmit Data register (QSPI\_TDR) and the Receive Data register (QSPI\_RDR), and a single internal shift register. The holding registers maintain the data flow at a constant rate.

After enabling the QSPI, a data transfer begins when the processor writes to the QSPI\_TDR. The written data is immediately transferred to the internal shift register and transfer on the SPI bus starts. While the data in the internal shift register is shifted on the MOSI line, the MISO line is sampled and shifted to the internal shift register. Receiving data cannot occur without transmitting data. If receiving mode is not needed, for example when communicating with a slave receiver only (such as an LCD), the receive status flags in the Status register (QSPI\_SR) can be discarded.

If new data is written in QSPI\_TDR during the transfer, it is retained there until the current transfer is completed. Then, the received data is transferred from the internal shift register to the QSPI\_RDR, the data in QSPI\_TDR is loaded in the internal shift register and a new transfer starts.

The transfer of a data written in QSPI\_TDR in the internal shift register is indicated by the Transmit Data Register Empty (TDRE) bit in the QSPI\_SR. When new data is written in QSPI\_TDR, this bit is cleared. QSPI\_SR.TDRE is used to trigger the Transmit DMA channel.

The end of transfer is indicated by the TXEMPTY flag in the QSPI\_SR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, QSPI\_SR.TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

The transfer of received data from the internal shift register in QSPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in the QSPI\_SR. When the received data is read, QSPI\_SR.RDRF bit is cleared.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

If the QSPI\_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in QSPI\_SR is set. As long as this flag is set, data is loaded in QSPI\_RDR. The user must read the QSPI\_SR to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Master mode, and a flow chart describing how transfers are handled.

### 49.6.4.2 SPI Mode Block Diagram

**Figure 49-5. SPI Mode Block Diagram**

### 49.6.4.3 SPI Mode Flow Diagram

Figure 49-6. SPI Mode Flow Diagram

The figure below shows Transmit Data Register Empty (TDRE), Receive Data Register Full (RDRF) and Transmission Register Empty (TXEMPTY) status flags behavior within the QSPI\_SR during an 8-bit data transfer in Fixed mode, without DMA.

**Figure 49-7. Status Register Flags Behavior**

#### 49.6.4.4 Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, the QSPI\_TDR is loaded by the processor and the flag TDRE rises as soon as the content of the QSPI\_TDR is transferred into the internal shift register. When this flag is detected high, the QSPI\_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. Depending on the application software handling the QSPI\_SR flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload the QSPI\_TDR in time to keep the chip select active (low). A null Delay Between Consecutive Transfer (DLYBCT) value in the QSPI\_MR gives even less time for the processor to reload the QSPI\_TDR. With some SPI slave peripherals, requiring the chip select line to remain active (low) during a full set of transfers may lead to communication errors.

To facilitate interfacing with such devices, QSPI\_MR.CSMODE may be configured to '1'. This allows the chip select lines to remain in their current state (low = active) until the end of transfer is indicated by the Last Transfer (LASTXFER) bit in the Control register (QSPI\_CR). Even if the QSPI\_TDR is not reloaded, the chip select remains active. To have the chip select line rise at the end of the last data transfer, QSPI\_CR.LASTXFER must be written to '1' at the same time or after writing the last data to transmit into the QSPI\_TDR.

#### 49.6.4.5 Peripheral Deselection with DMA

When the DMA Controller is used, the Chip Select line remains low during the transfer since the TDRE flag is managed by the DMA itself. Reloading the QSPI\_TDR by the DMA is done as soon as the TDRE flag is set. In this case, writing QSPI\_MR.CSMODE to '1' may not be needed. However, when other DMA channels connected to other peripherals are also in use, the QSPI DMA could be delayed by another DMA with a higher priority on the bus. Having DMA buffers in slower memories like Flash memory or SDRAM compared to fast internal SRAM, may lengthen the reload time of the QSPI\_TDR by the DMA as well. This means that the QSPI\_TDR might not be reloaded in time to keep the chip select line low. In this case, the chip select line may toggle between data transfer and according to some SPI Slave devices, the communication might get lost. It may be necessary to configure QSPI\_MR.CSMODE to '1'.

When QSPI\_MR.CSMODE is configured to '0', the QCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the flag TDRE rises as soon as the content of the QSPI\_TDR is transferred into the internal shifter. When this flag is detected, the QSPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. This might lead to difficulties for interfacing with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, the QSPI\_MR may be configured with QSPI\_MR.CSMODE at '2'.

### 49.6.5 QSPI Serial Memory Mode

In Serial Memory mode, the QSPI acts as a serial Flash memory controller. The QSPI can be used to read data from the serial Flash memory allowing the CPU to execute code from it (XIP execute in place). The QSPI can also be used to control the serial Flash memory (Program, Erase, Lock, etc.) by sending specific commands. In this mode, the QSPI is compatible with single-bit SPI, Dual SPI and Quad SPI protocols.

To activate this mode, QSPI\_MR.SMM must be written to '1'.

In Serial Memory mode, data is transferred either by QSPI\_TDR and QSPI\_RDR or by writing or read in the QSPI memory space (0x90000000/0x98000000/0xD0000000/0xD8000000) depending on TFRYP and SMRM configuration.

#### 49.6.5.1 Instruction Frame

In order to control serial Flash memories, the QSPI is able to send instructions via the SPI bus (ex: READ, PROGRAM, ERASE, LOCK, etc.). Because the instruction set implemented in serial Flash memories is memory vendor-dependent, the QSPI includes a complete Instruction Frame register (QSPI\_IFR), which makes it very flexible and compatible with all serial Flash memories.

An instruction frame includes:

- An instruction code (size: 8 bits). The instruction is optional in some cases (see section [Continuous Read mode](#)).
- An address (size: 24 bits or 32 bits). The address is optional but is required by instructions such as READ, PROGRAM, ERASE, LOCK. By default the address is 24 bits long, but it can be 32 bits long to support serial Flash memories larger than 128 Mbits (16 Mbytes).
- An option code (size: 1/2/4/8 bits). The option code is not required, but it is useful to activate the XIP mode or the Continuous Read mode (see section [Continuous Read mode](#)) for READ instructions, in some serial Flash memory devices. These modes improve the data read latency.
- Dummy cycles. Dummy cycles are optional but required by some READ instructions.
- Data bytes are optional. Data bytes are present for data transfer instructions such as READ or PROGRAM.

The instruction code, the address/option and the data can be sent with Single-bit SPI, Dual SPI or Quad SPI protocols.

**Figure 49-8. Instruction Frame**

### 49.6.5.2 Instruction Frame Transmission

To send an instruction frame, the user must first configure the address to send by writing the field ADDR in the Instruction Address register (QSPI\_IAR). This step is required if the instruction frame includes an address and no data. When data is present, the address of the instruction is defined by the address of the data accesses in the QSPI memory space, not by QSPI\_IAR.

If the instruction frame includes the instruction code and/or the option code, the user must configure the instruction code and/or the option code to send by writing the fields INST and OPT in the Instruction Code register (QSPI\_ICR).

Then, the user must write QSPI\_IFR to configure the instruction frame depending on which instruction must be sent. If the instruction frame does not include data, writing in this register triggers the send of the instruction frame in the QSPI. If the instruction frame includes data, the send of the instruction frame is triggered by the first data access in the QSPI memory space.

The instruction frame is configured by the following bits and fields of QSPI\_IFR:

- WIDTH field—used to configure which data lanes are used to send the instruction code, the address, the option code and to transfer the data. It is possible to use two unidirectional data lanes (MISO-MOSI Single-bit SPI), two bidirectional data lanes (QIO0-QIO1 Dual SPI) or four bidirectional data lanes (QIO0-QIO3 Quad SPI).
- INSTEN bit—used to enable the send of an instruction code.
- ADDRLEN bit—used to enable the send of an address after the instruction code.
- OPTEN bit—used to enable the send of an option code after the address.
- DATAEN bit—used to enable the transfer of data (READ or PROGRAM instruction).
- OPTL field—used to configure the option code length. The value written in OPTL must be consistent with the value written in the field WIDTH. For example: OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).
- ADDRLEN bit—used to configure the address length.
- TFRYP field—used to define which type of data transfer must be performed.
- NBDUM field—used to configure the number of dummy cycles when reading data from the serial Flash memory. Between the address/option and the data, with some instructions, dummy cycles are inserted by the serial Flash memory.

Refer to [49.6.5.2 Instruction Frame Transmission](#).

If data transfer is enabled, the user can access the serial memory by reading or writing the QSPI memory space:

- To read in the serial memory, but not a memory data, for example a JEDEC-ID or the QSPI\_SR, QSPI\_IFR.TFRTYP must be written to '0'.
- To read in the serial memory, and particularly a memory data, TFRTYP must be written to '1'.
- To write in the serial memory, but not a memory data, for example writing the configuration or the QSPI\_SR, TFRTYP must be written to '2'.
- If the user wants to write in the serial memory in particular to program a memory data, TFRTYP must be written to '3'.

If QSPI\_IFR.TFRTYP has a value other than '1' and QSPI\_MR.SMRM = 0, the address sent in the instruction frame is the address of the first system bus accesses. The addresses of the next accesses are not used by the QSPI. At each system bus access, an SPI transfer is performed with the same size. For example, a halfword system bus access leads to a 16-bit SPI transfer, and a byte system bus access leads to an 8-bit SPI transfer.

If SMRM = 1 and TFRTYP= (0 or 2), accesses are made via the QSPI registers and the address sent in the instruction frame is the address defined in QSPI\_IAR.

Each time QSPI\_IFR is written (in case of read access), or each time QSPI\_TDR is written (in case of write transfer), an SPI transfer is performed with a byte size. Another byte is read each time QSPI\_RDR is read (flag RDRF shows when a data can be read in QSPI\_RDR) or written each time QSPI\_TDR is written (flag TDRE shows when a new data can be written). The SPI transfer ends by writing QSPI\_CR.LASTXFER.

If TFRTYP = 1, the address of the first instruction frame is the one of the first read access in the QSPI memory space. Each time the read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the last system bus access address. In this way, the system can read data at a random location in the serial memory. The size of the SPI transfers may differ from the size of the system bus read accesses.

When data transfer is not enabled, the end of the instruction frame is indicated when QSPI\_SR.INSTRE rises. (The QSPI\_SR.CSR flag indicates when chip select rises. A delay between these flags may exist in case of high clock division or a high DLYBCT value).

When data transfer is enabled, the user must indicate when the data transfer is completed in the QSPI memory space by setting QSPI\_CR.LASTXFER. The end of the instruction frame is indicated when QSPI\_SR.INSTRE rises.

The following figure illustrates instruction transmission management.

### 49.6.5.3 Read Memory Transfer

The user can access the data of the serial memory by sending an instruction with QSPI\_IFR.DATAEN = 1 and QSPI\_IFR.TFRTYP = 1.

In this mode, the QSPI is able to read data at random address into the serial Flash memory, allowing the CPU to execute code directly from it (XIP execute-in-place).

In order to fetch data, the user must first configure the instruction frame by writing the QSPI\_IFR. Then data can be read at any address in the QSPI address space mapping. The address of the system bus read accesses match the address of the data inside the serial Flash memory.

When Fetch mode is enabled, several instruction frames can be sent before writing QSPI\_CR.LASTXFER. Each time the system bus read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the corresponding address.

### 49.6.5.4 Continuous Read Mode

The QSPI is compatible with the Continuous Read mode which is implemented in some serial Flash memories.

In Continuous Read mode, the instruction overhead is reduced by excluding the instruction code from the instruction frame. When the Continuous Read mode is activated in a serial Flash memory by a specific option code, the instruction code is stored in the memory. For the next instruction frames, the instruction code is not required as the memory uses the stored one.

In the QSPI, Continuous Read mode is used when reading data from the memory (QSPI\_IFR.TFRTYP = 1). The addresses of the system bus read accesses are often nonsequential and this leads to many instruction frames that have the same instruction code. By disabling the send of the instruction code, the Continuous Read mode reduces the access time of the data.

To be functional, this mode must be enabled in both the QSPI and the serial Flash memory. The Continuous Read mode is enabled in the QSPI by writing CRM to '1' in the QSPI\_IFR (TFRTYP must equal 1). The Continuous Read mode is enabled in the serial Flash memory by sending a specific option code.

If the Continuous Read mode is not supported by the serial Flash memory or disabled, CRM bit must not be written to '1', otherwise data read out of the serial Flash memory is unpredictable.

**Figure 49-9. Continuous Read Mode**

### 49.6.5.5 Instruction Frame Transmission Examples

All waveforms in the following examples describe SPI transfers in SPI Clock mode 0 (QSPI\_SCR.CPOL = 0 and QSPI\_SCR.CPHA = 0; see section [Serial Clock Phase and Polarity](#)).

All system bus accesses described below refer to the system bus address phase. System bus wait cycles and system bus data phases are not shown.

Example 1:

Instruction in Single-bit SPI, without address, without option, without data.

Command: CHIP ERASE (C7h).

- Write 0x0000\_00C7 in QSPI\_ICR.
- Write 0x0000\_0010 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-10. Instruction Transmission Waveform 1**

Example 2:

Instruction in Quad SPI, without address, without option, without data.

Command: POWER DOWN (B9h)

- Write 0x0000\_00B9 in QSPI\_ICR.
- Write 0x0000\_0016 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-11. Instruction Transmission Waveform 2**

Example 3:

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, without data.

Command: BLOCK ERASE (20h)

- Write the address (of the block to erase) in QSPI\_AR.
- Write 0x0000\_0020 in QSPI\_ICR.
- Write 0x0000\_0030 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-12. Instruction Transmission Waveform 3**

### Example 4:

Instruction in Single-bit SPI, without address, without option, with data write in Single-bit SPI.

Command: SET BURST (77h)

- Write 0x0000\_0077 in QSPI\_ICR.
- Write 0x0000\_2090 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Write data in the system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000). The address of system bus write accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-13. Instruction Transmission Waveform 4**

### Example 5:

Instruction in Single-bit SPI, with address in Dual SPI, without option, with data write in Dual SPI.

Command: BYTE/PAGE PROGRAM (02h)

- Write 0x0000\_0002 in QSPI\_ICR.
- Write 0x0000\_30B3 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Write data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000). The address of the first system bus write access is sent in the instruction frame. The address of the next system bus write accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-14. Instruction Transmission Waveform 5**

### Example 6:

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, with data read in Quad SPI, with eight dummy cycles.

Command: QUAD\_OUTPUT READ ARRAY (6Bh)

- Write 0x0000\_006B in QSPI\_ICR.
- Write 0x0008\_10B2 in QSPI\_IFR.
- Read QSPI\_IR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).  
The address of the first system bus read access is sent in the instruction frame.  
The address of the next system bus read accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-15. Instruction Transmission Waveform 6**

### Example 7:

Instruction in Single-bit SPI, with address and option in Quad SPI, with data read in Quad SPI, with four dummy cycles, with fetch and continuous read.

Command: FAST READ QUAD I/O (EBh) - 8-BIT OPTION (0x30h)

- Write 0x0030\_00EB in QSPI\_ICR.
- Write 0x0004\_33F4 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).  
Fetch is enabled, the address of the system bus read accesses is always used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

**Figure 49-16. Instruction Transmission Waveform 7**

Example 8:

Instruction in Quad SPI, with address in Quad SPI, without option, with data read in Quad SPI, with two dummy cycles, with fetch.

Command: HIGH-SPEED READ (0Bh)

- Write 0x0000\_000B in QSPI\_ICR.
- Write 0x0002\_20B6 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).  
Fetch is enabled, the address of the system bus read accesses is always used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-17. Instruction Transmission Waveform 8**

Example 9:

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch.

Command: HIGH-SPEED READ (05h)

- Write 0x0000\_0005 in QSPI\_ICR.
- Write 0x0000\_0096 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x90000000/0x98000000/0xD0000000/0xD8000000).  
Fetch is disabled.
- Write a '1' to QSPI\_CR.LASTXFR.

- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-18. Instruction Transmission Waveform 9**

Example 10:

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch, read launched through APB interface.

Command: HIGH-SPEED READ (05h)

- Set SMRM to '1' in QSPI\_MR
- Write 0x0000\_0005 in QSPI\_ICR.
- Write 0x0100\_0096 in QSPI\_IFR (will start the transfer).
- Wait flag RDRF and Read data in the QSPI\_RDR register  
Fetch is disabled.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 49-19. Instruction Transmission Waveform 10**

### 49.6.6 Scrambling/Unscrambling Function

The scrambling/unscrambling function cannot be performed on devices other than memories. Data is scrambled when written to memory and unscrambled when data is read.

The external data lines can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the QSPI slave device (e.g., memory).

The scrambling/unscrambling function can be enabled by writing a '1' to the SCREN bit in the QSPI Scrambling Mode Register (QSPI\_SMR).

The scrambling and unscrambling are performed on-the-fly without impacting the throughput.

The scrambling method depends on the user-configurable user scrambling key (field USRK) in the QSPI Scrambling Key Register (QSPI\_SKR). QSPI\_SKR is only accessible in Write mode.

If QSPI\_SMR.RVDIS is written to '0', the scrambling/unscrambling algorithm includes the user scrambling key plus a random value depending on device processing characteristics. Data scrambled by a given microcontroller cannot be unscrambled by another.

If QSPI\_SMR.RVDIS is written to '1', the scrambling/unscrambling algorithm includes only the user scrambling key. No random value is part of the key.

The user scrambling key or the seed for key generation must be securely stored in a reliable nonvolatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

#### 49.6.7 Register Write Protection

To prevent any single software error from corrupting QSPI behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the QSPI Write Protection Mode Register (QSPI\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the QSPI Write Protection Status Register (QSPI\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the QSPI\_WPSR.

The following registers can be write-protected when WPEN is set in QSPI\_WPMR:

- [QSPI Mode Register](#)
- [QSPI Serial Clock Register](#)
- [QSPI Scrambling Mode Register](#)
- [QSPI Scrambling Key Register](#)

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

### 49.7 Register Summary

| Offset              | Name     | Bit Pos. |             |  |             |             |         |      |         |          |
|---------------------|----------|----------|-------------|--|-------------|-------------|---------|------|---------|----------|
| 0x00                | QSPI_CR  | 7:0      | SWRST       |  |             |             |         |      | QSPIDIS | QSPIEN   |
|                     |          | 15:8     |             |  |             |             |         |      |         |          |
|                     |          | 23:16    |             |  |             |             |         |      |         |          |
|                     |          | 31:24    |             |  |             |             |         |      |         | LASTXFER |

| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |       |   |   |   |   |   |         |        |
|--------|-------|---|---|---|---|---|---------|--------|
| Bit    | 7     | 6 | 5 | 4 | 3 | 2 | 1       | 0      |
|        | SWRST |   |   |   |   |   | QSPIDIS | QSPIEN |
| Access | W     |   |   |   |   |   | W       | W      |
| Reset  | –     |   |   |   |   |   | –       | –      |

#### Bit 24 – LASTXFER Last Transfer

| Value | Description                                                                                    |
|-------|------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                     |
| 1     | The chip select is deasserted after the character written in QSPI_TDR.TD has been transferred. |

#### Bit 7 – SWRST QSPI Software Reset

DMA channels are not affected by software reset.

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | No effect.                                                                              |
| 1     | Reset the QSPI. A software-triggered hardware reset of the QSPI interface is performed. |

#### Bit 1 – QSPIDIS QSPI Disable

As soon as QSPIDIS is set, the QSPI finishes its transfer.

All pins are set in Input mode and no data is received or transmitted.

If a transfer is in progress, the transfer is finished before the QSPI is disabled.

If both QSPIEN and QSPIDIS are equal to one when QSPI\_CR is written, the QSPI is disabled.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

| Value | Description        |
|-------|--------------------|
| 0     | No effect.         |
| 1     | Disables the QSPI. |

### Bit 0 – QSPIEN QSPI Enable

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No effect.                                     |
| 1     | Enables the QSPI to transfer and receive data. |

#### 49.7.2 QSPI Mode Register

**Name:** QSPI\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

|        |             |     |             |     |      |       |     |     |
|--------|-------------|-----|-------------|-----|------|-------|-----|-----|
| Bit    | 31          | 30  | 29          | 28  | 27   | 26    | 25  | 24  |
|        | DLYCS[7:0]  |     |             |     |      |       |     |     |

| Access | R/W         | R/W | R/W         | R/W | R/W  | R/W   | R/W | R/W |
| Reset  | 0           | 0   | 0           | 0   | 0    | 0     | 0   | 0   |
| Bit    | 15          | 14  | 13          | 12  | 11   | 10    | 9   | 8   |
|        | NBBITS[3:0] |     |             |     |      |       |     |     |
| Access |             |     |             |     | R/W  | R/W   | R/W | R/W |
| Reset  |             |     |             |     | 0    | 0     | 0   | 0   |
| Bit    | 7           | 6   | 5           | 4   | 3    | 2     | 1   | 0   |
|        |             |     | CSMODE[1:0] |     | SMRM | WDRBT | LLB | SMM |
| Access |             |     | R/W         | R/W | R/W  | R/W   | R/W | R/W |
| Reset  |             |     | 0           | 0   | 0    | 0     | 0   | 0   |

##### Bits 31:24 – DLYCS[7:0] Minimum Inactive QCS Delay

This field defines the minimum delay between the deactivation and the activation of QCS. The DLYCS time guarantees the slave minimum deselect time.

If DLYCS written to '0', one peripheral clock period is inserted by default.

Otherwise, the following equation determines the delay:

$$\text{DLYCS} = \text{Minimum inactive} \times f_{\text{peripheral clock}}$$

##### Bits 23:16 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT is written to '0', no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers. In Serial Memory mode (SMM = 1), DLYBCT must be written to '0' and no delay is inserted.

Otherwise, the following equation determines the delay:

$$\text{DLYBCT} = (\text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}}) / 32$$

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

**Bits 11:8 – NBBITS[3:0]** Number Of Bits Per Transfer

| Value | Name   | Description          |
|-------|--------|----------------------|
| 0     | 8_BIT  | 8 bits for transfer  |
| 8     | 16_BIT | 16 bits for transfer |

**Bits 5:4 – CSMODE[1:0]** Chip Select Mode

The CSMODE field determines how the chip select is deasserted

**Note:** This field is forced to LASTXFER when SMM is written to '1'.

| Value | Name           | Description                                                                                                                          |
|-------|----------------|--------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NOT_RELOADED   | The chip select is deasserted if QSPI_TDR.TD has not been reloaded before the end of the current transfer.                           |
| 1     | LASTXFER       | The chip select is deasserted when the bit LASTXFER is written to '1' and the character written in QSPI_TDR.TD has been transferred. |
| 2     | SYSTEMATICALLY | The chip select is deasserted systematically after each transfer.                                                                    |

**Bit 3 – SMRM** Serial Memory Register Mode

| Value | Description                                                                                                                 |
|-------|-----------------------------------------------------------------------------------------------------------------------------|
| 0     | Serial Memory registers are written via AHB access. See section <a href="#">Instruction Frame Transmission</a> for details. |
| 1     | Serial Memory registers are written via APB access. See section <a href="#">Instruction Frame Transmission</a> for details. |

**Bit 2 – WDRBT** Wait Data Read Before Transfer

0 (DISABLED): No effect. In SPI mode, a transfer can be initiated whatever the state of the QSPI\_RDR is.

1 (ENABLED): In SPI mode, a transfer can start only if the QSPI\_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

**Bit 1 – LLB** Local Loopback Enable

0 (DISABLED): Local loopback path disabled.

1 (ENABLED): Local loopback path enabled.

LLB controls the local loopback on the data serializer for testing in SPI mode only. (MISO is internally connected on MOSI).

**Bit 0 – SMM** Serial Memory Mode

0 (SPI): The QSPI is in SPI mode.

1 (MEMORY): The QSPI is in Serial Memory mode.

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

### 49.7.3 QSPI Receive Data Register

**Name:** QSPI\_RDR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

|        |          |    |    |    |    |    |    |    |

#### Bit 24 – QSPIENS QSPI Enable Status

| Value | Description       |
|-------|-------------------|
| 0     | QSPI is disabled. |
| 1     | QSPI is enabled.  |

#### Bit 10 – INSTRE Instruction End Status (cleared on read)

| Value | Description                                                                    |
|-------|--------------------------------------------------------------------------------|
| 0     | No instruction end has been detected since the last read of QSPI_SR.           |
| 1     | At least one instruction end has been detected since the last read of QSPI_SR. |

#### Bit 9 – CSS Chip Select Status

| Value | Description                      |
|-------|----------------------------------|
| 0     | The chip select is asserted.     |
| 1     | The chip select is not asserted. |

#### Bit 8 – CSR Chip Select Rise (cleared on read)

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | No chip select rise has been detected since the last read of QSPI_SR.           |
| 1     | At least one chip select rise has been detected since the last read of QSPI_SR. |

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

### Bit 3 – OVRES Overrun Error Status (cleared on read)

An overrun occurs when QSPI\_RDR is loaded at least twice from the serializer since the last read of the QSPI\_RDR.

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | No overrun has been detected since the last read of QSPI_SR.            |
| 1     | At least one overrun error has occurred since the last read of QSPI_SR. |

### Bit 2 – TXEMPTY Transmission Registers Empty (cleared by writing QSPI\_TDR)

| Value | Description                                                                                                                           |
|-------|---------------------------------------------------------------------------------------------------------------------------------------|
| 0     | As soon as data is written in QSPI_TDR.                                                                                               |
| 1     | QSPI_TDR and the internal shifter are empty. If a transfer delay has been defined, TXEMPTY is set after the completion of such delay. |

### Bit 1 – TDRE Transmit Data Register Empty (cleared by writing QSPI\_TDR)

TDRE equals zero when the QSPI is disabled or at reset. The QSPI enable command sets this bit to one.

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | Data has been written to QSPI_TDR and not yet transferred to the serializer.  |
| 1     | The last data written in the QSPI_TDR has been transferred to the serializer. |

### Bit 0 – RDRF Receive Data Register Full (cleared by reading QSPI\_RDR)

| Value | Description                                                                                                                        |
|-------|------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No data has been received since the last read of QSPI_RDR.                                                                         |
| 1     | Data has been received and the received data has been transferred from the serializer to QSPI_RDR since the last read of QSPI_RDR. |

#### 49.7.6 QSPI Interrupt Enable Register

**Name:** QSPI\_IER  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |    |    |    |    |       |         |      |      |
|--------|----|----|----|----|-------|---------|------|------|
| Bit    | 31 | 30 | 29 | 28 | 27    | 26      | 25   | 24   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
| Bit    | 23 | 22 | 21 | 20 | 19    | 18      | 17   | 16   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
| Bit    | 15 | 14 | 13 | 12 | 11    | 10      | 9    | 8    |
|        |    |    |    |    |       | INSTRE  | CSS  | CSR  |
| Access |    |    |    |    |       | W       | W    | W    |
| Reset  |    |    |    |    |       | –       | –    | –    |

|        |    |    |    |    | OVRES | TXEMPTY | TDRE | RDRF |
| Access |    |    |    |    | W     | W       | W    | W    |
| Reset  |    |    |    |    | –     | –       | –    | –    |

**Bit 10 – INSTRE** Instruction End Interrupt Enable

**Bit 9 – CSS** Chip Select Status Interrupt Enable

**Bit 8 – CSR** Chip Select Rise Interrupt Enable

**Bit 3 – OVRES** Overrun Error Interrupt Enable

**Bit 2 – TXEMPTY** Transmission Registers Empty Enable

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Enable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Enable

#### 49.7.7 QSPI Interrupt Disable Register

**Name:** QSPI\_IDR  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |    |    |    |    |       |         |      |      |
|--------|----|----|----|----|-------|---------|------|------|

| Access |    |    |    |    | W     | W       | W    | W    |
| Reset  |    |    |    |    | –     | –       | –    | –    |

**Bit 10 – INSTRE** Instruction End Interrupt Disable

**Bit 9 – CSS** Chip Select Status Interrupt Disable

**Bit 8 – CSR** Chip Select Rise Interrupt Disable

**Bit 3 – OVRES** Overrun Error Interrupt Disable

**Bit 2 – TXEMPTY** Transmission Registers Empty Disable

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Disable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Disable

#### 49.7.8 QSPI Interrupt Mask Register

**Name:** QSPI\_IMR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

|        |    |    |    |    |       |         |      |      |
|--------|----|----|----|----|-------|---------|------|------|
| Bit    | 31 | 30 | 29 | 28 | 27    | 26      | 25   | 24   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
| Bit    | 23 | 22 | 21 | 20 | 19    | 18      | 17   | 16   |
|        |    |    |    |    |       |         |      |      |
| Access |    |    |    |    |       |         |      |      |
| Reset  |    |    |    |    |       |         |      |      |
| Bit    | 15 | 14 | 13 | 12 | 11    | 10      | 9    | 8    |
|        |    |    |    |    |       | INSTRE  | CSS  | CSR  |
| Access |    |    |    |    |       | R       | R    | R    |
| Reset  |    |    |    |    |       | 0       | 0    | 0    |
| Bit    | 7  | 6  | 5  | 4  | 3     | 2       | 1    | 0    |

| Access |    |    |    |    | R     | R       | R    | R    |
| Reset  |    |    |    |    | 0     | 0       | 0    | 0    |

**Bit 10 – INSTRE** Instruction End Interrupt Mask

**Bit 9 – CSS** Chip Select Status Interrupt Mask

**Bit 8 – CSR** Chip Select Rise Interrupt Mask

**Bit 3 – OVRES** Overrun Error Interrupt Mask

**Bit 2 – TXEMPTY** Transmission Registers Empty Mask

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

### 49.7.9 QSPI Serial Clock Register

**Name:** QSPI\_SCR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

|        |            |     |     |     |     |     |      |      |

| Access |            |     |     |     |     |     | R/W  | R/W  |
| Reset  |            |     |     |     |     |     | 0    | 0    |

#### Bits 23:16 – DLYBS[7:0] Delay Before QSCK

This field defines the delay from QCS valid to the first valid QSCK transition.

When DLYBS equals zero, the QCS valid to QSCK transition is 1/2 the QSCK clock period.

Otherwise, the following equation determines the delay:

$$\text{DLYBS} = \text{Delay Before QSCK} \times f_{\text{peripheral clock}}$$

#### Bits 15:8 – SCBR[7:0] Serial Clock Baud Rate

The QSPI uses a modulus counter to derive the QSCK baud rate from the peripheral clock. The baud rate is selected by writing a value from 0 to 255 in the SCBR field. The following equation determines the QSCK baud rate:

$$\text{SCBR} = (f_{\text{peripheral clock}} / \text{QSCK Baudrate}) - 1$$

#### Bit 1 – CPHA Clock Phase

CPHA determines which edge of QSCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between master and slave devices.

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | Data is captured on the leading edge of QSCK and changed on the following edge of QSCK. |

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 1     | Data is changed on the leading edge of QSCK and captured on the following edge of QSCK. |

### Bit 0 – CPOL Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (QSCK). It is used with CPHA to produce the required clock/data relationship between master and slave devices.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | The inactive state value of QSCK is logic level zero. |
| 1     | The inactive state value of QSCK is logic level one.  |

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

### 49.7.10 QSPI Instruction Address Register

**Name:** QSPI\_IAR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |             |     |     |     |     |     |     |     |

#### Bits 20:16 – NBDUM[4:0] Number Of Dummy Cycles

The NBDUM field defines the number of dummy cycles required by the serial Flash memory before data transfer.

#### Bit 14 – CRM Continuous Read Mode

0 (DISABLED): Continuous Read mode is disabled.

1 (ENABLED): Continuous Read mode is enabled.

#### Bits 13:12 – TFRTYP[1:0] Data Transfer Type

| Value | Name               | Description                                                                                                                                                           |
|-------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | TRSFRR_READ        | Read transfer from the serial memory.<br><br>Scrambling is not performed.<br><br>Read at random location (fetch) in the serial Flash memory is not possible.          |
| 1     | TRSFRR_READ_MEMORY | Read data transfer from the serial memory.<br><br>If enabled, scrambling is performed.<br><br>Read at random location (fetch) in the serial Flash memory is possible. |

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

| Value | Name               | Description                                                                         |
|-------|--------------------|-------------------------------------------------------------------------------------|
| 2     | TRSFR_WRITE        | Write transfer into the serial memory.<br>Scrambling is not performed.              |
| 3     | TRSFR_WRITE_MEMORY | Write data transfer into the serial memory.<br>If enabled, scrambling is performed. |

### Bit 10 – ADDRL Address Length

The ADDRL bit determines the length of the address.

0 (24\_BIT): The address is 24 bits long.

1 (32\_BIT): The address is 32 bits long.

### Bits 9:8 – OPTL[1:0] Option Code Length

The OPTL field determines the length of the option code. The value written in OPTL must be consistent with the value written in the field WIDTH. For example, OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).

| Value | Name        | Description                     |
|-------|-------------|---------------------------------|
| 0     | OPTION_1BIT | The option code is 1 bit long.  |
| 1     | OPTION_2BIT | The option code is 2 bits long. |
| 2     | OPTION_4BIT | The option code is 4 bits long. |
| 3     | OPTION_8BIT | The option code is 8 bits long. |

### Bit 7 – DATAEN Data Enable

| Value | Description                                               |
|-------|-----------------------------------------------------------|
| 0     | No data is sent/received to/from the serial Flash memory. |
| 1     | Data is sent/received to/from the serial Flash memory.    |

### Bit 6 – OPTEN Option Enable

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | The option is not sent to the serial Flash memory. |
| 1     | The option is sent to the serial Flash memory.     |

### Bit 5 – ADDREN Address Enable

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | The transfer address is not sent to the serial Flash memory. |
| 1     | The transfer address is sent to the serial Flash memory.     |

### Bit 4 – INSTEN Instruction Enable

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | The instruction is not sent to the serial Flash memory. |
| 1     | The instruction is sent to the serial Flash memory.     |

### Bits 2:0 – WIDTH[2:0] Width of Instruction Code, Address, Option Code and Data

# SAMA5D2 Series

## Quad Serial Peripheral Interface (QSPI)

| Value | Name           | Description                                                                         |
|-------|----------------|-------------------------------------------------------------------------------------|
| 0     | SINGLE_BIT_SPI | Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Single-bit SPI |
| 1     | DUAL_OUTPUT    | Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Dual SPI       |
| 2     | QUAD_OUTPUT    | Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Quad SPI       |
| 3     | DUAL_IO        | Instruction: Single-bit SPI / Address-Option: Dual SPI / Data: Dual SPI             |
| 4     | QUAD_IO        | Instruction: Single-bit SPI / Address-Option: Quad SPI / Data: Quad SPI             |
| 5     | DUAL_CMD       | Instruction: Dual SPI / Address-Option: Dual SPI / Data: Dual SPI                   |
| 6     | QUAD_CMD       | Instruction: Quad SPI / Address-Option: Quad SPI / Data: Quad SPI                   |

### 49.7.13 QSPI Scrambling Mode Register

**Name:** QSPI\_SMR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |

#### Bits 15:8 – WPVSR[7:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protection Violation Status

| Value | Description                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of the QSPI_WPSR.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last read of the QSPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## **50. Secure Digital MultiMedia Card Controller (SDMMC)**

### **50.1 Description**

The Secure Digital MultiMedia Card Controller (SDMMC) supports the embedded MultiMedia Card (e.MMC) Specification V4.51, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification.

The SDMMC includes the register set defined in the “SD Host Controller Simplified Specification V3.00” and additional registers to manage e.MMC devices, sampling tuning procedure, PAD calibration and enhanced features.

The SDMMC is clocked by three asynchronous clocks and requires the PMC to be configured first.

### **50.2 Embedded Characteristics**

- Compatible with SD Host Controller Standard Specification Version 3.00
- Compatible with MultiMedia Card Specification Version V4.51
- Compatible with SD Memory Card Specification Version 3.00
- Compatible with SDIO Specification Version 3.00
- Support for 1-bit/ 4-bit SD/SDIO Devices
- Support for 1-bit/4-bit/8-bit e.MMC Devices
- Support for SD/SDIO Default Speed (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO High Speed (Maximum SDCLK Frequency = 50 MHz)
- Support for SD/SDIO UHS-I SDR12 (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO UHS-I SDR25 (Maximum SDCLK Frequency = 50 MHz)
- Support for SD/SDIO UHS-I SDR50 (Maximum SDCLK Frequency = 100 MHz)
- Support for SD/SDIO UHS-I SDR104 (Maximum SDCLK Frequency = 120 MHz)
- Support for SD/SDIO UHS-I DDR50 (Maximum SDCLK Frequency = 50 MHz)
- Support for SDSC, SDHC and SDXC
- Support for MMC/e.MMC Default Speed (Maximum SDCLK Frequency = 26 MHz)
- Support for MMC/e.MMC High Speed (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC High Speed DDR (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC HS200 (Maximum SDCLK Frequency = 120 MHz)
- e.MMC Boot Operation Mode Support
- Support for Block Size from 1 to 512 Bytes
- Support for Stream, Block and Multiblock Data Read and Write
  - Advanced DMA and SDMA Capability
- Internal 1024-byte Dual Port RAM
- Support for both Synchronous and Asynchronous Abort
- Supports for SDIO Card Interrupt

## 50.3 Reference Documents

**Table 50-1. Reference Documents**

## 50.4 Block Diagram

Figure 50-1. Block Diagram

Notes: 1. SDMMC\_1V8SEL not available on SDMMC1.  
2. Limited to SDMMC\_DAT[3..0] on SDMMC1.

## 50.5 Application Block Diagram

Figure 50-2. Application Block Diagram

## 50.6 Pin Name List

Table 50-2. I/O Lines Description for 8-bit Configuration

| Pin Name <sup>(1)</sup> | Pin Description                             | Type   |
|-------------------------|---------------------------------------------|--------|
| SDMMC_CD                | SDCard / SDIO / e.MMC Card Detect           | Input  |
| SDMMC_CMD               | SDCard / SDIO / e.MMC Command/Response Line | I/O    |
| SDMMC_WP                | SDCard Connector Write Protect Signal       | Input  |
| SDMMC_RSTN              | e.MMC Reset Signal                          | Output |
| SDMMC_1V8SEL            | SDCard Signal Voltage Selection             | Output |
| SDMMC_CK                | SDCard / SDIO / e.MMC Clock Signal          | Output |
| SDMMC_DAT[7..0]         | SDCard / SDIO / e.MMC Data Lines            | I/O    |

Notes: 1. When several SDMMCs are embedded in a product, SDMMC\_CK refers to SDMMCx\_CK, SDMMC\_CMD to SDMMCx\_CMD, SDMMC\_DATy to SDMMCx\_DATy, SDMMC\_WP to SDMMCx\_WP, SDMMC\_1V8SEL to SDMMCx\_1V8SEL, SDMMC\_CD to SDMMCx\_CD and SDMMC\_RSTN to SDMMCx\_RSTN.

## **50.7 Product Dependencies**

### **50.7.1 I/O Lines**

The pins used for interfacing the Secure Digital MultiMedia Card (SDMMC) Controller are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the peripheral functions to SDMMC pins.

### **50.7.2 Power Management**

The SDMMC is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SDMMC clocks.

### **50.7.3 Interrupt Sources**

The SDMMC has an interrupt line connected to the interrupt controller.

Handling the SDMMC interrupt requires programming the interrupt controller before configuring the SDMMC.

## **50.8 SD/SDIO Operating Mode**

The SDMMC is fully compliant with the “SD Host Controller Simplified Specification V3.00” for SD/SDIO devices. See this specification for the SDMMC configuration.

See “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00” for SD/SDIO management.

## **50.9 e.MMC Operating Mode**

The SDMMC supports management of e.MMC devices. As the “SD Host Controller Simplified Specification V3.00” does not apply to e.MMC devices, some registers have been added to those described in this specification in order to manage e.MMC devices. Most of the registers described in the “SD Host Controller Simplified Specification V3.00” must be used for e.MMC management, but e.MMC-specific features are managed using SDMMC\_MC1R and SDMMC\_MC2R.

### **50.9.1 Boot Operation Mode**

In Boot Operation mode, the processor can read boot data from the e.MMC device by keeping the CMD line low after poweron before issuing the CMD1. The data can be read from either one of the boot partitions or the user area according to BOOT\_PARTITION\_ENABLE in the Extended CSD register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).

#### **50.9.1.1 Boot Procedure, Processor Mode**

1. Configure the SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to the BOOT\_BUS\_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” ).
  - b. Select the speed mode (using SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD Register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the e.MMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to ‘1’ (SDMMC\_MC1R.BOOTA = 1).

- e. Enable the interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the e.MMC Command Type to BOOT (SDMMC\_MC1R.CMDTYP = 3)
  - g. Set SDMMC\_TMR to read multiple blocks for the e.MMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.DTDSEL = 1).
  - h. Select the NonDMA transfer (SDMMC\_TMR.DMAEN = 0).
  - i. Optional: select the Auto CMD method (using SDMMC\_TMR.ACMDEN).
  - j. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - k. Set the required number of read blocks (using SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to '1'.
2. Write SDMMC\_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
  3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
  4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
  5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to '1'.

#### **50.9.1.2 Boot Procedure, SDMA Mode**

1. Configure SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to BOOT\_BUS\_WIDTH in the Extended CSD Register (see "Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51" ).
  - b. Select the speed mode (SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD Register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the e.MMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to 1 (SDMMC\_MC1R.BOOTA = 1).
  - e. Enable interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the e.MMC Command Type to BOOT (SDMMC\_MC1R.CMDTYP = 3).
  - g. Set SDMMC\_TMR to read multiple blocks for the e.MMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.TDSEL = 1).
  - h. Select the SDMA transfer (SDMMC\_TMR.DMAEN = 1 and SDMMC\_HC1R.DMASEL = 0).
  - i. Write the SDMA system address where the boot data will be copied (SDMMC\_SSAR.ADDR).
  - j. Optional: select the Auto CMD method (SDMMC\_TMR.ACMDEN).  
Note: Auto CMD23 cannot be used with SDMA.
  - k. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - l. Set the required number of read blocks (SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to 1.
2. Write SDMMC\_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.

5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to '1'.

#### **50.9.1.3 Boot Procedure, ADMA Mode**

1. Configure the SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to BOOT\_BUS\_WIDTH in the Extended CSD Register (see "Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51" ).
  - b. Select the speed mode (SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the e.MMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to '1' (SDMMC\_MC1R.BOOTAR = 1).
  - e. Enable interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the e.MMC Command Type to BOOT (SDMMC\_MC1R.CMDTYP = 3).
  - g. Set SDMMC\_TMR to read multiple blocks for the e.MMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.DTDSEL = 1).
  - h. Select the ADMA transfer (SDMMC\_TMR.DMAEN = 1 and SDMMC\_HC1R.DMASEL = 2 or 3).
  - i. Write the address of the descriptor table in the ADMA system address (SDMMC\_ASARx [0..1].ADMASA).
  - j. Optional: select the Auto CMD method (SDMMC\_TMR.ACMDEN).
  - k. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - l. Set the required number of read blocks (SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to '1'.
2. Write SDMMC\_CR = 20(hexa) to set the e.MMC in Boot Operation Mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to '1'.

## **50.10 SDR104 / HS200 Tuning**

### **50.10.1 DLL and Sampling Point**

In SD/SDIO SDR104 mode (SDMMC\_HC2R.VS18EN = 1 and SDMMC\_HC2R.UHSMS = 3) or e.MMC HS200 mode (HS200EN = B<sub>(hexa)</sub>), a tuning procedure must be performed first in order to adjust the sampling point for read transactions. For more details regarding the basic tuning procedure, see section "Sampling Clock Tuning Procedure" in the "SD Host Controller Simplified Specification V3.00" .

As the position of data and command coming from the device varies, a DLL is used to generate an accurate sampling point (DLL\_CLKOUT) (see the figure below).

**Figure 50-3. DLL Sampling Point**

Note: 1.  $t_{OUTPUT}$  varies from 0 to  $2 \times t_{SDCLK}$

The minimum SDCLK frequency is 100 MHz when SD/SDIO SDR104 or e.MMC HS200 is selected.

The sampling point can be selected to be located at 50% or 75% of the data window to anticipate the effect of the temperature rise. If SDMMC\_TUNCR.SMPLPT is cleared, the sampling point is centered (50% of the data window). If SDMMC\_TUNCR.SMPLPT is set to '1', the sampling point is set at 75% of the data window (see the figure below).

**Figure 50-4. SDR104/HS200 Sampling Point Selection**

### 50.10.2 Retuning Method

Once the data window sampling point has been tuned following the tuning procedure, the data window can be shifted by temperature drift. Thus, the tuning procedure must be applied periodically to adjust the sampling point position. The SDMMC implements a retuning timer which periodically instructs the software to restart the tuning procedure.

**Figure 50-5. Temperature Effect on Data Window**

Note: 1.  $t_{OUTPUT}$  varies from 0 to  $2 \times t_{SDCLK}$

### 50.10.2.1 SDMMC Tuning Sequence

The SDMMC tuning sequence must only be done when SD/SDIO SDR104 or e.MMC HS200 is selected and for a 100-MHz SDCLK frequency or higher.

1. Enable the retuning timer (SDMMC\_RTC1R.TMREN = 1).
2. Configure the retuning period by setting SDMMC\_RTCVR.TCVAL.
3. Set SDMMC\_RTISTR.TEVT to '1' so that the TEVT status flag in SDMMC\_RTISTR rises each time the retuning timer counter period elapses.
4. Set SDMMC\_RTISIER.TEVT to '1' to generate an interrupt on the TEVT status flag assertion (optional).
5. Execute the tuning procedure as defined in "Sampling Clock Tuning Procedure" in the "SD Host Controller Simplified Specification V3.00".
6. Start the retuning timer count (write SDMMC\_RTC2R.RLD to 1). At this step, data can be read by the SDMMC.
7. Each time SDMMC\_RTISTR.TEVT is set to '1':
  - a. Execute the tuning procedure as defined in "Sampling Clock Tuning Procedure" in the "SD Host Controller Simplified Specification V3.00" before issuing the next command.
  - b. Restart the retuning timer count (write SDMMC\_RTC2R.RLD to '1').
  - c. Resume data reading from the device.

When several instances of SDMMC are implemented in a product, the TEVT status flag of each SDMMC instance can be checked by reading SDMMC\_RTSSR.

## **50.11 I/O Calibration**

The need for output impedance calibration arises with higher data rates. As the data rate increases, some transmission line effects can occur and lead to the generation of undershoots and overshoots, hence degrading the signal quality.

To avoid these transmission problems, an I/O calibration cell is used to adjust the output impedance to the driven I/Os.

The I/O calibration sequence is mandatory when one of the SD/SDIO UHS-I modes (SDMMC\_HC2R.VS18EN = 1) or e.MMC HS200 (HS200EN = B<sub>(hexa)</sub>) is selected. It must be performed periodically to prevent the output impedance drift. Once the calibration is finished, the I/O calibration cell provides two four-bit control words (CALP[3:0] and CALN[3:0] in the Calibration Control register (SDMMC\_CALCR)) to tune the output impedance, and thus reach the best transmission performances.

The I/O calibration sequence can be started manually by writing a '1' to SDMMC\_CALCR.EN. This bit is cleared automatically at the end of the calibration.

The I/O calibration sequence can also be performed automatically if SDMMC\_CALCR.TUNDIS is cleared. In this case, the calibration starts automatically at the beginning of the tuning procedure when writing a '1' to SDMMC\_HC2R.EXTUN.

The I/O calibration cell requires a startup time defined by SDMMC\_CALCR.CNTVAL. Thus, CNTVAL must be configured prior to start the calibration sequence. If SDMMC\_CALCR.ALWYSON is set to '1', the startup time is only required for the first calibration sequence as the analog circuitry is not shut down at the end of the calibration. In order to reduce the power consumption, the analog circuitry can be shut down at the end of the calibration sequence by clearing ALWYSON. In this case, the startup time is performed each time a calibration sequence is started.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12 Register Summary

| Offset | Name                    | Bit Pos. |                  |               |             |             |             |         |              |              |

## 50.12.1 SDMMC SDMA System Address / Argument 2 Register

**Name:** SDMMC\_SSAR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register contains the physical system memory address used for SDMA transfers or the second argument for Auto CMD23.

|        |                  |    |    |    |    |    |    |    |

| Reset  | 0                | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 31:0 – ADDR/ARG2[31:0] SDMA System Address/Argument 2**

**ADDR:** This field is the system memory address for a SDMA transfer. When the SDMMC stops an SDMA transfer, this field points to the system address of the next contiguous data position. This field can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. An interrupt can be generated to instruct the software to update this field. Writing the next system address of the next data position restarts the SDMA transfer.

**ARG2:** This field is used with Auto CMD23 to set a 32-bit block count value to the CMD23 argument while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by SDMMC\_BCR. In this case, 65535 blocks is the maximum value.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.2 SDMMC Block Size Register

**Name:** SDMMC\_BSR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |               |     |     |    |    |              |     |
|--------|----|---------------|-----|-----|----|----|--------------|-----|
| Bit    | 15 | 14            | 13  | 12  | 11 | 10 | 9            | 8   |
|        |    | BOUNDARY[2:0] |     |     |    |    | BLKSIZE[9:8] |     |
| Access |    | R/W           | R/W | R/W |    |    | R/W          | R/W |
| Reset  |    | 0             | 0   | 0   |    |    | 0            | 0   |

|        |              |     |     |     |     |     |     |     |
|--------|--------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 7            | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | BLKSIZE[7:0] |     |     |     |     |     |     |     |
| Access | R/W          | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 14:12 – BOUNDARY[2:0] SDMA Buffer Boundary

This field specifies the size of the contiguous buffer in the system memory. The SDMA transfer waits at every boundary specified by this field and the SDMMC generates the DMA Interrupt to instruct the software to update SDMMC\_SSAR. If this field is set to 0 (buffer size = 4 Kbytes), the lowest 12 bits of SDMMC\_SSAR.ADDRESS point to data in the contiguous buffer, and the upper 20 bits point to the location of the buffer in the system memory. This function is active when SDMMC\_TMR.DMAEN is set.

| Value | Name | Description        |
|-------|------|--------------------|
| 0     | 4K   | 4-Kbyte boundary   |
| 1     | 8K   | 8-Kbyte boundary   |
| 2     | 16K  | 16-Kbyte boundary  |
| 3     | 32K  | 32-Kbyte boundary  |
| 4     | 64K  | 64-Kbyte boundary  |
| 5     | 128K | 128-Kbyte boundary |
| 6     | 256k | 256-Kbyte boundary |
| 7     | 512K | 512-Kbyte boundary |

#### Bits 9:0 – BLKSIZE[9:0] Transfer Block Size

This field specifies the block size of data transfers for CMD14, CMD17, CMD18, CMD19, CMD24, CMD25, CMD53 and other data transfer commands such as CMD6, CMD8, ACMD13 and ACMD51. Values ranging from 1 to 512 can be set. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations are ignored.

### 50.12.3 SDMMC Block Count Register

**Name:** SDMMC\_BCR  
**Offset:** 0x06  
**Reset:** 0x0000  
**Property:** Read/Write

|        |              |     |     |     |     |     |     |     |

| Reset  | 0            | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 15:0 – BLKCNT[15:0] Block Count for Current Transfer

This field is used only if SDMMC\_TMR.BCEN (Block Count Enable) is set to 1 and is valid only for multiple block transfers. BLKCNT is the number of blocks to be transferred and it must be set to a value between 1 and the maximum block count. The SDMMC decrements the block count after each block transfer and stops when the count reaches 0. When this field is set to 0, no data block is transferred.

This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored.

When a suspend command is completed, the number of blocks yet to be transferred can be determined by reading this register. Before issuing a resume command, the previously saved block count is restored.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.4 SDMMC Argument 1 Register

**Name:** SDMMC\_ARG1R  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |             |     |     |     |     |     |     |     |

|        | ARG1[7:0]   |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 31:0 – ARG1[31:0] Argument 1

This register contains the SD command argument which is specified as the bit 39-8 of Command-Format in the “Physical Layer Simplified Specification V3.01” or “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” .

### 50.12.5 SDMMC Transfer Mode Register

**Name:** SDMMC\_TMR  
**Offset:** 0x0C  
**Reset:** 0x0000  
**Property:** Read/Write

This register is used to control data transfers. The user shall set this register before issuing a command which transfers data (see SDMMC\_CR.DPSEL), or before issuing a Resume command. The user must save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, this register cannot be written while data transactions are in progress. Writes to this register are ignored when SDMMC\_PSR.CMDINHD is 1.

**Table 50-3. Determining the Transfer Type**

| MSBSEL | BCEN       | BLKCNT (SDMMC_BCR) | Function               |
|--------|------------|--------------------|------------------------|
| 0      | Don't care | Don't care         | Single Transfer        |
| 1      | 0          | Don't care         | Infinite Transfer      |
| 1      | 1          | Not Zero           | Multiple Transfer      |
| 1      | 1          | Zero               | Stop Multiple Transfer |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |        |        |             |     |      |       |
|--------|---|---|--------|--------|-------------|-----|------|-------|
| Bit    | 7 | 6 | 5      | 4      | 3           | 2   | 1    | 0     |
|        |   |   | MSBSEL | DTDSEL | ACMDEN[1:0] |     | BCEN | DMAEN |
| Access |   |   | R/W    | R/W    | R/W         | R/W | R/W  | R/W   |
| Reset  |   |   | 0      | 0      | 0           | 0   | 0    | 0     |

#### Bit 5 – MSBSEL Multi/Single Block Selection

This bit is set to 1 when issuing multiple-block transfer commands using DAT line(s). For any other commands, set this bit to 0. If this bit is 0, it is not necessary to set SDMMC\_BCR (see the table above, “Determining the Transfer Type”).

#### Bit 4 – DTDSEL Data Transfer Direction Selection

This bit defines the direction of the DAT lines data transfers. Set this bit to 1 to transfer data from the device (SD Card/SDIO/e.MMC) to the SDMMC, and to 0 for all other commands.

0 (WRITE): Writes data from the SDMMC to the device.

1 (READ): Reads data from the device to the SDMMC.

#### Bits 3:2 – ACMDEN[1:0] Auto Command Enable

Two methods can be used to stop Multiple-block read and write operation:

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

- Auto CMD12: when the ACMDEN field is set to 1, the SDMMC issues CMD12 automatically when the last block transfer is completed. An Auto CMD12 error is indicated to SDMMC\_ACESR. Auto CMD12 is not enabled if the command does not require CMD12.
- Auto CMD23: when the ACMDEN field is set to 2, the SDMMC issues a CMD23 automatically before issuing a command specified in SDMMC\_CR.

The following conditions are required to use Auto CMD23:

- A memory card that supports CMD23 (SCR[33] = 1)
- If DMA is used, it must be ADMA (SDMA not supported).
- Only CMD18 or CMD25 is issued.

**Note:** The SDMMC does not check the command index.

Auto CMD23 can be used with or without ADMA. By writing SDMMC\_CR, the SDMMC issues a CMD23 first and then issues a command specified by the SDMMC\_CR.CMDIDX field. If CMD23 response errors are detected, the second command is not issued. A CMD23 error is indicated in SDMMC\_ACESR. The CMD23 argument (32-bit block count value) is set in SDMMC\_SSAR.

This field determines the use of auto command functions.

| Value | Name     | Description           |
|-------|----------|-----------------------|
| 0     | DISABLED | Auto Command Disabled |
| 1     | CMD12    | Auto CMD12 Enabled    |
| 2     | CMD23    | Auto CMD23 Enabled    |
| 3     | —        | Reserved              |

### Bit 1 – BCEN Block Count Enable

This bit is used to enable SDMMC\_BCR, which is only relevant for multiple block transfers. When this bit is 0, SDMMC\_BCR is disabled, which is useful when executing an infinite transfer (see the table above). If an ADMA2 transfer is more than 65535 blocks, this bit is set to 0 and the data transfer length is designated by the Descriptor Table.

0 (DISABLED): Block count is disabled.

1 (ENABLED): Block count is enabled.

### Bit 0 – DMAEN DMA Enable

This bit enables the DMA functionality described in section “Supporting DMA” in “SD Host Controller Simplified Specification V3.00”. DMA can be enabled only if it is supported as indicated by the bit SDMMC\_CA0R.ADMA2SUP. One of the DMA modes can be selected using the field SDMMC\_HC1R.DMASEL. If DMA is not supported, this bit is meaningless and then always reads 0. When this bit is set to 1, a DMA operation begins when the user writes to the upper byte of SDMMC\_CR.

0 (DISABLED): DMA functionality is disabled.

1 (ENABLED): DMA functionality is enabled.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.6 SDMMC Command Register

**Name:** SDMMC\_CR  
**Offset:** 0x0E  
**Reset:** 0x0000  
**Property:** Read/Write

|        |    |    |             |     |     |     |     |     |
|--------|----|----|-------------|-----|-----|-----|-----|-----|
| Bit    | 15 | 14 | 13          | 12  | 11  | 10  | 9   | 8   |
|        |    |    | CMDIDX[5:0] |     |     |     |     |     |
| Access |    |    | R/W         | R/W | R/W | R/W | R/W | R/W |
| Reset  |    |    | 0           | 0   | 0   | 0   | 0   | 0   |

|        |             |     |       |         |         |   |              |     |
|--------|-------------|-----|-------|---------|---------|---|--------------|-----|
| Bit    | 7           | 6   | 5     | 4       | 3       | 2 | 1            | 0   |
|        | CMDTYP[1:0] |     | DPSEL | CMDICEN | CMDCCEN |   | RESPTYP[1:0] |     |
| Access | R/W         | R/W | R/W   | R/W     | R/W     |   | R/W          | R/W |
| Reset  | 0           | 0   | 0     | 0       | 0       |   | 0            | 0   |

#### Bits 13:8 – CMDIDX[5:0] Command Index

This bit shall be set to the command number (CMD0–63, ACMD0–63) that is specified in bits 45–40 of the Command-Format in the “Physical Layer Simplified Specification V3.01”, “SDIO Simplified Specification V3.00”, and “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”.

#### Bits 7:6 – CMDTYP[1:0] Command Type

| Value | Name    | Description                                                                                   |
|-------|---------|-----------------------------------------------------------------------------------------------|
| 0     | NORMAL  | Other commands                                                                                |
| 1     | SUSPEND | CMD52 to write “Bus Suspend” in the Card Common Control Registers (CCCR) (for SDIO only)      |
| 2     | RESUME  | CMD52 to write “Function Select” in the Card Common Control Registers (CCCR) (for SDIO only)  |
| 3     | ABORT   | CMD12, CMD52 to write “I/O Abort” in the Card Common Control Registers (CCCR) (for SDIO only) |

#### Bit 5 – DPSEL Data Present Select

This bit is set to 1 to indicate that data is present and shall be transferred using the DAT lines. It is set to 0 for the following:

- Commands using only CMD line (Ex. CMD52)
- Commands with no data transfer but using Busy signal on DAT[0] line (Ex. CMD38)
- Resume command

| Value | Description     |
|-------|-----------------|
| 0     | No data present |
| 1     | Data present    |

#### Bit 4 – CMDICEN Command Index Check Enable

If this bit is set to 1, the SDMMC checks the Index field in the response to see if it has the same value as the command index. If it has not, it is reported as a Command Index Error (CMDIDX) in SDMMC\_EISTR. If this bit is set to 0, the Index field of the response is not checked.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

0 (DISABLED): The Command Index Check is disabled.

1 (ENABLED): The Command Index Check is enabled.

### Bit 3 – CMDCCEN Command CRC Check Enable

If this bit is set to 1, the SDMMC checks the CRC field in the response. If an error is detected, it is reported as a Command CRC Error (CMDCRC) in SDMMC\_EISTR. If this bit is set to 0, the CRC field is not checked. The position of the CRC field is determined according to the length of the response.

0 (DISABLED): The Command CRC Check is disabled.

1 (ENABLED): The Command CRC Check is enabled.

### Bits 1:0 – RESPTYP[1:0] Response Type

This field is set according to the response type expected for the command index (CMDIDX).

| Value | Name     | Description                  |
|-------|----------|------------------------------|
| 0     | NORESP   | No Response                  |
| 1     | RL136    | Response Length 136          |
| 2     | RL48     | Response Length 48           |
| 3     | RL48BUSY | Response Length 48 with Busy |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.7 SDMMC Response Register x

**Name:** SDMMC\_RRx  
**Offset:** 0x10 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 31:0 – CMDRESP[31:0] Command Response

The table below describes the mapping of command responses from the SD\_SDIO/eMMC bus to these registers for each responses type. In this table, R[] refers to a bit range of the response data as transmitted on the SD\_SDIO/eMMC bus.

| Type of response          | Meaning of response        | Response field | Response register                                                        |
|---------------------------|----------------------------|----------------|--------------------------------------------------------------------------|
| R1, R1b (normal response) | Card Status                | R[39:8]        | SDMMC_RR0[31:0]                                                          |
| R1b (Auto CMD12 response) | Card Status for Auto CMD12 | R[39:8]        | SDMMC_RR3[31:0]                                                          |
| R1 (Auto CMD23 response)  | Card Status for Auto CMD23 | R[39:8]        | SDMMC_RR3[31:0]                                                          |
| R2 (CID, CSD register)    | CID or CSD register        | R[127:8]       | SDMMC_RR0[31:0]<br>SDMMC_RR1[31:0]<br>SDMMC_RR2[31:0]<br>SDMMC_RR3[23:0] |
| R3 (OCR register)         | OCR register for memory    | R[39:8]        | SDMMC_RR0[31:0]                                                          |
| R4 (OCR register)         | OCR register for I/O       | R[39:8]        | SDMMC_RR0[31:0]                                                          |
| R5, R5b                   | SDIO response              | R[39:8]        | SDMMC_RR0[31:0]                                                          |

#### Bits 31:0 – BUFDATA[31:0] Buffer Data

The SDMMC data buffer can be accessed through this 32-bit Data Port register.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.9 SDMMC Present State Register

**Name:** SDMMC\_PSR  
**Offset:** 0x24  
**Reset:** 0x00F80000  
**Property:** Read-only

|        |    |    |    |    |    |    |    |       |
|--------|----|----|----|----|----|----|----|-------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24    |
|        |    |    |    |    |    |    |    | CMDLL |
| Access |    |    |    |    |    |    |    | R     |
| Reset  |    |    |    |    |    |    |    | 0     |

|        |            |    |    |    |       |         |        |         |
|--------|------------|----|----|----|-------|---------|--------|---------|

| Access |    |    |    |    | R       | R       | R     | R     |
| Reset  |    |    |    |    | 0       | 0       | 0     | 0     |

|        |   |   |   |   |   |       |          |          |
|--------|---|---|---|---|---|-------|----------|----------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2     | 1        | 0        |
|        |   |   |   |   |   | DLACT | CMDINHDL | CMDINHCL |
| Access |   |   |   |   |   | R     | R        | R        |
| Reset  |   |   |   |   |   | 0     | 0        | 0        |

#### Bit 24 – CMDLL CMD Line Level

This status is used to check the CMD line level to recover from errors, and for debugging.

#### Bits 23:20 – DATLL[3:0] DAT[3:0] Line Level

This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the Busy signal level from DAT[0].

#### Bit 19 – WRPPL Write Protect Pin Level

The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDMMC\_WP pin.

| Value | Description                    |
|-------|--------------------------------|
| 0     | Write protected (SDMMC_WP = 0) |
| 1     | Write enabled (SDMMC_WP = 1)   |

#### Bit 18 – CARDDDL Card Detect Pin Level

This bit reflects the inverse value of the SDMMC\_CD pin. Debouncing is not performed on this bit. This bit may be valid when CARDSS is set to 1, but it is not guaranteed because of the propagation delay. Use of this bit is limited to testing since it must be debounced by software.

| Value | Description                     |
|-------|---------------------------------|
| 0     | No card present (SDMMC_CD = 1). |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| Value | Description                  |
|-------|------------------------------|
| 1     | Card present (SDMMC_CD = 0). |

### Bit 17 – CARDSS Card State Stable

This bit is used for testing. If it is 0, the CARDDPL is not stable. If this bit is set to 1, it means that the CARDDPL is stable. No Card state can be detected if this bit is set to 1 and CARDINS is set to 0.

The Software Reset For All (SWRSTALL) in SDMMC\_SRR does not affect this bit.

| Value | Description               |
|-------|---------------------------|
| 0     | Reset or debouncing.      |
| 1     | No card or card inserted. |

### Bit 16 – CARDINS Card Inserted

This bit indicates whether a card has been inserted. The SDMMC debounces this signal so that the user does not need to wait for it to stabilize.

A change from 0 to 1 raises the Card Insertion (CINS) status flag in SDMMC\_NISTR if SDMMC\_NISTER.CINS is set to 1. An interrupt is generated if SDMMC\_NISIER.CINS is set to 1.

A change from 1 to 0 raises the Card Removal (CREM) status flag in SDMMC\_NISTR if SDMMC\_NISTER.CREM is set to 1. An interrupt is generated if SDMMC\_NISIER.CREM is set to 1.

The Software Reset For All (SWRSTALL) in SDMMC\_SRR does not affect this bit.

### Bit 11 – BUFRDEN Buffer Read Enable

This bit is used for nonDMA read transfers. This flag indicates that valid data exists in the SDMMC data buffer. If this bit is 1, readable data exists in the buffer.

A change from 1 to 0 occurs when all the block data is read from the buffer.

A change from 0 to 1 occurs when block data is ready in the buffer. This raises the Buffer Read Ready (BRDRDY) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BRDRDY is set to 1. An interrupt is generated if SDMMC\_NISIER.BRDRDY is set to 1.

### Bit 10 – BUFWREN Buffer Write Enable

This bit is used for nonDMA write transfers. This flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer.

A change from 1 to 0 occurs when all the block data are written to the buffer.

A change from 0 to 1 occurs when top of block data can be written to the buffer. This raises the Buffer Write Ready (BWRRDY) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BWRRDY is set to 1. An interrupt is generated if SDMMC\_NISIER.BWRRDY is set to 1.

### Bit 9 – RTACT Read Transfer Active

This bit is used to detect completion of a read transfer. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit is set to 1 in either of the following conditions:

- After the end bit of the read command.
- When a read operation is restarted by writing a 1 to SDMMC\_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- When the last data block as specified by Transfer Block Size (BLKSIZE) is transferred to the system.
- In case of ADMA2, end of read is designated by the descriptor table.
- When all valid data blocks in the SDMMC have been transferred to the system and no current block transfers are being sent as a result of the Stop At Block Gap Request (STPBGR) of SDMMC\_BGCR being set to 1.

A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1.

**Bit 8 – WTACT** Write Transfer Active

This bit indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the SDMMC. See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit is set to 1 in either of the following conditions:

- After the end bit of the write command.
- When a write operation is restarted by writing a 1 to SDMMC\_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- After getting the CRC status of the last data block as specified by the transfer count (single and multiple). In case of ADMA2, transfer count is designated by the descriptor table.
- After getting the CRC status of any block where a data transmission is about to be stopped by a Stop At Block Gap Request (STPBGR) of SDMMC\_BGCR.

During a write transaction and as the result of the Stop At Block Gap Request (STPBGR) being set, a change from 1 to 0 raises the Block Gap Event (BLKGE) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BLKGE is set to 1. An interrupt is generated if BLKGE is set to 1 in SDMMC\_NISIER. This status is useful to determine whether nonDAT line commands can be issued during Write Busy.

**Bit 2 – DLACT** DAT Line Active

This bit indicates whether one of the DAT lines on the bus is in use.

In the case of read transactions:

- This status indicates whether a read transfer is executing on the bus. A change from 1 to 0 resulting from setting the Stop At Block Gap Request (STPBGR) raises the Block Gap Event (BLKGE) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BLKGE is set to 1. An interrupt is generated if SDMMC\_NISIER.BLKGE is set to 1. See the section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the read command.
  - When writing 1 to SDMMC\_BGCR.CONTR (Continue Request) to restart a read transfer.
- This bit is SDMMC cleared in either of the following cases:
  - When the end bit of the last data block is sent from the bus to the SDMMC. In case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  - When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request (STPBGR).
- The SDMMC stops a read operation at the start of the interrupt cycle by driving the Read Wait (DAT[2] line) or by stopping the SD Clock. If the Read Wait signal is already driven (due to the fact

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

that the data buffer cannot receive data), the SDMMC can continue to stop the read operation by driving the Read Wait signal. It is necessary to support the Read Wait in order to use the Suspend/Resume operation.

In the case of write transactions:

- This status indicates that a write transfer is executing on the bus. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1. See the section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the write command.
  - When writing 1 to SDMMC\_BGCR.CONTR (Continue Request) to continue a write transfer.
- This bit is cleared in either of the following cases:
  - When the card releases Write Busy of the last data block. If the card does not drive a Busy signal for 8 SDCLK, the SDMMC considers the card drive “Not Busy”. In the case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  - When the card releases Write Busy prior to wait for write transfer as a result of a Stop At Block Gap Request (STPBGR).

Command with Busy:

This status indicates whether a command that indicates Busy (ex. erase command for memory) is executing on the bus. This bit is set to 1 after the end bit of the command with Busy and cleared when Busy is deasserted. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1. See Figures 2.11 to 2.13 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description        |
|-------|--------------------|
| 0     | DAT line inactive. |
| 1     | DAT line active.   |

### Bit 1 – CMDINH D Command Inhibit (DAT)

This status bit is 1 if either the DAT Line Active (DLACT) or the Read Transfer Active (RTACT) is set to 1. If this bit is 0, it indicates that the SDMMC can issue the next command. Commands with a Busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1.

Note: The software can save registers in the 000–00Dh range for a suspend transaction after this bit has changed from 1 to 0.

| Value | Description                                        |
|-------|----------------------------------------------------|
| 0     | Can issue a command which uses the DAT line(s).    |
| 1     | Cannot issue a command which uses the DAT line(s). |

### Bit 0 – CMDINH C Command Inhibit (CMD)

If this bit is 0, it indicates the CMD line is not in use and the SDMMC can issue a command using the CMD line. This bit is set to 1 immediately after SDMMC\_CR is written. This bit is cleared when the

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the CMD12 or CMD23 response, but by the Read/Write command response.

Status issuing Auto CMD12 is not read from this bit. So, if a command is issued during Auto CMD12 operation, the SDMMC manages to issue both commands: CMD12 and a command set by SDMMC\_CR.

Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0.

A change from 1 to 0 raises the Command Complete (CMDC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.CMDC is set to 1. An interrupt is generated if SDMMC\_NISIER.CMDC is set to 1.

If the SDMMC cannot issue the command because of a command conflict error (see SDMMC\_EISTR.CMDCRC) or because of a 'Command Not Issued By Auto CMD12' error (see section "SDMMC Auto CMD Error Status Register"), this bit remains 1 and Command Complete is not set.

| Value | Description                              |
|-------|------------------------------------------|
| 0     | Can issue a command using only CMD line. |
| 1     | Cannot issue a command.                  |

### 50.12.10 SDMMC Host Control 1 Register (SD\_SDIO)

**Name:** SDMMC\_HC1R (SD\_SDIO)  
**Offset:** 0x28  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

| Bit    | 7        | 6       | 5 | 4           | 3   | 2    | 1   | 0       |
|--------|----------|---------|---|-------------|-----|------|-----|---------|
|        | CARDDSEL | CARDDTL |   | DMASEL[1:0] |     | HSEN | DW  | LEDCTRL |
| Access | R/W      | R/W     |   | R/W         | R/W | R/W  | R/W | R/W     |
| Reset  | 0        | 0       |   | 0           | 0   | 0    | 0   | 0       |

#### Bit 7 – CARDDSEL Card Detect Signal Selection

This bit selects the source for the card detection.

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 0     | The SDMMC_CD pin is selected.                                         |
| 1     | The Card Detect Test Level (CARDDTL) is selected (for test purposes). |

#### Bit 6 – CARDDTL Card Detect Test Level

This bit is enabled while the Card Detect Signal Selection (CARDDSEL) is set to 1 and it indicates whether the card is inserted or not.

| Value | Description    |
|-------|----------------|
| 0     | No card.       |
| 1     | Card inserted. |

#### Bits 4:3 – DMASEL[1:0] DMA Select

One of the supported DMA modes can be selected. The DMA modes supported are given in SDMMC\_CA0R. Use of a selected DMA is determined by DMA Enable (DMAEN) in SDMMC\_TMR.

| Value | Name   | Description                      |
|-------|--------|----------------------------------|
| 0     | SDMA   | SDMA is selected                 |
| 1     | –      | Reserved                         |
| 2     | ADMA32 | 32-bit Address ADMA2 is selected |
| 3     | –      | Reserved                         |

#### Bit 2 – HSEN High Speed Enable

Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC\_CA0R.

If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).

If Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, the user needs to reset SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.

**Note:** This bit is effective only if SDMMC\_MC1R.DDR is set to 0.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

**Note:** The clock divider (DIV) in SDMMC\_CCR must be set to a value different from 0 when HSEN is 1.

| Value | Description        |
|-------|--------------------|
| 0     | Normal Speed mode. |
| 1     | High Speed mode.   |

### Bit 1 – DW Data Width

This bit selects the data width of the SDMMC. It must be set to match the data width of the card.

0 (1\_BIT): 1-bit mode.

1 (4\_BIT): 4-bit mode.

**Note:** If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

### Bit 0 – LEDCTRL LED Control

This bit is used to caution the user not to remove the card while it is being accessed. If the software is going to issue multiple commands, this bit is set to 1 during all transactions.

0 (OFF): LED off.

1 (ON): LED on.

### 50.12.11 SDMMC Host Control 1 Register (e.MMC)

**Name:** SDMMC\_HC1R (e.MMC)  
**Offset:** 0x28  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |   |   |       |             |     |      |     |   |
|--------|---|---|-------|-------------|-----|------|-----|---|
| Bit    | 7 | 6 | 5     | 4           | 3   | 2    | 1   | 0 |
|        |   |   | EXTDW | DMASEL[1:0] |     | HSEN | DW  |   |
| Access |   |   | R/W   | R/W         | R/W | R/W  | R/W |   |
| Reset  |   |   | 0     | 0           | 0   | 0    | 0   |   |

#### Bit 5 – EXTDW Extended Data Width

This bit controls the 8-bit Bus Width mode for embedded devices. Support of this function is indicated in 8-bit Support for Embedded Device in SDMMC\_CA0R. If a device supports the 8-bit mode, this may be set to 1. If this bit is 0, the bus width is controlled by Data Width (DW).

#### Bits 4:3 – DMASEL[1:0] DMA Select

One of the supported DAM modes can be selected. The DMA modes supported are given in SDMMC\_CA0R. Use of selected DMA is determined by DMA Enable (DMAEN) in SDMMC\_TMR.

| Value | Name   | Description                      |
|-------|--------|----------------------------------|
| 0     | SDMA   | SDMA is selected                 |
| 1     | —      | Reserved                         |
| 2     | ADMA32 | 32-bit Address ADMA2 is selected |
| 3     | —      | Reserved                         |

#### Bit 2 – HSEN High Speed Enable

Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC\_CA0R.

If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).

If Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, the user needs to reset the SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.

**Note:** This bit is effective only if SDMMC\_MC1R.DDR is set to 0.

**Note:** The clock divider (DIV) in SDMMC\_CCR must be set to a value different from 0 when HSEN is 1.

| Value | Description        |
|-------|--------------------|
| 0     | Normal Speed mode. |
| 1     | High Speed mode.   |

#### Bit 1 – DW Data Width

This bit selects the data width of the SDMMC. It must be set to match the data width of the card.

0 (1\_BIT): 1-bit mode.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

1 (4\_BIT): 4-bit mode.

**Note:** If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.12 SDMMC Power Control Register

**Name:** SDMMC\_PCR  
**Offset:** 0x29  
**Reset:** 0x0E  
**Property:** Read/Write

|        |   |   |   |   |   |   |   |        |
|--------|---|---|---|---|---|---|---|--------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0      |
|        |   |   |   |   |   |   |   | SDBPWR |
| Access |   |   |   |   |   |   |   | R/W    |
| Reset  |   |   |   |   |   |   |   | 0      |

#### Bit 0 – SDBPWR SD Bus Power

This bit is automatically cleared by the SDMMC if the card is removed. If this bit is cleared, the SDMMC stops driving SDMMC\_CMD and SDMMC\_DAT[7:0] (tri-state) and drives SDMMC\_CK to low level.

### 50.12.13 SDMMC Block Gap Control Register (SD\_SDIO)

**Name:** SDMMC\_BGCR (SD\_SDIO)  
**Offset:** 0x2A  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |   |   |   |   |       |        |       |        |
|--------|---|---|---|---|-------|--------|-------|--------|
| Bit    | 7 | 6 | 5 | 4 | 3     | 2      | 1     | 0      |
|        |   |   |   |   | INTBG | RWCTRL | CONTR | STPBGR |
| Access |   |   |   |   | R/W   | R/W    | R/W   | R/W    |
| Reset  |   |   |   |   | 0     | 0      | 0     | 0      |

#### Bit 3 – INTBG Interrupt at Block Gap

This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. If the SDIO card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the software detects an SDIO card insertion, it sets this bit according to the CCCR of the SDIO card.

| Value | Name     | Description                   |
|-------|----------|-------------------------------|
| 0     | DISABLED | Interrupt detection disabled. |
| 1     | ENABLED  | Interrupt detection enabled.  |

#### Bit 2 – RWCTRL Read Wait Control

The Read Wait control is optional for SDIO cards. If the card supports Read Wait, set this bit to enable use of the Read Wait protocol to stop read data using the SDMMC\_DAT[2] line. Otherwise, the SDMMC stops the SDCLK to hold read data, which restricts command generation. When the software detects an SD card insertion, this bit must be set according to the CCCR of the SDIO card. If the card does not support Read Wait, this bit shall never be set to 1, otherwise an SDMMC\_DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.

| Value | Description                 |
|-------|-----------------------------|
| 0     | Disables Read Wait control. |
| 1     | Enables Read Wait control.  |

#### Bit 1 – CONTR Continue Request

This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.

The SDMMC automatically clears this bit in either of the following cases:

- In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
- In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.

Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| Value | Description |
|-------|-------------|
| 0     | No effect.  |
| 1     | Restart.    |

### Bit 0 – STPBGR Stop At Block Gap Request

This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in SDMMC\_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not.

During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC\_DAT[2]) if supported, or by stopping the SD clock otherwise.

In case of write transfers in which the user writes data to SDMMC\_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC\_BDPR.

This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

| Value | Description |
|-------|-------------|
| 0     | Transfer    |
| 1     | Stop        |

### 50.12.14 SDMMC Block Gap Control Register (e.MMC)

**Name:** SDMMC\_BGCR (e.MMC)  
**Offset:** 0x2A  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |   |   |   |   |   |   |       |        |
|--------|---|---|---|---|---|---|-------|--------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1     | 0      |
|        |   |   |   |   |   |   | CONTR | STPBGR |
| Access |   |   |   |   |   |   | R/W   | R/W    |
| Reset  |   |   |   |   |   |   | 0     | 0      |

#### Bit 1 – CONTR Continue Request

This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.

The SDMMC automatically clears this bit in either of the following cases:

- In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
- In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.

Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

| Value | Description |
|-------|-------------|
| 0     | No effect.  |
| 1     | Restart.    |

#### Bit 0 – STPBGR Stop At Block Gap Request

This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in SDMMC\_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not.

During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC\_DAT[2]) if supported, or by stopping the SD clock otherwise.

In case of write transfers in which the user writes data to SDMMC\_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC\_BDPR.

This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

| Value | Description |
|-------|-------------|
| 0     | Transfer    |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| Value | Description |
|-------|-------------|
| 1     | Stop        |

### 50.12.15 SDMMC Wakeup Control Register (SD\_SDIO)

**Name:** SDMMC\_WCR (SD\_SDIO)  
**Offset:** 0x2B  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |   |   |   |   |   |          |          |          |
|--------|---|---|---|---|---|----------|----------|----------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2        | 1        | 0        |
|        |   |   |   |   |   | WKENCREM | WKENCINS | WKENCINT |
| Access |   |   |   |   |   | R/W      | R/W      | R/W      |
| Reset  |   |   |   |   |   | 0        | 0        | 0        |

**Bit 2 – WKENCREM** Wakeup Event Enable on Card Removal

This bit enables a wakeup event via Card Removal (CREM) in SDMMC\_NISTR. FN\_WUS (Wakeup Support) in the CIS (Card Information Structure) does not affect this bit.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

**Bit 1 – WKENCINS** Wakeup Event Enable on Card Insertion

This bit enables a wakeup event via Card Insertion (CINS) in SDMMC\_NISTR. FN\_WUS (Wakeup Support) in the CIS (Card Information Structure) does not affect this bit.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

**Bit 0 – WKENCINT** Wakeup Event Enable on Card Interrupt

This bit enables a wakeup event via Card Interrupt (CINT) in SDMMC\_NISTR. This bit can be set to 1 if FN\_WUS (Wakeup Support) in the CIS (Card Information Structure) is set to 1 in the SDIO card.

0 (DISABLED): Wakeup Event disabled.

1 (ENABLED): Wakeup Event enabled.

### 50.12.16 SDMMC Clock Control Register

**Name:** SDMMC\_CCR  
**Offset:** 0x2C  
**Reset:** 0x0000  
**Property:** Read/Write

|        |                 |     |         |     |     |         |         |          |
|--------|-----------------|-----|---------|-----|-----|---------|---------|----------|
| Bit    | 15              | 14  | 13      | 12  | 11  | 10      | 9       | 8        |
|        | SDCLKFSEL[7:0]  |     |         |     |     |         |         |          |
| Access | R/W             | R/W | R/W     | R/W | R/W | R/W     | R/W     | R/W      |
| Reset  | 0               | 0   | 0       | 0   | 0   | 0       | 0       | 0        |
| Bit    | 7               | 6   | 5       | 4   | 3   | 2       | 1       | 0        |
|        | USDCLKFSEL[1:0] |     | CLKGSEL |     |     | SDCLKEN | INTCLKS | INTCLKEN |
| Access | R/W             | R/W | R/W     |     |     | R/W     | R/W     | R/W      |
| Reset  | 0               | 0   | 0       |     |     | 0       | 0       | 0        |

#### Bits 15:8 – SDCLKFSEL[7:0] SDCLK Frequency Select

This register is used to select the frequency of the SDCLK pin. There are two SDCLK Frequency modes according to Clock Generator Select (CLKGSEL).

The length of the clock divider (DIV) is extended to 10 bits (DIV[9:8] = USDCLKFSEL, DIV[7:0] = SDCLKFSEL)

– 10-bit Divided Clock Mode (CLKGSEL = 0):  $f_{SDCLK} = f_{BASECLK} / (2 \times DIV)$ . If DIV = 0 then  $f_{SDCLK} = f_{BASECLK}$

– Programmable Clock Mode (CLKGSEL = 1):  $f_{SDCLK} = f_{MULTCLK} / (DIV + 1)$

When HSEN is set in SDMMC\_HC1R, or DDR is set in SDMMC\_MC1R, the clock divider (DIV) must be non-zero. This field depends on the setting of Preset Value Enable (PVALEN) in SDMMC\_HC2R.

If PVALEN = 0, this field is set by the user.

If PVALEN = 1, this field is automatically set to a value specified in one of the SDMMC\_PVR.

#### Bits 7:6 – USDCLKFSEL[1:0] Upper Bits of SDCLK Frequency Select

These bits expand the SDCLK Frequency Select (SDCLKFSEL) to 10 bits. These two bits are assigned to bit 09-08 of the clock divider as described in SDCLKFSEL.

#### Bit 5 – CLKGSEL Clock Generator Select

This bit is used to select the clock generator mode in the SDCLK Frequency Select field. If the Programmable mode is not supported (SDMMC\_CA1R.CLKMULT (Clock Multiplier) set to 0), then this bit cannot be written and is always read at 0.

This bit depends on the setting of Preset Value Enable (PVALEN) in SDMMC\_HC2R.

If PVALEN = 0, this bit is set by the user.

If PVALEN = 1, this bit is automatically set to a value specified in one of the SDMMC\_PVRx.

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | Divided Clock mode (BASECLK is used to generate SDCLK). |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 1     | Programmable Clock mode (MULTCLK is used to generate SDCLK). |

### Bit 2 – SDCLKEN SD Clock Enable

The SDMMC stops the SD Clock when writing this bit to 0. SDCLK Frequency Select (SDCLKFSEL) can be changed when this bit is 0. Then, the SDMMC maintains the same clock frequency until SDCLK is stopped (Stop at SDCLK = 0). If Card Inserted (CARDINS) in SDMMC\_PSR is cleared, this bit is also cleared.

| Value | Description       |
|-------|-------------------|
| 0     | SD Clock disabled |
| 1     | SD Clock enabled  |

### Bit 1 – INTCLKS Internal Clock Stable

This bit is set to 1 when the SD clock is stable after setting SDMMC\_CCR.INTCLKEN (Internal Clock Enable) to 1. The user must wait to set SD Clock Enable (SDCLKEN) until this bit is set to 1.

| Value | Description               |
|-------|---------------------------|
| 0     | Internal clock not ready. |
| 1     | Internal clock ready.     |

### Bit 0 – INTCLKEN Internal Clock Enable

This bit is set to 0 when the SDMMC is not used or is awaiting a wakeup interrupt. In this case, its internal clock is stopped to reach a very low power state. Registers are still able to be read and written. The clock starts to oscillate when this bit is set to 1. Once the clock oscillation is stable, the SDMMC sets Internal Clock Stable (INTCLKS) in this register to 1.

This bit does not affect card detection.

| Value | Description                    |
|-------|--------------------------------|
| 0     | The internal clock stops.      |
| 1     | The internal clock oscillates. |

## 50.12.17 SDMMC Timeout Control Register

**Name:** SDMMC\_TCR  
**Offset:** 0x2E  
**Reset:** 0x00  
**Property:** Read/Write

|        |   |   |   |   |             |     |     |     |
|--------|---|---|---|---|-------------|-----|-----|-----|
| Bit    | 7 | 6 | 5 | 4 | 3           | 2   | 1   | 0   |
|        |   |   |   |   | DTCVAL[3:0] |     |     |     |
| Access |   |   |   |   | R/W         | R/W | R/W | R/W |
| Reset  |   |   |   |   | 0           | 0   | 0   | 0   |

**Bits 3:0 – DTCVAL[3:0]** Data Timeout Counter Value

This value determines the interval at which DAT line timeouts are detected. For more information about timeout generation, see Data Timeout Error (DATTEO) in SDMMC\_EISTR. When setting this register, the user can prevent inadvertent timeout events by clearing the Data Timeout Error Status Enable (in SDMMC\_EISTER).

$$\text{TIMEOUT}_{(\mu\text{s})} = \frac{2^{13 + \text{DTCVAL}}}{f_{\text{FTEOCLK}}(\text{MHz})}$$

**Note:** DTCVAL = f<sub>(Hexa)</sub> is reserved.

### 50.12.18 SDMMC Software Reset Register

**Name:** SDMMC\_SRR  
**Offset:** 0x2F  
**Reset:** 0x00  
**Property:** Read/Write

| Bit    | 7 | 6 | 5 | 4 | 3 | 2        | 1        | 0        |
|--------|---|---|---|---|---|----------|----------|----------|
|        |   |   |   |   |   | SWRSTDAT | SWRSTCMD | SWRSTALL |
| Access |   |   |   |   |   | R/W      | R/W      | R/W      |
| Reset  |   |   |   |   |   | 0        | 0        | 0        |

#### Bit 2 – SWRSTDAT Software Reset for DAT Line

Only part of a data circuit is reset. The DMA circuit is also reset.

The following registers and bits are cleared by this bit:

#### “SDMMC Buffer Data Port Register”

- Buffer is cleared and initialized.

#### “SDMMC Present State Register”

- Buffer Read Enable (BUFRDEN)
- Buffer Write Enable (BUFWREN)
- Read Transfer Active (RTACT)
- Write Transfer Active (WTACT)
- DAT Line Active (DATLL)
- Command Inhibit (DAT) (CMDINH)

#### “SDMMC Block Gap Control Register (SD\_SDIO)”

- Continue Request (CONTR)
- Stop At Block Gap Request (STPBGR)

#### “SDMMC Normal Interrupt Status Register (SD\_SDIO)”

- Buffer Read Ready (BRDRDY)
- Buffer Write Ready (BWRRDY)
- DMA Interrupt (DMAINT)
- Block Gap Event (BLKGE)
- Transfer Complete (TRFC)

| Value | Description |
|-------|-------------|
| 0     | Work        |
| 1     | Reset       |

#### Bit 1 – SWRSTCMD Software Reset for CMD Line

Only part of a command circuit is reset.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

The following registers and bits are cleared by this bit:

“SDMMC Present State Register”

– Command Inhibit (CMD) (CMDINHC)

“SDMMC Normal Interrupt Status Register (SD\_SDIO)” and “SDMMC Normal Interrupt Status Register (e.MMC)”

– Command Complete (CMDC)

| Value | Description |
|-------|-------------|
| 0     | Work        |
| 1     | Reset       |

### Bit 0 – SWRSTALL Software Reset for All

This reset affects the entire SDMMC except the card detection circuit. During initialization, the SDMMC must be reset by setting this bit to '1'. This bit is automatically cleared to '0' when SDMMC\_CA0R and SDMMC\_CA1R are valid and the user can read them. If this bit is set to '1', the user should issue a reset command and reinitialize the card.

List of registers cleared to '0':

- “SDMMC SDMA System Address / Argument 2 Register”
- “SDMMC Block Size Register”
- “SDMMC Block Count Register”
- “SDMMC Argument 1 Register”
- “SDMMC Command Register”
- “SDMMC Transfer Mode Register”
- “SDMMC Response Register”
- “SDMMC Buffer Data Port Register”
- “SDMMC Present State Register” (except CMDLL, DATLL, WRPPL, CARDDDL, CARDSS, CARDINS)
- “SDMMC Host Control 1 Register (SD\_SDIO)”
- “SDMMC Host Control 1 Register (e.MMC)”
- “SDMMC Power Control Register”
- “SDMMC Block Gap Control Register (SD\_SDIO)”
- “SDMMC Block Gap Control Register (e.MMC)”
- “SDMMC Wakeup Control Register (SD\_SDIO)”
- “SDMMC Clock Control Register”
- “SDMMC Timeout Control Register”
- “SDMMC Normal Interrupt Status Register (SD\_SDIO)”
- “SDMMC Error Interrupt Status Register (SD\_SDIO)”
- “SDMMC Normal Interrupt Status Enable Register (SD\_SDIO)”
- “SDMMC Error Interrupt Status Enable Register (SD\_SDIO)”

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

- “SDMMC Normal Interrupt Signal Enable Register (SD\_SDIO)”
- “SDMMC Error Interrupt Signal Enable Register (SD\_SDIO)”
- “SDMMC Auto CMD Error Status Register”
- “SDMMC Host Control 2 Register (SD\_SDIO)”
- “SDMMC ADMA Error Status Register”
- “SDMMC ADMA System Address Register”
- “SDMMC Slot Interrupt Status Register”
- “SDMMC e.MMC Control 1 Register”
- “SDMMC e.MMC Control 2 Register”
- “SDMMC AHB Control Register”
- “SDMMC Clock Control 2 Register”
- “SDMMC Retuning Control 1 Register”
- “SDMMC Retuning Counter Value Register”
- “SDMMC Retuning Interrupt Status Enable Register”
- “SDMMC Retuning Interrupt Signal Enable Register”
- “SDMMC Retuning Interrupt Status Register”
- “SDMMC Tuning Control Register”
- “SDMMC Capabilities Control Register” (except KEY)
- “SDMMC Calibration Control Register” (except CALN, CALP)

| Value | Description |
|-------|-------------|
| 0     | Work        |
| 1     | Reset       |

### 50.12.19 SDMMC Normal Interrupt Status Register (SD\_SDIO)

**Name:** SDMMC\_NISTR (SD\_SDIO)  
**Offset:** 0x30  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |        |    |    |    |    |    |   |      |
|--------|--------|----|----|----|----|----|---|------|
| Bit    | 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8    |
|        | ERRINT |    |    |    |    |    |   | CINT |
| Access | R      |    |    |    |    |    |   | R/W  |
| Reset  | 0      |    |    |    |    |    |   | 0    |

|        |      |      |        |        |        |       |      |      |
|--------|------|------|--------|--------|--------|-------|------|------|
| Bit    | 7    | 6    | 5      | 4      | 3      | 2     | 1    | 0    |
|        | CREM | CINS | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access | R/W  | R/W  | R/W    | R/W    | R/W    | R/W   | R/W  | R/W  |
| Reset  | 0    | 0    | 0      | 0      | 0      | 0     | 0    | 0    |

#### Bit 15 – ERRINT Error Interrupt

If any of the bits in SDMMC\_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

#### Bit 8 – CINT Card Interrupt

Writing this bit to '1' does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the SDMMC detects the Card Interrupt without SDCLK to support wakeup. In 4-bit mode, the Card Interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the system.

When this bit has been set to '1' and the user needs to start this interrupt service, Card Interrupt Status Enable (CINT) in SDMMC\_NISTER may be set to '0' in order to clear the card interrupt statuses latched in the SDMMC and to stop driving the interrupt signal to the system. After completion of the card interrupt service (it should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set SDMMC\_NISTER.CINT to '1' and start sampling the interrupt signal again.

Interrupt detected by DAT[1] is supported when there is one card per slot.

This bit can only be set to '1' if SDMMC\_NISTER.CREM is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CREM is set to '1'.

| Value | Description        |
|-------|--------------------|
| 0     | No card interrupt. |
| 1     | Card interrupt.    |

#### Bit 7 – CREM Card Removal

This status is set to '1' if Card Inserted (CARDINS) in SDMMC\_PSR changes from '1' to '0'. When the user writes this bit to '1' to clear this status, the status of SDMMC\_PSR.CARDINS must be confirmed

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

because the card detect state may possibly be changed when the user clears this bit and no interrupt event can be generated.

This bit can only be set to '1' if SDMMC\_NISTER.CREM is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CREM is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Card state unstable or card inserted. |
| 1     | Card removed.                         |

### Bit 6 – CINS Card Insertion

This status is set if Card Inserted (CARDINS) in SDMMC\_PSR changes from '0' to '1'. When the user writes this bit to '1' to clear this status, the status of SDMMC\_PSR.CARDINS must be confirmed because the card detect state may possibly be changed when the user clears this bit and no interrupt event can be generated.

This bit can only be set to '1' if SDMMC\_NISTER.CINS is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CINS is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                          |
|-------|--------------------------------------|
| 0     | Card state unstable or card removed. |
| 1     | Card inserted.                       |

### Bit 5 – BRDRDY Buffer Read Ready

This status is set to '1' if the Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See BUFRDEN in SDMMC\_PSR. While processing the tuning procedure (Execute Tuning (EXTUN) in SDMMC\_HC2R is set to '1'), BRDRDY is set to '1' for every CMD19 execution.

This bit can only be set to '1' if SDMMC\_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BRDRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description               |
|-------|---------------------------|
| 0     | Not ready to read buffer. |
| 1     | Ready to read buffer.     |

### Bit 4 – BWRRDY Buffer Write Ready

This status is set to '1' if the Buffer Write Enable (BUFWREN) changes from '0' to '1'. See BUFWREN in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BWRRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                |
|-------|----------------------------|
| 0     | Not ready to write buffer. |
| 1     | Ready to write buffer.     |

**Bit 3 – DMAINT** DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC\_BSR.

In case of ADMA, by setting the “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after Transfer Complete (TRFC).

This bit can only be set to '1' if SDMMC\_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.DMAINT is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description       |
|-------|-------------------|
| 0     | No DMA Interrupt. |
| 1     | DMA Interrupt.    |

**Bit 2 – BLKGE** Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR is set to 1, this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to 1, this bit is not set to 1.

**In the case of a Read transaction:**

This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.

**In the case of a Write transaction:**

This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit can only be set to '1' if SDMMC\_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BLKGE is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No block gap event.               |
| 1     | Transaction stopped at block gap. |

**Bit 1 – TRFC** Transfer Complete

This bit is set when a read/write transfer and a command with Busy is completed.

**In the case of a Read Transaction:**

This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data has been read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR (after valid data has been read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

**In the case of a Write Transaction:**

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section "Write Transaction Wait / Continue Timing" in the "SD Host Controller Simplified Specification V3.00" for more details on the sequence of events.

### In the case of command with Busy:

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.TRFC is set to '1'.

Writing this bit to '1' clears this bit.

The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

| TRFC | DATTEO     | Meaning of the status            |
|------|------------|----------------------------------|
| 0    | 0          | Interrupted by another factor    |
| 0    | 1          | Timeout occurred during transfer |
| 1    | Don't Care | Command execution complete       |

| Value | Description                        |
|-------|------------------------------------|
| 0     | Command execution is not complete. |
| 1     | Command execution is complete.     |

### Bit 0 – CMDC Command Complete

This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See Command Inhibit (CMD) in SDMMC\_PSR for details on how to control this bit.

This bit can only be set to 1 if SDMMC\_NISTER.CMDC is set to 1. An interrupt can only be generated if SDMMC\_NISIER.CMDC is set to 1.

Writing this bit to 1 clears this bit.

The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to 1, it can be considered that the response was not received correctly.

| CMDC       | CMDTEO | Meaning of the status                        |
|------------|--------|----------------------------------------------|
| 0          | 0      | Interrupted by another factor                |
| Don't care | 1      | Response not received within 64 SDCLK cycles |
| 1          | 0      | Response received                            |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| Value | Description          |
|-------|----------------------|
| 0     | No command complete. |
| 1     | Command complete.    |

### 50.12.20 SDMMC Normal Interrupt Status Register (e.MMC)

**Name:** SDMMC\_NISTR (e.MMC)  
**Offset:** 0x30  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |        |        |    |    |    |    |   |   |
|--------|--------|--------|----|----|----|----|---|---|
| Bit    | 15     | 14     | 13 | 12 | 11 | 10 | 9 | 8 |
|        | ERRINT | BOOTAR |    |    |    |    |   |   |
| Access | R      | R/W    |    |    |    |    |   |   |
| Reset  | 0      | 0      |    |    |    |    |   |   |

|        |   |   |        |        |        |       |      |      |
|--------|---|---|--------|--------|--------|-------|------|------|
| Bit    | 7 | 6 | 5      | 4      | 3      | 2     | 1    | 0    |
|        |   |   | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access |   |   | R/W    | R/W    | R/W    | R/W   | R/W  | R/W  |
| Reset  |   |   | 0      | 0      | 0      | 0     | 0    | 0    |

#### Bit 15 – ERRINT Error Interrupt

If any of the bits in SDMMC\_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

#### Bit 14 – BOOTAR Boot Acknowledge Received

This bit is set to '1' when the SDMMC received a Boot Acknowledge pattern from the e.MMC.

This bit can only be set to '1' if SDMMC\_NISTER.BOOTAR is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BOOTAR is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                            |
|-------|----------------------------------------|
| 0     | Boot Acknowledge pattern not received. |
| 1     | Boot Acknowledge pattern received.     |

#### Bit 5 – BRDRDY Buffer Read Ready

This status is set to '1' if Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See Buffer Read Enable (BUFRDEN) in SDMMC\_PSR. While processing the tuning procedure (Execute Tuning (EXTUN) in SDMMC\_HC2R is set to '1'), BRDRDY is set to '1' for every CMD19 execution.

This bit can only be set to '1' if SDMMC\_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BRDRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description               |
|-------|---------------------------|
| 0     | Not ready to read buffer. |
| 1     | Ready to read buffer.     |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 4 – BWRRDY Buffer Write Ready

This status is set to 1 if Buffer Write Enable (BUFWREN) changes from '0' to '1'. See Buffer Write Enable (BUFWREN) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BWRRDY is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                |
|-------|----------------------------|
| 0     | Not ready to write buffer. |
| 1     | Ready to write buffer.     |

### Bit 3 – DMAINT DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC\_BSR.

In case of ADMA, by setting “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after the Transfer Complete (TRFC).

This bit can only be set to '1' if SDMMC\_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.DMAINT is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description       |
|-------|-------------------|
| 0     | No DMA interrupt. |
| 1     | DMA interrupt.    |

### Bit 2 – BLKGE Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR is set to '1', this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to '1', this bit is not set to '1'.

#### In the case of a Read transaction:

This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.

#### In the case of a Write transaction:

This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit can only be set to '1' if SDMMC\_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BLKGE is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No block gap event.               |
| 1     | Transaction stopped at block gap. |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 1 – TRFC Transfer Complete

This bit is set when a read/write transfer and a command with Busy is completed.

#### In the case of a Read Transaction:

This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data has been read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR (after valid data has been read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

#### In the case of a Write Transaction:

This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

#### In the case of command with Busy:

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.TRFC is set to '1'.

Writing this bit to '1' clears this bit.

The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

| TRFC | DATTEO     | Meaning of the status            |
|------|------------|----------------------------------|
| 0    | 0          | Interrupted by another factor    |
| 0    | 1          | Timeout occurred during transfer |
| 1    | Don't Care | Command execution complete       |

| Value | Description                        |
|-------|------------------------------------|
| 0     | Command execution is not complete. |
| 1     | Command execution is complete.     |

### Bit 0 – CMDC Command Complete

This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See CMRINHC in SDMMC\_PSR for details on how to control this bit.

This bit can only be set to '1' if SDMMC\_NISTER.CMDC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CMDC is set to '1'.

Writing this bit to '1' clears this bit.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to '1', it can be considered that the response was not received correctly.

| CMDC       | CMDTEO | Meaning of the status                        |
|------------|--------|----------------------------------------------|
| 0          | 0      | Interrupted by another factor                |
| Don't care | 1      | Response not received within 64 SDCLK cycles |
| 1          | 0      | Response received                            |

| Value | Description          |
|-------|----------------------|
| 0     | No command complete. |
| 1     | Command complete.    |

## 50.12.21 SDMMC Error Interrupt Status Register (SD\_SDIO)

**Name:** SDMMC\_EISTR (SD\_SDIO)  
**Offset:** 0x32  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |    |    |    |    |    |    |      |      |
|--------|----|----|----|----|----|----|------|------|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9    | 8    |
|        |    |    |    |    |    |    | ADMA | ACMD |
| Access |    |    |    |    |    |    | R/W  | R/W  |
| Reset  |    |    |    |    |    |    | 0    | 0    |

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Bit    | 7      | 6      | 5      | 4      | 3      | 2      | 1      | 0      |
|        | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access | R/W    | R/W    | R/W    |        | R/W    | R/W    | R/W    | R/W    |
| Reset  | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      |

**Bit 9 – ADMA** ADMA Error

This bit is set to '1' when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC\_AESR.

In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST\_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC\_AESR indicates that an error occurred in ST\_FDS state. The user may find that the Valid bit is not set at the error descriptor.

This bit can only be set to '1' if SDMMC\_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ADMA is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 8 – ACMD** Auto CMD Error

Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC\_ACESR[4:0] has changed from '0' to '1'. In the case of Auto CMD12, this bit is set to '1', not only when errors occur in Auto CMD12 but also when auto CMD12 is not executed due to the previous command error.

This bit can only be set to '1' if SDMMC\_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ACMD is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 7 – CURLIM Current Limit Error

By setting SD Bus Power (SDBPWR) in SDMMC\_PCR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.

This bit can only be set to '1' if SDMMC\_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CURLIM is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.

This bit can only be set to '1' if SDMMC\_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 5 – DATCRC Data CRC error

This bit is set to '1' when detecting a CRC error when transferring read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATCRC is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 4 – DATTEO Data Timeout Error

This bit is set to '1' when detecting one of following timeout conditions.

- Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SD Host Controller Simplified Specification V3.00”).
- Busy timeout after Write CRC status.
- Write CRC Status timeout.
- Read data timeout

This bit can only be set to '1' if SDMMC\_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATTEO is set to '1'.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 3 – CMDIDX Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.

This bit can only be set to '1' if SDMMC\_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDIDX is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 2 – CMDEND Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.

This bit can only be set to '1' if SDMMC\_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 1 – CMDCRC Command CRC Error

The Command CRC Error is generated in two cases.

If a response is returned and the Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.

The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see the table above).

This bit can only be set to '1' if SDMMC\_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDCRC is set to '1'.

Writing this bit to '1' clears this bit.

### Bit 0 – CMDTEO Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table below, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.

This bit can only be set to '1' if SDMMC\_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDTEO is set to '1'.

Writing this bit to '1' clears this bit.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| CMDCRC | CMDTEO | Types of error         |
|--------|--------|------------------------|
| 0      | 0      | No error               |
| 0      | 1      | Response timeout error |
| 1      | 0      | Response CRC error     |
| 1      | 1      | CMD line conflict      |

## 50.12.22 SDMMC Error Interrupt Status Register (e.MMC)

**Name:** SDMMC\_EISTR (e.MMC)  
**Offset:** 0x32  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |    |    |    |        |    |    |      |      |

| Reset  | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      |

**Bit 12 – BOOTAE** Boot Acknowledge Error

This bit is set to '1' when detecting that the e.MMC Boot Acknowledge Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.BOOTAE is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.BOOTAE is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 9 – ADMA** ADMA Error

This bit is set to 1 when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC\_AESR.

In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST\_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC\_AESR indicates that an error occurred in ST\_FDS state. The user may find that the Valid bit is not set at the error descriptor.

This bit can only be set to '1' if SDMMC\_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ADMA is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 8 – ACMD** Auto CMD Error

Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC\_ACESR[4:0] has changed from 0 to 1. In the case of Auto CMD12, this bit is set to

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

'1', not only when errors occur in Auto CMD12, but also when Auto CMD12 is not executed due to the previous command error.

This bit can only be set to '1' if SDMMC\_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ACMD is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 7 – CURLIM Current Limit Error

By setting SD Bus Power (SDBPWR) in SDMMC\_PSR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.

This bit can only be set to '1' if SDMMC\_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CURLIM is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.

This bit can only be set to '1' if SDMMC\_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### Bit 5 – DATCRC Data CRC Error

This bit is set to '1' when detecting a CRC error during a transfer of read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATCRC is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 4 – DATTEO** Data Timeout error

This bit is set to '1' when detecting one of following timeout conditions.

- Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00” ).
- Busy timeout after Write CRC Status.
- Write CRC Status timeout.
- Read data timeout

This bit can only be set to '1' if SDMMC\_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATTEO is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 3 – CMDIDX** Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.

This bit can only be set to '1' if SDMMC\_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDIDX is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 2 – CMDEND** Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.

This bit can only be set to '1' if SDMMC\_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDEND is set to '1'.

Writing this bit to '1' clears this bit.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bit 1 – CMDCRC** Command CRC Error

The Command CRC Error is generated in two cases.

If a response is returned and Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.

The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see the table “Relations between CMDCRC and CMDTEO”).

This bit can only be set to '1' if SDMMC\_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDCRC is set to '1'.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

Writing this bit to 1 clears this bit.

### Bit 0 – CMDTEO Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table “Relations between CMDCRC and CMDTEO”, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.

This bit can only be set to '1' if SDMMC\_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDTEO is set to '1'.

Writing this bit to '1' clears this bit.

| CMDCRC | CMDTEO | Types of error         |
|--------|--------|------------------------|
| 0      | 0      | No error               |
| 0      | 1      | Response timeout error |
| 1      | 0      | Response CRC error     |
| 1      | 1      | CMD line conflict      |

### 50.12.23 SDMMC Normal Interrupt Status Enable Register (SD\_SDIO)

**Name:** SDMMC\_NISTR (SD\_SDIO)  
**Offset:** 0x34  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |    |    |    |    |    |    |   |      |
|--------|----|----|----|----|----|----|---|------|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8    |
|        |    |    |    |    |    |    |   | CINT |
| Access |    |    |    |    |    |    |   | R/W  |
| Reset  |    |    |    |    |    |    |   | 0    |

|        |      |      |        |        |        |       |      |      |
|--------|------|------|--------|--------|--------|-------|------|------|
| Bit    | 7    | 6    | 5      | 4      | 3      | 2     | 1    | 0    |
|        | CREM | CINS | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access | R/W  | R/W  | R/W    | R/W    | R/W    | R/W   | R/W  | R/W  |
| Reset  | 0    | 0    | 0      | 0      | 0      | 0     | 0    | 0    |

**Bit 8 – CINT** Card Interrupt Status Enable

If this bit is set to 0, the SDMMC clears interrupt requests to the system. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1. The user may clear this bit before servicing the Card Interrupt and may set this bit again after all interrupt requests from the card are cleared to prevent inadvertent interrupts.

0 (MASKED): The CINT status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The CINT status flag in SDMMC\_NISTR is enabled.

**Bit 7 – CREM** Card Removal Status Enable

0 (MASKED): The CREM status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The CREM status flag in SDMMC\_NISTR is enabled.

**Bit 6 – CINS** Card Insertion Status Enable

0 (MASKED): The CINS status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The CINS status flag in SDMMC\_NISTR is enabled.

**Bit 5 – BRDRDY** Buffer Read Ready Status Enable

0 (MASKED): The BRDRDY status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The BRDRDY status flag in SDMMC\_NISTR is enabled.

**Bit 4 – BWRRDY** Buffer Write Ready Status Enable

0 (MASKED): The BWRRDY status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The BWRRDY status flag in SDMMC\_NISTR is enabled.

**Bit 3 – DMAINT** DMA Interrupt Status Enable

0 (MASKED): The DMAINT status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The DMAINT status flag in SDMMC\_NISTR is enabled.

**Bit 2 – BLKGE** Block Gap Event Status Enable

0 (MASKED): The BLKGE status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The BLKGE status flag in SDMMC\_NISTR is enabled.

**Bit 1 – TRFC** Transfer Complete Status Enable

0 (MASKED): The TRFC status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The TRFC status flag in SDMMC\_NISTR is enabled.

**Bit 0 – CMDC** Command Complete Status Enable

0 (MASKED): The CMDC status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The CMDC status flag in SDMMC\_NISTR is enabled.

### 50.12.24 SDMMC Normal Interrupt Status Enable Register (e.MMC)

**Name:** SDMMC\_NISTER (e.MMC)  
**Offset:** 0x34  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |    |        |    |    |    |    |   |   |

| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8    |
|        |    |    |    |    |    |    |   | CINT |
| Access |    |    |    |    |    |    |   | R/W  |
| Reset  |    |    |    |    |    |    |   | 0    |

|        |      |      |        |        |        |       |      |      |
|--------|------|------|--------|--------|--------|-------|------|------|
| Bit    | 7    | 6    | 5      | 4      | 3      | 2     | 1    | 0    |
|        | CREM | CINS | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access | R/W  | R/W  | R/W    | R/W    | R/W    | R/W   | R/W  | R/W  |
| Reset  | 0    | 0    | 0      | 0      | 0      | 0     | 0    | 0    |

**Bit 8 – CINT** Card Interrupt Signal Enable

0 (MASKED): No interrupt is generated when the CINT status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the CINT status rises in SDMMC\_NISTR.

**Bit 7 – CREM** Card Removal Signal Enable

0 (MASKED): No interrupt is generated when the CREM status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the CREM status rises in SDMMC\_NISTR.

**Bit 6 – CINS** Card Insertion Signal Enable

0 (MASKED): No interrupt is generated when the CINS status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the CINS status rises in SDMMC\_NISTR.

**Bit 5 – BRDRDY** Buffer Read Ready Signal Enable

0 (MASKED): No interrupt is generated when the BRDRDY status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the BRDRDY status rises in SDMMC\_NISTR.

**Bit 4 – BWRRDY** Buffer Write Ready Signal Enable

0 (MASKED): No interrupt is generated when the BWRRDY status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the BWRRDY status rises in SDMMC\_NISTR.

**Bit 3 – DMAINT** DMA Interrupt Signal Enable

0 (MASKED): No interrupt is generated when the DMAINT status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the DMAINT status rises in SDMMC\_NISTR.

**Bit 2 – BLKGE** Block Gap Event Signal Enable

0 (MASKED): No interrupt is generated when the BLKGE status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the BLKGE status rises in SDMMC\_NISTR.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

### **Bit 1 – TRFC** Transfer Complete Signal Enable

0 (MASKED): No interrupt is generated when the TRFC status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the TRFC status rises in SDMMC\_NISTR.

### **Bit 0 – CMDC** Command Complete Signal Enable

0 (MASKED): No interrupt is generated when the CMDC status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the CMDC status rises in SDMMC\_NISTR.

### 50.12.28 SDMMC Normal Interrupt Signal Enable Register (e.MMC)

**Name:** SDMMC\_NISIER (e.MMC)  
**Offset:** 0x38  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |    |        |    |    |    |    |   |   |
|--------|----|--------|----|----|----|----|---|---|
| Bit    | 15 | 14     | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    | BOOTAR |    |    |    |    |   |   |
| Access |    | R/W    |    |    |    |    |   |   |
| Reset  |    | 0      |    |    |    |    |   |   |

|        |   |   |        |        |        |       |      |      |
|--------|---|---|--------|--------|--------|-------|------|------|
| Bit    | 7 | 6 | 5      | 4      | 3      | 2     | 1    | 0    |
|        |   |   | BRDRDY | BWRRDY | DMAINT | BLKGE | TRFC | CMDC |
| Access |   |   | R/W    | R/W    | R/W    | R/W   | R/W  | R/W  |
| Reset  |   |   | 0      | 0      | 0      | 0     | 0    | 0    |

**Bit 14 – BOOTAR** Boot Acknowledge Received Signal Enable

0 (MASKED): No interrupt is generated when the BOOTAR status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the BOOTAR status rises in SDMMC\_NISTR.

**Bit 5 – BRDRDY** Buffer Read Ready Signal Enable

0 (MASKED): No interrupt is generated when the BRDRDY status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the BRDRDY status rises in SDMMC\_NISTR.

**Bit 4 – BWRRDY** Buffer Write Ready Signal Enable

0 (MASKED): No interrupt is generated when the BWRRDY status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the BWRRDY status rises in SDMMC\_NISTR.

**Bit 3 – DMAINT** DMA Interrupt Signal Enable

0 (MASKED): No interrupt is generated when the DMAINT status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the DMAINT status rises in SDMMC\_NISTR.

**Bit 2 – BLKGE** Block Gap Event Signal Enable

0 (MASKED): No interrupt is generated when the BLKGE status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the BLKGE status rises in SDMMC\_NISTR.

**Bit 1 – TRFC** Transfer Complete Signal Enable

0 (MASKED): No interrupt is generated when the TRFC status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the TRFC status rises in SDMMC\_NISTR.

**Bit 0 – CMDC** Command Complete Signal Enable

0 (MASKED): No interrupt is generated when the CMDC status rises in SDMMC\_NISTR.

1 (ENABLED): An interrupt is generated when the CMDC status rises in SDMMC\_NISTR.

### 50.12.29 SDMMC Error Interrupt Signal Enable Register (SD\_SDIO)

**Name:** SDMMC\_EISIER (SD\_SDIO)  
**Offset:** 0x3A  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |    |    |    |    |    |    |      |      |
|--------|----|----|----|----|----|----|------|------|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9    | 8    |
|        |    |    |    |    |    |    | ADMA | ACMD |
| Access |    |    |    |    |    |    | R/W  | R/W  |
| Reset  |    |    |    |    |    |    | 0    | 0    |

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Bit    | 7      | 6      | 5      | 4      | 3      | 2      | 1      | 0      |
|        | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access | R/W    | R/W    | R/W    | R/W    | R/W    | R/W    | R/W    | R/W    |
| Reset  | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      |

**Bit 9 – ADMA** ADMA Error Signal Enable

0 (MASKED): No interrupt is generated when the ADMA status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the ADMA status rises in SDMMC\_EISTR.

**Bit 8 – ACMD** Auto CMD Error Signal Enable

0 (MASKED): No interrupt is generated when the ACMD status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the ACMD status rises in SDMMC\_EISTR.

**Bit 7 – CURLIM** Current Limit Error Signal Enable

0 (MASKED): No interrupt is generated when the CURLIM status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CURLIM status rises in SDMMC\_EISTR.

**Bit 6 – DATEND** Data End Bit Error Signal Enable

0 (MASKED): No interrupt is generated when the DATEND status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the DATEND status rises in SDMMC\_EISTR.

**Bit 5 – DATCRC** Data CRC Error Signal Enable

0 (MASKED): No interrupt is generated when the DATCRC status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the DATCRC status rises in SDMMC\_EISTR.

**Bit 4 – DATTEO** Data Timeout Error Signal Enable

0 (MASKED): No interrupt is generated when the DATTEO status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the DATTEO status rises in SDMMC\_EISTR.

**Bit 3 – CMDIDX** Command Index Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.

**Bit 2 – CMDEND** Command End Bit Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.

**Bit 1 – CMDCRC** Command CRC Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.

**Bit 0 – CMDTEO** Command Timeout Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

### 50.12.30 SDMMC Error Interrupt Signal Enable Register (e.MMC)

**Name:** SDMMC\_EISIER (e.MMC)  
**Offset:** 0x3A  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |    |    |    |        |    |    |      |      |
|--------|----|----|----|--------|----|----|------|------|
| Bit    | 15 | 14 | 13 | 12     | 11 | 10 | 9    | 8    |
|        |    |    |    | BOOTAE |    |    | ADMA | ACMD |
| Access |    |    |    |        |    |    |      |      |
| Reset  |    |    |    | 0      |    |    | 0    | 0    |

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Bit    | 7      | 6      | 5      | 4      | 3      | 2      | 1      | 0      |
|        | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access |        |        |        |        |        |        |        |        |
| Reset  | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      |

**Bit 12 – BOOTAE** Boot Acknowledge Error Signal Enable

0 (MASKED): No interrupt is generated when the BOOTAE status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the BOOTAE status rises in SDMMC\_EISTR.

**Bit 9 – ADMA** ADMA Error Signal Enable

0 (MASKED): No interrupt is generated when the ADMA status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the ADMA status rises in SDMMC\_EISTR.

**Bit 8 – ACMD** Auto CMD Error Signal Enable

0 (MASKED): No interrupt is generated when the ACMD status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the ACMD status rises in SDMMC\_EISTR.

**Bit 7 – CURLIM** Current Limit Error Signal Enable

0 (MASKED): No interrupt is generated when the CURLIM status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CURLIM status rises in SDMMC\_EISTR.

**Bit 6 – DATEND** Data End Bit Error Signal Enable

0 (MASKED): No interrupt is generated when the DATEND status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the DATEND status rises in SDMMC\_EISTR.

**Bit 5 – DATCRC** Data CRC Error Signal Enable

0 (MASKED): No interrupt is generated when the DATCRC status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the DATCRC status rises in SDMMC\_EISTR.

**Bit 4 – DATTEO** Data Timeout Error Signal Enable

0 (MASKED): No interrupt is generated when the DATTEO status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the DATTEO status rises in SDMMC\_EISTR.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

### **Bit 3 – CMDIDX** Command Index Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.

### **Bit 2 – CMDEND** Command End Bit Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.

### **Bit 1 – CMDCRC** Command CRC Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.

### **Bit 0 – CMDTEO** Command Timeout Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

### 50.12.31 SDMMC Auto CMD Error Status Register

**Name:** SDMMC\_ACESR  
**Offset:** 0x3C  
**Reset:** 0x0000  
**Property:** Read-only

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |       |   |   |         |         |         |         |          |
|--------|-------|---|---|---------|---------|---------|---------|----------|
| Bit    | 7     | 6 | 5 | 4       | 3       | 2       | 1       | 0        |
|        | CMDNI |   |   | ACMDIDX | ACMDEND | ACMDCRC | ACMDTEO | ACMD12NE |
| Access | R     |   |   | R       | R       | R       | R       | R        |
| Reset  | 0     |   |   | 0       | 0       | 0       | 0       | 0        |

#### Bit 7 – CMDNI Command Not Issued by Auto CMD12 Error

This bit is set to 1 when CMD\_wo\_DAT is not executed due to an Auto CMD12 error (SDMMC\_ACESR[4:1]). This bit is set to 0 when Auto CMD Error is generated by Auto CMD23.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

#### Bit 4 – ACMDIDX Auto CMD Index Error

This bit is set to 1 when the Command Index error occurs in response to a command.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

#### Bit 3 – ACMDEND Auto CMD End Bit Error

This bit is set to 1 when detecting that the end bit of the command response is 0.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

#### Bit 2 – ACMDCRC Auto CMD CRC Error

This bit is set to 1 when detecting a CRC error in the command response (see [the table above](#) for more details).

#### Bit 1 – ACMDTEO Auto CMD Timeout Error

This bit is set to 1 if no response is returned within 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, the other error status bits (SDMMC\_ACESR[4:2]) are meaningless.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

**Table 50-4. Relation between ACMDCRC and ACMDTEO**

| ACMDCRC | ACMDTEO | Types of error         |
|---------|---------|------------------------|
| 0       | 0       | No error               |
| 0       | 1       | Response Timeout error |
| 1       | 0       | Response CRC error     |
| 1       | 1       | CMD line conflict      |

**Bit 0 – ACMD12NE** Auto CMD12 Not Executed

If a memory multiple block data transfer is not started due to a command error, this bit is not set to 1 because it is not necessary to issue Auto CMD12. Setting this bit to 1 means the SDMMC cannot issue Auto CMD12 to stop a memory multiple block data transfer due to some error. If this bit is set to 1, other error status bits (SDMMC\_ACESR[4:1]) are meaningless.

This bit is set to 0 when an Auto CMD error is generated by Auto CMD23.

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

### 50.12.32 SDMMC Host Control 2 Register (SD\_SDIO)

**Name:** SDMMC\_HC2R (SD\_SDIO)  
**Offset:** 0x3E  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

|        |        |         |    |    |    |    |   |   |
|--------|--------|---------|----|----|----|----|---|---|
| Bit    | 15     | 14      | 13 | 12 | 11 | 10 | 9 | 8 |
|        | PVALEN | ASINTEN |    |    |    |    |   |   |
| Access | R/W    | R/W     |    |    |    |    |   |   |
| Reset  | 0      | 0       |    |    |    |    |   |   |

|        |         |       |             |     |        |            |     |     |
|--------|---------|-------|-------------|-----|--------|------------|-----|-----|
| Bit    | 7       | 6     | 5           | 4   | 3      | 2          | 1   | 0   |
|        | SCLKSEL | EXTUN | DRVSEL[1:0] |     | VS18EN | UHSMS[2:0] |     |     |
| Access | R/W     | R/W   | R/W         | R/W | R/W    | R/W        | R/W | R/W |
| Reset  | 0       | 0     | 0           | 0   | 0      | 0          | 0   | 0   |

#### Bit 15 – PVALEN Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When PVALEN is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC\_PVR.

If this bit is set to 0, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the user.

If this bit is set to 1, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the SDMMC as specified in SDMMC\_PVR.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | SDCLK and Driver strength are controlled by the user. |
| 1     | Automatic selection by Preset Value is enabled.       |

#### Bit 14 – ASINTEN Asynchronous Interrupt Enable

This bit can be set to 1 if a card supports asynchronous interrupts and Asynchronous Interrupt Support (ASINTSUP) is set to 1 in SDMMC\_CA0R. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode. If this bit is set to 1, the user can stop the SDCLK during the asynchronous interrupt period to save power. During this period, the SDMMC continues to deliver the Card Interrupt to the host when it is asserted by the card.

| Value | Description |
|-------|-------------|
| 0     | Disabled    |
| 1     | Enabled     |

#### Bit 7 – SCLKSEL Sampling Clock Select

The SDMMC uses this bit to select the sampling clock to receive CMD and DAT.

This bit is set by the tuning procedure and is valid after completion of tuning (when EXTUN is cleared). Setting 1 means that tuning is completed successfully and setting 0 means that tuning has failed.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by writing to 0. This bit can be cleared by setting EXTUN to 1. Once the tuning circuit is reset, it takes time to complete the tuning sequence. Therefore, the user should keep this bit to 1 to perform a retuning sequence to complete a retuning sequence in a short time. Changing this bit is not allowed while the SDMMC is receiving a response or a read data block. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | The fixed clock is used to sample data. |
| 1     | The tuned clock is used to sample data. |

### Bit 6 – EXTUN Execute Tuning

This bit is set to 1 to start the tuning procedure and is automatically cleared when the tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select (SCLKSEL). The tuning procedure is aborted by writing 0. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description                    |
|-------|--------------------------------|
| 0     | Not tuned or tuning completed. |
| 1     | Execute tuning.                |

### Bits 5:4 – DRVSEL[1:0] Driver Strength Select

The SDMMC output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set according to the Driver Type A, C and D support bits in SDMMC\_CA1R.

This field depends on the setting of Preset Value Enable (PVALEN):

- PVALEN = 0: This field is set by the user.
- PVALEN = 1: This field is automatically set by a value specified in one of the SDMMC\_PVRx.

| Value | Name  | Description                         |
|-------|-------|-------------------------------------|
| 0     | TYPEB | Driver Type B is selected (Default) |
| 1     | TYPEA | Driver Type A is selected           |
| 2     | TYPEC | Driver Type C is selected           |
| 3     | TYPED | Driver Type D is selected           |

### Bit 3 – VS18EN 1.8V Signaling Enable

This bit controls the SDMMC\_1V8SEL output, which in turn may control an external voltage regulator for the I/O cell and card I/Os. 3.3V or some other fixed voltage is supplied to the card/device regardless of the signaling voltage.

Setting this bit from 0 to 1 starts changing the signal voltage from 3.3V to 1.8V. The 1.8V regulator output must be stable within 5 ms.

Clearing this bit from 1 to 0 starts changing the signal voltage from 1.8V to 3.3V. The 3.3V regulator output must be stable within 5 ms.

The user can set this bit to 1 when the SDMMC supports 1.8V signaling (one of the support bits is set to 1: SDR50SUP, SDR104SUP or DDR50SUP in SDMMC\_CA1R) and the card or device supports UHS-I (S18A = 1. See “Bus Switch Voltage Switch Sequence in the “Physical Layer Simplified Specification V3.01” ).

| Value | Description     |
|-------|-----------------|
| 0     | 3.3V signaling. |
| 1     | 1.8V signaling. |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bits 2:0 – UHSMS[2:0] UHS Mode Select

This field is used to select one of the UHS-I modes and is effective when 1.8V Signal Enable (VS18EN) is set to 1.

This field is effective only if SDMMC\_MC1R.DDR is set to 0.

If Preset Value Enable is set to 1, the SDMMC sets SDCLK Frequency Select (SDCLKFSEL), Clock Generator Select (CLKGSEL) in SDMMC\_CCR and Driver Strength Select (DRVSEL) according to SDMMC\_PVR. In this case, one of the preset value registers is selected by this field. The user needs to reset SD Clock Enable (SDCLKEN) before changing this field to avoid generating a clock glitch. After setting this field, the user sets SDCLKEN to 1 again.

| Value | Name   | Description     |
|-------|--------|-----------------|
| 0     | SDR12  | UHS SDR12 Mode  |
| 1     | SDR25  | UHS SDR25 Mode  |
| 2     | SDR50  | UHS SDR50 Mode  |
| 3     | SDR104 | UHS SDR104 Mode |
| 4     | DDR50  | UHS DDR50 Mode  |

### 50.12.33 SDMMC Host Control 2 Register (e.MMC)

**Name:** SDMMC\_HC2R (e.MMC)  
**Offset:** 0x3E  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

|        |        |    |    |    |    |    |   |   |
|--------|--------|----|----|----|----|----|---|---|
| Bit    | 15     | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        | PVALEN |    |    |    |    |    |   |   |
| Access | R/W    |    |    |    |    |    |   |   |
| Reset  | 0      |    |    |    |    |    |   |   |

|        |         |       |             |     |              |     |     |     |
|--------|---------|-------|-------------|-----|--------------|-----|-----|-----|
| Bit    | 7       | 6     | 5           | 4   | 3            | 2   | 1   | 0   |
|        | SCLKSEL | EXTUN | DRVSEL[1:0] |     | HS200EN[3:0] |     |     |     |
| Access | R/W     | R/W   | R/W         | R/W | R/W          | R/W | R/W | R/W |
| Reset  | 0       | 0     | 0           | 0   | 0            | 0   | 0   | 0   |

#### Bit 15 – PVALEN Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When Preset Value Enable (PVALEN) is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC\_PVR.

If this bit is set to 0, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the user.

If this bit is set to 1, SDCLKFSEL, CLKGSEL in SDMMC\_CCR and DRVSEL in SDMMC\_HC2R are set by the SDMMC as specified in SDMMC\_PVR.

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | SDCLK and Driver strength are controlled by the user. |
| 1     | Automatic selection by Preset Value is enabled.       |

#### Bit 7 – SCLKSEL Sampling Clock Select

The SDMMC uses this bit to select the sampling clock to receive CMD and DAT.

This bit is set by the tuning procedure and is valid after completion of tuning (when EXTUN is cleared). Setting 1 means that tuning is completed successfully and setting 0 means that tuning has failed.

Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by writing to 0. This bit can be cleared by setting EXTUN to 1. Once the tuning circuit is reset, it takes time to complete a tuning sequence. Therefore, the user should keep this bit to 1 to perform a retuning sequence to complete a retuning sequence in a short time. Changing this bit is not allowed while the SDMMC is receiving a response or a read data block. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | The fixed clock is used to sample data. |
| 1     | The tuned clock is used to sample data. |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 6 – EXTUN Execute Tuning

This bit is set to 1 to start the tuning procedure and is automatically cleared when the tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select (SCLKSEL). The tuning procedure is aborted by writing 0. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

| Value | Description                   |
|-------|-------------------------------|
| 0     | Not tuned or tuning completed |
| 1     | Execute tuning                |

### Bits 5:4 – DRVSEL[1:0] Driver Strength Select

The SDMMC output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set according to the Driver Type A, C and D support bits in SDMMC\_CA1R.

This field depends on setting of Preset Value Enable (PVALEN):

- PVALEN = 0: This field is set by the user.
- PVALEN = 1: This field is automatically set by a value specified in one of the SDMMC\_PVRx.

| Value | Name  | Description                         |
|-------|-------|-------------------------------------|
| 0     | TYPEB | Driver Type B is selected (Default) |
| 1     | TYPEA | Driver Type A is selected           |
| 2     | TYPEC | Driver Type C is selected           |
| 3     | TYPED | Driver Type D is selected           |

### Bits 3:0 – HS200EN[3:0] HS200 Mode Enable

This field is used to select the e.MMC HS200 mode. When HS200EN is set to B<sub>(hexa)</sub>, the HS200 mode is enabled. Any other value except 0 is forbidden when interfacing an e.MMC device.

If Preset Value Enable is set to 1, SDMMC sets SDCLK Frequency Select (SDCLKFSEL), Clock Generator Select (CLKGSEL) in SDMMC\_CCR and Driver Strength Select (DRVSEL) according to SDMMC\_PVR. In this case, one of the preset value registers is selected by this field. The user needs to reset SD Clock Enable (SDCLKEN) before changing this field to avoid generating a clock glitch. After setting this field, the user sets SDCLKEN to 1 again.

Note: This field is effective only if DDR in SDMMC\_MC1R is set to 0.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.34 SDMMC Capabilities 0 Register

**Name:** SDMMC\_CA0R

**Offset:** 0x40

**Property:** Read/Write

**Reset:** Register reset values depend on the instance of the SDMMC:

| Instance | Reset Value |
|----------|-------------|
| SDMMC0   | 0x27EC0C8C  |
| SDMMC1   | 0x27E80C8C  |

**Note:** The Capabilities 0 Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC\_CACR.

|        |               |         |          |         |          |              |              |         |
|--------|---------------|---------|----------|---------|----------|--------------|--------------|---------|
| Bit    | 31            | 30      | 29       | 28      | 27       | 26           | 25           | 24      |
|        | SLTYPE[1:0]   |         | ASINTSUP | SB64SUP |          | V18VSUP      | V30VSUP      | V33VSUP |
| Access | R/W           | R/W     | R/W      | R/W     |          | R/W          | R/W          | R/W     |
| Reset  |               |         |          |         |          |              |              |         |
| Bit    | 23            | 22      | 21       | 20      | 19       | 18           | 17           | 16      |

| Access | R/W           | R/W     | R/W      |         | R/W      | R/W          | R/W          | R/W     |
| Reset  |               |         |          |         |          |              |              |         |
| Bit    | 15            | 14      | 13       | 12      | 11       | 10           | 9            | 8       |
|        | BASECLKF[7:0] |         |          |         |          |              |              |         |
| Access | R/W           | R/W     | R/W      | R/W     | R/W      | R/W          | R/W          | R/W     |
| Reset  |               |         |          |         |          |              |              |         |
| Bit    | 7             | 6       | 5        | 4       | 3        | 2            | 1            | 0       |
|        | TEOCLKU       |         |          |         |          | TEOCLKF[5:0] |              |         |
| Access | R/W           |         | R/W      | R/W     | R/W      | R/W          | R/W          | R/W     |
| Reset  |               |         |          |         |          |              |              |         |

#### Bits 31:30 – SLTYPE[1:0] Slot Type

This field indicates usage of a slot by a specific system. An SDMMC control register set is defined per slot.

Embedded Slot for One Device means that only one nonremovable device is connected to a bus slot.

The Standard Host Driver controls a removable card (SLTYPE = 0) or one embedded device (SLTYPE = 1) connected to an SD bus slot.

| Value | Name                         |
|-------|------------------------------|
| 0     | Removable Card Slot          |
| 1     | Embedded Slot for One Device |
| 2     | Reserved                     |
| 3     | Reserved                     |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 29 – ASINTSUP Asynchronous Interrupt Support

See section “Asynchronous Interrupt” in the “SDIO Simplified Specification V3.00” .

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Asynchronous interrupt not supported. |
| 1     | Asynchronous interrupt supported.     |

### Bit 28 – SB64SUP 64-Bit System Bus Support

Reading this bit to 1 means that the SDMMC supports the 64-bit Address Descriptor mode and is connected to the 64-bit address system bus.

| Value | Description                       |
|-------|-----------------------------------|
| 0     | 64-bit address bus not supported. |
| 1     | 64-bit address bus supported.     |

### Bit 26 – V18VSUP Voltage Support 1.8V

| Value | Description                        |
|-------|------------------------------------|
| 0     | 1.8V Voltage supply not supported. |
| 1     | 1.8V Voltage supply supported.     |

### Bit 25 – V30VSUP Voltage Support 3.0V

| Value | Description                        |
|-------|------------------------------------|
| 0     | 3.0V Voltage supply not supported. |
| 1     | 3.0V Voltage supply supported.     |

### Bit 24 – V33VSUP Voltage Support 3.3V

| Value | Description                        |
|-------|------------------------------------|
| 0     | 3.3V Voltage supply not supported. |
| 1     | 3.3V Voltage supply supported.     |

### Bit 23 – SRSUP Suspend/Resume Support

This bit indicates whether the SDMMC supports the Suspend/Resume functionality. If this bit is set to 0, the user does not issue either Suspend or Resume commands because the Suspend and Resume mechanism (see “Suspend and Resume Mechanism” in the “SD Host Controller Simplified Specification V3.00” ) is not supported.

| Value | Description                   |
|-------|-------------------------------|
| 0     | Suspend/Resume not supported. |
| 1     | Suspend/Resume supported.     |

### Bit 22 – SDMASUP SDMA Support

This bit indicates whether the SDMMC is capable of using SDMA to transfer data between system memory and the SDMMC directly.

| Value | Description         |
|-------|---------------------|
| 0     | SDMA not supported. |
| 1     | SDMA supported.     |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 21 – HSSUP High Speed Support

This bit indicates whether the SDMMC and the system support High Speed mode and they can supply SDCLK frequency from 25 MHz to 50 MHz.

| Value | Description               |
|-------|---------------------------|
| 0     | High Speed not supported. |
| 1     | High Speed supported.     |

### Bit 19 – ADMA2SUP ADMA2 Support

This bit indicates whether the SDMMC is capable of using ADMA2.

| Value | Description          |
|-------|----------------------|
| 0     | ADMA2 not supported. |
| 1     | ADMA2 supported.     |

### Bit 18 – ED8SUP 8-Bit Support for Embedded Device

This bit indicates whether the SDMMC is capable of using the 8-bit Bus Width mode.

| Value | Description                    |
|-------|--------------------------------|
| 0     | 8-bit bus width not supported. |
| 1     | 8-bit bus width supported.     |

### Bits 17:16 – MAXBLKL[1:0] Max Block Length

This field indicates the maximum block size that the user can read and write to the buffer in the SDMMC. Three sizes can be defined, as shown below. It is noted that the transfer block length is always 512 bytes for SD Memory Cards regardless of this field.

| Value | Name | Description |
|-------|------|-------------|
| 0     | 512  | 512 bytes   |
| 1     | 1024 | 1024 bytes  |
| 2     | 2048 | 2048 bytes  |
| 3     | NONE | Reserved    |

### Bits 15:8 – BASECLKF[7:0] Base Clock Frequency

This value indicates the frequency of the base clock (BASECLK). The user uses this value to calculate the clock divider value (see SDCLK Frequency Select (SDCLKFSEL) in SDMMC\_CCR).

If this field is set to 0, the user must get the information via another method.

$$f_{\text{BASECLK}} = \text{BASECLKF}_{\text{MHz}}$$

### Bit 7 – TEOCLKU Timeout Clock Unit

This bit shows the unit of the base clock frequency used to detect Data Timeout Error.

| Value | Description |
|-------|-------------|
| 0     | KHz         |
| 1     | MHz         |

### Bits 5:0 – TEOCLKF[5:0] Timeout Clock Frequency

This bit shows the timeout clock frequency (TEOCLK) used to detect Data Timeout Error.

If this field is set to 0, the user must get the information via another method.

The Timeout Clock Unit (TEOCLKU) defines the unit of this field's value.

– TEOCLKU = 0:  $f_{\text{TEOCLK}} = \text{TEOCLKF}_{\text{KHz}}$

– TEOCLKU = 1:  $f_{\text{TEOCLK}} = \text{TEOCLKF}_{\text{MHz}}$

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.35 SDMMC Capabilities 1 Register

**Name:** SDMMC\_CA1R  
**Offset:** 0x44  
**Property:** Read/Write

**Note:** The Capabilities 1 Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC\_CACR.

**Note:** Register reset values depend on the instance of the SDMMC:

| Instance | Reset Value |
|----------|-------------|
| SDMMC0   | 0x00200F77  |
| SDMMC1   | 0x00200070  |

|        |              |         |         |         |             |          |           |          |
|--------|--------------|---------|---------|---------|-------------|----------|-----------|----------|
| Bit    | 31           | 30      | 29      | 28      | 27          | 26       | 25        | 24       |
|        |              |         |         |         |             |          |           |          |
| Access |              |         |         |         |             |          |           |          |
| Reset  |              |         |         |         |             |          |           |          |
| Bit    | 23           | 22      | 21      | 20      | 19          | 18       | 17        | 16       |
|        | CLKMULT[7:0] |         |         |         |             |          |           |          |
| Access | R/W          | R/W     | R/W     | R/W     | R/W         | R/W      | R/W       | R/W      |
| Reset  |              |         |         |         |             |          |           |          |
| Bit    | 15           | 14      | 13      | 12      | 11          | 10       | 9         | 8        |
|        | RTMOD[1:0]   |         | TSDR50  |         | TCNTRT[3:0] |          |           |          |
| Access | R/W          | R/W     | R/W     |         | R/W         | R/W      | R/W       | R/W      |
| Reset  |              |         |         |         |             |          |           |          |
| Bit    | 7            | 6       | 5       | 4       | 3           | 2        | 1         | 0        |
|        |              | DRVDSUP | DRVCSUP | DRVASUP |             | DDR50SUP | SDR104SUP | SDR50SUP |
| Access |              | R/W     | R/W     | R/W     |             | R/W      | R/W       | R/W      |
| Reset  |              |         |         |         |             |          |           |          |

#### Bits 23:16 – CLKMULT[7:0] Clock Multiplier

This field indicates the multiplier factor between the Base Clock (BASECLK) used for the Divided Clock Mode and the Multiplied Clock (MULTCLK) used for the Programmable Clock mode (see SDMMC\_CCR).

Reading this field to 0 means that the Programmable Clock mode is not supported.

$$f_{\text{MULTCLK}} = f_{\text{BASECLK}} \times (\text{CLKMULT} + 1)$$

#### Bits 15:14 – RTMOD[1:0] Retuning Modes

This field selects the retuning method and limits the maximum data length.

There are two retuning timings: Retuning Request (RTREQ) controlled by the SDMMC, and expiration of a Retuning timer controlled by the user. By receiving either timing, the user executes the retuning procedure just before a next command issue.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

The maximum data length per read/write command is restricted so that retuning procedures can be inserted during data transfers.

### Retuning Mode 1:

The SDMMC does not have any internal logic to detect when retuning needs to be performed. In this case, the user should maintain all retuning timings by using the Retuning Timer. To enable inserting the retuning procedure during data transfers, the data length per Read/Write command must be limited to 4 Mbytes.

### Retuning Mode 2:

The SDMMC has the capability to indicate the retuning timing by Retuning Request (RTREQ) during data transfers. Then the data length per Read/Write command must be limited to 4 Mbytes.

During nondata transfer, retuning timing is determined by either Retuning Request or Retuning Timer. If Retuning Request is used, Retuning Timer should be disabled.

### Retuning Mode 3:

The SDMMC has the capability to take care of the retuning during data transfer (Auto Retuning). Retuning Request is not generated during data transfers and there is no limitation to data length per Read/Write command.

During nondata transfer, retuning timing is determined either by Retuning Request or Retuning Timer. If Retuning Request is used, Retuning Timer should be disabled.

| Value | Name  | Description                                             | Data Length    |
|-------|-------|---------------------------------------------------------|----------------|
| 0     | MODE1 | Timer                                                   | 4 Mbytes (Max) |
| 1     | MODE2 | Timer and Retuning Request                              | 4 Mbytes (Max) |
| 2     | MODE3 | Auto Retuning (for transfer) Timer and Retuning Request | Any            |
| 3     | —     | Reserved                                                | —              |

### Bit 13 – TSDR50 Use Tuning for SDR50

If this bit is set to 1, the SDMMC requires tuning to operate SDR50 (tuning is always required to operate SDR104).

| Value | Description                    |
|-------|--------------------------------|
| 0     | SDR50 does not require tuning. |
| 1     | SDR50 requires tuning.         |

### Bits 11:8 – TCNTRT[3:0] Timer Count For Retuning

This field indicates an initial value of the Retuning Timer for Retuning Mode (RTMOD) 1 to 3. Reading this field at 0 means that the Retuning Timer is disabled. The Retuning Timer initial value ranges from 0 to 1024 seconds.

$$t_{\text{TIMER}} = 2^{(\text{TCNTRT} - 1)} \text{Seconds}$$

### Bit 6 – DRVDSUP Driver Type D Support

| Value | Description                     |
|-------|---------------------------------|
| 0     | Driver type D is not supported. |
| 1     | Driver type D is supported.     |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 5 – DRVCSUP Driver Type C Support

| Value | Description                     |
|-------|---------------------------------|
| 0     | Driver type C is not supported. |
| 1     | Driver type C is supported.     |

### Bit 4 – DRVASUP Driver Type A Support

| Value | Description                     |
|-------|---------------------------------|
| 0     | Driver type A is not supported. |
| 1     | Driver type A is supported.     |

### Bit 2 – DDR50SUP DDR50 Support

| Value | Description                  |
|-------|------------------------------|
| 0     | DDR50 mode is not supported. |
| 1     | DDR50 mode is supported.     |

### Bit 1 – SDR104SUP SDR104 Support

| Value | Description                   |
|-------|-------------------------------|
| 0     | SDR104 mode is not supported. |
| 1     | SDR104 mode is supported.     |

### Bit 0 – SDR50SUP SDR50 Support

| Value | Description                  |
|-------|------------------------------|
| 0     | SDR50 mode is not supported. |
| 1     | SDR50 mode is supported.     |

## 50.12.36 SDMMC Maximum Current Capabilities Register

**Name:** SDMMC\_MCCAR  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

**Note:** The Maximum Current Capabilities Register is not supposed to be written by the user. However, the user can modify preset values only if Capabilities Write Enable (CAPWREN) is set to 1 in SDMMC\_CACR.

|        |                |    |    |    |    |    |    |    |
|--------|----------------|----|----|----|----|----|----|----|
| Bit    | 31             | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
| Access |                |    |    |    |    |    |    |    |
| Reset  |                |    |    |    |    |    |    |    |
| Bit    | 23             | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Access | MAXCUR18V[7:0] |    |    |    |    |    |    |    |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15             | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
| Access | MAXCUR30V[7:0] |    |    |    |    |    |    |    |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7              | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Access | MAXCUR33V[7:0] |    |    |    |    |    |    |    |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 23:16 – MAXCUR18V[7:0]** Maximum Current for 1.8V

This field indicates the maximum current capability for 1.8V voltage. This value is meaningful only if V18VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR18V at 0 means that the user must get information via another method.

$$I_{\max_{mA}} = 4 \times \text{MAXCUR18V}$$

**Bits 15:8 – MAXCUR30V[7:0]** Maximum Current for 3.0V

This field indicates the maximum current capability for 3.0V voltage. This value is meaningful only if V30VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR30V at 0 means that the user must get information via another method.

$$I_{\max_{mA}} = 4 \times \text{MAXCUR30V}$$

**Bits 7:0 – MAXCUR33V[7:0]** Maximum Current for 3.3V

This field indicates the maximum current capability for 3.3V voltage. This value is meaningful only if V33VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR33V at 0 means that the user must get information via another method.

$$I_{\max_{mA}} = 4 \times \text{MAXCUR33V}$$

### 50.12.37 SDMMC Force Event Register for Auto CMD Error Status

**Name:** SDMMC\_FERACES  
**Offset:** 0x50  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |       |   |   |         |         |         |         |          |
|--------|-------|---|---|---------|---------|---------|---------|----------|
| Bit    | 7     | 6 | 5 | 4       | 3       | 2       | 1       | 0        |
|        | CMDNI |   |   | ACMDIDX | ACMDEND | ACMDCRC | ACMDTEO | ACMD12NE |
| Access | W     |   |   | W       | W       | W       | W       | W        |
| Reset  | –     |   |   | –       | –       | –       | –       | –        |

**Bit 7 – CMDNI** Force Event for Command Not Issued by Auto CMD12 Error  
 For test purposes, the user can write this bit to 1 to raise the CMDNI status flag in SDMMC\_ACESR.  
 Writing this bit to 0 has no effect.

**Bit 4 – ACMDIDX** Force Event for Auto CMD Index Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDIDX status flag in SDMMC\_ACESR.  
 Writing this bit to 0 has no effect.

**Bit 3 – ACMDEND** Force Event for Auto CMD End Bit Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDEND status flag in SDMMC\_ACESR.  
 Writing this bit to 0 has no effect.

**Bit 2 – ACMDCRC** Force Event for Auto CMD CRC Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDCRC status flag in SDMMC\_ACESR.  
 Writing this bit to 0 has no effect.

**Bit 1 – ACMDTEO** Force Event for Auto CMD Timeout Error  
 For test purposes, the user can write this bit to 1 to raise the ACMDTEO status flag in SDMMC\_ACESR.  
 Writing this bit to 0 has no effect.

**Bit 0 – ACMD12NE** Force Event for Auto CMD12 Not Executed  
 For test purposes, the user can write this bit to 1 to raise the ACMD12NE status flag in SDMMC\_ACESR.  
 Writing this bit to 0 has no effect.

### 50.12.38 SDMMC Force Event Register for Error Interrupt Status

**Name:** SDMMC\_FEREIS  
**Offset:** 0x52  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |        |    |    |      |      |
|--------|----|----|----|--------|----|----|------|------|
| Bit    | 15 | 14 | 13 | 12     | 11 | 10 | 9    | 8    |
|        |    |    |    | BOOTAE |    |    | ADMA | ACMD |
| Access |    |    |    | W      |    |    | W    | W    |
| Reset  |    |    |    | –      |    |    | –    | –    |

|        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Bit    | 7      | 6      | 5      | 4      | 3      | 2      | 1      | 0      |
|        | CURLIM | DATEND | DATCRC | DATTEO | CMDIDX | CMDEND | CMDCRC | CMDTEO |
| Access | W      | W      | W      | W      | W      | W      | W      | W      |
| Reset  | –      | –      | –      | –      | –      | –      | –      | –      |

**Bit 12 – BOOTAE** Force Event for Boot Acknowledge Error  
 For test purposes, the user can write this bit to 1 to raise the BOOTAE status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 9 – ADMA** Force Event for ADMA Error  
 For test purposes, the user can write this bit to 1 to raise the ADMA status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 8 – ACMD** Force Event for Auto CMD Error  
 For test purposes, the user can write this bit to 1 to raise the ACMD status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 7 – CURLIM** Force Event for Current Limit Error  
 For test purposes, the user can write this bit to 1 to raise the CURLIM status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 6 – DATEND** Force Event for Data End Bit Error  
 For test purposes, the user can write this bit to 1 to raise the DATEND status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 5 – DATCRC** Force Event for Data CRC error  
 For test purposes, the user can write this bit to 1 to raise the DATCRC status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

**Bit 4 – DATTEO** Force Event for Data Timeout error  
 For test purposes, the user can write this bit to 1 to raise the DATTEO status flag in SDMMC\_EISTR.  
 Writing this bit to 0 has no effect.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

---

### **Bit 3 – CMDIDX** Force Event for Command Index Error

For test purposes, the user can write this bit to 1 to raise the CMDIDX status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

### **Bit 2 – CMDEND** Force Event for Command End Bit Error

For test purposes, the user can write this bit to 1 to raise the CDMEND status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

### **Bit 1 – CMDCRC** Force Event for Command CRC Error

For test purposes, the user can write this bit to 1 to raise the CMDCRC status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

### **Bit 0 – CMDTEO** Force Event for Command Timeout Error

For test purposes, the user can write this bit to 1 to raise the CMDTEO status flag in SDMMC\_EISTR.

Writing this bit to 0 has no effect.

## 50.12.39 SDMMC ADMA Error Status Register

**Name:** SDMMC\_AESR  
**Offset:** 0x54  
**Reset:** 0x00  
**Property:** Read-only

|        |   |   |   |   |   |      |            |   |
|--------|---|---|---|---|---|------|------------|---|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2    | 1          | 0 |
|        |   |   |   |   |   | LMIS | ERRST[1:0] |   |
| Access |   |   |   |   |   | R    | R          | R |
| Reset  |   |   |   |   |   | 0    | 0          | 0 |

**Bit 2 – LMIS** ADMA Length Mismatch Error

This error occurs in the following two cases:

- While Block Count Enable (BCEN) is being set, the total data length specified by the Descriptor table is different from that specified by the Block Count (BLKCNT) and Transfer Block Size (BLKSIZE).
- The total data length cannot be divided by the Transfer Block Size (BLKSIZE).

| Value | Description |
|-------|-------------|
| 0     | No error.   |
| 1     | Error.      |

**Bits 1:0 – ERRST[1:0]** ADMA Error State

This field indicates the state of ADMA when an error has occurred during an ADMA data transfer. This field never reads 2 because ADMA never stops in this state.

| Value | Name                      | Description                                             |
|-------|---------------------------|---------------------------------------------------------|
| 0     | ST_STOP (Stop DMA)        | Points to the descriptor following the error descriptor |
| 1     | ST_FDS (Fetch Descriptor) | Points to the error descriptor                          |
| 2     | –                         | (Not used)                                              |
| 3     | ST_TRF (Transfer Data)    | Points to the descriptor following the error descriptor |

## 50.12.40 SDMMC ADMA System Address Register 0

Name: SDMMC\_ASAR0

Offset: 0x58

Reset: 0x00000000

Property: Read/Write

|        |               |     |     |     |     |     |     |     |
|--------|---------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31            | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | ADMASA[31:24] |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23            | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | ADMASA[23:16] |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15            | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | ADMASA[15:8]  |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7             | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | ADMASA[7:0]   |     |     |     |     |     |     |     |
| Access | R/W           | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0             | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – ADMASA[31:0] ADMA System Address**

This field holds the byte address of the executing command of the descriptor table. The 32-bit address descriptor uses SDMMC\_ASAR. At the start of ADMA, the user must set the start address of the descriptor table. The ADMA increments this register address, which points to the next Descriptor line to be fetched.

When the ADMA Error (ADMA) status flag rises, this field holds a valid descriptor address depending on the ADMA Error State (ERRST). The user must program Descriptor Table on 32-bit boundary and set 32-bit boundary address to this register. ADMA2 ignores the lower 2 bits of this register and assumes it to be 0.

### 50.12.41 SDMMC Preset Value Register

**Name:** SDMMC\_PVRx  
**Offset:** 0x60 + x\*0x02 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

One of the Preset Value Registers is effective based on the selected bus speed mode. The table below defines the conditions to select one of the SDMMC\_PVRs.

**Table 50-5. Preset Value Register Select Condition**

| Selected Bus Speed Mode | VS18EN<br>(SDMMC_HC2R) | HSEN<br>(SDMMC_HC1R) | UHSMS<br>(SDMMC_HC2R) |
|-------------------------|------------------------|----------------------|-----------------------|
| Default Speed           | 0                      | 0                    | don't care            |
| High Speed              | 0                      | 1                    | don't care            |
| SDR12                   | 1                      | don't care           | 0                     |
| SDR25                   | 1                      | don't care           | 1                     |
| SDR50                   | 1                      | don't care           | 2                     |
| SDR104/HS200            | 1                      | don't care           | 3                     |
| DDR50                   | 1                      | don't care           | 4                     |
| Reserved                | 1                      | don't care           | Other values          |

The table below shows the effective Preset Value Register according to the Selected Bus Speed mode.

**Table 50-6. Preset Value Registers**

| SDMMC_PVRx | Selected Bus Speed Mode | Signal Voltage |
|------------|-------------------------|----------------|
| SDMMC_PVR0 | Initialization          | 3.3V or 1.8V   |
| SDMMC_PVR1 | Default Speed           | 3.3V           |
| SDMMC_PVR2 | High Speed              | 3.3V           |
| SDMMC_PVR3 | SDR12                   | 1.8V           |
| SDMMC_PVR4 | SDR25                   | 1.8V           |
| SDMMC_PVR5 | SDR50                   | 1.8V           |
| SDMMC_PVR6 | SDR104/HS200            | 1.8V           |
| SDMMC_PVR7 | DDR50                   | 1.8V           |

When Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, SDCLK Frequency Select (SDCLKFSEL) and Clock Generator Select (CLKGSEL) in SDMMC\_CCR, and Driver Strength Select (DRVSEL) in SDMMC\_HC2R are automatically set based on the Selected Bus Speed mode. This means that the user does not need to set these fields when preset is enabled. A Preset Value Register for Initialization (SDMMC\_PVR0) is not selected by Bus Speed mode. Before starting the initialization

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

sequence, the user needs to set a clock preset value to SDCLKFSEL in SDMMC\_CCR. PVALEN can be set to 1 after the initialization is completed.

**Bits 15:14 – DRVSEL[1:0]** Driver Strength Select  
See DRVSEL in SDMMC\_HC2R.

**Bit 10 – CLKGSEL** Clock Generator Select  
See CLKGSEL in SDMMC\_CCR.

**Bits 9:0 – SDCLKFSEL[9:0]** SDCLK Frequency Select  
See SDCLKFSEL in SDMMC\_CCR.

## 50.12.42 SDMMC Slot Interrupt Status Register

Name: SDMMC\_SISR

Offset: 0xFC

Reset: 0x0000

Property: Read-only

|        |    |    |    |    |    |    |             |   |
|--------|----|----|----|----|----|----|-------------|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9           | 8 |
|        |    |    |    |    |    |    |             |   |
| Access |    |    |    |    |    |    |             |   |
| Reset  |    |    |    |    |    |    |             |   |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1           | 0 |
|        |    |    |    |    |    |    | INTSSL[1:0] |   |
| Access |    |    |    |    |    |    | R           | R |
| Reset  |    |    |    |    |    |    | 0           | 0 |

**Bits 1:0 – INTSSL[1:0]** Interrupt Signal for Each Slot

These status bits indicate the logical OR of Interrupt Signals and Wakeup Signal for each SDMMC instance in the product (INTSSL[x] corresponds to SDMMCx instance in the product).

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.43 SDMMC Host Controller Version Register

**Name:** SDMMC\_HCVR  
**Offset:** 0xFE  
**Reset:** 0x1502  
**Property:** Read-only

|        |           |    |    |    |    |    |   |   |
|--------|-----------|----|----|----|----|----|---|---|
| Bit    | 15        | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        | VVER[7:0] |    |    |    |    |    |   |   |
| Access | R         | R  | R  | R  | R  | R  | R | R |
| Reset  |           |    |    |    |    |    |   |   |

| Reset  |           |    |    |    |    |    |   |   |

#### Bits 15:8 – VVER[7:0] Vendor Version Number

Reserved. Value subject to change. No functionality associated. This is the internal version of the module.

#### Bits 7:0 – SVER[7:0] Specification Version Number

This status indicates the SD Host Controller Specification Version.

| Value | Name                                                                                    |
|-------|-----------------------------------------------------------------------------------------|
| 0     | SD Host Specification Version 1.00                                                      |
| 1     | SD Host Specification Version 2.00, including the feature of the ADMA and Test Register |
| 2     | SD Host Specification Version 3.00                                                      |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.44 SDMMC Additional Present State Register

**Name:** SDMMC\_APSR  
**Offset:** 0x200  
**Reset:** –  
**Property:** Read-only

#### Reset:

Reset value depends on the instance of the SDMMC:

| Instance | Reset Value |
|----------|-------------|
| SDMMC0   | 0x0000000F  |
| SDMMC1   | 0x00000000  |

|        |    |    |    |    |             |    |    |    |
|--------|----|----|----|----|-------------|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27          | 26 | 25 | 24 |
|        |    |    |    |    |             |    |    |    |
| Access |    |    |    |    |             |    |    |    |
| Reset  |    |    |    |    |             |    |    |    |
| Bit    | 23 | 22 | 21 | 20 | 19          | 18 | 17 | 16 |
|        |    |    |    |    |             |    |    |    |
| Access |    |    |    |    |             |    |    |    |
| Reset  |    |    |    |    |             |    |    |    |
| Bit    | 15 | 14 | 13 | 12 | 11          | 10 | 9  | 8  |
|        |    |    |    |    |             |    |    |    |
| Access |    |    |    |    |             |    |    |    |
| Reset  |    |    |    |    |             |    |    |    |
| Bit    | 7  | 6  | 5  | 4  | 3           | 2  | 1  | 0  |
|        |    |    |    |    | HDATLL[3:0] |    |    |    |
| Access |    |    |    |    | R           | R  | R  | R  |
| Reset  |    |    |    |    | –           | –  | –  | –  |

#### Bits 3:0 – HDATLL[3:0] DAT[7:4] High Line Level

This status is used to check the DAT[7:4] line level to recover from errors, and for debugging.

### 50.12.45 SDMMC e.MMC Control 1 Register

**Name:** SDMMC\_MC1R  
**Offset:** 0x204  
**Reset:** 0x00  
**Property:** Read/Write

| Bit    | 7   | 6    | 5     | 4   | 3   | 2 | 1           | 0   |
|--------|-----|------|-------|-----|-----|---|-------------|-----|
|        | FCD | RSTN | BOOTA | OPD | DDR |   | CMDTYP[1:0] |     |
| Access | R/W | R/W  | R/W   | R/W | R/W |   | R/W         | R/W |
| Reset  | 0   | 0    | 0     | 0   | 0   |   | 0           | 0   |

#### Bit 7 – FCD e.MMC Force Card Detect

When using e.MMC, the user can set this bit to 1 to bypass the card detection procedure using the SDMMC\_CD signal.

0 (DISABLED): e.MMC Forced Card Detect is disabled. The SDMMC\_CD signal is used and debounce timing is applied.

1 (ENABLED): e.MMC Forced Card Detect is enabled.

#### Bit 6 – RSTN e.MMC Reset Signal

This bit controls the e.MMC reset signal.

| Value | Description               |
|-------|---------------------------|
| 0     | Reset signal is inactive. |
| 1     | Reset signal is active.   |

#### Bit 5 – BOOTA e.MMC Boot Acknowledge Enable

This bit must be set according to the value of BOOT\_ACK in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”).

When this bit is set to 1, the SDMMC waits for boot acknowledge pattern from the e.MMC before receiving boot data.

If the boot acknowledge pattern is wrong, the BOOTAE status flag rises in SDMMC\_EISTR if BOOTAE is set in SDMMC\_EISTER. An interrupt is generated if BOOTAE is set in SDMMC\_EISIER.

If the no boot acknowledge pattern is received, the DATTEO status flag rises in SDMMC\_EISTR if DATTEO is set in SDMMC\_EISTER. An interrupt is generated if DATTEO is set in SDMMC\_EISIER.

#### Bit 4 – OPD e.MMC Open Drain Mode

This bit sets the command line in open drain.

| Value | Description                        |
|-------|------------------------------------|
| 0     | The command line is in push-pull.  |
| 1     | The command line is in open drain. |

#### Bit 3 – DDR e.MMC HSDDR Mode

This bit selects the High Speed DDR mode.

The clock divider (DIV) in SDMMC\_CCR must be set to a value different from 0 when DDR is 1.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

| Value | Description                     |
|-------|---------------------------------|
| 0     | High Speed DDR is not selected. |
| 1     | High Speed DDR is selected.     |

### Bits 1:0 – CMDTYP[1:0] e.MMC Command Type

| Value | Name    | Description                                                                                                                                                      |
|-------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | NORMAL  | The command is not an e.MMC specific command.                                                                                                                    |
| 1     | WAITIRQ | This bit must be set to 1 when the e.MMC is in Interrupt mode (CMD40). See “Interrupt Mode” in the “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” . |
| 2     | STREAM  | This bit must be set to 1 in the case of Stream Read(CMD11) or Stream Write (CMD20). Only effective for e.MMC up to revision 4.41.                               |
| 3     | BOOT    | Starts a Boot Operation mode at the next write to SDMMC_CR. Boot data are read directly from e.MMC device.                                                       |

### 50.12.46 SDMMC e.MMC Control 2 Register

**Name:** SDMMC\_MC2R  
**Offset:** 0x205  
**Reset:** –  
**Property:** Write-only

| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1     | 0     |
|--------|---|---|---|---|---|---|-------|-------|
|        |   |   |   |   |   |   | ABOOT | SRESP |
| Access |   |   |   |   |   |   | W     | W     |
| Reset  |   |   |   |   |   |   | –     | –     |

#### Bit 1 – ABOOT e.MMC Abort Boot

This bit is used to exit from Boot mode. Writing this bit to 1 exits the Boot Operation mode. Writing 0 is ignored.

#### Bit 0 – SRESP e.MMC Abort Wait IRQ

This bit is used to exit from the Interrupt mode. When this bit is written to 1, the SDMMC sends the CMD40 response automatically. This brings the e.MMC from Interrupt mode to the standard Data Transfer mode. Writing this bit to 0 is ignored.

This bit is only effective when CMD\_TYP in SDMMC\_MC1R is set to WAITIRQ.

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.47 SDMMC AHB Control Register

**Name:** SDMMC\_ACR  
**Offset:** 0x208  
**Reset:** 0x00  
**Property:** Read/Write

|        |    |    |    |    |    |    |           |     |
|--------|----|----|----|----|----|----|-----------|-----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25        | 24  |
|        |    |    |    |    |    |    |           |     |
| Access |    |    |    |    |    |    |           |     |
| Reset  |    |    |    |    |    |    |           |     |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17        | 16  |
|        |    |    |    |    |    |    |           |     |
| Access |    |    |    |    |    |    |           |     |
| Reset  |    |    |    |    |    |    |           |     |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9         | 8   |
|        |    |    |    |    |    |    |           |     |
| Access |    |    |    |    |    |    |           |     |
| Reset  |    |    |    |    |    |    |           |     |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1         | 0   |
|        |    |    |    |    |    |    | BMAX[1:0] |     |
| Access |    |    |    |    |    |    | R/W       | R/W |
| Reset  |    |    |    |    |    |    | 0         | 0   |

#### Bits 1:0 – BMAX[1:0] AHB Maximum Burst

This field selects the maximum burst size in case of DMA transfer.

| Value | Name   | Description                          |
|-------|--------|--------------------------------------|
| 0     | INCR16 | The maximum burst size is INCR16.    |
| 1     | INCR8  | The maximum burst size is INCR8.     |
| 2     | INCR4  | The maximum burst size is INCR4.     |
| 3     | SINGLE | Only SINGLE transfers are performed. |

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### 50.12.48 SDMMC Clock Control 2 Register

**Name:** SDMMC\_CC2R  
**Offset:** 0x20C  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |    |    |    |    |         |
|--------|----|----|----|----|----|----|----|---------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24      |
|        |    |    |    |    |    |    |    |         |
| Access |    |    |    |    |    |    |    |         |
| Reset  |    |    |    |    |    |    |    |         |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16      |
|        |    |    |    |    |    |    |    |         |
| Access |    |    |    |    |    |    |    |         |
| Reset  |    |    |    |    |    |    |    |         |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8       |
|        |    |    |    |    |    |    |    |         |
| Access |    |    |    |    |    |    |    |         |
| Reset  |    |    |    |    |    |    |    |         |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0       |
|        |    |    |    |    |    |    |    | FSDCLKD |
| Access |    |    |    |    |    |    |    | R/W     |
| Reset  |    |    |    |    |    |    |    | 0       |

#### Bit 0 – FSDCLKD Force SDCLK Disabled

The user can choose to maintain the SDCLK during 8 SDCLK cycles after the end bit of the last data block in case of a read transaction, or after the end bit of the CRC status in case of a write transaction.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | The SDCLK is forced and it cannot be stopped immediately after the transaction.  |
| 1     | The SDCLK is not forced and it can be stopped immediately after the transaction. |

### 50.12.49 SDMMC Retuning Control 1 Register

**Name:** SDMMC\_RTC1R  
**Offset:** 0x210  
**Reset:** 0x00  
**Property:** Read/Write

| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0     |
|--------|---|---|---|---|---|---|---|-------|
|        |   |   |   |   |   |   |   | TMREN |
| Access |   |   |   |   |   |   |   | R/W   |
| Reset  |   |   |   |   |   |   |   | 0     |

**Bit 0 – TMREN** Retuning Timer Enable

Enable the retuning timer.

0 (DISABLED): The retuning timer is disabled.

1 (ENABLED): The retuning timer is enabled.

#### 50.12.50 SDMMC Retuning Control 2 Register

**Name:** SDMMC\_RTC2R  
**Offset:** 0x211  
**Reset:** –  
**Property:** Write-only

|        |   |   |   |   |   |   |   |     |
|--------|---|---|---|---|---|---|---|-----|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0   |
|        |   |   |   |   |   |   |   | RLD |
| Access |   |   |   |   |   |   |   | W   |
| Reset  |   |   |   |   |   |   |   | –   |

**Bit 0 – RLD** Retuning Timer Reload

This bit is only efficient if the Retuning timer is enabled (SDMMC\_RTC1R.TMREN set to 1). Once the Timer Counter Value (TCVAL) is set to a nonzero value in SDMMC\_RTCVR, setting this bit to 1 starts the timer count. The retuning timer count restarts each time this bit is written to 1.

Writing this bit to 0 has no effect.

### 50.12.51 SDMMC Retuning Counter Value Register

**Name:** SDMMC\_RTCVR  
**Offset:** 0x214  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bits 3:0 – TCVAL[3:0] Retuning Timer Counter Value

The TCVAL value is used to define the time before expiration of the retuning timer where:

$$\text{Time} = 2^{\text{TCVAL} - 1} \text{seconds}$$

This value must range between 1 and 11. Any other value results in the retuning timer being disabled.

**Bits 31:28 – CALPBP[3:0]** Calibration P Bypass Value

Calibration code applied for the p-channel transistors when BPEN is set to 1. This field is ignored if BPEN is 0.

**Bits 27:24 – CALP[3:0]** Calibration P Status

Calibration code for the p-channel transistors to match the required output impedance.

**Bits 23:20 – CALNBP[3:0]** Calibration N Bypass Value

Calibration code applied for the n-channel transistors when BPEN is set to 1. This field is ignored if BPEN is 0.

**Bits 19:16 – CALN[3:0]** Calibration N Status

Calibration code for the n-channel transistors to match the required output impedance.

**Bits 15:8 – CNTVAL[7:0]** Calibration Counter Value

Defines the number of XXXX cycles (divided by 4) required to cover the I/O calibration cell startup time.

$$\text{CNTVAL}_{\text{Minimum}} = \frac{t_{\text{STARTUP}}}{4 \times t_{\text{HCLOCK}}}$$

$$t_{\text{STARTUP}} = 2 \mu\text{s}$$

# SAMA5D2 Series

## Secure Digital MultiMedia Card Controller (SDMMC)

### Bit 6 – BPEN Calibration Bypass Enabled

| Value | Description                                                                                 |
|-------|---------------------------------------------------------------------------------------------|
| 0     | Calibration bypass is not enabled.                                                          |
| 1     | Calibration bypass is enabled. CALPBP and CALNBP codes are applied to the calibration cell. |

### Bit 5 – TUNDIS Calibration During Tuning Disabled

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | Calibration is launched before each tuning. |
| 1     | Calibration is not launched at tuning.      |

### Bit 4 – ALWYSON Calibration Analog Always ON

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | Calibration analog is shut down after each calibration. |
| 1     | Calibration analog remains powered after calibration.   |

### Bits 3:1 – CLKDIV[2:0] Calibration Clock Division

The clock applied to the calibration cell is divided by  $\text{CLKDIV} + 1$

### Bit 0 – EN PADs Calibration Enable

| Value | Description                     |
|-------|---------------------------------|
| 0     | SDMMC I/O calibration disabled. |
| 1     | SDMMC I/O calibration enabled.  |

## **51. Image Sensor Controller (ISC)**

### **51.1 Description**

The Image Sensor Controller (ISC) system manages incoming data from a parallel sensor. It supports a single active interface. The parallel interface protocol can use a free-running clock or a gated clock strategy. It supports the ITU-R BT 656/1120 422 protocol with a data width of 8 bits or 10 bits and raw Bayer format. The internal image processor includes adjustable white balance, color filter array interpolation, color correction, gamma correction, 12 bits to 10 bits compression, programmable color space conversion, horizontal and vertical chrominance subsampling module. The module also integrates a triple channel direct memory access controller master interface.

### **51.2 Embedded Characteristics**

- Parallel 12-bit Interface for Raw Bayer, YCbCr, Monochrome and JPEG Compressed Sensor Interface
- BT.601/656/1120 Video Interface Supported
- Progressive Systems and Segmented Frame Systems
- Raw Bayer, YCbCr, Luminance (Black and White) Pixel Format Supported
- Resolution up to 2592 x 1944
- Input Pixel Clock up to 96 MHz
- Output Master Clock Generation
- Cropping
- Adjustable White Balance
- Raw Bayer Color Filter Array Interpolation
- Color Correction
- Gamma Correction
- Color Space Conversion
- Contrast and Brightness Control
- 4:4:4 to 4:2:2 Subsamplers
- 4:2:2 to 4:2:0 Subsamplers
- Rounding, Limiting and Packing unit
- Histogram Generation
- System Interface: Direct Memory Access Interface with Packed, Semi Planar and Planar output format
- Output Memory Format: 16 bpp RGB, 32 bpp RGB, 16 bpp, YCbCr 444, YCbCr 422, YCbCr 420, up to 12 bit raw Bayer

## 51.3 Block Diagram and Use Cases

### 51.3.1 Image Sensor Controller Functional Diagrams

**Figure 51-1. ISC Block Diagram**

**Figure 51-2. ISC Raw Bayer Signal Processor**

The ISC video pipeline integrates the following submodules:

- PFE: Parallel Front End to sample the camera sensor input stream
- WB: Programmable white balance in the Bayer domain
- CFA: Color filter array interpolation module
- CC: Programmable color correction
- GAM: Gamma correction
- CSC: Programmable color space conversion
- CBC: Contrast and Brightness control
- SUB: This module performs YCbCr444 to YCbCr420 chrominance subsampling.
- RLP: This module performs rounding, range limiting and packing of the incoming data.

Figure 51-5. Raw Bayer Sensor with Embedded Image Processor

Figure 51-6. BT656 Video Interface Sensor

**Figure 51-7. Sensor with JPEG Output**

**Figure 51-8. Serial CMOS Sensor with External Parallel Bridge**

## 51.4 Product Dependencies

### 51.4.1 I/O Lines

The pins used for interfacing the ISC are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the ISC pins to their peripheral function. If I/O lines of the ISC are not used by the application, they can be used for other purposes by the PIO controller.

### 51.4.2 Power Management

The peripheral clock is not continuously provided to the ISC. The programmer must first enable the ISC clock in the Power Management Controller (PMC) before using the ISC.

### 51.4.3 Interrupt Sources

The ISC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the ISC interrupt requires the Interrupt Controller to be programmed first.

## 51.5 Functional Description

### 51.5.1 ISC Clock Management

The ISC module provides the `isc_mck` output clock to the image sensor. The `isc_mck` clock has three selectable clock sources (`ISC_CLKCFG.MCSEL`) and one programmable clock divider (`ISC_CLKCFG.MCDIV`). The clock is enabled using the `ISC_CLKEN.MCEN`. The `isc_mck` is driven by the ISC and is the external reference clock of the CMOS sensor.

**Figure 51-9. Clock Divider Block Diagram**

The ISC digital pipeline requires internally a functional clock named `isc_ispck`. This clock is also fully programmable. This `isc_ispck` is enabled using the `ISC_CLKEN.ICEN`. This clock is mandatory for ISC operation. The ISC module is designed to accept input signals that are asynchronous to the `isc_ispck`. Synchronization is done internally as long as the following relationship holds:

`isc_pck` frequency is less than or equal to `isc_ispck`, and `isc_ispck` is greater than or equal to `HCLOCK`.

#### 51.5.1.1 Software Requirement

A software write operation to the `ISC_CLKEN` or `ISC_CLKDIS` register requires double clock domain synchronization and is not permitted when the `ISC_CLKSR.SIP` is asserted.

#### 51.5.2 Parallel Interface Timing Description

The parallel interface protocol supports two operating modes.

**Figure 51-10. Free-Running Pixel Clock**

**Figure 51-11. Gated Pixel Clock**

### 51.5.3 BT.601/656/1120 Embedded Timing Synchronization Operation

The ISC module supports embedded synchronization decoding. When the ISC\_PFE\_CFG0.CCIR656 is set, the decoder is activated and signals `isc_vsync` `isc_hsync` are not used to decode the valid pixels. If the `CCIR10_8N` is set, the bitstream is 10 bits wide, otherwise it is only 8 bits wide. When the `ISC_PFE_CFG0.CCIR_CRC` is set, the decoder automatically corrects the error.

**Figure 51-12. Field/Segment Timing Relationship for Interlaced and Segmented Frame Systems**

**Figure 51-13. Frame Timing Relationship for Progressive Systems**

#### 51.5.4 Parallel Interface External Sensor Connections

##### 51.5.4.1 YCbCr, 10-bit CCIR656 with Embedded Synchronization

This mode is activated when ISC\_PFE\_CFG0.CCIR656 and ISC\_PFE\_CFG0.CCIR10\_8N are both set.

| Interface Bit     | First Word | Second Word | Third Word | Fourth Word |
|-------------------|------------|-------------|------------|-------------|
| isc_data[11](MSB) | 1          | 0           | 0          | 1           |
| isc_data[10]      | 1          | 0           | 0          | F           |
| isc_data[9]       | 1          | 0           | 0          | V           |
| isc_data[8]       | 1          | 0           | 0          | H           |
| isc_data[7]       | 1          | 0           | 0          | P3          |
| isc_data[6]       | 1          | 0           | 0          | P2          |
| isc_data[5]       | 1          | 0           | 0          | P1          |
| isc_data[4]       | 1          | 0           | 0          | P0          |
| isc_data[3]       | 1          | 0           | 0          | 0           |
| isc_data[2]       | 1          | 0           | 0          | 0           |
| isc_data[1]       | Not Used   | Not Used    | Not Used   | Not Used    |
| isc_data[0]       | Not Used   | Not Used    | Not Used   | Not Used    |

##### 51.5.4.2 YCbCr, 8-bit CCIR656 with Embedded Synchronization

This mode is activated when ISC\_PFE\_CFG0.CCIR656 is set and ISC\_PFE\_CFG0.CCIR10\_8N is cleared.

| Interface Bit     | First Word | Second Word | Third Word | Fourth Word |
|-------------------|------------|-------------|------------|-------------|
| isc_data[11](MSB) | 1          | 0           | 0          | 1           |
| isc_data[10]      | 1          | 0           | 0          | F           |
| isc_data[9]       | 1          | 0           | 0          | V           |
| isc_data[8]       | 1          | 0           | 0          | H           |
| isc_data[7]       | 1          | 0           | 0          | P3          |

### 51.5.5 Parallel Front End (PFE) Module

**Figure 51-14. PFE Block Diagram**

The Parallel Front End module performs data resampling across clock domain boundary. It includes a CCIR656 decoder used to convert a standard ITU-R BT.656 stream to 24-bit digital video. It also generates pixels, syncs flags and valid signals to the main video pipeline. It outputs field, video and synchronization signals. The PFE can optionally crop and limit the incoming pixel stream to a predefined horizontal and vertical value. By default, the PFE only relies on the cmos sensor horizontal and vertical reference to sample the incoming pixel stream. A pixel is sampled if, and only if, the vertical and horizontal synchronizations are valid and a pixel clock edge is detected. ISC\_PFE\_CFG0.BPS shows the number of bits per sample. The PFE module outputs a 12-bit data on the vp\_data[11:0] bus, and asserts the vp\_valid signal when the data can be sampled.

| PFE VP_DATA Mapping | Raw Bayer 12-bit | Raw Bayer 10-bit | YUV422 8-bit | YUV422 10-bit | Mono 12-bit |
|---------------------|------------------|------------------|--------------|---------------|-------------|
| VP_DATA[11]         | RGGB[11]         | RGGB[9]          | YC422[7]     | YC422[9]      | Y[11]       |
| VP_DATA[10]         | RGGB[10]         | RGGB[8]          | YC422[6]     | YC422[8]      | Y[10]       |
| VP_DATA[9]          | RGGB[9]          | RGGB[7]          | YC422[5]     | YC422[7]      | Y[9]        |
| VP_DATA[8]          | RGGB[8]          | RGGB[6]          | YC422[4]     | YC422[6]      | Y[8]        |
| VP_DATA[7]          | RGGB[7]          | RGGB[5]          | YC422[3]     | YC422[5]      | Y[7]        |
| VP_DATA[6]          | RGGB[6]          | RGGB[4]          | YC422[2]     | YC422[4]      | Y[6]        |
| VP_DATA[5]          | RGGB[5]          | RGGB[3]          | YC422[1]     | YC422[3]      | Y[5]        |

.....continued

| PFE VP_DATA Mapping | Raw Bayer 12-bit | Raw Bayer 10-bit | YUV422 8-bit  | YUV422 10-bit | Mono 12-bit |
|---------------------|------------------|------------------|---------------|---------------|-------------|
| VP_DATA[4]          | RGGB[4]          | RGGB[2]          | YC422[0]      | YC422[2]      | Y[4]        |
| VP_DATA[3]          | RGGB[3]          | RGGB[1]          | YC422[7] or 0 | YC422[1]      | Y[3]        |
| VP_DATA[2]          | RGGB[2]          | RGGB[0]          | YC422[6] or 0 | YC422[0]      | Y[2]        |
| VP_DATA[1]          | RGGB[1]          | RGGB[9] or 0     | YC422[5] or 0 | YC422[9] or 0 | Y[1]        |
| VP_DATA[0]          | RGGB[0]          | RGGB[8] or 0     | YC422[4] or 0 | YC422[8] or 0 | Y[0]        |

**Note:** When ISC\_PFE\_CFG0.REP is set, missing VP\_DATA LSBs are replaced with replicated LSBs of the incoming stream, otherwise they are forced to zero.

The PFE module also includes logic to synchronize capture request with the incoming pixel stream. Two operating modes are available: Single Shot and Continuous Acquisition. When the ISC\_PFE\_CFG0.CONT is cleared, the ISC transfers a single image to memory,

**Figure 51-15. Single Shot Mode**

**Figure 51-16. Continuous Acquisition Mode**

When Continuous Acquisition mode is activated (ISC\_PFE\_CFG0.CONT is set), the data transfer terminates when either a DMA end of list is reached, a software disable is performed or a software reset is activated. The ISC\_INTSR.DDONE is set at the end of the DMA data transfer.

**Figure 51-17. Continuous Acquisition, DMA Terminated**

The linked list DMA transfer is terminated when an item of the list is programmed with `ISC_DCTRL.DE` cleared or when `ISC_DNDA.NDA` is equal to zero. This configuration also clears `ISC_CTRLISR.CAPTURE` and sets the `ISC_INTSR.LDONE` interrupt flag.

The linked list DMA transfer starts if `ISC_DCTRL.DE` is set and if `ISC_DNDA.NDA` is different from zero.

### 51.5.5.1 Update the ISC Profile

Each ISC register is double-buffered to simplify the software configuration and the synchronization with the associated frame buffer. When the configuration of the ISC is modified, `ISC_CTRLLEN.UPPRO` must be set to transfer the configuration from the input buffer to the ISC video pipeline.

**Figure 51-18. Update Profile Timing Diagram**

### 51.5.5.2 Software Requirements

Writing to the `ISC_CTRLLEN` or `ISC_CTRLDIS` register requires a double domain synchronization, so it is forbidden to write these registers when `ISC_CTRLISR.SIP` is asserted.

### 51.5.6 White Balance (WB) Module

The White Balance (WB) module captures the `vp_data[11:0]` bus from the PFE module when the `vp_valid` signal is asserted, and it generates a `wb_data[11:0]` data along with its validity signal `wb_valid`. When `ISC_WB_CTRL.ENABLE` is set, each Bayer color component (R, Gr, B, Gb) can be manually adjusted using an offset and a gain. The Bayer pattern is adjustable using `ISC_WB_CFG.BAYCFG`.

**Figure 51-19. WB Block Diagram**

There are four {gain, offset} sets for each Bayer component. The output value is clipped.

| ISC_WB_CTRL.ENABLE | WB_DATA Slice | Value                                |
|--------------------|---------------|--------------------------------------|
| 0                  | wb_data[11:0] | vp_data[11:0]                        |
| 1                  | wb_data[11:0] | clipped((vp_data[11:0]+offset)*gain) |

### 51.5.7 Color Filter Array (CFA) Interpolation Module

In a single-sensor system, each cell on the sensor has a specific color filter and microlens positioned above it. The raw data obtained from the sensor do not have the full R/G/B information at each cell position. Color interpolation is required to retrieve the missing components. The CFA module samples the wb\_data[11:0] 12-bit bus when wb\_valid is asserted and generates a 36-bit width data bus cfa\_data[35:0] with the validity bit cfa\_valid.

**Figure 51-20. CFA Block Diagram**

| ISC_CFA_CTRL.ENABLE | CFA_DATA Slice  | Value                               |
|---------------------|-----------------|-------------------------------------|
| 0                   | cfa_data[35:24] | wb_data[11:0]                       |
|                     | cfa_data[23:12] | wb_data[11:0]                       |
|                     | cfa_data[11:0]  | wb_data[11:0]                       |
| 1                   | cfa_data[35:24] | R = spatial_filter_R(wb_data[11:0]) |
|                     | cfa_data[23:12] | G = spatial_filter_G(wb_data[11:0]) |
|                     | cfa_data[11:0]  | B = spatial_filter_B(wb_data[11:0]) |

The filter kernel size is 5, and requires two additional lines to initialize the filter. When ISC\_CFA\_CFG.EITPOL is set, the missing information is interpolated from the nearest neighbor. If ISC\_CFA\_CFG.EITPOL is cleared, only valid pixels are used to initialize the filter kernel, but the output number of lines is less than the input number of lines. In that case, four lines are consumed to fill the kernel.

#### 51.5.7.1 Frame Size Requirement when Edge Interpolation is Off, ISC\_CFA\_CFG.EITPOL Cleared

- Minimum number of rows (in): 5
- Minimum number of columns (in): 5
- Number of rows after CFA: Number of rows (in) - 4

- Number of columns after CFA: Number of columns (in) - 4

### 51.5.7.2 Frame Size Requirement when Edge Interpolation is On, ISC\_CFA\_CFG.EITPOL Set

- Minimum number of rows (in): 3
- Minimum number of columns (in): 3
- Number of rows after CFA: Number of rows (in)
- Number of columns after CFA: Number of columns (in)

### 51.5.7.3 Bayer Mode and Edge Interpolation Description

When Edge Interpolation mode (ISC\_CFA\_CFG.EITPOL) is activated, dummy lines are generated using rows and columns replication.

The CFA module supports four sensor alignments using ISC\_CFA\_CFG.BAYCFG. See the figure below.

**Figure 51-21. Supported Color Filter Array Patterns**

### 51.5.8 Color Correction (CC) Module

RGB color correction is used to compensate for cross color bleeding in the filter used with the image sensor. The module samples the `cfa_data[35:0]` 36-bit bus when `cfa_valid` is asserted and generate a `cc_data[35:0]` 36-bit wide bus and a `cc_valid` signal.

**Figure 51-22. CC Block Diagram**

There are three {gain, offset} sets for color component R, G, B.

| ISC_CC_CTRL.ENABLE | CC_DATA Slice  | Value                                           |
|--------------------|----------------|-------------------------------------------------|
| 0                  | cc_data[35:24] | cfa_data[11:0]                                  |
|                    | cc_data[23:12] | cfa_data[11:0]                                  |
|                    | cc_data[11:0]  | cfa_data[11:0]                                  |
| 1                  | cc_data[35:24] | R=clipped(sum(cfa_data_x * gain_Rx) + offset_R) |
|                    | cc_data[23:12] | G=clipped(sum(cfa_data_x * gain_gx) + offset_g) |
|                    | cc_data[11:0]  | B=clipped(sum(cfa_data_x * gain_Bx) + offset_B) |

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} \text{RRGAIN} & \text{RGGAIN} & \text{RBGAIN} \\ \text{GRGAIN} & \text{GGGAIN} & \text{GBGAIN} \\ \text{BRGAIN} & \text{BGGAIN} & \text{BBGAIN} \end{bmatrix} \times \begin{bmatrix} \text{cfa\_data}[35:24] \\ \text{cfa\_data}[23:12] \\ \text{cfa\_data}[11:0] \end{bmatrix} + \begin{bmatrix} \text{ROFST} \\ \text{GOFST} \\ \text{BOFST} \end{bmatrix}$$

#### 51.5.9 Gamma Curve (GAM) Module

The GAM module samples the cc\_data[35:0] bus when cc\_valid is asserted, and generates gam\_data[29:0] 30-bit width data along with the validity signal gam\_valid. Imaging devices have non-linear characteristics, but the transfer function is approximated by a power function. The intensity of each of the linear RGB components is transformed to a non-linear signal through the use of the gamma correction submodule. The power function is linearly interpolated using 64 breakpoints. This also performs a 12-bit to 10-bit compression. The polynomial for the linear interpolation between breakpoints is  $i$  and  $i + 1$ . Consequently, for each breakpoint, two values are required: constant and slope. The table values are programmable through the user interface when the gamma correction module is disabled (ISC\_GAM\_CTRL.ENABLE is cleared). ISC\_GAM\_RENTRY is used for Red gamma correction. ISC\_GAM\_GENTRY is used for Green gamma correction. ISC\_GAM\_BENTRY is used for Blue gamma correction. Each table entry is composed of a 10-bit (signed) slope and a 10-bit constant.

**Figure 51-23. GAM Block Diagram**

| ISC_GAM_CTRL.ENABLE | ISC_GAM_CTRL.XLUT | GAM_DATA Slice  | Value                               |
|---------------------|-------------------|-----------------|-------------------------------------|
| 0                   | 0                 | gam_data[29:0]  | cc_data[29:0]                       |
| 1                   | 0                 | gam_data[29:20] | cc_data[35:26]                      |

|                     |                   | gam_data[9:0]   | B=piecewise_itpol(cc_data_r[11:0])  |

**Figure 51-24. Piecewise Linear Interpolation Block Diagram**

The interpolation consists of three tables that store the function values GAM\_XENTRY[0:63] where X stands for R, G and B. The input of the table has six bits. It outputs a slope and a constant. The slope is later multiplied by the data lsb (6-bit) and added to a constant. The final value is the gamma-corrected value of the input. This module performs a 12-to-10 compression.

#### 51.5.10 Color Space Conversion (CSC) Module

By converting an image from RGB to YCbCr color space, it is possible to separate Y, Cb and Cr information. The CSC samples the gam\_data[29:0] 30-bit data bus, extracts YCbCr information from the sampled data, and then generates the color-converted data csc\_data[29:0] and the validity signal csc\_valid.

**Figure 51-25. CSC Block Diagram**

| ISC_CSC_CTRL.ENABLE | CSC_DATA Slice  | Value                                                                                               |
|---------------------|-----------------|-----------------------------------------------------------------------------------------------------|
| 0                   | csc_data[29:0]  | gam_data[29:0]                                                                                      |
| 1                   | csc_data[29:20] | $Y = \text{clipped}(\text{sum}(\text{gam\_data\_x} * \text{gain\_Yx}) + \text{offset\_y} \ll 2)$    |
|                     | csc_data[19:10] | $Cb = \text{clipped}(\text{sum}(\text{gam\_data\_x} * \text{gain\_Cbx}) + \text{offset\_cb} \ll 2)$ |
|                     | csc_data[9:0]   | $Cr = \text{clipped}(\text{sum}(\text{gam\_data\_x} * \text{gain\_CrX}) + \text{offset\_cr} \ll 2)$ |

$$\begin{bmatrix} Y \\ CB \\ CR \end{bmatrix} = \begin{bmatrix} YR & YG & YB \\ CBR & CBG & CBB \\ CRR & CRG & CRB \end{bmatrix} \times \begin{bmatrix} \text{gam\_data}[29:20] \\ \text{gam\_data}[19:10] \\ \text{gam\_data}[9:0] \end{bmatrix} + \begin{bmatrix} YOFST \\ CBOFST \\ CROFST \end{bmatrix}$$

#### 51.5.11 Contrast and Brightness

Luminance is adjusted through the use of Brightness Offset and Contrast Gain. Chrominance is left unchanged. The CBC samples the csc\_data[29:0] 30-bit bus when csc\_valid is asserted and generates cbc\_data[29:0] with the validity signal cbc\_valid.

**Figure 51-26. CBC Block Diagram**

| ISC_CBC_CTRL.ENABLE | ISC_CBC_CFG.CCIR | CBC_DATA Slice  | Value                                                                         |
|---------------------|------------------|-----------------|-------------------------------------------------------------------------------|
| 0                   | 0                | cbc_data[29:0]  | csc_data[29:0]                                                                |
| 1                   | 0                | cbc_data[29:20] | $Y = \text{clipped}((\text{csc\_data}[29:20] + \text{offset}) * \text{gain})$ |

### 51.5.12 4:4:4 To 4:2:2 Chrominance Horizontal Subsampler (SUB422) Module

The color space conversion output stream is a full-bandwidth YCbCr 4:4:4 signal. The chrominance subsampling divides the horizontal chrominance sampling rate by two. A horizontal low pass filter is applied to avoid aliasing effect. The SUB422 module samples 444 full scale YCbCr cbc\_data[29:0] 30-bit data, performs horizontal subsampling and generates the sub422\_data[39:0] 40-bit data bus with its validity signal sub422\_valid.

**Figure 51-27. SUB422 Block Diagram**

| ISC_SUB422_CTRL.ENABLE | ISC_SUB422_CFG.CCIR | SUB422_DATA Slice  | Value                                              |
|------------------------|---------------------|--------------------|----------------------------------------------------|
| 0                      | 0                   | sub422_data[29:0]  | cbc_data[29:0]                                     |
| 1                      | 0                   | sub422_data[39:30] | $Y1 = \text{cbc\_data}[29:20]$                     |
|                        |                     | sub422_data[29:20] | $Y0 = \text{cbc\_data}[0:20]$                      |
|                        |                     | sub422_data[19:10] | $Cb = \text{filter\_hor}(\text{cbc\_data}[19:10])$ |
|                        |                     | sub422_data[9:0]   | $Cr = \text{filter\_hor}(\text{cbc\_data}[9:0])$   |

.....continued

| ISC_SUB422_CTRL.ENABLE | ISC_SUB422_CFG.CCIR | SUB422_DATA Slice  | Value              |
|------------------------|---------------------|--------------------|--------------------|
| 1                      | 1                   | sub422_data[39:30] | Y1 = cbc_data[9:0] |
|                        |                     | sub422_data[29:20] | Y0 = cbc_data[9:0] |
|                        |                     | sub422_data[19:10] | Cb = cbc_data[9:0] |
|                        |                     | sub422_data[9:0]   | Cr = cbc_data[9:0] |

The filter\_hor function included in the sub422 module is the chrominance horizontal filter.

| sub422 data slice  | YCbCr mapping    |
|--------------------|------------------|
| sub422_data[39:30] | Y1 (sample n)    |
| sub422_data[29:20] | Y0 (sample n-1)  |
| sub422_data[19:10] | Cb (from filter) |
| sub422_data[9:0]   | Cr (from filter) |

The filter chrominance position is selectable through the use of ISC\_SUB422\_CFG.FILTER.

**Figure 51-28. Cosited Filter Configuration**

**Figure 51-29. Centered Filter Configuration**

The SUB422 module performs luminance and chrominance packing. When the line length is odd, the missing luminance is a copy of the last but one luminance. It also means that the final dma stream written to memory is equal to the original horizontal size plus one when the line length is odd.

| SUB422_DATA Slice  | Line Length Even | Line Length Odd |
|--------------------|------------------|-----------------|
| sub422_data[39:30] | Y(n)             | Y(n-1)          |
| sub422_data[29:20] | Y(n-1)           | Y(n-1)          |
| sub422_data[19:10] | Cb (filtered)    | Cb (filtered)   |
| sub422_data[9:0]   | Cr (filtered)    | Cr (filtered)   |

#### 51.5.13 4:2:2 To 4:2:0 Chrominance Vertical Subampler (SUB420) Module

The chrominance subsampling divides the vertical chrominance sampling rate by two. A vertical low pass filter is applied to avoid aliasing effect. Two different filters are used when the source frame is interlaced, and the filter configuration depends on the field value (the field is propagated in the video pipeline).

**Figure 51-30. SUB420 Block Diagram**

The SUB420 module samples the sub422\_data[39:0] 40-bit data when sub422\_valid is asserted, then it performs a vertical subsampling and generates a valid sub420\_data[39:0] 40-bit word and the corresponding sub420\_valid signal.

| ISC_CFA_CTRL.ENABLE | SUB420_DATA Slice  | Value                          |
|---------------------|--------------------|--------------------------------|
| 0                   | sub420_data[39:0]  | sub422_data[39:0]              |
| 1                   | sub420_data[39:30] | Y1 = sub422_data[39:30]        |
|                     | sub420_data[29:20] | Y0 = sub422_data[29:20]        |
|                     | sub420_data[19:10] | Cb = filter_ver(sub422[19:10]) |
|                     | sub420_data[9:0]   | Cr = filter_ver(sub422[9:0])   |

The vertical filter is a two-tap filter; for progressive content the coefficient  $i \in \{1, 1\}$ . When an interlaced field is downsampled, the coefficients are different between the top and the bottom fields.

**Figure 51-31. Vertical Chrominance Filter for Progressive Content (Cosited Chrominance Example)**

**Figure 51-32. Field-dependent Chrominance Filter for Interlaced Content (Cosited Chrominance Example)**

**Table 51-1. Filter Configuration**

| ISC_SUB420_CTRL.FILTER | Field       | Filter Configuration |
|------------------------|-------------|----------------------|
| 0                      | progressive | {1, 1}               |
| 1                      | 0 (TOP)     | {3, 1}               |
|                        | 1 (BOTTOM)  | {1, 3}               |

**Table 51-2. Output Line Length Configuration**

| SUB420 Input Number of Rows | SUB420 Luminance Rows | SUB420 Chrominance Rows |
|-----------------------------|-----------------------|-------------------------|
| M rows, M odd               | M rows                | (M+1)/2 rows            |
| M rows, M even              | M rows                | M/2 rows                |

#### 51.5.14 Rounding, Limiting and Packing (RLP) Module

This module is used to round, limit and pack in the incoming pixel stream before the DMA master module. The RLP samples the sub420\_data[39:0] 40-bit data bus and generates rlp\_data[31:0] 32-bit data words with the associated validity signal rlp\_valid.

**Figure 51-33. RLP Block Diagram**

| ISC_RLP_CFG | RLP_DATA Slice  | Value             |
|-------------|-----------------|-------------------|
| DAT8        | rlp_data[31:8]  | 0                 |
|             | rlp_data[7:0]   | sub420_data[11:4] |

### 51.5.15 DMA Interface

The descriptor-based DMA interface supports multiple buffers. A DMA stride value shows the offset between two consecutive lines (in bytes). If the stride is set to zero, the frame buffer is contiguous. When ISC\_DCTRL.WB is set (Write Back), the DMA interface performs a single write operation to the ISC\_DCTRL register, and sets ISC\_DCTRL[7] to one and ISC\_DCTRL[6] to the value of the frame field when interlaced content is being used. That means that interlaced fields are tagged with their relevant field values. The Write Back operation is always performed when the whole frame has been transferred to memory.

**Figure 51-34. DMA Engine Block Diagram**

| YC420P         | rlp_data[31:0]        |

When a bus error is detected, an interrupt flag is set. If the error occurs on a write operation, ISC\_INTSR.WERR is asserted. If the error occurs on a read operation, ISC\_INTSR.RERR is asserted. ISC\_INTSR.WERRID gives details on the first error channel identifier.

### 51.5.15.1 Descriptor Memory Address Mapping

| ISC_DCFG.IMODE              | ISC_DAD0.AD0 | ISC_DAD1.AD1 | ISC_DAD2.AD2 |
|-----------------------------|--------------|--------------|--------------|
| PACKED8, PACKED16, PACKED32 | data address | not used     | not used     |
| YC422SP                     | Y address    | CbCr address | not used     |
| YC422P                      | Y address    | Cb address   | Cr address   |
| YC420SP                     | Y address    | CbCr address | not used     |
| YC420P                      | Y address    | Cb address   | Cr address   |

### 51.5.15.2 Descriptor Memory Mapping

Three descriptor views are available. Descriptor view 0 is used when the pixel or data stream is packed. Descriptor view 1 is used for YCbCr semi-planar pixel stream. Descriptor view 2 is used for YCbCr planar pixel stream.

### 51.5.16 Histogram Module

For each possible pixel value, the histogram counts the number of times the value was encountered in the current image. RGGB Bayer, RAW data or luminance histogram are available. There are 512 entries

in the histogram entries, and each histogram bin can count up to  $2^{20}$  data. As the table entries are limited, each bin is actually a range, i.e., least significant bits are ignored. A write to ISC\_CTRLLEN.HISREQ initiates a new histogram. The counting operation ends when ISC\_INTSR.HISDONE is set. At that time, a software or hardware dma transfer copies the table from the interface to the internal or external memory. To clear the table content (for a new operation), use ISC\_CTRLLEN.HISCLR. An automatic clear (reset after read) is available when ISC\_HIS\_CFG.RAR is set. In that case, as soon as the data is read from the table, the table entry is cleared.

### 51.6.1 ISC Control Enable Register 0

**Name:** ISC\_CTRLLEN  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding command.

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |        |   |
|--------|----|----|----|----|----|----|--------|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9      | 8 |
|        |    |    |    |    |    |    | FUPPRO |   |
| Access |    |    |    |    |    |    | W      |   |
| Reset  |    |    |    |    |    |    | –      |   |

|        |   |   |   |   |        |        |       |         |
|--------|---|---|---|---|--------|--------|-------|---------|
| Bit    | 7 | 6 | 5 | 4 | 3      | 2      | 1     | 0       |
|        |   |   |   |   | HISCLR | HISREQ | UPPRO | CAPTURE |
| Access |   |   |   |   | W      | W      | W     | W       |
| Reset  |   |   |   |   | –      | –      | –     | –       |

**Bit 9 – FUPPRO** Force Update Color Profile

**Bit 3 – HISCLR** Histogram Clear

**Bit 2 – HISREQ** Histogram Request

**Bit 1 – UPPRO** Update Profile

**Bit 0 – CAPTURE** Capture Input Stream Command

### 51.6.2 ISC Control Disable Register 0

**Name:** ISC\_CTRLDIS  
**Offset:** 0x04  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Performs the corresponding command.

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |       |
|--------|----|----|----|----|----|----|---|-------|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8     |
|        |    |    |    |    |    |    |   | SWRST |
| Access |    |    |    |    |    |    |   | W     |
| Reset  |    |    |    |    |    |    |   | –     |

|        |   |   |   |   |   |   |   |         |
|--------|---|---|---|---|---|---|---|---------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0       |
|        |   |   |   |   |   |   |   | DISABLE |
| Access |   |   |   |   |   |   |   | W       |
| Reset  |   |   |   |   |   |   |   | –       |

**Bit 8 – SWRST** Software Reset

**Bit 0 – DISABLE** Capture Disable

### 51.6.3 ISC Control Status Register 0

**Name:** ISC\_CTRLR0  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

|        |     |    |    |    |    |    |    |    |
|--------|-----|----|----|----|----|----|----|----|
| Bit    | 31  | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | SIP |    |    |    |    |    |    |    |
| Access | R   |    |    |    |    |    |    |    |
| Reset  | 0   |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |       |   |        |       |         |
|--------|---|---|---|-------|---|--------|-------|---------|
| Bit    | 7 | 6 | 5 | 4     | 3 | 2      | 1     | 0       |
|        |   |   |   | FIELD |   | HISREQ | UPPRO | CAPTURE |
| Access |   |   |   | R     |   | R      | R     | R       |
| Reset  |   |   |   | 0     |   | 0      | 0     | 0       |

#### Bit 31 – SIP Synchronization In Progress

| Value | Description                                       |
|-------|---------------------------------------------------|
| 0     | The double domain synchronization is terminated.  |
| 1     | The double domain synchronization is in progress. |

#### Bit 4 – FIELD Field Status (only relevant when the video stream is interlaced)

| Value | Description                                  |
|-------|----------------------------------------------|
| 0     | The current field/segment is a top field     |
| 1     | The current field/segment is a bottom field. |

#### Bit 2 – HISREQ Histogram Request Pending

| Value | Description                                            |
|-------|--------------------------------------------------------|
| 0     | There is no histogram pending request.                 |
| 1     | Indicates that the histogram request is still pending. |

#### Bit 1 – UPPRO Profile Update Pending

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | There is no profile update pending request.                 |
| 1     | Indicates that the profile update request is still pending. |

---

**Bit 0 – CAPTURE** Capture pending

| Value | Description               |
|-------|---------------------------|
| 0     | Capture mode is disabled. |
| 1     | Capture is pending.       |

### 51.6.4 ISC Parallel Front End Configuration 0 Register

**Name:** ISC\_PFE\_CFG0  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |     |          |     |     |          |    |    |    |
|--------|-----|----------|-----|-----|----------|----|----|----|

|        |      |           |     |     |      |      |      |      |
|--------|------|-----------|-----|-----|------|------|------|------|
| Bit    | 7    | 6         | 5   | 4   | 3    | 2    | 1    | 0    |
|        | CONT | MODE[2:0] |     |     | FPOL | PPOL | VPOL | HPOL |
| Access | R/W  | R/W       | R/W | R/W | R/W  | R/W  | R/W  | R/W  |
| Reset  | 0    | 0         | 0   | 0   | 0    | 0    | 0    | 0    |

#### Bit 31 – REP Up Multiply with Replication

| Value | Description                      |
|-------|----------------------------------|
| 0     | Unused bits are stuck at 0.      |
| 1     | Unused bits are copied from MSB. |

#### Bits 30:28 – BPS[2:0] Bits Per Sample

| Value | Name   | Description  |
|-------|--------|--------------|
| 0     | TWELVE | 12-bit input |
| 1     | ELEVEN | 11-bit input |
| 2     | TEN    | 10-bit input |
| 3     | NINE   | 9-bit input  |
| 4     | EIGHT  | 8-bit input  |

#### Bit 27 – CCIR\_REP CCIR Replication

| Value | Description                      |
|-------|----------------------------------|
| 0     | Unused bits are stuck at 0.      |
| 1     | Unused bits are copied from MSB. |

#### Bits 23:16 – SKIPCNT[7:0] Frame Skipping Counter

### Bit 13 – ROWEN Row Cropping Enable

| Value | Description               |
|-------|---------------------------|
| 0     | Row Cropping is disabled. |
| 1     | Row Cropping is enabled.  |

### Bit 12 – COLEN Column Cropping Enable

| Value | Description                  |
|-------|------------------------------|
| 0     | Column Cropping is disabled. |
| 1     | Column Cropping is enabled.  |

### Bit 11 – CCIR10\_8N CCIR 10 bits or 8 bits

| Value | Description  |
|-------|--------------|
| 0     | 8-bit mode.  |
| 1     | 10-bit mode. |

### Bit 10 – CCIR\_CRC CCIR656 CRC Decoder

| Value | Description                |
|-------|----------------------------|
| 0     | Embedded CRC is discarded. |
| 1     | Embedded CRC is decoded.   |

### Bit 9 – CCIR656 CCIR656 input mode

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | HSYNC and VSYNC signals are used to synchronize the input stream. |
| 1     | Embedded synchronization is used.                                 |

### Bit 8 – GATED Gated input clock

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | The external pixel clock is free running. |
| 1     | The external pixel clock is gated.        |

### Bit 7 – CONT Continuous Acquisition

| Value | Description       |
|-------|-------------------|
| 0     | Single Shot mode. |
| 1     | Video mode.       |

### Bits 6:4 – MODE[2:0] Parallel Front End Mode

| Value | Name         | Description                                                                     |
|-------|--------------|---------------------------------------------------------------------------------|
| 0     | PROGRESSIVE  | Video source is progressive.                                                    |
| 1     | DF_TOP       | Video source is interlaced, two fields are captured starting with top field.    |
| 2     | DF_BOTTOM    | Video source is interlaced, two fields are captured starting with bottom field. |
| 3     | DF_IMMEDIATE | Video source is interlaced, two fields are captured immediately.                |
| 4     | SF_TOP       | Video source is interlaced, one field is captured starting with the top field.  |

# SAMA5D2 Series

## Image Sensor Controller (ISC)

| Value | Name         | Description                                                                       |
|-------|--------------|-----------------------------------------------------------------------------------|
| 5     | SF_BOTTOM    | Video source is interlaced, one field is captured starting with the bottom field. |
| 6     | SF_IMMEDIATE | Video source is interlaced, one field is captured starting immediately.           |

### Bit 3 – FPOL Field Polarity

| Value | Description                                                                        |
|-------|------------------------------------------------------------------------------------|
| 0     | Top field is sampled when F value is 0; Bottom field is sampled when F value is 1. |
| 1     | Top field is sampled when F value is 1; Bottom field is sampled when F value is 0. |

### Bit 2 – PPOL Pixel Clock Polarity

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | The pixel stream is sampled on the rising edge of the pixel clock.  |
| 1     | The pixel stream is sampled on the falling edge of the pixel clock. |

### Bit 1 – VPOL Vertical Synchronization Polarity

| Value | Description                                                                         |
|-------|-------------------------------------------------------------------------------------|
| 0     | VSYNC signal is active high, i.e. valid pixels are sampled when VSYNC is asserted.  |
| 1     | VSYNC signal is active low, i.e. valid pixels are sampled when VSYNC is deasserted. |

### Bit 0 – HPOL Horizontal Synchronization Polarity

| Value | Description                                                                         |
|-------|-------------------------------------------------------------------------------------|
| 0     | HSYNC signal is active high, i.e. valid pixels are sampled when HSYNC is asserted.  |
| 1     | HSYNC signal is active low, i.e. valid pixels are sampled when HSYNC is deasserted. |

### 51.6.5 ISC Parallel Front End Configuration 1 Register

**Name:** ISC\_PFE\_CFG1  
**Offset:** 0x10  
**Reset:** 0x00000000

| Access |   |   |   |   |   |   | W    | W    |
| Reset  |   |   |   |   |   |   | –    | –    |

#### Bit 1 – MCEN Master Clock Enable

| Value | Description               |
|-------|---------------------------|
| 0     | No effect.                |
| 1     | Enables the master clock. |

#### Bit 0 – ICEN ISP Clock Enable

| Value | Description            |
|-------|------------------------|
| 0     | No effect.             |
| 1     | Enables the ISP clock. |

### 51.6.8 ISC Clock Disable Register

**Name:** ISC\_CLKDIS  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Performs the corresponding command.

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Reset  | 0          | 0   | 0   | 0   | 0   | 0   | 0          | 0     |

#### Bits 25:24 – MCSEL[1:0] Master Clock Reference Clock Selection

| Value | Description         |
|-------|---------------------|
| 0     | HCLOCK is selected. |
| 1     | ISCCLK is selected. |
| 2     | GCK is selected.    |

#### Bits 23:16 – MCDIV[7:0] Master Clock Divider

$$f_{mc} = \frac{f_{mref}}{MCDIV + 1}$$

#### Bit 8 – ICSEL ISP Clock Selection

| Value | Description         |
|-------|---------------------|
| 0     | HCLOCK is selected. |
| 1     | ISCCLK is selected. |

#### Bits 7:0 – ICDIV[7:0] ISP Clock Divider

$$f_{cc} = \frac{f_{ccref}}{ICDIV + 1}$$

### 51.6.11 ISC Interrupt Enable Register

**Name:** ISC\_INTEN  
**Offset:** 0x28  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the interrupt.

|        |    |    |    |         |      |      |      |       |
|--------|----|----|----|---------|------|------|------|-------|

**Bit 28 – CCIRERR** CCIR Decoder Error Interrupt Enable

**Bit 27 – HDTO** Horizontal Synchronization Timeout Interrupt Enable

**Bit 26 – VDTO** Vertical Synchronization Timeout Interrupt Enable

**Bit 25 – DAOV** Data Overflow Interrupt Enable

**Bit 24 – VFPOV** Vertical Front Porch Overflow Interrupt Enable

**Bit 20 – RERR** Read Channel Error Interrupt Enable

**Bit 16 – WERR** Write Channel Error Interrupt Enable

**Bit 13 – HISCLR** Histogram Clear Interrupt Enable

**Bit 12 – HISDONE** Histogram Completed Interrupt Enable

**Bit 9 – LDONE** DMA List Done Interrupt Enable

**Bit 8 – DDONE** DMA Done Interrupt Enable

**Bit 5 – DIS** Disable Completed Interrupt Enable

**Bit 4 – SWRST** Software Reset Completed Interrupt Enable

**Bit 1 – HD** Horizontal Synchronization Detection Interrupt Enable

**Bit 0 – VD** Vertical Synchronization Detection Interrupt Enable

### 51.6.12 ISC Interrupt Disable Register

**Name:** ISC\_INTDIS  
**Offset:** 0x2C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the interrupt.

|        |    |    |    |         |      |      |      |       |
|--------|----|----|----|---------|------|------|------|-------|
| Bit    | 31 | 30 | 29 | 28      | 27   | 26   | 25   | 24    |

|        |    |    |        |         |    |    |       |       |
|--------|----|----|--------|---------|----|----|-------|-------|
| Bit    | 15 | 14 | 13     | 12      | 11 | 10 | 9     | 8     |
|        |    |    | HISCLR | HISDONE |    |    | LDONE | DDONE |
| Access |    |    | R      | R       |    |    | R     | R     |
| Reset  |    |    | 0      | 0       |    |    | 0     | 0     |

|        |   |   |     |       |   |   |    |    |
|--------|---|---|-----|-------|---|---|----|----|
| Bit    | 7 | 6 | 5   | 4     | 3 | 2 | 1  | 0  |
|        |   |   | DIS | SWRST |   |   | HD | VD |
| Access |   |   | R   | R     |   |   | R  | R  |
| Reset  |   |   | 0   | 0     |   |   | 0  | 0  |

**Bit 28 – CCIRERR** CCIR Decoder Error Interrupt (cleared on read)

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | No CCIR CRC error detected since the last read of the Interrupt Status register. |
| 1     | A CCIR CRC error has been detected.                                              |

**Bit 27 – HDTO** Horizontal Synchronization Timeout Interrupt (cleared on read)

| Value | Description                                |
|-------|--------------------------------------------|
| 0     | A horizontal synchronization is detected.  |
| 1     | No horizontal synchronization is detected. |

**Bit 26 – VDTO** Vertical Synchronization Timeout Interrupt (cleared on read)

| Value | Description                              |
|-------|------------------------------------------|
| 0     | A vertical synchronization is detected.  |
| 1     | No vertical synchronization is detected. |

**Bit 25 – DAOV** Data Overflow Interrupt (cleared on read)

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | No data overflow error occurred since the last reset of the Interrupt Status register. |
| 1     | A data overflow occurred.                                                              |

**Bit 24 – VFPOV** Vertical Front Porch Overflow Interrupt (cleared on read)

| Value | Description                                                                                  |
|-------|----------------------------------------------------------------------------------------------|
| 0     | No vertical front porch error occurred since the last read of the Interrupt Status register. |
| 1     | The vertical synchronization has been detected but the DMA channel is still busy.            |

**Bit 20 – RERR** Read Channel Error Interrupt (cleared on read)

| Value | Description                                                                 |
|-------|-----------------------------------------------------------------------------|
| 0     | No read channel error since the last read of the Interrupt Status register. |
| 1     | A read channel error occurred when the ISC read the descriptor.             |

**Bits 18:17 – WERRID[1:0]** Write Channel Error Identifier (cleared on read)

| Value | Name | Description                                 |
|-------|------|---------------------------------------------|
| 0     | CH0  | An error occurred for Channel 0 (RAW/RGB/Y) |
| 1     | CH1  | An error occurred for Channel 1 (CbCr/Cb)   |
| 2     | CH2  | An error occurred for Channel 2 (Cr)        |
| 3     | WB   | Write back channel error                    |

**Bit 16 – WERR** Write Channel Error Interrupt (cleared on read)

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | No write channel error since the last read of the Interrupt Status register. |
| 1     | A write channel error occurred.                                              |

**Bit 13 – HISCLR** Histogram Clear Interrupt (cleared on read)

| Value | Description                                                                                        |
|-------|----------------------------------------------------------------------------------------------------|
| 0     | No Histogram Clear Interrupt has been raised since the last read of the Interrupt Status register. |
| 1     | The Histogram Clear Interrupt has occurred.                                                        |

**Bit 12 – HISDONE** Histogram Completed Interrupt (cleared on read)

| Value | Description                                                                                            |
|-------|--------------------------------------------------------------------------------------------------------|
| 0     | No Histogram Completed Interrupt has been raised since the last read of the Interrupt Status register. |
| 1     | The Histogram Completed Interrupt has occurred.                                                        |

**Bit 9 – LDONE** DMA List Done Interrupt (cleared on read)

| Value | Description                                                                                   |
|-------|-----------------------------------------------------------------------------------------------|
| 0     | No DMA List Done Interrupt has occurred since the last read of the Interrupt Status register. |
| 1     | The DMA List Done Interrupt has occurred.                                                     |

**Bit 8 – DDONE** DMA Done Interrupt (cleared on read)

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | No DMA Transfer Done Interrupt has occurred since the last read of the Interrupt Status register. |
| 1     | The DMA Transfer Done Interrupt has occurred.                                                     |

**Bit 5 – DIS** Disable Completed Interrupt (cleared on read)

| Value | Description                                                                        |
|-------|------------------------------------------------------------------------------------|
| 0     | The disable has not occurred since the last read of the Interrupt Status register. |
| 1     | The disable has completed.                                                         |

**Bit 4 – SWRST** Software Reset Completed Interrupt (cleared on read)

| Value | Description                                                                        |
|-------|------------------------------------------------------------------------------------|
| 0     | No software reset completion since the last read of the Interrupt Status register. |
| 1     | The software reset has completed.                                                  |

**Bit 1 – HD** Horizontal Synchronization Detected Interrupt (cleared on read)

| Value | Description                                                                                   |
|-------|-----------------------------------------------------------------------------------------------|
| 0     | No horizontal synchronization detection since the last read of the Interrupt Status register. |
| 1     | A horizontal synchronization has been detected.                                               |

**Bit 0 – VD** Vertical Synchronization Detected Interrupt (cleared on read)

| Value | Description                                                                                 |
|-------|---------------------------------------------------------------------------------------------|
| 0     | No vertical synchronization detection since the last read of the Interrupt Status register. |
| 1     | A vertical synchronization has been detected.                                               |

### 51.6.15 ISC White Balance Control Register

**Name:** ISC\_WB\_CTRL  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |    |    |    |    |        |
|--------|----|----|----|----|----|----|----|--------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24     |
|        |    |    |    |    |    |    |    |        |
| Access |    |    |    |    |    |    |    |        |
| Reset  |    |    |    |    |    |    |    |        |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16     |
|        |    |    |    |    |    |    |    |        |
| Access |    |    |    |    |    |    |    |        |
| Reset  |    |    |    |    |    |    |    |        |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8      |
|        |    |    |    |    |    |    |    |        |
| Access |    |    |    |    |    |    |    |        |
| Reset  |    |    |    |    |    |    |    |        |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0      |
|        |    |    |    |    |    |    |    | ENABLE |
| Access |    |    |    |    |    |    |    | R/W    |
| Reset  |    |    |    |    |    |    |    | 0      |

#### Bit 0 – ENABLE White Balance Enable

| Value | Description                    |
|-------|--------------------------------|
| 0     | The white balance is disabled. |
| 1     | The white balance is enabled.  |

### 51.6.16 ISC White Balance Configuration Register

**Name:** ISC\_WB\_CFG  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |    |    |    |             |     |
|--------|----|----|----|----|----|----|-------------|-----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25          | 24  |

#### Bit 4 – BIPART Bipartite Table Configuration

| Value | Description                                                                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Bipartite table is disabled. There are 64 points of interpolation from 0 to 4095.                                                                          |
| 1     | Bipartite table is enabled. There are 32 points of interpolation (spacing is 8) from 0 to 255, then there are 30 points of interpolation from 256 to 4095. |

#### Bit 3 – RENABLE Gamma Correction Enable for R Channel

| Value | Description                                                                                  |
|-------|----------------------------------------------------------------------------------------------|
| 0     | 12-bit to 10-bit compression is performed skipping two bits.                                 |
| 1     | Piecewise interpolation is used to perform 12-bit to 10-bit compression for the red channel. |

#### Bit 2 – GENABLE Gamma Correction Enable for G Channel

| Value | Description                                                                                    |
|-------|------------------------------------------------------------------------------------------------|
| 0     | 12-bit to 10-bit compression is performed skipping two bits.                                   |
| 1     | Piecewise interpolation is used to perform 12-bit to 10-bit compression for the green channel. |

#### Bit 1 – BENABLE Gamma Correction Enable for B Channel

# SAMA5D2 Series

## Image Sensor Controller (ISC)

| Value | Description                                                                                   |
|-------|-----------------------------------------------------------------------------------------------|
| 0     | 12-bit to 10-bit compression is performed skipping two bits.                                  |
| 1     | Piecewise interpolation is used to perform 12-bit to 10-bit compression for the blue channel. |

**Bit 0 – ENABLE** Gamma Correction Enable

| Value | Description                   |
|-------|-------------------------------|
| 0     | Gamma correction is disabled. |
| 1     | Gamma correction is enabled.  |

| Access |    |    | R/W         | R/W |    | R/W           | R/W | R/W  |
| Reset  |    |    | 0           | 0   |    | 0             | 0   | 0    |

#### Bits 5:4 – FILTER[1:0] Low Pass Filter Selection

| Value | Name    | Description           |
|-------|---------|-----------------------|
| 0     | FILT0CO | Cosited, {1}          |
| 1     | FILT1CE | Centered {1, 1}       |
| 2     | FILT2CO | Cosited {1,2,1}       |
| 3     | FILT3CE | Centered {1, 3, 3, 1} |

#### Bits 2:1 – CCIRMODE[1:0] CCIR656 Byte Ordering

| Value | Name | Description                    |
|-------|------|--------------------------------|
| 0     | CBY  | Byte ordering Cb0, Y0, Cr0, Y1 |
| 1     | CRY  | Byte ordering Cr0, Y0, Cb0, Y1 |
| 2     | YCB  | Byte ordering Y0, Cb0, Y1, Cr0 |
| 3     | YCR  | Byte ordering Y0, Cr0, Y1, Cb0 |

#### Bit 0 – CCIR CCIR656 Input Stream

| Value | Description |
|-------|-------------|
| 0     | Raw mode.   |
| 1     | CCIR mode.  |

#### 51.6.47 ISC Subsampling 4:2:2 to 4:2:0 Control Register

**Name:** ISC\_SUB420\_CTRL  
**Offset:** 0x3CC  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |        |    |    |    |        |
|--------|----|----|----|--------|----|----|----|--------|
| Bit    | 31 | 30 | 29 | 28     | 27 | 26 | 25 | 24     |
|        |    |    |    |        |    |    |    |        |
| Access |    |    |    |        |    |    |    |        |
| Reset  |    |    |    |        |    |    |    |        |
| Bit    | 23 | 22 | 21 | 20     | 19 | 18 | 17 | 16     |
|        |    |    |    |        |    |    |    |        |
| Access |    |    |    |        |    |    |    |        |
| Reset  |    |    |    |        |    |    |    |        |
| Bit    | 15 | 14 | 13 | 12     | 11 | 10 | 9  | 8      |
|        |    |    |    |        |    |    |    |        |
| Access |    |    |    |        |    |    |    |        |
| Reset  |    |    |    |        |    |    |    |        |
| Bit    | 7  | 6  | 5  | 4      | 3  | 2  | 1  | 0      |
|        |    |    |    | FILTER |    |    |    | ENABLE |
| Access |    |    |    | R/W    |    |    |    | R/W    |
| Reset  |    |    |    | 0      |    |    |    | 0      |

**Bit 4 – FILTER** Interlaced or Progressive Chrominance Filter

| Value | Description                                                                                    |
|-------|------------------------------------------------------------------------------------------------|
| 0     | Progressive filter {0.5, 0.5}.                                                                 |
| 1     | Field-dependent filter, top field filter is {0.75, 0.25}, bottom field filter is {0.25, 0.75}. |

**Bit 0 – ENABLE** 4:2:2 to 4:2:0 Vertical Subsampling Filter Enable (Center Aligned)

| Value | Description          |
|-------|----------------------|
| 0     | Subsampler disabled. |
| 1     | Subsampler enabled.  |

| Access | R/W  | R/W   | R/W | R/W |    | R/W        | R/W | R/W |
| Reset  | 0    | 0     | 0   | 0   |    | 0          | 0   | 0   |

#### Bit 7 – DONE Descriptor Processing Status

This bit appears only in the descriptor located in memory and can be used only if WB (Write Back) is set.

| Value | Description                   |
|-------|-------------------------------|
| 0     | Descriptor not processed yet. |
| 1     | Descriptor processed.         |

#### Bit 6 – FIELD Value of Captured Frame Field Signal

This bit is only relevant for interlaced content. It appears only in the descriptor located in memory and can be used only if WB (Write Back) is set.

| Value | Description       |
|-------|-------------------|
| 0     | Field value is 0. |
| 1     | Field value is 1. |

#### Bit 5 – WB Write Back Operation Enable

| Value | Description                        |
|-------|------------------------------------|
| 0     | Write Back operation is skipped.   |
| 1     | Write Back operation is performed. |

#### Bit 4 – IE Interrupt Enable

# SAMA5D2 Series

## Image Sensor Controller (ISC)

| Value | Description                      |
|-------|----------------------------------|
| 0     | DMA Done interrupt is generated. |
| 1     | DMA Done interrupt is not set.   |

### Bits 2:1 – DVIEW[1:0] Descriptor View

| Value | Name       | Description                                |
|-------|------------|--------------------------------------------|
| 0     | PACKED     | Address {0} Stride {0} are updated         |
| 1     | SEMIPLANAR | Address {0,1} Stride {0,1} are updated     |
| 2     | PLANAR     | Address {0,1,2} Stride {0,1,2} are updated |

### Bit 0 – DE Descriptor Enable

| Value | Description          |
|-------|----------------------|
| 0     | Descriptor disabled. |
| 1     | Descriptor enabled.  |

### 51.6.53 ISC DMA Descriptor Address Register

## **52. Controller Area Network (MCAN)**

### **52.1 Description**

The Controller Area Network (MCAN) performs communication according to CAN Protocol Version 2.0 Part A,B and Bosch CAN FD Specification V1.0 (Non-ISO). Additional transceiver hardware is required for connection to the physical layer.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN core to the Message RAM, as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN core, as well as providing transmit status information.

Acceptance filtering is implemented by a combination of up to 128 filter elements, where each element can be configured as a range, as a bit mask, or as a dedicated ID filter.

MCAN implements the non-ISO CAN FD frame format and therefore does not pass the CAN FD Conformance Test according to ISO 16845-1:2016.

---

### **52.2 Embedded Characteristics**

- Classic CAN (2.0 A,B) in Conformance with ISO11898-1:2015 and ISO16845-1:2016
- CAN FD Frame Format according to Bosch CAN FD Specification V1.0 (Non-ISO)
- CAN-FD with up to 64 Data Bytes Supported
- CAN Error Logging
- AUTOSAR Optimized
- SAE J1939 Optimized
- Improved Acceptance Filtering
- Two Configurable Receive FIFOs
- Separate Signalling on Reception of High Priority Messages
- Up to 64 Dedicated Receive Buffers
- Up to 32 Dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM Access for Processor
- Multiple MCANs May Share the Same Message RAM
- Programmable Loop-back Test Mode
- Maskable Module Interrupts
- Support for Asynchronous CAN and System Bus Clocks
- Power-down Support
- Debug on CAN Support

## 52.3 Block Diagram

**Figure 52-1. MCAN Block Diagram**

**Note:** Refer to section “Power Management Controller (PMC)” for details about the bus-independent clock (GCLK).

## 52.4 Product Dependencies

### 52.4.1 I/O Lines

The pins used to interface to the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the CAN pins to their peripheral functions.

### 52.4.2 Power Management

The MCAN can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the MCAN clock.

In order to achieve a stable function of the MCAN, the system bus clock must always be faster than or equal to the CAN clock.

It is recommended to use the CAN clock at frequencies of 20, 40 or 80 MHz. To achieve these frequencies, PMC GCLK must select the UPLLCK (480 MHz) as source clock and divide by 24, 12, or 6. GCLK allows the system bus and processor clock to be modified without affecting the bit rate communication.

### 52.4.3 Interrupt Sources

The two MCAN interrupt lines (MCAN\_INT0, MCAN\_INT1) are connected on internal sources of the Interrupt Controller.

Using the MCAN interrupts requires the Interrupt Controller to be programmed first.

Interrupt sources can be routed either to MCAN\_INT0 or to MCAN\_INT1. By default, all interrupt sources are routed to interrupt line MCAN\_INT0/1. By programming MCAN\_ILE.EINT0 and MCAN\_ILE.EINT1, the interrupt sources can be enabled or disabled separately.

### 52.4.4 Address Configuration

The LSBs [bits 15:2] for each section of the CAN Message RAM are configured in the respective buffer configuration registers as detailed in [Message RAM](#).

The MSBs [bits 31:16] of the CAN Message RAM for CAN0 and CAN1 are configured in 0x00200000.

## 52.5 Functional Description

### 52.5.1 Operating Modes

#### 52.5.1.1 Software Initialization

Software initialization is started by setting bit MCAN\_CCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus\_Off. While MCAN\_CCCR.INIT is set, message transfer from and to the CAN bus is stopped and the status of the CAN bus output CANTX is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MCAN\_CCCR.INIT does not change any configuration register. Resetting MCAN\_CCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits ( $\equiv$  Bus\_Idle) before it can take part in bus activities and start the message transfer.

Access to the MCAN configuration registers is only enabled when both bits MCAN\_CCCR.INIT and MCAN\_CCCR.CCE are set (protected write).

MCAN\_CCCR.CCE can only be configured when MCAN\_CCCR.INIT = '1'. MCAN\_CCCR.CCE is automatically cleared when MCAN\_CCCR.INIT = '0'.

The following registers are cleared when MCAN\_CCCR.CCE = '1':

- High Priority Message Status (MCAN\_HPMS)
- Receive FIFO 0 Status (MCAN\_RXF0S)
- Receive FIFO 1 Status (MCAN\_RXF1S)
- Transmit FIFO/Queue Status (MCAN\_TXFQS)
- Transmit Buffer Request Pending (MCAN\_TXBRP)
- Transmit Buffer Transmission Occurred (MCAN\_TXBTO)
- Transmit Buffer Cancellation Finished (MCAN\_TXBCF)
- Transmit Event FIFO Status (MCAN\_TXEFS)

The Timeout Counter value MCAN\_TOCV.TOC is loaded with the value configured by MCAN\_TOCC.TOP when MCAN\_CCCR.CCE = '1'.

In addition, the state machines of the Tx Handler and Rx Handler are held in idle state while MCAN\_CCCR.CCE = '1'.

The following registers are only writeable while MCAN\_CCCR.CCE = '0'

- Transmit Buffer Add Request (MCAN\_TXBAR)
- Transmit Buffer Cancellation Request (MCAN\_TXBCR)

MCAN\_CCCR.TEST and MCAN\_CCCR.MON can only be set when MCAN\_CCCR.INIT = '1' and MCAN\_CCCR.CCE = '1'. Both bits may be cleared at any time. MCAN\_CCCR.DAR can only be configured when MCAN\_CCCR.INIT = '1' and MCAN\_CCCR.CCE = '1'.

### 52.5.1.2 Normal Operation

Once the MCAN is initialized and MCAN\_CCCR.INIT is cleared, the MCAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted, dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

### 52.5.1.3 CAN FD Operation

There are two variants in the CAN FD frame format, first the CAN FD frame without bit rate switching where the data field of a CAN frame may be longer than 8 bytes. The second variant is the CAN FD frame where control field, data field, and CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame.

The previously reserved bit in CAN frames with 11-bit identifiers and the first previously reserved bit in CAN frames with 29-bit identifiers will now be decoded as FDF bit. FDF = recessive signifies a CAN FD frame, FDF = dominant signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF, res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. The coding of res = recessive is reserved for future expansion of the protocol. In case the MCAN receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting bit MCAN\_PSR.PXE. When Protocol Exception Handling is enabled (MCAN\_CCCR.PXHD = 0), this causes the operation state to change from Receiver (MCAN\_PSR.ACT = 2) to Integrating (MCAN\_PSR.ACT = 00) at the next sample point. In case Protocol Exception Handling is disabled (MCAN\_CCCR.PXHD = 1), the MCAN will treat a recessive res bit as an form error and will respond with an error frame.

CAN FD operation is enabled by programming CCCR.FDOE. In case CCCR.FDOE = '1', transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via bit FDF in the respective Tx Buffer element. With CCCR.FDOE = '0', received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if bit FDF of a Tx Buffer element is set. CCCR.FDOE and CCCR.BRSE can only be changed while CCCR.INIT and CCCR.CCE are both set.

With MCAN\_CCCR.FDOE = 0, the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format. With MCAN\_CCCR.FDOE = 1 and MCAN\_CCCR.BRSE = 0, only bit FDF of a Tx Buffer element is evaluated. With MCAN\_CCCR.FDOE = 1 and MCAN\_CCCR.BRSE = 1, transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching.

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting according to ISO11898-1 until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- Wake-up messages in CAN Partial Networking have to be transmitted in Classic CAN format.

- End-of-line programming in case not all nodes are CAN FD-capable. Non-CAN FD nodes are held in Silent mode until programming has completed. Then all nodes revert to Classic CAN communication.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to the table below.

**Table 52-1. Coding of DLC in CAN FD**

| DLC                  | 9  | 10 | 11 | 12 | 13 | 14 | 15 |
|----------------------|----|----|----|----|----|----|----|
| Number of Data Bytes | 12 | 16 | 20 | 24 | 32 | 48 | 64 |

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal CAN bit timing is used as defined by the Nominal Bit Timing and Prescaler register (MCAN\_NBTP). In the following CAN FD data phase, the data phase CAN bit timing is used as defined by the FastData Bit Timing and Prescaler register (MCAN\_DBTP). The bit timing reverts back from the data phase timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN core clock frequency. Example: with a CAN clock frequency of 20 MHz and the shortest configurable bit time of  $4 t_q$ , the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD and CAN FD with bit rate switching, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

#### 52.5.1.4 Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin CANTX the protocol controller receives the transmitted data from its local CAN transceiver via pin CANRX. The received data is delayed by the transmitter delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transmitter delay, the delay compensation is introduced. Without delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the delay.

##### 52.5.1.4.1 Description

The MCAN protocol unit has implemented a delay compensation mechanism to compensate the delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver.

To check for bit errors during the data phase, the delayed transmit data is compared against the received data at the secondary sample point. If a bit error is detected, the transmitter will react to this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

The transmitter delay compensation enables configurations where the data bit time is shorter than the transmitter delay, it is described in detail in the new ISO11898-1. It is enabled by setting bit MCAN\_DBTP.TDC.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the MCAN's transmit output CANTX through the transceiver to the receive input CANRX plus the transmitter delay compensation offset as configured by

MCAN\_TDCR.TDCO. The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (e.g. half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of CAN core clock periods.

MCAN\_PSR.TDCV shows the actual transmitter delay compensation value. MCAN\_PSR.TDCV is cleared when MCAN\_CCCR.INIT is set and is updated at each transmission of an FD frame while MCAN\_DBTP.TDC is set.

The following boundary conditions have to be considered for the delay compensation implemented in the MCAN:

- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN\_TDCR.TDCO has to be less than 6 bit times in the data phase.
- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN\_TDCR.TDCO has to be less or equal 127 CAN core clock periods. In case this sum exceeds 127 CAN core clock periods, the maximum value of 127 CAN core clock periods is used for delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs.

#### 52.5.1.4.2 Transmitter Delay Measurement

If transmitter delay compensation is enabled by programming MCAN\_DBTP.TDC = '1', the measurement is started within each transmitted CAN FD frame at the falling edge of bit FDF to bit res. The measurement is stopped when this edge is seen at the receive input CANRX of the transmitter.

The resolution of this measurement is one mtq.

**Figure 52-2. Transmitter Delay Measurement**

To avoid that a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in a too early SSP position, the use of a transmitter delay compensation filter window can be enabled by programming MCAN\_TDCR.TDCF.

This defines a minimum value for the SSP position. Dominant edges on CANRX, that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MCAN\_TDCR.TDCF AND CANRX is low.

#### 52.5.1.5 Restricted Operation Mode

In Restricted Operation mode, the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or

overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters are not incremented. The processor can set the MCAN into Restricted Operation mode by setting bit MCAN\_CCCR.ASM. The bit can only be set by the processor when both MCAN\_CCCR.CCE and MCAN\_CCCR.INIT are set to '1'. The bit can be reset by the processor at any time.

Restricted Operation mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation mode, the processor has to reset MCAN\_CCCR.ASM.

The Restricted Operation mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation mode after it has received a valid frame.

**Note:** The Restricted Operation Mode must not be combined with the Loop Back mode (internal or external).

### 52.5.1.6 Bus Monitoring Mode

The MCAN is set in Bus Monitoring mode by setting MCAN\_CCCR.MON. In Bus Monitoring mode (see ISO11898-1, 10.12 Bus monitoring), the MCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus. If the MCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the MCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring mode, the Tx Buffer Request Pending register (MCAN\_TXBRP) is held in reset state.

The Bus Monitoring mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. The figure below shows the connection of signals CANTX and CANRX to the MCAN in Bus Monitoring mode.

**Figure 52-3. Pin Control in Bus Monitoring Mode**

### 52.5.1.7 Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1, 6.3.3 Recovery Management), the MCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MCAN\_CCCR.DAR.

#### 52.5.1.7.1 Frame Transmission in DAR Mode

In DAR mode, all transmissions are automatically cancelled after they start on the CAN bus. A Tx Buffer's Tx Request Pending bit TXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx set  
Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx not set
- Successful transmission in spite of cancellation:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx set  
Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx set
- Arbitration lost or frame transmission disturbed:  
Corresponding Tx Buffer Transmission Occurred bit MCAN\_TXBTO.TOx not set  
Corresponding Tx Buffer Cancellation Finished bit MCAN\_TXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = "10" (transmission in spite of cancellation).

#### 52.5.1.8 Power-down (Sleep Mode)

The MCAN can be set into Power-down mode via bit MCAN\_CCCR.CSR.

When all pending transmission requests have completed, the MCAN waits until bus idle state is detected. Then the MCAN sets MCAN\_CCCR.INIT to prevent any further CAN transfers. Now the MCAN acknowledges that it is ready for power down by setting to one the bit MCAN\_CCCR.CSA. In this state, before the clocks are switched off, further register accesses can be made. A write access to MCAN\_CCCR.INIT will have no effect. Now the bus clock (peripheral clock) and the CAN core clock may be switched off.

To leave Power-down mode, the application has to turn on the MCAN clocks before clearing CC Control Register flag MCAN\_CCCR.CSR. The MCAN will acknowledge this by clearing MCAN\_CCCR.CSA. The application can then restart CAN communication by clearing the bit CCCR.INIT.

#### 52.5.1.9 Test Modes

To enable write access to the MCAN Test register (MCAN\_TEST) (see Section 7.6), bit MCAN\_CCCR.TEST must be set. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin CANTX by programming MCAN\_TEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the MCAN's bit timing and it can drive constant dominant or recessive values. The actual value at pin CANRX can be read from MCAN\_TEST.RX. Both functions can be used to check the CAN bus' physical layer.

Due to the synchronization mechanism between CAN clock and system bus clock domain, there may be a delay of several system bus clock periods between writing to MCAN\_TEST.TX until the new configuration is visible at output pin CANTX. This applies also when reading input pin CANRX via MCAN\_TEST.RX.

**Note:** Test modes should be used for production tests or self-test only. The software control for pin CANTX interferes with all CAN protocol functions. It is not recommended to use test modes for application.

### 52.5.1.9.1 External Loop Back Mode

The MCAN can be set in External Loop Back mode by setting the bit MCAN\_TEST.LBCK. In Loop Back mode, the MCAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into an Rx Buffer or an Rx FIFO. The figure below shows the connection of signals CANTX and CANRX to the MCAN in External Loop Back mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the MCAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back mode. In this mode, the MCAN performs an internal feedback from its Tx output to its Rx input. The actual value of the CANRX input pin is disregarded by the MCAN. The transmitted messages can be monitored at the CANTX pin.

### 52.5.1.9.2 Internal Loop Back Mode

Internal Loop Back mode is entered by setting bits MCAN\_TEST.LBCK and MCAN\_CCCR.MON. This mode can be used for a “Hot Selftest”, meaning the MCAN can be tested without affecting a running CAN system connected to the pins CANTX and CANRX. In this mode, pin CANRX is disconnected from the MCAN, and pin CANTX is held recessive. The figure below shows the connection of CANTX and CANRX to the MCAN when Internal Loop Back mode is enabled.

**Figure 52-4. Pin Control in Loop Back Modes**

### 52.5.2 Timestamp Generation

For timestamp generation, the MCAN supplies a 16-bit wrap-around counter. A prescaler TSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1...16). The counter is readable via MCAN\_TSCV.TSC. A write access to the Timestamp Counter Value register (MCAN\_TSCV) resets the counter to zero. When the timestamp counter wraps around, the interrupt flag MCAN\_IR.TSW is set.

On start of frame reception / transmission, the counter value is captured and stored into the timestamp section of an Rx Buffer / Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

By programming bit MCAN\_TSCC.TSS, an external 16-bit timestamp can be used.

### 52.5.3 Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO, the MCAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by TSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via the Timeout Counter Configuration register (MCAN\_TOCC). The actual counter value can be read from MCAN\_TOCV.TOC. The Timeout Counter can only be started while MCAN\_CCCR.INIT = '0'. It is stopped when MCAN\_CCCR.INIT = '1', e.g. when the MCAN enters Bus\_Off state.

The operating mode is selected by MCAN\_TOCC.TOS. When operating in Continuous mode, the counter starts when MCAN\_CCCR.INIT is reset. A write to MCAN\_TOCV presets the counter to the value configured by MCAN\_TOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN\_TOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MCAN\_TOCV has no effect.

When the counter reaches zero, interrupt flag MCAN\_IR.TOO is set. In Continuous mode, the counter is immediately restarted at MCAN\_TOCC.TOP.

**Note:** The clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the bit rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

### 52.5.4 Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

#### 52.5.4.1 Acceptance Filtering

The MCAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration (MCAN\_GFC)
- Standard ID Filter Configuration (MCAN\_SIDFC)
- Extended ID Filter Configuration (MCAN\_XIDFC)
- Extended ID and Mask (MCAN\_XIDAM)

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag (MCAN\_IR.HPM)

- Set High Priority Message interrupt flag (MCAN\_IR.HPM) and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the effected Rx Buffer or Rx FIFO:

- Rx Buffer  
New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type, see MCAN\_PSR.LEC and MCAN\_PSR.DLEC.
- Rx FIFO  
Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type, see MCAN\_PSR.LEC and MCAN\_PSR.DLEC. In case the matching Rx FIFO is operated in Overwrite mode, the boundary conditions described in [Rx FIFO Overwrite Mode](#) have to be considered.  
**Note:** When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

#### 52.5.4.1.1 Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

- EFT = "00": The Message ID of received frames is ANDed with MCAN\_XIDAM before the range filter is applied.
- EFT = "11": MCAN\_XIDAM is not used for range filtering.

#### 52.5.4.1.2 Filter for Specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

#### 52.5.4.1.3 Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

#### 52.5.4.1.4 Standard Message ID Filtering

The figure below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in [52.5.7.5 Standard Message ID Filter Element](#).

Controlled by MCAN\_GFC and MCAN\_SIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

**Figure 52-5. Standard Message ID Filter Path**

#### **Extended Message ID Filtering**

The figure below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in [52.5.7.6 Extended Message ID Filter Element](#).

Controlled by MCAN\_GFC and MCAN\_XIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

MCAN\_XIDAM is ANDed with the received identifier before the filter list is executed.

**Figure 52-6. Extended Message ID Filter Path**

### 52.5.4.2 Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via the Rx FIFO 0 Configuration register (MCAN\_RXF0C) and the Rx FIFO 1 Configuration register (MCAN\_RXF1C).

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1, see [Acceptance Filtering](#). The Rx FIFO element is described in [Rx Buffer and FIFO Element](#).

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by MCAN\_RXFnC.FnWM, interrupt flag MCAN\_IR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index, an Rx FIFO Full condition is signalled by MCAN\_RXFnS.FnF. In addition, the interrupt flag MCAN\_IR.RFnF is set.

**Figure 52-7. Rx FIFO Status**

When reading from an Rx FIFO, Rx FIFO Get Index  $\text{MCAN\_RXFnS.FnGI} \times \text{FIFO Element Size}$  has to be added to the corresponding Rx FIFO start address  $\text{MCAN\_RXFnC.FnSA}$ .

**Table 52-2. Rx Buffer / FIFO Element Size**

| $\text{MCAN\_RXESC.RBDS}[2:0]$<br>$\text{MCAN\_RXESC.FnDS}[2:0]$ | Data Field<br>[bytes] | FIFO Element Size<br>[RAM words] |
|------------------------------------------------------------------|-----------------------|----------------------------------|
| 0                                                                | 8                     | 4                                |
| 1                                                                | 12                    | 5                                |
| 2                                                                | 16                    | 6                                |
| 3                                                                | 20                    | 7                                |
| 4                                                                | 24                    | 8                                |
| 5                                                                | 32                    | 10                               |
| 6                                                                | 48                    | 14                               |
| 7                                                                | 64                    | 18                               |

#### 52.5.4.2.1 Rx FIFO Blocking Mode

The Rx FIFO Blocking mode is configured by  $\text{MCAN\_RXFnC.FnOM} = '0'$ . This is the default operating mode for the Rx FIFOs.

When an Rx FIFO full condition is reached ( $\text{MCAN\_RXFnS.FnPI} = \text{MCAN\_RXFnS.FnGI}$ ), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by  $\text{MCAN\_RXFnS.FnF} = '1'$ . In addition, the interrupt flag  $\text{MCAN\_IR.RFnF}$  is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by  $\text{MCAN\_RXFnS.RFnL} = '1'$ . In addition, the interrupt flag  $\text{MCAN\_IR.RFnL}$  is set.

#### 52.5.4.2.2 Rx FIFO Overwrite Mode

The Rx FIFO Overwrite mode is configured by  $\text{MCAN\_RXFnC.FnOM} = '1'$ .

When an Rx FIFO full condition ( $\text{MCAN\_RXFnS.FnPI} = \text{MCAN\_RXFnS.FnGI}$ ) is signalled by  $\text{MCAN\_RXFnS.FnF} = '1'$ , the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in Overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the processor is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the processor accesses the Rx FIFO. The figure below shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

**Figure 52-8. Rx FIFO Overflow Handling**

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index  $\text{MCAN\_RXFnA.FnA}$ . This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset ( $\text{MCAN\_RXFnS.FnF} = '0'$ ).

### 52.5.4.3 Dedicated Rx Buffers

The MCAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via  $\text{MCAN\_RXBC.RBSA}$ .

For each Rx Buffer, a Standard or Extended Message ID Filter Element with  $\text{SFEC} / \text{EFEC} = 7$  and  $\text{SFID2} / \text{EFID2}[10:9] = 0$  has to be configured.

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition, the flag  $\text{MCAN\_IR.DRX}$  (Message stored in dedicated Rx Buffer) in  $\text{MCAN\_IR}$  is set.

**Table 52-3. Example Filter Configuration for Rx Buffers**

| Filter Element | SFID1[10:0]<br>EFID1[28:0] | SFID2[10:9]<br>EFID2[10:9] | SFID2[5:0]<br>EFID2[5:0] |
|----------------|----------------------------|----------------------------|--------------------------|
| 0              | ID message 1               | 0                          | 0                        |

| .....continued |                            |                            |                          |
|----------------|----------------------------|----------------------------|--------------------------|
| Filter Element | SFID1[10:0]<br>EFID1[28:0] | SFID2[10:9]<br>EFID2[10:9] | SFID2[5:0]<br>EFID2[5:0] |
| 1              | ID message 2               | 0                          | 1                        |
| 2              | ID message 3               | 0                          | 2                        |

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in the New Data 1 register (MCAN\_NDAT1) and New Data 2 register (MCAN\_NDAT2) is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the processor by writing a '1' to the respective bit position.

While an Rx Buffer's New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

#### 52.5.4.3.1 Rx Buffer Handling

- Reset interrupt flag IR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

#### 52.5.4.4 Debug on CAN Support

Debug messages are stored into Rx Buffers. For debug handling three consecutive Rx buffers (e.g. #61, #62, #63) have to be used for storage of debug messages A, B, and C. The format is the same as for an Rx Buffer or an Rx FIFO element (see [Rx Buffer and FIFO Element](#)).

Advantage: Fixed start address for the DMA transfers (relative to MCAN\_RXBC.RBSA), no additional configuration required.

For filtering of debug messages Standard / Extended Filter Elements with SFEC / EFEC = '111' have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by SFID2 / EFID2[5:0].

After message C has been stored, the DMA request output m\_can\_dma\_req is activated and the three messages can be read from the Message RAM under DMA control. The RAM words holding the debug messages will not be changed by the MCAN while m\_can\_dma\_req is activated. The behavior is similar to that of an Rx Buffer with its New Data flag set.

After the DMA has completed, the MCAN is prepared to receive the next set of debug messages.

##### 52.5.4.4.1 Filtering for Debug Messages

Filtering for debug messages is done by configuring one Standard / Extended Message ID Filter Element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC / EFEC has to be programmed to "111". In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning. While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New Data flag nor MCAN\_IR.DRX are set. The reception of debug messages can be monitored via RXF1S.DMS.

**Table 52-4. Example Filter Configuration for Debug Messages**

| Filter Element | SFID1[10:0]<br>EFID1[28:0] | SFID2[10:9]<br>EFID2[10:9] | SFID2[5:0]<br>EFID2[5:0] |
|----------------|----------------------------|----------------------------|--------------------------|
| 0              | ID debug message A         | 1                          | 11 1101                  |
| 1              | ID debug message B         | 2                          | 11 1110                  |
| 2              | ID debug message C         | 3                          | 11 1111                  |

#### 52.5.4.4.2 Debug Message Handling

The debug message handling state machine ensures that debug messages are stored to three consecutive Rx Buffers in the correct order. If some messages are missing, the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in the correct order.

The status of the debug message handling state machine is signalled via MCAN\_RXF1S.DMS.

**Figure 52-9. Debug Message Handling State Machine**

T0: reset m\_can\_dma\_req output, enable reception of debug messages A, B, and C

T1: reception of debug message A

T2: reception of debug message A

T3: reception of debug message C

T4: reception of debug message B

T5: reception of debug messages A, B

T6: reception of debug message C

T7: DMA transfer completed

T8: reception of debug message A,B,C (message rejected)

#### 52.5.5 Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The CAN mode for transmission (Classic CAN or CAN FD) can be configured separately for each Tx Buffer element. The Tx

Buffer element is described in [Tx Buffer Element](#). The table below describes the possible configurations for frame transmission.

**Table 52-5. Possible Configurations for Frame Transmission**

| MCAN_CCCR |      | Tx Buffer Element |         | Frame Transmission            |
|-----------|------|-------------------|---------|-------------------------------|
| BRSE      | FDOE | FDF               | BRS     |                               |
| ignored   | 0    | ignored           | ignored | Classic CAN                   |
| 0         | 1    | 0                 | ignored | Classic CAN                   |
| 0         | 1    | 1                 | ignored | FD without bit rate switching |
| 1         | 1    | 0                 | ignored | Classic CAN                   |
| 1         | 1    | 1                 | 0       | FD without bit rate switching |
| 1         | 1    | 1                 | 1       | FD with bit rate switching    |

**Note:** AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation.

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when MCAN\_TXBRP is updated, or when a transmission has been started.

### 52.5.5.1 Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MCAN\_CCCR.TXP. If the bit is set, the MCAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MCAN\_CCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against “babbling idiot” scenarios where the application program erroneously requests too many transmissions.

### 52.5.5.2 Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the processor. Each dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an Add Request via MCAN\_TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see the table below). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0...31) × Element Size to the Tx Buffer Start Address TXBC.TBSA.

**Table 52-6. Tx Buffer / FIFO / Queue Element Size**

| TXESC.TBDS[2:0] | Data Field [bytes] | Element Size [RAM words] |
|-----------------|--------------------|--------------------------|
| 0               | 8                  | 4                        |
| 1               | 12                 | 5                        |
| 2               | 16                 | 6                        |
| 3               | 20                 | 7                        |
| 4               | 24                 | 8                        |
| 5               | 32                 | 10                       |
| 6               | 48                 | 14                       |
| 7               | 64                 | 18                       |

### 52.5.5.3 Tx FIFO

Tx FIFO operation is configured by programming MCAN\_TXBC.TFQM to '0'. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MCAN\_TXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The MCAN calculates the Tx FIFO Free Level MCAN\_TXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCAN\_TXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MCAN\_TXFQS.TFQF = '1') is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a '1' to the TXBAR bit related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MCAN\_TXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see the table [Table 52-6](#)). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/ Queue Put Index MCAN\_TXFQS.TFQPI (0...31) × Element Size to the Tx Buffer Start Address MCAN\_TXBC.TBSA.

### 52.5.5.4 Tx Queue

Tx Queue operation is configured by programming MCAN\_TXBC.TFQM to '1'. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx Buffer referenced by the Put Index MCAN\_TXFQS.TFQPI. An Add Request cyclically increments the Put Index to the next free Tx Buffer. In case that the Tx Queue is full (MCAN\_TXFQS.TFQF = '1'), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register MCAN\_TXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see the table [Tx Buffer / FIFO / Queue Element Size](#)). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN\_TXFQS.TFQPI (0...31) × Element Size to the Tx Buffer Start Address MCAN\_TXBC.TBSA.

### 52.5.5.5 Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx FIFO. The number of dedicated Tx Buffers is configured by MCAN\_TXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MCAN\_TXBC.TFQS. In case MCAN\_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

**Figure 52-10. Example of Mixed Configuration Dedicated Tx Buffers / Tx FIFO**

Tx prioritization:

- Scan dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by MCAN\_TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

### 52.5.5.6 Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx Queue. The number of dedicated Tx Buffers is configured by MCAN\_TXBC.NDTB. The number of Tx Queue Buffers is configured by MCAN\_TXBC.TFQS. In case MCAN\_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

**Figure 52-11. Example of Mixed Configuration Dedicated Tx Buffers / Tx Queue**

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

### 52.5.5.7 Transmit Cancellation

The MCAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR-based applications. To cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer, the processor has to write a '1' to the corresponding bit position (=number of Tx Buffer) of register MCAN\_TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MCAN\_TXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding TXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCAN\_TXBTO and MCAN\_TXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MCAN\_TXBCF bit is set.

**Note:** In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

### 52.5.5.8 Tx Event Handling

To support Tx event handling the MCAN has implemented a Tx Event FIFO. After the MCAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in [Debug on CAN Support](#).

When a Tx Event FIFO full condition is signalled by IR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MCAN\_IR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MCAN\_TXEFC.EFWM, interrupt flag MCAN\_IR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCAN\_TXEFS.EFGI has to be added to the Tx Event FIFO start address MCAN\_TXEFC.EFSA.

### 52.5.6 FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index in the registers MCAN\_RXF0A, MCAN\_RXF1A and MCAN\_TXEFA. Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the processor has free access to the MCAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

**Note:** The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The MCAN does not check for erroneous values.

### 52.5.7 Message RAM

#### 52.5.7.1 Message RAM Configuration

The Message RAM has a width of 32 bits. The MCAN module can be configured to allocate up to 4352 words in the Message RAM. It is not necessary to configure each of the sections listed in the figure below, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode, the required Message RAM size depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MCAN\_RXESC.F0DS, MCAN\_RXESC.F1DS, MCAN\_RXESC.RBDS, and MCAN\_TXESC.TBDS.

**Figure 52-12. Message RAM Configuration**

When the MCAN addresses the Message RAM, it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses; i.e., only bits 15 to 2 are evaluated, the two least significant bits are ignored.

**Note:** The MCAN does not check for erroneous configuration of the Message RAM. The configuration of the start addresses of the different sections and the number of elements of each section must be checked carefully to avoid falsification or loss of data.

### 52.5.7.2 Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in the table below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MCAN\_RXESC.

**Table 52-7. Rx Buffer and FIFO Element**

|     |          |           |     |          |            |     |     |          |    |    |            |  |  |   |            |  |  |  |   |
|-----|----------|-----------|-----|----------|------------|-----|-----|----------|----|----|------------|--|--|---|------------|--|--|--|---|
|     | 31       |           |     | 24       | 23         |     |     |          | 16 | 15 |            |  |  | 8 | 7          |  |  |  | 0 |
| R0  | ESI      | XTD       | RTR | ID[28:0] |            |     |     |          |    |    |            |  |  |   |            |  |  |  |   |
| R1  | ANMF     | FIDX[6:0] |     |          | —          | FDF | BRS | DLC[3:0] |    |    | RXTS[15:0] |  |  |   |            |  |  |  |   |

- R0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active.

1: Transmitting node is error passive.

- R0 Bit 30 XTD: Extended Identifier

Signals to the processor whether the received frame has a standard or extended identifier.

0: 11-bit standard identifier.

1: 29-bit extended identifier.

- R0 Bit 29 RTR: Remote Transmission Request

Signals to the processor whether the received frame is a data frame or a remote frame.

0: Received frame is a data frame.

1: Received frame is a remote frame.

**Note:** There are no remote frames in CAN FD format. In case a CAN FD frame was received (FDF = 1), bit RTR reflects the state of the reserved bit r1.

- R0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

- R1 Bit 31 ANMF: Accepted Non-matching Frame

Acceptance of non-matching frames may be enabled via MCAN\_GFC.ANFS and MCAN\_GFC.ANFE.

0: Received frame matching filter index FIDX.

1: Received frame did not match any Rx filter element.

- R1 Bits 30:24 FIDX[6:0]: Filter Index

0-127: Index of matching Rx acceptance filter element (invalid if ANMF = '1').

Range is 0 to MCAN\_SIDFC.LSS - 1 resp. MCAN\_XIDFC.LSE - 1.

- R1 Bit 21 FDF: FD Format

0: Standard frame format.

1: CAN FD frame format (new DLC-coding and CRC).

- R1 Bit 20 BRS: Bit Rate Switch

0: Frame received without bit rate switching.

1: Frame received with bit rate switching.

**Note:**

Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN\_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN\_CCCR.BRSE = 1.

- R1 Bits 19:16 DLC[3:0]: Data Length Code

0-8: CAN + CAN FD: received frame has 0-8 data bytes.

9-15: CAN: received frame has 8 data bytes.

9-15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes.

- R1 Bits 15:0 RXTS[15:0]: Rx Timestamp

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN\_TSCC.TCP.

- R2 Bits 31:24 DB3[7:0]: Data Byte 3

- R2 Bits 23:16 DB2[7:0]: Data Byte 2

- R2 Bits 15:8 DB1[7:0]: Data Byte 1

- R2 Bits 7:0 DB0[7:0]: Data Byte 0

- R3 Bits 31:24 DB7[7:0]: Data Byte 7

- R3 Bits 23:16 DB6[7:0]: Data Byte 6

- R3 Bits 15:8 DB5[7:0]: Data Byte 5

- R3 Bits 7:0 DB4[7:0]: Data Byte 4

... ..

- Rn Bits 31:24 DBm[7:0]: Data Byte m

- Rn Bits 23:16 DBm-1[7:0]: Data Byte m-1

- Rn Bits 15:8 DBm-2[7:0]: Data Byte m-2

- Rn Bits 7:0 DBm-3[7:0]: Data Byte m-3

**Note:** Depending on the configuration of the element size (MCAN\_RXESC), between two and sixteen 32-bit words (Rn = 3 .. 17) are used for storage of a CAN message's data field.

### 52.5.7.3 Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration TXBC.TFQS and TXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register TXESC.

**Table 52-8. Tx Buffer Element**

|     |          |     |     |          |    |            |          |  |  |     |     |          |    |  |          |            |  |   |   |  |            |  |  |  |   |
|-----|----------|-----|-----|----------|----|------------|----------|--|--|-----|-----|----------|----|--|----------|------------|--|---|---|--|------------|--|--|--|---|

| T0  | ESI      | XTD | RTR | ID[28:0] |    |            |          |  |  |     |     |          |    |  |          |            |  |   |   |  |            |  |  |  |   |
| T1  | MM[7:0]  |     |     |          |    | EFC        | reserved |  |  | FDF | BRS | DLC[3:0] |    |  | reserved |            |  |   |   |  |            |  |  |  |   |
| T2  | DB3[7:0] |     |     |          |    | DB2[7:0]   |          |  |  |     |     |          |    |  |          | DB1[7:0]   |  |   |   |  | DB0[7:0]   |  |  |  |   |
| T3  | DB7[7:0] |     |     |          |    | DB6[7:0]   |          |  |  |     |     |          |    |  |          | DB5[7:0]   |  |   |   |  | DB4[7:0]   |  |  |  |   |
| ... | ...      |     |     |          |    | ...        |          |  |  |     |     |          |    |  |          | ...        |  |   |   |  | ...        |  |  |  |   |
| Tn  | DBm[7:0] |     |     |          |    | DBm-1[7:0] |          |  |  |     |     |          |    |  |          | DBm-2[7:0] |  |   |   |  | DBm-3[7:0] |  |  |  |   |

- T0 Bit 30 ESI: Error State Indicator

T0 Bit 31 ESI: Error State Indicator

0: ESI bit in CAN FD format depends only on error passive flag

1: ESI bit in CAN FD format transmitted recessive

**Note:** The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive. This feature can be used in gateway applications when a message from an error passive node is routed to another CAN network.

- T0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier.

1: 29-bit extended identifier.

- T0 Bit 29 RTR: Remote Transmission Request

0: Transmit data frame.

1: Transmit remote frame.

**Note:** When RTR = 1, the MCAN transmits a remote frame according to ISO11898-1, even if MCAN\_CCCR.FDOE enables the transmission in CAN FD format.

- T0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

- T1 Bits 31:24 MM[7:0]: Message Marker

Written by processor during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

- T1 Bit 23 EFC: Event FIFO Control

0: Do not store Tx events.

1: Store Tx events.

- T1 Bit 21 FDF: FD Format

0: Frame transmitted in Classic CAN format

1: Frame transmitted in CAN FD format

- T1 Bit 20 BRS: Bit Rate Switching

0: CAN FD frames transmitted without bit rate switching

1: CAN FD frames transmitted with bit rate switching

**Note:**

Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN\_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN\_CCCR.BRSE = 1.

- T1 Bits 19:16 DLC[3:0]: Data Length Code

0-8: CAN + CAN FD: transmit frame has 0-8 data bytes.

9-15: CAN: transmit frame has 8 data bytes.

9-15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes.

- T2 Bits 31:24 DB3[7:0]: Data Byte 3

- T2 Bits 23:16 DB2[7:0]: Data Byte 2

- T2 Bits 15:8 DB1[7:0]: Data Byte 1

- T2 Bits 7:0 DB0[7:0]: Data Byte 0

- T3 Bits 31:24 DB7[7:0]: Data Byte 7

- T3 Bits 23:16 DB6[7:0]: Data Byte 6

- T3 Bits 15:8 DB5[7:0]: Data Byte 5

- T3 Bits 7:0 DB4[7:0]: Data Byte 4

... ..

- Tn Bits 31:24 DBm[7:0]: Data Byte m

- Tn Bits 23:16 DBm-1[7:0]: Data Byte m-1

- Tn Bits 15:8 DBm-2[7:0]: Data Byte m-2

- Tn Bits 7:0 DBm-3[7:0]: Data Byte m-3

**Note:** Depending on the configuration of the element size (MCAN\_TXESC), between two and sixteen 32-bit words (Tn = 3 ..17) are used for storage of a CAN message's data field.

#### 52.5.7.4 Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the processor gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register TXEFS.

**Table 52-9. Tx Event FIFO Element**

|    |         |     |     |          |             |     |     |          |  |    |            |   |   |   |
|----|---------|-----|-----|----------|-------------|-----|-----|----------|--|----|------------|---|---|---|
|    | 31      |     |     | 24       | 23          |     |     |          |  | 16 | 15         | 8 | 7 | 0 |
| E0 | ESI     | XTD | RTR | ID[28:0] |             |     |     |          |  |    |            |   |   |   |
| E1 | MM[7:0] |     |     |          | ET<br>[1:0] | FDF | BRS | DLC[3:0] |  |    | TXTS[15:0] |   |   |   |

- E0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active.

1: Transmitting node is error passive.

- E0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier.

1: 29-bit extended identifier.

- E0 Bit 29 RTR: Remote Transmission Request

0: Data frame transmitted.

1: Remote frame transmitted.

- E0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

- E1 Bits 31:24 MM[7:0]: Message Marker

Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.

- E1 Bit 23:22 ET[1:0]: Event Type

0: Reserved

1: Tx event

2: Transmission in spite of cancellation (always set for transmissions in DAR mode)

3: Reserved

- E1 Bit 21 FDF: FD Format

0: Standard frame format.

1: CAN FD frame format (new DLC-coding and CRC).

- E1 Bit 20 BRS: Bit Rate Switch

0: Frame transmitted without bit rate switching.

1: Frame transmitted with bit rate switching.

- E1 Bits 19:16 DLC[3:0]: Data Length Code

0-8: CAN + CAN FD: frame with 0-8 data bytes transmitted.

9-15: CAN: frame with 8 data bytes transmitted.

9-15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted

- E1 Bits 15:0 TXTS[15:0]: Tx Timestamp

Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN\_TSCC.TCP.

### 52.5.7.5 Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MCAN\_SIDFC.FLSSA plus the index of the filter element (0...127).

**Table 52-10. Standard Message ID Filter Element**

|    |          |  |            |  |             |    |    |  |    |    |             |   |   |  |  |   |
|----|----------|--|------------|--|-------------|----|----|--|----|----|-------------|---|---|--|--|---|
|    | 31       |  |            |  |             | 24 | 23 |  | 16 | 15 |             | 8 | 7 |  |  | 0 |
| S0 | SFT[1:0] |  | SFEC [2:0] |  | SFID1[10:0] |    |    |  | –  |    | SFID2[10:0] |   |   |  |  |   |

- Bits 31:30 SFT[1:0]: Standard Filter Type

0: Range filter from SF1ID to SF2ID (SF2ID ≥ SF1ID)

1: Dual ID filter for SF1ID or SF2ID

2: Classic filter: SF1ID = filter, SF2ID = mask

3: Reserved

- Bit 29:27 SFEC[2:0]: Standard Filter Element Configuration

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MCAN\_IR.HPM and, if enabled, an interrupt is generated. In this case register HPMS is updated with the status of the priority match.

0: Disable filter element

1: Store in Rx FIFO 0 if filter matches

2: Store in Rx FIFO 1 if filter matches

3: Reject ID if filter matches

4: Set priority if filter matches

5: Set priority and store in FIFO 0 if filter matches

6: Set priority and store in FIFO 1 if filter matches

7: Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored

- Bits 26:16 SFID1[10:0]: Standard Filter ID 1

First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

- Bits 10:0 SFID2[10:0]: Standard Filter ID 2

This field has a different meaning depending on the configuration of SFEC:

- SFEC = “001”...“110”–Second ID of standard ID filter element
- SFEC = “111”–Filter for Rx Buffers or for debug messages

SFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

0: Store message in a Rx buffer

1: Debug Message A

2: Debug Message B

3: Debug Message C

SFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

### 52.5.7.6 Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MCAN\_XIDFC.FLESA plus two times the index of the filter element (0...63).

**Table 52-11. Extended Message ID Filter Element**

|    |               |  |   |             |    |  |    |    |  |   |   |  |   |
|----|---------------|--|---|-------------|----|--|----|----|--|---|---|--|---|
|    | 31            |  |   | 24          | 23 |  | 16 | 15 |  | 8 | 7 |  | 0 |
| F0 | EFEC<br>[2:0] |  |   | EFID1[28:0] |    |  |    |    |  |   |   |  |   |
| F1 | EFT[1:0]      |  | – | EFID2[28:0] |    |  |    |    |  |   |   |  |   |

- F0 Bit 31:29 EFEC[2:0]: Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = “100”, “101”, or “110”, a match sets the interrupt flag MCAN\_IR.HPM and, if enabled, an interrupt is generated. In this case, register MCAN\_HPMS is updated with the status of the priority match.

0: Disable filter element

1: Store in Rx FIFO 0 if filter matches

2: Store in Rx FIFO 1 if filter matches

3: Reject ID if filter matches

4: Set priority if filter matches

5: Set priority and store in FIFO 0 if filter matches

6: Set priority and store in FIFO 1 if filter matches

7: Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored

- F0 Bits 28:0 EFID1[28:0]: Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MCAN\_XIDAM masking mechanism (see [Extended Message ID Filtering](#)) is used.

- F1 Bits 31:30 EFT[1:0]: Extended Filter Type

0: Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID)

1: Dual ID filter for EF1ID or EF2ID

2: Classic filter: EF1ID = filter, EF2ID = mask

3: Range filter from EF1ID to EF2ID ( $EF2ID \geq EF1ID$ ), MCAN\_XIDAM mask not applied

- F1 Bits 28:0 EFID2[28:0]: Extended Filter ID 2

This field has a different meaning depending on the configuration of EFEC:

- EFEC = “001”...“110”—Second ID of extended ID filter element
- EFEC = “111”—Filter for Rx Buffers or for debug messages

EFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

0: Store message in an Rx buffer

1: Debug Message A

2: Debug Message B

3: Debug Message C

EFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

#### **52.5.8 Hardware Reset Description**

After hardware reset, the registers of the MCAN hold the reset values listed in the register descriptions. Additionally the Bus\_Off state is reset and the output CANTX is set to recessive (HIGH). The value 0x0001 (MCAN\_CCCR.INIT = ‘1’) in the CC Control register enables software initialization. The MCAN does not influence the CAN bus until the processor resets MCAN\_CCCR.INIT to ‘0’.

#### **52.5.9 Access to Reserved Register Addresses**

In case the application software accesses one of the reserved addresses in the MCAN register map (read or write access), interrupt flag MCAN\_IR.ARA is set and, if enabled, the selected interrupt line is risen.

# SAMA5D2 Series

## Controller Area Network (MCAN)

### 52.6 Register Summary

| Offset | Name      | Bit Pos. |             |             |      |             |          |           |          |           |  |
|--------|-----------|----------|-------------|-------------|------|-------------|----------|-----------|----------|-----------|--|
| 0x04   | MCAN_ENDN | 7:0      | ETV[7:0]    |             |      |             |          |           |          |           |  |
|        |           | 15:8     | ETV[15:8]   |             |      |             |          |           |          |           |  |
|        |           | 23:16    | ETV[23:16]  |             |      |             |          |           |          |           |  |
|        |           | 31:24    | ETV[31:24]  |             |      |             |          |           |          |           |  |
| 0x08   | MCAN_CUST | 7:0      | CSV[7:0]    |             |      |             |          |           |          |           |  |
|        |           | 15:8     | CSV[15:8]   |             |      |             |          |           |          |           |  |

 Customer-specific value.

### 52.6.3 MCAN Data Bit Timing and Prescaler Register

**Name:** MCAN\_DBTP  
**Offset:** 0x0C  
**Reset:** 0x00000A33  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

The CAN bit time may be programmed in the range of 4 to 25 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 CAN core clock periods.  $t_q = (\text{DBRP} + 1) \text{ CAN core clock periods}$ .

DTSEG1 is the sum of Prop\_Seg and Phase\_Seg1. DTSEG2 is Phase\_Seg2.

Therefore the length of the bit time is (programmed values)  $[\text{DTSEG1} + \text{DTSEG2} + 3] t_q$   
 or (functional values)  $[\text{Sync\_Seg} + \text{Prop\_Seg} + \text{Phase\_Seg1} + \text{Phase\_Seg2}] t_q$ .

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x00000A33 configures the MCAN for a fast bit rate of 500 kbit/s.

The bit rate configured for the CAN FD data phase via MCAN\_DBTP must be higher than or equal to the bit rate configured for the arbitration phase via MCAN\_NBTP.

|        | DTSEG2[3:0] |     |     |     |     | DSJW[2:0]   |     |     |
| Access | R/W         | R/W | R/W | R/W |     | R/W         | R/W | R/W |
| Reset  | 0           | 0   | 1   | 1   |     | 0           | 1   | 1   |

#### Bit 23 – TDC Transmitter Delay Compensation

0 (DISABLED): Transmitter Delay Compensation disabled.

1 (ENABLED): Transmitter Delay Compensation enabled.

**Bits 20:16 – DBRP[4:0]** Data Bit Rate Prescaler

The value by which the peripheral clock is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

**Bits 12:8 – DTSEG1[4:0]** Data Time Segment Before Sample Point

0: Forbidden.

1 to 31: The duration of time segment is  $t_q \times (DTSEG1 + 1)$ .

**Bits 7:4 – DTSEG2[3:0]** Data Time Segment After Sample Point

The duration of time segment is  $t_q \times (DTSEG2 + 1)$ .

**Bits 2:0 – DSJW[2:0]** Data (Re) Synchronization Jump Width

The duration of a synchronization jump is  $t_q \times (DSJW + 1)$ .

### 52.6.4 MCAN Test Register

**Name:** MCAN\_TEST  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

Write access to the Test Register has to be enabled by setting bit MCAN\_CCCR.TEST to '1'.

All MCAN Test Register functions are set to their reset values when bit MCAN\_CCCR.TEST is cleared.

Loop Back mode and software control of pin CANTX are hardware test modes. Programming of TX ≠ 0 disturbs the message transfer on the CAN bus.

The reset value for MCAN\_TEST.RX is undefined.

|        |    |         |    |      |    |    |    |    |

| Reset  | x  | 0       |    | 0    |    |    |    |    |

**Bit 7 – RX** Receive Pin (read-only)  
 Monitors the actual value of pin CANRX.

The reset value for this bit is undefined.

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | The CAN bus is dominant (CANRX = '0').  |
| 1     | The CAN bus is recessive (CANRX = '1'). |

**Bits 6:5 – TX[1:0]** Control of Transmit Pin (read/write)

| Value | Name                    | Description                                                                            |
|-------|-------------------------|----------------------------------------------------------------------------------------|
| 0     | RESET                   | Reset value, CANTX controlled by the CAN Core, updated at the end of the CAN bit time. |
| 1     | SAMPLE_POINT_MONITORING | Sample Point can be monitored at pin CANTX.                                            |
| 2     | DOMINANT                | Dominant ('0') level at pin CANTX.                                                     |

# SAMA5D2 Series

## Controller Area Network (MCAN)

| Value | Name      | Description                   |
|-------|-----------|-------------------------------|
| 3     | RECESSIVE | Recessive ('1') at pin CANTX. |

### Bit 4 – LBCK Loop Back Mode (read/write)

0 (DISABLED): Reset value. Loop Back mode is disabled.

1 (ENABLED): Loop Back mode is enabled (see [Test Modes](#)).

### 52.6.5 MCAN RAM Watchdog Register

**Name:** MCAN\_RWD  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

The RAM Watchdog monitors the Message RAM response time. A Message RAM access via the MCAN's Generic Master Interface starts the Message RAM Watchdog Counter with the value configured by MCAN\_RWD.WDC. The counter is reloaded with MCAN\_RWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MCAN\_IR.WDI is set. The RAM Watchdog Counter is clocked by the system bus clock (peripheral clock).

|        |          |     |     |     |     |     |     |     |

| Reset  | 0        | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 15:8 – WDV[7:0]** Watchdog Value (read-only)  
 Watchdog Counter Value for the current message located in RAM.

**Bits 7:0 – WDC[7:0]** Watchdog Configuration (read/write)  
 Start value of the Message RAM Watchdog Counter. The counter is disabled when WDC is cleared.

### 52.6.6 MCAN CC Control Register

**Name:** MCAN\_CCCR  
**Offset:** 0x18  
**Reset:** 0x00000001  
**Property:** Read/Write

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |

| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |     |      |      |    |    |      |      |
|--------|----|-----|------|------|----|----|------|------|
| Bit    | 15 | 14  | 13   | 12   | 11 | 10 | 9    | 8    |
|        |    | TXP | EFBI | PXHD |    |    | BRSE | FDOE |
| Access |    | R/W | R/W  | R/W  |    |    | R/W  | R/W  |
| Reset  |    | 0   | 0    | 0    |    |    | 0    | 0    |

|        |      |     |     |     |     |     |     |      |
|--------|------|-----|-----|-----|-----|-----|-----|------|
| Bit    | 7    | 6   | 5   | 4   | 3   | 2   | 1   | 0    |
|        | TEST | DAR | MON | CSR | CSA | ASM | CCE | INIT |
| Access | R/W  | R/W | R/W | R/W | R   | R/W | R/W | R/W  |
| Reset  | 0    | 0   | 0   | 0   | 0   | 0   | 0   | 1    |

#### Bit 14 – TXP Transmit Pause (read/write, write protection)

If this bit is set, the MCAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see [Tx Handling](#)).

| Value | Description              |
|-------|--------------------------|
| 0     | Transmit pause disabled. |
| 1     | Transmit pause enabled.  |

#### Bit 13 – EFBI Edge Filtering during Bus Integration (read/write, write protection)

| Value | Description                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------|
| 0     | Edge filtering is disabled.                                                                                 |
| 1     | Edge filtering is enabled. Two consecutive dominant tq required to detect an edge for hard synchronization. |

#### Bit 12 – PXHD Protocol Exception Event Handling (read/write, write protection)

| Value | Description                           |
|-------|---------------------------------------|
| 0     | Protocol exception handling enabled.  |
| 1     | Protocol exception handling disabled. |

**Bit 9 – BRSE** Bit Rate Switching Enable (read/write, write protection)

0 (DISABLED): Bit rate switching for transmissions disabled.

1 (ENABLED): Bit rate switching for transmissions enabled.

**Bit 8 – FDOE** CAN FD Operation Enable (read/write, write protection)

0 (DISABLED): FD operation disabled.

1 (ENABLED): FD operation enabled.

**Bit 7 – TEST** Test Mode Enable (read/write, write protection against '1')

0 (DISABLED): Normal operation, MCAN\_TEST register holds reset values.

1 (ENABLED): Test mode, write access to MCAN\_TEST register enabled.

**Bit 6 – DAR** Disable Automatic Retransmission (read/write, write protection)

0 (AUTO\_RETX): Automatic retransmission of messages not transmitted successfully enabled.

1 (NO\_AUTO\_RETX): Automatic retransmission disabled.

**Bit 5 – MON** Bus Monitoring Mode (read/write, write protection against '1')

0 (DISABLED): Bus Monitoring mode is disabled.

1 (ENABLED): Bus Monitoring mode is enabled.

**Bit 4 – CSR** Clock Stop Request (read/write)

0 (NO\_CLOCK\_STOP): No clock stop is requested.

1 (CLOCK\_STOP): Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.

**Bit 3 – CSA** Clock Stop Acknowledge (read-only)

| Value | Description                                                                            |
|-------|----------------------------------------------------------------------------------------|
| 0     | No clock stop acknowledged.                                                            |
| 1     | MCAN may be set in power down by stopping the peripheral clock and the CAN core clock. |

**Bit 2 – ASM** Restricted Operation Mode (read/write, write protection against '1')

For a description of the Restricted Operation mode see [Restricted Operation Mode](#).

0 (NORMAL): Normal CAN operation.

1 (RESTRICTED): Restricted Operation mode active.

**Bit 1 – CCE** Configuration Change Enable (read/write, write protection)

0 (PROTECTED): The processor has no write access to the protected configuration registers.

1 (CONFIGURABLE): The processor has write access to the protected configuration registers (while MCAN\_CCCR.INIT = '1').

**Bit 0 – INIT** Initialization (read/write)

Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to ensure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

0 (DISABLED): Normal operation.

1 (ENABLED): Initialization is started.

### 52.6.7 MCAN Nominal Bit Timing and Prescaler Register

**Name:** MCAN\_NBTP  
**Offset:** 0x1C  
**Reset:** 0x06000A03  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN\_CCCR.

The CAN bit time may be programmed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 CAN core clock periods.  $t_q = t_{\text{core clock}} \times (\text{NBRP} + 1)$ .

NTSEG1 is the sum of Prop\_Seg and Phase\_Seg1. NTSEG2 is Phase\_Seg2.

Therefore the length of the bit time is (programmed values)  $[\text{NTSEG1} + \text{NTSEG2} + 3] t_q$   
or (functional values)  $[\text{Sync\_Seg} + \text{Prop\_Seg} + \text{Phase\_Seg1} + \text{Phase\_Seg2}] t_q$ .

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x06000A03 configures the MCAN for a bit rate of 500 kbit/s.

| Bit    | 31          | 30          | 29  | 28  | 27  | 26  | 25  | 24        |
|--------|-------------|-------------|-----|-----|-----|-----|-----|-----------|
|        | NSJW[6:0]   |             |     |     |     |     |     | NBRP[8:8] |
| Access | R/W         | R/W         | R/W | R/W | R/W | R/W | R/W | R/W       |

| Bit    | 23          | 22          | 21  | 20  | 19  | 18  | 17  | 16        |
|        | NBRP[7:0]   |             |     |     |     |     |     |           |
| Access | R/W         | R/W         | R/W | R/W | R/W | R/W | R/W | R/W       |
| Reset  | 0           | 0           | 0   | 0   | 0   | 0   | 0   | 0         |
| Bit    | 15          | 14          | 13  | 12  | 11  | 10  | 9   | 8         |
|        | NTSEG1[7:0] |             |     |     |     |     |     |           |
| Access | R/W         | R/W         | R/W | R/W | R/W | R/W | R/W | R/W       |
| Reset  | 0           | 0           | 0   | 0   | 1   | 0   | 1   | 0         |
| Bit    | 7           | 6           | 5   | 4   | 3   | 2   | 1   | 0         |
|        |             | NTSEG2[6:0] |     |     |     |     |     |           |
| Access |             | R/W         | R/W | R/W | R/W | R/W | R/W | R/W       |
| Reset  |             | 0           | 0   | 0   | 0   | 0   | 1   | 1         |

**Bits 31:25 – NSJW[6:0]** Nominal (Re) Synchronization Jump Width

0 to 127: The duration of a synchronization jump is  $t_q \times (\text{NSJW} + 1)$ .

**Bits 24:16 – NBRP[8:0]** Nominal Bit Rate Prescaler

0 to 511: The value by which the oscillator frequency is divided for generating the CAN time quanta. The CAN time is built up from a multiple of this quanta. CAN time quantum ( $t_q$ ) =  $t_{\text{core clock}} \times (\text{NBRP} + 1)$

**Bits 15:8 – NTSEG1[7:0]** Nominal Time Segment Before Sample Point

## SAMA5D2 Series

### Controller Area Network (MCAN)

| Value    | Description                                                        |
|----------|--------------------------------------------------------------------|
| 0        | Reserved; do not use.                                              |
| 1 to 255 | The duration of time segment is $t_q \times (\text{NTSEG1} + 1)$ . |

**Bits 6:0 – NTSEG2[6:0]** Nominal Time Segment After Sample Point

| Value    | Description                                                        |
|----------|--------------------------------------------------------------------|
| 0        | Reserved; do not use.                                              |
| 1 to 127 | The duration of time segment is $t_q \times (\text{NTSEG2} + 1)$ . |

### 52.6.8 MCAN Timestamp Counter Configuration Register

**Name:** MCAN\_TSCC  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

For a description of the Timestamp Counter see [Timestamp Generation](#).

With CAN FD, an external counter is required for timestamp generation (TSS = 2).

|        |    |    |    |    |          |     |          |     |
|--------|----|----|----|----|----------|-----|----------|-----|

| Access |    |    |    |    |          |     | R/W      | R/W |
| Reset  |    |    |    |    |          |     | 0        | 0   |

#### Bits 19:16 – TCP[3:0] Timestamp Counter Prescaler

Configures the timestamp and timeout counters time unit in multiples of CAN bit times [ 1...16 ]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

#### Bits 1:0 – TSS[1:0] Timestamp Select

| Value | Name          | Description                                          |
|-------|---------------|------------------------------------------------------|
| 0     | ALWAYS_0      | Timestamp counter value always 0x0000                |
| 1     | TCP_INC       | Timestamp counter value incremented according to TCP |
| 2     | EXT_TIMESTAMP | External timestamp counter value used                |
| 3     | ALWAYS_0      | Timestamp counter value always 0x0000                |

### 52.6.9 MCAN Timestamp Counter Value Register

**Name:** MCAN\_TSCV  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |           |     |     |     |     |     |     |     |
| Access |           |     |     |     |     |     |     |     |
| Reset  |           |     |     |     |     |     |     |     |
| Bit    | 23        | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        |           |     |     |     |     |     |     |     |
| Access |           |     |     |     |     |     |     |     |
| Reset  |           |     |     |     |     |     |     |     |
| Bit    | 15        | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | TSC[15:8] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | TSC[7:0]  |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 15:0 – TSC[15:0] Timestamp Counter (cleared on write)

The internal/external Timestamp Counter value is captured on start of frame (both Receive and Transmit). When MCAN\_TSCC.TSS = 1, the Timestamp Counter is incremented in multiples of CAN bit times [ 1... 16 ] depending on the configuration of MCAN\_TSCC.TCP. A wrap around sets interrupt flag MCAN\_IR.TSW. Write access resets the counter to zero.

When MCAN\_TSCC.TSS = 2, TSC reflects the external Timestamp Counter value. Thus a write access has no impact.

**Note:** A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MCAN\_TSCV.

## 52.6.10 MCAN Timeout Counter Configuration Register

**Name:** MCAN\_TOCC  
**Offset:** 0x28  
**Reset:** 0xFFFF0000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

For a description of the Timeout Counter, see [Timeout Counter](#).

|        |           |     |     |     |     |          |     |      |
|--------|-----------|-----|-----|-----|-----|----------|-----|------|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26       | 25  | 24   |
|        | TOP[15:8] |     |     |     |     |          |     |      |

| Bit    | 15        | 14  | 13  | 12  | 11  | 10       | 9   | 8    |
|        |           |     |     |     |     |          |     |      |
| Access |           |     |     |     |     |          |     |      |
| Reset  |           |     |     |     |     |          |     |      |
| Bit    | 7         | 6   | 5   | 4   | 3   | 2        | 1   | 0    |
|        |           |     |     |     |     | TOS[1:0] |     | ETOC |
| Access |           |     |     |     |     | R/W      | R/W | R/W  |
| Reset  |           |     |     |     |     | 0        | 0   | 0    |

### Bits 31:16 – TOP[15:0] Timeout Period

Start value of the Timeout Counter (down-counter). Configures the Timeout Period.

### Bits 2:1 – TOS[1:0] Timeout Select

When operating in Continuous mode, a write to MCAN\_TOCV presets the counter to the value configured by MCAN\_TOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN\_TOCC.TOP. Down-counting is started when the first FIFO element is stored.

| Value | Name           | Description                           |
|-------|----------------|---------------------------------------|
| 0     | CONTINUOUS     | Continuous operation.                 |
| 1     | TX_EV_TIMEOUT  | Timeout controlled by Tx Event FIFO.  |
| 2     | RX0_EV_TIMEOUT | Timeout controlled by Receive FIFO 0. |
| 3     | RX1_EV_TIMEOUT | Timeout controlled by Receive FIFO 1. |

### Bit 0 – ETOC Enable Timeout Counter

0 (NO\_TIMEOUT): Timeout Counter disabled.

1 (TOS\_CONTROLLED): Timeout Counter enabled.

For use of timeout function with CAN FD, see [Timeout Counter](#).

### 52.6.11 MCAN Timeout Counter Value Register

**Name:** MCAN\_TOCV  
**Offset:** 0x2C  
**Reset:** 0x0000FFFF  
**Property:** Read/Write

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |           |     |     |     |     |     |     |     |
| Access |           |     |     |     |     |     |     |     |
| Reset  |           |     |     |     |     |     |     |     |
| Bit    | 23        | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        |           |     |     |     |     |     |     |     |
| Access |           |     |     |     |     |     |     |     |
| Reset  |           |     |     |     |     |     |     |     |
| Bit    | 15        | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | TOC[15:8] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 1         | 1   | 1   | 1   | 1   | 1   | 1   | 1   |
| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | TOC[7:0]  |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 1         | 1   | 1   | 1   | 1   | 1   | 1   | 1   |

**Bits 15:0 – TOC[15:0]** Timeout Counter (cleared on write)

The Timeout Counter is decremented in multiples of CAN bit times [ 1...16 ] depending on the configuration of MCAN\_TSCC.TCP. When decremented to zero, interrupt flag MCAN\_IR.TOO is set and the Timeout Counter is stopped. Start and reset/restart conditions are configured via MCAN\_TOCC.TOS.

## 52.6.12 MCAN Error Counter Register

**Name:** MCAN\_ECR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read-only

When MCAN\_CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented.

|        |          |          |    |    |    |    |    |    |
|--------|----------|----------|----|----|----|----|----|----|
| Bit    | 31       | 30       | 29 | 28 | 27 | 26 | 25 | 24 |
|        |          |          |    |    |    |    |    |    |
| Access |          |          |    |    |    |    |    |    |
| Reset  |          |          |    |    |    |    |    |    |
| Bit    | 23       | 22       | 21 | 20 | 19 | 18 | 17 | 16 |
|        | CEL[7:0] |          |    |    |    |    |    |    |
| Access | R        | R        | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0        | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15       | 14       | 13 | 12 | 11 | 10 | 9  | 8  |
|        | RP       | REC[6:0] |    |    |    |    |    |    |
| Access | R        | R        | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0        | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7        | 6        | 5  | 4  | 3  | 2  | 1  | 0  |
|        | TEC[7:0] |          |    |    |    |    |    |    |
| Access | R        | R        | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0        | 0  | 0  | 0  | 0  | 0  | 0  |

### Bits 23:16 – CEL[7:0] CAN Error Logging (cleared on read)

The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at 0xFF; the next increment of TEC or REC sets interrupt flag IR.ELO.

### Bit 15 – RP Receive Error Passive

| Value | Description                                                           |
|-------|-----------------------------------------------------------------------|
| 0     | The Receive Error Counter is below the error passive level of 128.    |
| 1     | The Receive Error Counter has reached the error passive level of 128. |

### Bits 14:8 – REC[6:0] Receive Error Counter

Actual state of the Receive Error Counter, values between 0 and 127.

### Bits 7:0 – TEC[7:0] Transmit Error Counter

Actual state of the Transmit Error Counter, values between 0 and 255.

### 52.6.13 MCAN Protocol Status Register

**Name:** MCAN\_PSR  
**Offset:** 0x44  
**Reset:** 0x00000707  
**Property:** Read-only

|        |    |           |      |          |      |           |    |    |
|--------|----|-----------|------|----------|------|-----------|----|----|
| Bit    | 31 | 30        | 29   | 28       | 27   | 26        | 25 | 24 |
|        |    |           |      |          |      |           |    |    |

| Reset  |    | 0         | 0    | 0        | 0    | 0         | 0  | 0  |
| Bit    | 15 | 14        | 13   | 12       | 11   | 10        | 9  | 8  |
|        |    | PXE       | RFDF | RBRS     | RESI | DLEC[2:0] |    |    |
| Access |    |           |      |          |      |           |    |    |
| Reset  |    | 0         | 0    | 0        | 0    | 1         | 1  | 1  |
| Bit    | 7  | 6         | 5    | 4        | 3    | 2         | 1  | 0  |
|        | BO | EW        | EP   | ACT[1:0] |      | LEC[2:0]  |    |    |
| Access | R  | R         | R    | R        | R    |           |    |    |
| Reset  | 0  | 0         | 0    | 0        | 0    | 1         | 1  | 1  |

**Bits 22:16 – TDCV[6:0]** Transmitter Delay Compensation Value

0 to 127: Position of the secondary sample point, in CAN core clock periods, defined by the sum of the measured delay from CANTX to CANRX and MCAN\_TDCR.TDCO.

**Bit 14 – PXE** Protocol Exception Event (cleared on read)

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | No protocol exception event occurred since last read access |
| 1     | Protocol exception event occurred                           |

**Bit 13 – RFDF** Received a CAN FD Message (cleared on read)

This bit is set independently from acceptance filtering.

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | Since this bit was reset by the CPU, no CAN FD message has been received |
| 1     | Message in CAN FD format with FDF flag set has been received             |

**Bit 12 – RBRS** BRS Flag of Last Received CAN FD Message (cleared on read)

This bit is set together with RFDF, independently from acceptance filtering.

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | Last received CAN FD message did not have its BRS flag set. |

| Value | Description                                        |
|-------|----------------------------------------------------|
| 1     | Last received CAN FD message had its BRS flag set. |

**Bit 11 – RESI** ESI Flag of Last Received CAN FD Message (cleared on read)

This bit is set together with RFDF, independently from acceptance filtering.

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | Last received CAN FD message did not have its ESI flag set. |
| 1     | Last received CAN FD message had its ESI flag set.          |

**Bits 10:8 – DLEC[2:0]** Data Phase Last Error Code (set to 111 on read)

Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.

**Bit 7 – BO** Bus\_Off Status

| Value | Description                   |
|-------|-------------------------------|
| 0     | The MCAN is not Bus_Off.      |
| 1     | The MCAN is in Bus_Off state. |

**Bit 6 – EW** Warning Status

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | Both error counters are below the Error_Warning limit of 96.             |
| 1     | At least one of error counter has reached the Error_Warning limit of 96. |

**Bit 5 – EP** Error Passive

| Value | Description                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The MCAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected. |
| 1     | The MCAN is in the Error_Passive state.                                                                                                            |

**Bits 4:3 – ACT[1:0]** Activity

Monitors the CAN communication state of the CAN module.

| Value | Name          | Description                                |
|-------|---------------|--------------------------------------------|
| 0     | SYNCHRONIZING | Node is synchronizing on CAN communication |
| 1     | IDLE          | Node is neither receiver nor transmitter   |
| 2     | RECEIVER      | Node is operating as receiver              |
| 3     | TRANSMITTER   | Node is operating as transmitter           |

**Bits 2:0 – LEC[2:0]** Last Error Code (set to 111 on read)

The LEC indicates the type of the last error to occur on the CAN bus. This field is cleared when a message has been transferred (reception or transmission) without error.

| Value | Name        | Description                                                                                                   |
|-------|-------------|---------------------------------------------------------------------------------------------------------------|
| 0     | NO_ERROR    | No error occurred since LEC has been reset by successful reception or transmission.                           |
| 1     | STUFF_ERROR | More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed. |

## SAMA5D2 Series

### Controller Area Network (MCAN)

| Value | Name       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2     | FORM_ERROR | A fixed format part of a received frame has the wrong format.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 3     | ACK_ERROR  | The message transmitted by the MCAN was not acknowledged by another node.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 4     | BIT1_ERROR | During transmission of a message (with the exception of the arbitration field), the device tried to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.                                                                                                                                                                                                                                                                                                         |
| 5     | BIT0_ERROR | During transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device tried to send a dominant level (data or identifier bit logical value '0'), but the monitored bus value was recessive. During Bus_Off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the processor to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). |
| 6     | CRC_ERROR  | The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match the CRC calculated from the received data.                                                                                                                                                                                                                                                                                                                                                          |
| 7     | NO_CHANGE  | Any read access to the Protocol Status Register re-initializes the LEC to '7'. When the LEC shows value '7', no CAN bus event was detected since the last processor read access to the Protocol Status Register.                                                                                                                                                                                                                                                                                         |

### 52.6.14 MCAN Transmitter Delay Compensation Register

**Name:** MCAN\_TDCR  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |           |     |     |     |     |     |     |
|--------|----|-----------|-----|-----|-----|-----|-----|-----|
| Bit    | 31 | 30        | 29  | 28  | 27  | 26  | 25  | 24  |
|        |    |           |     |     |     |     |     |     |
| Access |    |           |     |     |     |     |     |     |
| Reset  |    |           |     |     |     |     |     |     |
| Bit    | 23 | 22        | 21  | 20  | 19  | 18  | 17  | 16  |
|        |    |           |     |     |     |     |     |     |
| Access |    |           |     |     |     |     |     |     |
| Reset  |    |           |     |     |     |     |     |     |
| Bit    | 15 | 14        | 13  | 12  | 11  | 10  | 9   | 8   |
|        |    | TDCO[6:0] |     |     |     |     |     |     |
| Access |    | R/W       | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |    | 0         | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7  | 6         | 5   | 4   | 3   | 2   | 1   | 0   |
|        |    | TDCF[6:0] |     |     |     |     |     |     |
| Access |    | R/W       | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  |    | 0         | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 14:8 – TDCO[6:0]** Transmitter Delay Compensation Offset

0 to 127: Offset value, in CAN core clock periods, defining the distance between the measured delay from CANTX to CANRX and the secondary sample point.

**Bits 6:0 – TDCF[6:0]** Transmitter Delay Compensation Filter

0 to 127: defines the minimum value for the SSP position, in CAN core clock periods. Dominant edges on CANRX that would result in an earlier SSP position are ignored for transmitter delay measurement. The feature is enabled when TDCF is configured to a value greater than TDCO.

### 52.6.15 MCAN Interrupt Register

**Name:** MCAN\_IR  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read/Write

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of IE controls whether an interrupt is generated. The configuration of ILS controls on which interrupt line an interrupt is signalled.

|        |    |    |     |     |     |     |     |     |
|--------|----|----|-----|-----|-----|-----|-----|-----|
| Bit    | 31 | 30 | 29  | 28  | 27  | 26  | 25  | 24  |

| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

#### Bit 29 – ARA Access to Reserved Address

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No access to reserved address occurred |
| 1     | Access to reserved address occurred    |

#### Bit 28 – PED Protocol Error in Data Phase

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 0     | No protocol error in data phase                                           |
| 1     | Protocol error in data phase detected (MCAN_PSR.DLEC differs from 0 or 7) |

#### Bit 27 – PEA Protocol Error in Arbitration Phase

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | No protocol error in arbitration phase                                          |
| 1     | Protocol error in arbitration phase detected (MCAN_PSR.LEC differs from 0 or 7) |

---

**Bit 26 – WDI** Watchdog Interrupt

| Value | Description                                      |
|-------|--------------------------------------------------|
| 0     | No Message RAM Watchdog event occurred.          |
| 1     | Message RAM Watchdog event due to missing READY. |

**Bit 25 – BO** Bus\_Off Status

| Value | Description               |
|-------|---------------------------|
| 0     | Bus_Off status unchanged. |
| 1     | Bus_Off status changed.   |

**Bit 24 – EW** Warning Status

| Value | Description                     |
|-------|---------------------------------|
| 0     | Error_Warning status unchanged. |
| 1     | Error_Warning status changed.   |

**Bit 23 – EP** Error Passive

| Value | Description                     |
|-------|---------------------------------|
| 0     | Error_Passive status unchanged. |
| 1     | Error_Passive status changed.   |

**Bit 22 – ELO** Error Logging Overflow

| Value | Description                                     |
|-------|-------------------------------------------------|
| 0     | CAN Error Logging Counter did not overflow.     |
| 1     | Overflow of CAN Error Logging Counter occurred. |

**Bit 19 – DRX** Message stored to Dedicated Receive Buffer

The flag is set whenever a received message has been stored into a dedicated Receive Buffer.

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | No Receive Buffer updated.                                  |
| 1     | At least one received message stored into a Receive Buffer. |

**Bit 18 – TOO** Timeout Occurred

| Value | Description      |
|-------|------------------|
| 0     | No timeout.      |
| 1     | Timeout reached. |

**Bit 17 – MRAF** Message RAM Access Failure

The flag is set, when the Rx Handler

- has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message.
- was not able to write a message to the Message RAM. In this case message storage is aborted.

In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Receive Buffer is not set, a partly stored message is overwritten when the next message is stored to this location.

The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the MCAN is switched into Restricted Operation mode (see [Restricted Operation Mode](#)). To leave Restricted Operation mode, the processor has to reset MCAN\_CCCR.ASM.

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | No Message RAM access failure occurred. |
| 1     | Message RAM access failure occurred.    |

### Bit 16 – TSW Timestamp Wraparound

| Value | Description                       |
|-------|-----------------------------------|
| 0     | No timestamp counter wrap-around. |
| 1     | Timestamp counter wrapped around. |

### Bit 15 – TEFL Tx Event FIFO Element Lost

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | No Tx Event FIFO element lost.                                                          |
| 1     | Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero. |

### Bit 14 – TEFF Tx Event FIFO Full

| Value | Description             |
|-------|-------------------------|
| 0     | Tx Event FIFO not full. |
| 1     | Tx Event FIFO full.     |

### Bit 13 – TEFW Tx Event FIFO Watermark Reached

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | Tx Event FIFO fill level below watermark.   |
| 1     | Tx Event FIFO fill level reached watermark. |

### Bit 12 – TEFN Tx Event FIFO New Entry

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | Tx Event FIFO unchanged.                |
| 1     | Tx Handler wrote Tx Event FIFO element. |

### Bit 11 – TFE Tx FIFO Empty

| Value | Description        |
|-------|--------------------|
| 0     | Tx FIFO non-empty. |
| 1     | Tx FIFO empty.     |

### Bit 10 – TCF Transmission Cancellation Finished

| Value | Description                            |
|-------|----------------------------------------|
| 0     | No transmission cancellation finished. |
| 1     | Transmission cancellation finished.    |

### Bit 9 – TC Transmission Completed

| Value | Description                |
|-------|----------------------------|
| 0     | No transmission completed. |
| 1     | Transmission completed.    |

**Bit 8 – HPM** High Priority Message

| Value | Description                        |
|-------|------------------------------------|
| 0     | No high priority message received. |
| 1     | High priority message received.    |

**Bit 7 – RF1L** Receive FIFO 1 Message Lost

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | No Receive FIFO 1 message lost.                                                           |
| 1     | Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero. |

**Bit 6 – RF1F** Receive FIFO 1 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 1 not full. |
| 1     | Receive FIFO 1 full.     |

**Bit 5 – RF1W** Receive FIFO 1 Watermark Reached

| Value | Description                                  |
|-------|----------------------------------------------|
| 0     | Receive FIFO 1 fill level below watermark.   |
| 1     | Receive FIFO 1 fill level reached watermark. |

**Bit 4 – RF1N** Receive FIFO 1 New Message

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No new message written to Receive FIFO 1. |
| 1     | New message written to Receive FIFO 1.    |

**Bit 3 – RF0L** Receive FIFO 0 Message Lost

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | No Receive FIFO 0 message lost.                                                           |
| 1     | Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero. |

**Bit 2 – RF0F** Receive FIFO 0 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 0 not full. |
| 1     | Receive FIFO 0 full.     |

**Bit 1 – RF0W** Receive FIFO 0 Watermark Reached

| Value | Description                                  |
|-------|----------------------------------------------|
| 0     | Receive FIFO 0 fill level below watermark.   |
| 1     | Receive FIFO 0 fill level reached watermark. |

---

**Bit 0 – RF0N** Receive FIFO 0 New Message

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | No new message written to Receive FIFO 0. |
| 1     | New message written to Receive FIFO 0.    |

## 52.6.16 MCAN Interrupt Enable Register

**Name:** MCAN\_IE  
**Offset:** 0x54  
**Reset:** 0x00000000  
**Property:** Read/Write

The following configuration values are valid for all listed bit names of this register:

0: Disables the corresponding interrupt.

1: Enables the corresponding interrupt.

|        |    |    |      |      |      |      |     |     |
|--------|----|----|------|------|------|------|-----|-----|
| Bit    | 31 | 30 | 29   | 28   | 27   | 26   | 25  | 24  |

**Bit 29 – ARAE** Access to Reserved Address Enable

**Bit 28 – PEDE** Protocol Error in Data Phase Enable

**Bit 27 – PEAE** Protocol Error in Arbitration Phase Enable

**Bit 26 – WDIE** Watchdog Interrupt Enable

**Bit 25 – BOE** Bus\_Off Status Interrupt Enable

**Bit 24 – EWE** Warning Status Interrupt Enable

**Bit 23 – EPE** Error Passive Interrupt Enable

**Bit 22 – ELOE** Error Logging Overflow Interrupt Enable

**Bit 19 – DRXE** Message stored to Dedicated Receive Buffer Interrupt Enable

- Bit 18 – TOOE** Timeout Occurred Interrupt Enable
- Bit 17 – MRAFE** Message RAM Access Failure Interrupt Enable
- Bit 16 – TSWE** Timestamp Wraparound Interrupt Enable
- Bit 15 – TEFLE** Tx Event FIFO Event Lost Interrupt Enable
- Bit 14 – TEF FE** Tx Event FIFO Full Interrupt Enable
- Bit 13 – TEFWE** Tx Event FIFO Watermark Reached Interrupt Enable
- Bit 12 – TEFNE** Tx Event FIFO New Entry Interrupt Enable
- Bit 11 – TFEE** Tx FIFO Empty Interrupt Enable
- Bit 10 – TC FE** Transmission Cancellation Finished Interrupt Enable
- Bit 9 – TCE** Transmission Completed Interrupt Enable
- Bit 8 – HPME** High Priority Message Interrupt Enable
- Bit 7 – RF1LE** Receive FIFO 1 Message Lost Interrupt Enable
- Bit 6 – RF1FE** Receive FIFO 1 Full Interrupt Enable
- Bit 5 – RF1WE** Receive FIFO 1 Watermark Reached Interrupt Enable
- Bit 4 – RF1NE** Receive FIFO 1 New Message Interrupt Enable
- Bit 3 – RF0LE** Receive FIFO 0 Message Lost Interrupt Enable
- Bit 2 – RF0FE** Receive FIFO 0 Full Interrupt Enable
- Bit 1 – RF0WE** Receive FIFO 0 Watermark Reached Interrupt Enable
- Bit 0 – RF0NE** Receive FIFO 0 New Message Interrupt Enable

## 52.6.17 MCAN Interrupt Line Select Register

**Name:** MCAN\_ILS  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines.

0: Interrupt assigned to interrupt line MCAN\_INT0.

1: Interrupt assigned to interrupt line MCAN\_INT1.

|        |       |       |       |       |       |       |       |       |
|--------|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit    | 31    | 30    | 29    | 28    | 27    | 26    | 25    | 24    |

**Bit 29 – ARAL** Access to Reserved Address Line

**Bit 28 – PEDL** Protocol Error in Data Phase Line

**Bit 27 – PEAL** Protocol Error in Arbitration Phase Line

**Bit 26 – WDIL** Watchdog Interrupt Line

**Bit 25 – BOL** Bus\_Off Status Interrupt Line

**Bit 24 – EWL** Warning Status Interrupt Line

**Bit 23 – EPL** Error Passive Interrupt Line

**Bit 22 – ELOL** Error Logging Overflow Interrupt Line

**Bit 19 – DRXL** Message stored to Dedicated Receive Buffer Interrupt Line

- Bit 18 – TOOL** Timeout Occurred Interrupt Line
- Bit 17 – MRAFL** Message RAM Access Failure Interrupt Line
- Bit 16 – TSWL** Timestamp Wraparound Interrupt Line
- Bit 15 – TEFL** Tx Event FIFO Event Lost Interrupt Line
- Bit 14 – TEFFL** Tx Event FIFO Full Interrupt Line
- Bit 13 – TEFWL** Tx Event FIFO Watermark Reached Interrupt Line
- Bit 12 – TEFNL** Tx Event FIFO New Entry Interrupt Line
- Bit 11 – TFEL** Tx FIFO Empty Interrupt Line
- Bit 10 – TCFL** Transmission Cancellation Finished Interrupt Line
- Bit 9 – TCL** Transmission Completed Interrupt Line
- Bit 8 – HPML** High Priority Message Interrupt Line
- Bit 7 – RF1LL** Receive FIFO 1 Message Lost Interrupt Line
- Bit 6 – RF1FL** Receive FIFO 1 Full Interrupt Line
- Bit 5 – RF1WL** Receive FIFO 1 Watermark Reached Interrupt Line
- Bit 4 – RF1NL** Receive FIFO 1 New Message Interrupt Line
- Bit 3 – RF0LL** Receive FIFO 0 Message Lost Interrupt Line
- Bit 2 – RF0FL** Receive FIFO 0 Full Interrupt Line
- Bit 1 – RF0WL** Receive FIFO 0 Watermark Reached Interrupt Line
- Bit 0 – RF0NL** Receive FIFO 0 New Message Interrupt Line

### 52.6.18 MCAN Interrupt Line Enable

**Name:** MCAN\_ILE  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

Each of the two interrupt lines to the processor can be enabled/disabled separately by programming bits EINT0 and EINT1.

|        |    |    |    |    |    |    |       |       |
|--------|----|----|----|----|----|----|-------|-------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25    | 24    |
|        |    |    |    |    |    |    |       |       |
| Access |    |    |    |    |    |    |       |       |
| Reset  |    |    |    |    |    |    |       |       |
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17    | 16    |
|        |    |    |    |    |    |    |       |       |
| Access |    |    |    |    |    |    |       |       |
| Reset  |    |    |    |    |    |    |       |       |
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9     | 8     |
|        |    |    |    |    |    |    |       |       |
| Access |    |    |    |    |    |    |       |       |
| Reset  |    |    |    |    |    |    |       |       |
| Bit    | 7  | 6  | 5  | 4  | 3  | 2  | 1     | 0     |
|        |    |    |    |    |    |    | EINT1 | EINT0 |
| Access |    |    |    |    |    |    | R/W   | R/W   |
| Reset  |    |    |    |    |    |    | 0     | 0     |

#### Bit 1 – EINT1 Enable Interrupt Line 1

| Value | Description                        |
|-------|------------------------------------|
| 0     | Interrupt line MCAN_INT1 disabled. |
| 1     | Interrupt line MCAN_INT1 enabled.  |

#### Bit 0 – EINT0 Enable Interrupt Line 0

| Value | Description                        |
|-------|------------------------------------|
| 0     | Interrupt line MCAN_INT0 disabled. |
| 1     | Interrupt line MCAN_INT0 enabled.  |

### 52.6.19 MCAN Global Filter Configuration

**Name:** MCAN\_GFC  
**Offset:** 0x80  
**Reset:** 0x00000000  
**Property:** Read/Write

Global settings for Message ID filtering. The Global Filter Configuration controls the filter path for standard and extended messages as illustrated in [Standard Message ID Filter Path](#) and [Extended Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |           |     |           |     |      |      |
|--------|---|---|-----------|-----|-----------|-----|------|------|
| Bit    | 7 | 6 | 5         | 4   | 3         | 2   | 1    | 0    |
|        |   |   | ANFS[1:0] |     | ANFE[1:0] |     | RRFS | RRFE |
| Access |   |   | R/W       | R/W | R/W       | R/W | R/W  | R/W  |
| Reset  |   |   | 0         | 0   | 0         | 0   | 0    | 0    |

#### Bits 5:4 – ANFS[1:0] Accept Non-matching Frames Standard

Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated.

| Value | Name      | Description         |
|-------|-----------|---------------------|
| 0     | RX_FIFO_0 | Accept in Rx FIFO 0 |
| 1     | RX_FIFO_1 | Accept in Rx FIFO 1 |
| 2–3   | REJECTED  | Message rejected    |

#### Bits 3:2 – ANFE[1:0] Accept Non-matching Frames Extended

Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated.

| Value | Name      | Description         |
|-------|-----------|---------------------|
| 0     | RX_FIFO_0 | Accept in Rx FIFO 0 |
| 1     | RX_FIFO_1 | Accept in Rx FIFO 1 |
| 2–3   | REJECTED  | Message rejected    |

**Bit 1 – RRFS** Reject Remote Frames Standard

0 (FILTER): Filter remote frames with 11-bit standard IDs.

1 (REJECT): Reject all remote frames with 11-bit standard IDs.

**Bit 0 – RRFE** Reject Remote Frames Extended

0 (FILTER): Filter remote frames with 29-bit extended IDs.

1 (REJECT): Reject all remote frames with 29-bit extended IDs.

### 52.6.20 MCAN Standard ID Filter Configuration

**Name:** MCAN\_SIDFC  
**Offset:** 0x84  
**Reset:** 0x00000000  
**Property:** Read/Write

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as illustrated in [Standard Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |             |     |     |     |     |     |     |     |
| Access |             |     |     |     |     |     |     |     |
| Reset  |             |     |     |     |     |     |     |     |
| Bit    | 23          | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | LSS[7:0]    |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | FLSSA[13:6] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | FLSSA[5:0]  |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W |     |     |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   |     |     |

#### Bits 23:16 – LSS[7:0] List Size Standard

>128: Values greater than 128 are interpreted as 128.

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No standard Message ID filter.                 |
| 1-128 | Number of standard Message ID filter elements. |

#### Bits 15:2 – FLSSA[13:0] Filter List Standard Start Address

Start address of standard Message ID filter list (32-bit word address, see [Message RAM Configuration](#)).

Write FLSSA with the bits [15:2] of the 32-bit address.

### 52.6.21 MCAN Extended ID Filter Configuration

**Name:** MCAN\_XIDFC  
**Offset:** 0x88  
**Reset:** 0x00000000  
**Property:** Read/Write

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages as described in [Extended Message ID Filter Path](#).

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |             |          |     |     |     |     |     |     |

| Reset  | 0           | 0        | 0   | 0   | 0   | 0   |     |     |

#### Bits 22:16 – LSE[6:0] List Size Extended

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No extended Message ID filter.                 |
| 1–64  | Number of extended Message ID filter elements. |
| >64   | Values greater than 64 are interpreted as 64.  |

#### Bits 15:2 – FLESA[13:0] Filter List Extended Start Address

Start address of extended Message ID filter list (32-bit word address, see [Message RAM Configuration](#)).

Write FLESA with the bits [15:2] of the 32-bit address.

### 52.6.22 MCAN Extended ID AND Mask

**Name:** MCAN\_XIDAM  
**Offset:** 0x90  
**Reset:** 0x1FFFFFFF  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |             |     |     |             |     |     |     |     |

|        | EIDM[7:0]   |     |     |             |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W         | R/W | R/W | R/W | R/W |
| Reset  | 1           | 1   | 1   | 1           | 1   | 1   | 1   | 1   |

#### Bits 28:0 – EIDM[28:0] Extended ID Mask

For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

### 52.6.23 MCAN High Priority Message Status

**Name:** MCAN\_HPMS  
**Offset:** 0x94  
**Reset:** 0x00000000  
**Property:** Read-only

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

|        |          |           |           |    |    |    |    |    |

|        | MSI[1:0] |           | BIDX[5:0] |    |    |    |    |    |
| Access | R        | R         | R         | R  | R  | R  | R  | R  |
| Reset  | 0        | 0         | 0         | 0  | 0  | 0  | 0  | 0  |

#### Bit 15 – FLST Filter List

Indicates the filter list of the matching filter element.

| Value | Description          |
|-------|----------------------|
| 0     | Standard filter list |
| 1     | Extended filter list |

#### Bits 14:8 – FIDX[6:0] Filter Index

Index of matching filter element. Range is 0 to MCAN\_SIDFC.LSS - 1 resp. MCAN\_XIDFC.LSE - 1.

#### Bits 7:6 – MSI[1:0] Message Storage Indicator

| Value | Name        | Description               |
|-------|-------------|---------------------------|
| 0     | NO_FIFO_SEL | No FIFO selected.         |
| 1     | LOST        | FIFO message lost.        |
| 2     | FIFO_0      | Message stored in FIFO 0. |
| 3     | FIFO_1      | Message stored in FIFO 1. |

**Bits 5:0 – BIDX[5:0]** Buffer Index

Index of Receive FIFO element to which the message was stored. Only valid when MSI[1] = '1'.

### 52.6.24 MCAN New Data 1

**Name:** MCAN\_NDAT1  
**Offset:** 0x98  
**Reset:** 0x00000000  
**Property:** Read/Write

| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0   | 0   |

|        |     |     |     |     |     |     |     |     |
|--------|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | ND7 | ND6 | ND5 | ND4 | ND3 | ND2 | ND1 | ND0 |
| Access | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – NDx New Data

The register holds the New Data flags of Receive Buffers 0 to 31. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | Receive Buffer not updated              |
| 1     | Receive Buffer updated from new message |

### 52.6.25 MCAN New Data 2

**Name:** MCAN\_NDAT2  
**Offset:** 0x9C  
**Reset:** 0x00000000  
**Property:** Read/Write

| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

#### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – NDx New Data

The register holds the New Data flags of Receive Buffers 32 to 63. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

| Value | Description                              |
|-------|------------------------------------------|
| 0     | Receive Buffer not updated.              |
| 1     | Receive Buffer updated from new message. |

### 52.6.26 MCAN Receive FIFO 0 Configuration

**Name:** MCAN\_RXF0C  
**Offset:** 0xA0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |            |          |           |     |     |     |     |     |

|        | F0SA[5:0]  |          |           |     |     |     |     |     |
| Access | R/W        | R/W      | R/W       | R/W | R/W | R/W |     |     |
| Reset  | 0          | 0        | 0         | 0   | 0   | 0   |     |     |

#### Bit 31 – F0OM FIFO 0 Operation Mode

FIFO 0 can be operated in Blocking or in Overwrite mode (see [Rx FIFOs](#)).

| Value | Description            |
|-------|------------------------|
| 0     | FIFO 0 Blocking mode.  |
| 1     | FIFO 0 Overwrite mode. |

#### Bits 30:24 – F0WM[6:0] Receive FIFO 0 Watermark

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | Watermark interrupt disabled.                                |
| 1–64  | Level for Receive FIFO 0 watermark interrupt (MCAN_IR.RF0W). |
| >64   | Watermark interrupt disabled.                                |

#### Bits 22:16 – F0S[6:0] Receive FIFO 0 Size

The Receive FIFO 0 elements are indexed from 0 to F0S-1.

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No Receive FIFO 0                             |
| 1–64  | Number of Receive FIFO 0 elements.            |
| >64   | Values greater than 64 are interpreted as 64. |

**Bits 15:2 – F0SA[13:0]** Receive FIFO 0 Start Address

Start address of Receive FIFO 0 in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write F0SA with the bits [15:2] of the 32-bit address.

### 52.6.27 MCAN Receive FIFO 0 Status

**Name:** MCAN\_RXF0S  
**Offset:** 0xA4  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |      |     |
|--------|----|----|----|----|----|----|------|-----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25   | 24  |
|        |    |    |    |    |    |    | RF0L | F0F |
| Access |    |    |    |    |    |    | R    | R   |
| Reset  |    |    |    |    |    |    | 0    | 0   |

|        |    |    |           |    |    |    |    |    |
|--------|----|----|-----------|----|----|----|----|----|
| Bit    | 23 | 22 | 21        | 20 | 19 | 18 | 17 | 16 |

| Access |   | R         | R | R | R | R | R | R |
| Reset  |   | 0         | 0 | 0 | 0 | 0 | 0 | 0 |

#### Bit 25 – RF0L Receive FIFO 0 Message Lost

This bit is a copy of interrupt flag MCAN\_IR.RF0L. When MCAN\_IR.RF0L is reset, this bit is also reset.

Overwriting the oldest message when MCAN\_RXF0C.F0OM = '1' will not set this flag.

| Value | Description                                                                              |
|-------|------------------------------------------------------------------------------------------|
| 0     | No Receive FIFO 0 message lost                                                           |
| 1     | Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero |

#### Bit 24 – F0F Receive FIFO 0 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 0 not full. |
| 1     | Receive FIFO 0 full.     |

#### Bits 21:16 – F0PI[5:0] Receive FIFO 0 Put Index

Receive FIFO 0 write index pointer, range 0 to 63.

#### Bits 13:8 – F0GI[5:0] Receive FIFO 0 Get Index

Receive FIFO 0 read index pointer, range 0 to 63.

#### Bits 6:0 – F0FL[6:0] Receive FIFO 0 Fill Level

Number of elements stored in Receive FIFO 0, range 0 to 64.

52.6.28 MCAN Receive FIFO 0 Acknowledge

Name: MCAN\_RXF0A  
Offset: 0xA8  
Reset: 0x00000000  
Property: Read/Write

|        |    |    |           |     |     |     |     |     |
|--------|----|----|-----------|-----|-----|-----|-----|-----|
| Bit    | 31 | 30 | 29        | 28  | 27  | 26  | 25  | 24  |
|        |    |    |           |     |     |     |     |     |
| Access |    |    |           |     |     |     |     |     |
| Reset  |    |    |           |     |     |     |     |     |
| Bit    | 23 | 22 | 21        | 20  | 19  | 18  | 17  | 16  |
|        |    |    |           |     |     |     |     |     |
| Access |    |    |           |     |     |     |     |     |
| Reset  |    |    |           |     |     |     |     |     |
| Bit    | 15 | 14 | 13        | 12  | 11  | 10  | 9   | 8   |
|        |    |    |           |     |     |     |     |     |
| Access |    |    |           |     |     |     |     |     |
| Reset  |    |    |           |     |     |     |     |     |
| Bit    | 7  | 6  | 5         | 4   | 3   | 2   | 1   | 0   |
|        |    |    | F0AI[5:0] |     |     |     |     |     |
| Access |    |    | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  |    |    | 0         | 0   | 0   | 0   | 0   | 0   |

**Bits 5:0 – F0AI[5:0]** Receive FIFO 0 Acknowledge Index  
After the processor has read a message or a sequence of messages from Receive FIFO 0 it has to write the buffer index of the last element read from Receive FIFO 0 to F0AI. This will set the Receive FIFO 0 Get Index MCAN\_RXF0S.F0GI to F0AI + 1 and update the FIFO 0 Fill Level MCAN\_RXF0S.F0FL.

## 52.6.29 MCAN Receive Buffer Configuration

**Name:** MCAN\_RXBC  
**Offset:** 0xAC  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |            |     |     |     |     |     |     |     |
|--------|------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31         | 30  | 29  | 28  | 27  | 26  | 25  | 24  |

|        | RBSA[5:0]  |     |     |     |     |     |     |     |
| Access | R/W        | R/W | R/W | R/W | R/W | R/W |     |     |
| Reset  | 0          | 0   | 0   | 0   | 0   | 0   |     |     |

### Bits 15:2 – RBSA[13:0] Receive Buffer Start Address

Configures the start address of the Receive Buffers section in the Message RAM (32-bit word address, see [Message RAM Configuration](#)). Also used to reference debug messages A,B,C.

Write RBSA with the bits [15:2] of the 32-bit address.

### 52.6.30 MCAN Receive FIFO 1 Configuration

**Name:** MCAN\_RXF1C  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

|        |            |          |           |     |     |     |     |     |

| Access |            | R/W      | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  |            | 0        | 0         | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15         | 14       | 13        | 12  | 11  | 10  | 9   | 8   |
|        | F1SA[13:6] |          |           |     |     |     |     |     |
| Access | R/W        | R/W      | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0        | 0         | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7          | 6        | 5         | 4   | 3   | 2   | 1   | 0   |
|        | F1SA[5:0]  |          |           |     |     |     |     |     |
| Access | R/W        | R/W      | R/W       | R/W | R/W | R/W |     |     |
| Reset  | 0          | 0        | 0         | 0   | 0   | 0   |     |     |

#### Bit 31 – F1OM FIFO 1 Operation Mode

FIFO 1 can be operated in Blocking or in Overwrite mode (see [Rx FIFOs](#)).

| Value | Description            |
|-------|------------------------|
| 0     | FIFO 1 Blocking mode.  |
| 1     | FIFO 1 Overwrite mode. |

#### Bits 30:24 – F1WM[6:0] Receive FIFO 1 Watermark

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | Watermark interrupt disabled                                 |
| 1–64  | Level for Receive FIFO 1 watermark interrupt (MCAN_IR.RF1W). |
| >64   | Watermark interrupt disabled.                                |

#### Bits 22:16 – F1S[6:0] Receive FIFO 1 Size

The elements in Receive FIFO 1 are indexed from 0 to F1S - 1.

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No Receive FIFO 1                             |
| 1–64  | Number of elements in Receive FIFO 1.         |
| >64   | Values greater than 64 are interpreted as 64. |

**Bits 15:2 – F1SA[13:0]** Receive FIFO 1 Start Address

Start address of Receive FIFO 1 in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write F1SA with the bits [15:2] of the 32-bit address.

### 52.6.31 MCAN Receive FIFO 1 Status

**Name:** MCAN\_RXF1S  
**Offset:** 0xB4  
**Reset:** 0x00000000  
**Property:** Read-only

|        |          |    |    |    |    |    |      |     |
|--------|----------|----|----|----|----|----|------|-----|
| Bit    | 31       | 30 | 29 | 28 | 27 | 26 | 25   | 24  |

|--------|---|-----------|---|---|---|---|---|---|
| Bit    | 7 | 6         | 5 | 4 | 3 | 2 | 1 | 0 |
|        |   | F1FL[6:0] |   |   |   |   |   |   |
| Access |   | R         | R | R | R | R | R | R |
| Reset  |   | 0         | 0 | 0 | 0 | 0 | 0 | 0 |

#### Bits 31:30 – DMS[1:0] Debug Message Status

| Value | Name    | Description                                                               |
|-------|---------|---------------------------------------------------------------------------|
| 0     | IDLE    | Idle state, wait for reception of debug messages, DMA request is cleared. |
| 1     | MSG_A   | Debug message A received.                                                 |
| 2     | MSG_AB  | Debug messages A, B received.                                             |
| 3     | MSG_ABC | Debug messages A, B, C received, DMA request is set.                      |

#### Bit 25 – RF1L Receive FIFO 1 Message Lost

This bit is a copy of interrupt flag IR.RF1L. When IR.RF1L is reset, this bit is also reset.

Overwriting the oldest message when MCAN\_RXF1C.F1OM = '1' will not set this flag.

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | No Receive FIFO 1 message lost.                                                           |
| 1     | Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero. |

#### Bit 24 – F1F Receive FIFO 1 Full

| Value | Description              |
|-------|--------------------------|
| 0     | Receive FIFO 1 not full. |
| 1     | Receive FIFO 1 full.     |

**Bits 21:16 – F1PI[5:0]** Receive FIFO 1 Put Index  
Receive FIFO 1 write index pointer, range 0 to 63.

**Bits 13:8 – F1GI[5:0]** Receive FIFO 1 Get Index  
Receive FIFO 1 read index pointer, range 0 to 63.

**Bits 6:0 – F1FL[6:0]** Receive FIFO 1 Fill Level  
Number of elements stored in Receive FIFO 1, range 0 to 64.

52.6.32 MCAN Receive FIFO 1 Acknowledge

Name: MCAN\_RXF1A  
Offset: 0xB8  
Reset: 0x00000000  
Property: Read/Write

**Bits 5:0 – F1AI[5:0]** Receive FIFO 1 Acknowledge Index  
After the processor has read a message or a sequence of messages from Receive FIFO 1 it has to write the buffer index of the last element read from Receive FIFO 1 to F1AI. This will set the Receive FIFO 1 Get Index MCAN\_RXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MCAN\_RXF1S.F1FL.

### 52.6.33 MCAN Receive Buffer / FIFO Element Size Configuration

**Name:** MCAN\_RXESC  
**Offset:** 0xBC  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Configures the number of data bytes belonging to a Receive Buffer / Receive FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Receive Buffer or Receive FIFO, only the number of bytes as configured by MCAN\_RXESC are stored to the Receive Buffer resp. Receive FIFO element. The rest of the frame's data field is ignored.

#### Bits 10:8 – RBDS[2:0] Receive Buffer Data Field Size

| Value | Name    | Description        |
|-------|---------|--------------------|
| 0     | 8_BYTE  | 8-byte data field  |
| 1     | 12_BYTE | 12-byte data field |
| 2     | 16_BYTE | 16-byte data field |
| 3     | 20_BYTE | 20-byte data field |
| 4     | 24_BYTE | 24-byte data field |
| 5     | 32_BYTE | 32-byte data field |
| 6     | 48_BYTE | 48-byte data field |
| 7     | 64_BYTE | 64-byte data field |

#### Bits 6:4 – F1DS[2:0] Receive FIFO 1 Data Field Size

# SAMA5D2 Series

## Controller Area Network (MCAN)

| Value | Name    | Description        |
|-------|---------|--------------------|
| 0     | 8_BYTE  | 8-byte data field  |
| 1     | 12_BYTE | 12-byte data field |
| 2     | 16_BYTE | 16-byte data field |
| 3     | 20_BYTE | 20-byte data field |
| 4     | 24_BYTE | 24-byte data field |
| 5     | 32_BYTE | 32-byte data field |
| 6     | 48_BYTE | 48-byte data field |
| 7     | 64_BYTE | 64-byte data field |

### Bits 2:0 – F0DS[2:0] Receive FIFO 0 Data Field Size

| Value | Name    | Description        |
|-------|---------|--------------------|
| 0     | 8_BYTE  | 8-byte data field  |
| 1     | 12_BYTE | 12-byte data field |
| 2     | 16_BYTE | 16-byte data field |
| 3     | 20_BYTE | 20-byte data field |
| 4     | 24_BYTE | 24-byte data field |
| 5     | 32_BYTE | 32-byte data field |
| 6     | 48_BYTE | 48-byte data field |
| 7     | 64_BYTE | 64-byte data field |

### 52.6.34 MCAN Tx Buffer Configuration

**Name:** MCAN\_TXBC  
**Offset:** 0xC0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

The sum of TFQS and NDTB may not exceed 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

|        |            |      |           |     |     |     |     |     |
|--------|------------|------|-----------|-----|-----|-----|-----|-----|
| Bit    | 31         | 30   | 29        | 28  | 27  | 26  | 25  | 24  |
|        |            | TFQM | TFQS[5:0] |     |     |     |     |     |
| Access |            | R/W  | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  |            | 0    | 0         | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23         | 22   | 21        | 20  | 19  | 18  | 17  | 16  |
|        |            |      | NDTB[5:0] |     |     |     |     |     |
| Access |            |      | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  |            |      | 0         | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15         | 14   | 13        | 12  | 11  | 10  | 9   | 8   |
|        | TBSA[13:6] |      |           |     |     |     |     |     |
| Access | R/W        | R/W  | R/W       | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0          | 0    | 0         | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7          | 6    | 5         | 4   | 3   | 2   | 1   | 0   |
|        | TBSA[5:0]  |      |           |     |     |     |     |     |
| Access | R/W        | R/W  | R/W       | R/W | R/W | R/W |     |     |
| Reset  | 0          | 0    | 0         | 0   | 0   | 0   |     |     |

#### Bit 30 – TFQM Tx FIFO/Queue Mode

| Value | Description         |
|-------|---------------------|
| 0     | Tx FIFO operation.  |
| 1     | Tx Queue operation. |

#### Bits 29:24 – TFQS[5:0] Transmit FIFO/Queue Size

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No Tx FIFO/Queue.                             |
| 1–32  | Number of Tx Buffers used for Tx FIFO/Queue.  |
| >32   | Values greater than 32 are interpreted as 32. |

#### Bits 21:16 – NDTB[5:0] Number of Dedicated Transmit Buffers

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | No dedicated Tx Buffers.                      |
| 1–32  | Number of dedicated Tx Buffers.               |
| >32   | Values greater than 32 are interpreted as 32. |

**Bits 15:2 – TBSA[13:0]** Tx Buffers Start Address

Start address of Tx Buffers section in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write TBSA with the bits [15:2] of the 32-bit address.

### 52.6.35 MCAN Tx FIFO/Queue Status

**Name:** MCAN\_TXFQS  
**Offset:** 0xC4  
**Reset:** 0x00000000  
**Property:** Read-only

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MCAN\_TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MCAN\_TXBRP not yet updated).

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers. Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |      |            |    |    |    |    |
|--------|----|----|------|------------|----|----|----|----|
| Bit    | 23 | 22 | 21   | 20         | 19 | 18 | 17 | 16 |

| Access |    |    | R    | R          | R  | R  | R  | R  |
| Reset  |    |    | 0    | 0          | 0  | 0  | 0  | 0  |

|        |    |    |    |           |    |    |   |   |
|--------|----|----|----|-----------|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12        | 11 | 10 | 9 | 8 |
|        |    |    |    | TFGI[4:0] |    |    |   |   |
| Access |    |    |    | R         | R  | R  | R | R |
| Reset  |    |    |    | 0         | 0  | 0  | 0 | 0 |

|        |   |   |   |           |   |   |   |   |
|--------|---|---|---|-----------|---|---|---|---|
| Bit    | 7 | 6 | 5 | 4         | 3 | 2 | 1 | 0 |
|        |   |   |   | TFFL[5:0] |   |   |   |   |
| Access |   |   | R | R         | R | R | R | R |
| Reset  |   |   | 0 | 0         | 0 | 0 | 0 | 0 |

#### Bit 21 – TFQF Tx FIFO/Queue Full

| Value | Description             |
|-------|-------------------------|
| 0     | Tx FIFO/Queue not full. |
| 1     | Tx FIFO/Queue full.     |

#### Bits 20:16 – TFQPI[4:0] Tx FIFO/Queue Put Index

Tx FIFO/Queue write index pointer, range 0 to 31.

#### Bits 12:8 – TFGI[4:0] Tx FIFO Get Index

Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MCAN\_TXBC.TFQM = '1').

**Bits 5:0 – TFFL[5:0]** Tx FIFO Free Level

Number of consecutive free Tx FIFO elements starting from TFGL, range 0 to 32. Read as zero when Tx Queue operation is configured (MCAN\_TXBC.TFQM = '1').

### 52.6.36 MCAN Tx Buffer Element Size Configuration

**Name:** MCAN\_TXESC  
**Offset:** 0xC8  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the bits CCE and INIT are set in [MCAN CC Control Register](#).

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size MCAN\_TXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as “0xCC” (padding bytes).

#### Bits 2:0 – TBDS[2:0] Tx Buffer Data Field Size

| Value | Name    | Description         |
|-------|---------|---------------------|
| 0     | 8_BYTE  | 8-byte data field   |
| 1     | 12_BYTE | 12-byte data field  |
| 2     | 16_BYTE | 16-byte data field  |
| 3     | 20_BYTE | 20-byte data field  |
| 4     | 24_BYTE | 24-byte data field  |
| 5     | 32_BYTE | 32-byte data field  |
| 6     | 48_BYTE | 48- byte data field |
| 7     | 64_BYTE | 64-byte data field  |

### 52.6.37 MCAN Transmit Buffer Request Pending

**Name:** MCAN\_TXBRP  
**Offset:** 0xCC  
**Reset:** 0x00000000  
**Property:** Read-only

MCAN\_TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MCAN\_TXBRP bit is reset.

|        |       |       |       |       |       |       |       |       |

| Reset  | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    |

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – TRPx** Transmission Request Pending for Buffer x

Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MCAN\_TXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MCAN\_TXBCR.

TXBRP bits are set only for those Tx Buffers configured via MCAN\_TXBC. After a MCAN\_TXBRP bit has been set, a Tx scan (see [Tx Handling](#)) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).

A cancellation request resets the corresponding transmission request pending bit of register MCAN\_TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding TXBRP bit has been reset.

After a cancellation has been requested, a finished cancellation is signalled via MCAN\_TXBCF.

- after successful transmission together with the corresponding MCAN\_TXBTO bit.
- when the transmission has not yet been started at the point of cancellation.

## SAMA5D2 Series

### Controller Area Network (MCAN)

- when the transmission has been aborted due to lost arbitration.
- when an error occurred during frame transmission.

In DAR mode, all transmissions are automatically cancelled if they are not successful. The corresponding MCAN\_TXBCF bit is set for all unsuccessful transmissions.

| Value | Description                     |
|-------|---------------------------------|
| 0     | No transmission request pending |
| 1     | Transmission request pending    |

### 52.6.38 MCAN Transmit Buffer Add Request

**Name:** MCAN\_TXBAR  
**Offset:** 0xD0  
**Reset:** 0x00000000  
**Property:** Read/Write

If an add request is applied for a Transmit Buffer with pending transmission request (corresponding MCAN\_TXBRP bit already set), this Add Request is ignored.

#### **Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – ARx** Add Request for Transmit Buffer x

Each Transmit Buffer has its own Add Request bit. Writing a '1' will set the corresponding Add Request bit; writing a '0' has no impact. This enables the processor to set transmission requests for multiple Transmit Buffers with one write to MCAN\_TXBAR. MCAN\_TXBAR bits are set only for those Transmit Buffers configured via TXBC. When no Transmit scan is running, the bits are reset immediately, else the bits remain set until the Transmit scan process has completed.

| Value | Description                    |
|-------|--------------------------------|
| 0     | No transmission request added. |
| 1     | Transmission requested added.  |

#### Bits 29:24 – EFWM[5:0] Event FIFO Watermark

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | Watermark interrupt disabled.                               |
| 1–32  | Level for Tx Event FIFO watermark interrupt (MCAN_IR.TEFW). |
| >32   | Watermark interrupt disabled.                               |

#### Bits 21:16 – EFS[5:0] Event FIFO Size

The Tx Event FIFO elements are indexed from 0 to EFS - 1.

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | Tx Event FIFO disabled.                       |
| 1–32  | Number of Tx Event FIFO elements.             |
| >32   | Values greater than 32 are interpreted as 32. |

#### Bits 15:2 – EFSA[13:0] Event FIFO Start Address

Start address of Tx Event FIFO in Message RAM (32-bit word address, see [Message RAM Configuration](#)).

Write EFSA with the bits [15:2] of the 32-bit address.

### 52.6.45 MCAN Tx Event FIFO Status

**Name:** MCAN\_TXEFS  
**Offset:** 0xF4  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |      |     |

#### Bit 25 – TEFL Tx Event FIFO Element Lost

This bit is a copy of interrupt flag MCAN\_IR.TEFL. When MCAN\_IR.TEFL is reset, this bit is also reset.

| Value | Description                                                                             |
|-------|-----------------------------------------------------------------------------------------|
| 0     | No Tx Event FIFO element lost.                                                          |
| 1     | Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero. |

#### Bit 24 – EFF Event FIFO Full

| Value | Description             |
|-------|-------------------------|
| 0     | Tx Event FIFO not full. |
| 1     | Tx Event FIFO full.     |

#### Bits 20:16 – EFPI[4:0] Event FIFO Put Index

Tx Event FIFO write index pointer, range 0 to 31.

#### Bits 12:8 – EFGI[4:0] Event FIFO Get Index

Tx Event FIFO read index pointer, range 0 to 31.

#### Bits 5:0 – EFFL[5:0] Event FIFO Fill Level

Number of elements stored in Tx Event FIFO, range 0 to 32.

## 52.6.46 MCAN Tx Event FIFO Acknowledge

**Name:** MCAN\_TXEFA  
**Offset:** 0xF8  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |           |     |     |     |     |
|--------|----|----|----|-----------|-----|-----|-----|-----|
| Bit    | 31 | 30 | 29 | 28        | 27  | 26  | 25  | 24  |
|        |    |    |    |           |     |     |     |     |
| Access |    |    |    |           |     |     |     |     |
| Reset  |    |    |    |           |     |     |     |     |
| Bit    | 23 | 22 | 21 | 20        | 19  | 18  | 17  | 16  |
|        |    |    |    |           |     |     |     |     |
| Access |    |    |    |           |     |     |     |     |
| Reset  |    |    |    |           |     |     |     |     |
| Bit    | 15 | 14 | 13 | 12        | 11  | 10  | 9   | 8   |
|        |    |    |    |           |     |     |     |     |
| Access |    |    |    |           |     |     |     |     |
| Reset  |    |    |    |           |     |     |     |     |
| Bit    | 7  | 6  | 5  | 4         | 3   | 2   | 1   | 0   |
|        |    |    |    | EFAI[4:0] |     |     |     |     |
| Access |    |    |    | R/W       | R/W | R/W | R/W | R/W |
| Reset  |    |    |    | 0         | 0   | 0   | 0   | 0   |

### Bits 4:0 – EFAI[4:0] Event FIFO Acknowledge Index

After the processor has read an element or a sequence of elements from the Tx Event FIFO, it has to write the index of the last element read from Tx Event FIFO to EFAI. This will set the Tx Event FIFO Get Index MCAN\_TXEFS.EFGI to EFAI + 1 and update the FIFO 0 Fill Level MCAN\_TXEFS.EFFL.

## **53. Timer Counter (TC)**

### **53.1 Description**

A Timer Counter (TC) module includes three identical TC channels. The number of implemented TC modules is device-specific.

Each TC channel can be independently programmed to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation.

Each channel has three external clock inputs, five internal clock inputs and two multipurpose input/output signals which can be configured by the user. Each channel drives an internal interrupt signal which can be programmed to generate processor interrupts.

The TC embeds a quadrature decoder (QDEC) connected in front of the timers and driven by TIOA0, TIOB0 and TIOB1 inputs. When enabled, the QDEC performs the input lines filtering, decoding of quadrature signals and connects to the timers/counters in order to read the position and speed of the motor through the user interface.

The TC block has two global registers which act upon all TC channels:

- Block Control register (TC\_BCR)—allows channels to be started simultaneously with the same instruction
- Block Mode register (TC\_BMR)—defines the external clock inputs for each channel, allowing them to be chained

### **53.2 Embedded Characteristics**

- Total of 6 Channels
- 32-bit Channel Size
- Wide Range of Functions Including:
  - Frequency measurement
  - Event counting
  - Interval measurement
  - Pulse generation
  - Delay timing
  - Pulse Width Modulation
  - Up/down capabilities
  - Quadrature decoder
  - 2-bit Gray up/down count for stepper motor
- Each Channel is User-Configurable and Contains:
  - Three external clock inputs
  - Five Internal clock inputs
  - Two multipurpose input/output signals acting as trigger event
  - Trigger/capture events can be directly synchronized by PWM signals
- Internal Interrupt Signal

- Read of the Capture Registers by the DMAC
- Compare Event Fault Generation for PWM
- Register Write Protection

### 53.3 Block Diagram

**Table 53-1. Timer Counter Clock Assignment**

| Name                     | Definition                      |
|--------------------------|---------------------------------|
| TIMER_CLOCK1             | GCLK[35], GCLK[36]              |
| TIMER_CLOCK2             | System bus clock divided by 8   |
| TIMER_CLOCK3             | System bus clock divided by 32  |
| TIMER_CLOCK4             | System bus clock divided by 128 |
| TIMER_CLOCK5 (See Notes) | slow_clock                      |

**Note:**

1. The GCLK frequency must be at least three times lower than peripheral clock frequency.

**Figure 53-1. Timer Counter Block Diagram**

**Note:**

The QDEC connections are detailed in [Figure 53-17](#).

**Table 53-2. Channel Signal Description**

| Signal Name   | Description                                                                    |
|---------------|--------------------------------------------------------------------------------|
| XC0, XC1, XC2 | External Clock Inputs                                                          |
| TIOAx         | Capture Mode: Timer Counter Input<br>Waveform Mode: Timer Counter Output       |
| TIOBx         | Capture Mode: Timer Counter Input<br>Waveform Mode: Timer Counter Input/Output |
| INT           | Interrupt Signal Output (internal signal)                                      |
| SYNC          | Synchronization Input Signal (from configuration register)                     |

### 53.4 Pin List

**Table 53-3. Pin List**

| Pin Name    | Description          | Type  |
|-------------|----------------------|-------|
| TCLK0–TCLK2 | External Clock Input | Input |
| TIOA0–TIOA2 | I/O Line A           | I/O   |
| TIOB0–TIOB2 | I/O Line B           | I/O   |

### 53.5 Product Dependencies

#### 53.5.1 I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the TC pins to their peripheral functions.

#### 53.5.2 Power Management

The TC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the Timer Counter clock.

#### 53.5.3 Interrupt Sources

The TC has an interrupt line connected to the interrupt controller. Handling the TC interrupt requires programming the interrupt controller before configuring the TC.

#### 53.5.4 Synchronization Inputs from PWM

The TC has trigger/capture inputs internally connected to the PWM. Refer to [“Synchronization with PWM”](#) and to the implementation of the Pulse Width Modulation (PWM) in this product.

#### 53.5.5 Fault Output

The TC has the FAULT output internally connected to the fault input of PWM. Refer to [“Fault Mode”](#) and to the implementation of the Pulse Width Modulation (PWM) in this product.

### 53.6 Functional Description

#### 53.6.1 Description

All channels of the Timer Counter are independent and identical in operation except when the QDEC is enabled. The registers for channel programming are listed in [53.7 Register Summary](#).

#### 53.6.2 32-bit Counter

Each 32-bit channel is organized around a 32-bit counter. The value of the counter is incremented at each positive edge of the selected clock. When the counter has reached the value  $2^{32}-1$  and passes to zero, an overflow occurs and the COVFS bit in the Interrupt Status register (TC\_SR) is set.

The current value of the counter is accessible in real time by reading the Counter Value register (TC\_CV). The counter can be reset by a trigger. In this case, the counter value passes to zero on the next valid edge of the selected clock.

#### 53.6.3 Clock Selection

At block level, input clock signals of each channel can be connected either to the external inputs TCLKx, or to the internal I/O signals TIOAx for chaining<sup>(1)</sup> by programming the Block Mode register (TC\_BMR). See [Clock Chaining Selection](#).

Each channel can independently select an internal or external clock source for its counter<sup>(2)</sup>:

- External clock signals: XC0, XC1 or XC2
- Internal clock signals: GCLK[35], GCLK[36], System bus clock divided by 8, System bus clock divided by 32, System bus clock divided by 128, slow\_clock

This selection is made by the TCCLKS bits in the Channel Mode register (TC\_CMRx).

The selected clock can be inverted with TC\_CMRx.CLKI. This allows counting on the opposite edges of the clock.

The burst function allows the clock to be validated when an external signal is high. The BURST parameter in the TC\_CMRx defines this signal (none, XC0, XC1, XC2). See [Clock Selection](#).

**Note:**

1. In Waveform mode, to chain two timers, it is mandatory to initialize some parameters:
  - Configure TIOx outputs to 1 or 0 by writing the required value to TC\_CMRx.ASWTRG.
  - Bit TC\_BCR.SYNC must be written to 1 to start the channels at the same time.
2. In all cases, if an external clock or asynchronous internal clock GCLK is used, the duration of each of its levels must be longer than the peripheral clock period, so the clock frequency will be at least 2.5 times lower than the peripheral clock.

**Figure 53-2. Clock Chaining Selection**

**Figure 53-3. Clock Selection**

### 53.6.4 Clock Control

The clock of each counter can be controlled in two different ways: it can be enabled/disabled and started/stopped, as shown in the following figure.

- The clock can be enabled or disabled by the user with the CLKEN and the CLKDIS commands in the Channel Control register (TC\_CCR). In Capture mode it can be disabled by an RB load event if TC\_CMRx.LDBDIS is set to '1'. In Waveform mode, it can be disabled by an RC Compare event if TC\_CMRx.CPCDIS is set to '1'. When disabled, the start or the stop actions have no effect: only a CLKEN command in the TC\_CCR can reenale the clock. When the clock is enabled, TC\_SR.CLKSTA is set.
- The clock can also be started or stopped: a trigger (software, synchro, external or compare) always starts the clock. The clock can be stopped by an RB load event in Capture mode (TC\_CMRx.LDBSTOP = 1) or an RC compare event in Waveform mode (TC\_CMRx.CPCSTOP = 1). The start and the stop commands are effective only if the clock is enabled.

**Figure 53-4. Clock Control**

### 53.6.5 Operating Modes

Each channel can operate independently in two different modes:

- Capture mode provides measurement on signals.
- Waveform mode provides wave generation.

The TC operating mode is programmed with TC\_CMRx.WAVE.

In Capture mode, TIOAx and TIOBx are configured as inputs.

In Waveform mode, TIOAx is always configured to be an output and TIOBx is an output if it is not selected to be the external trigger.

### 53.6.6 Trigger

A trigger resets the counter and starts the counter clock. Three types of triggers are common to both modes, and a fourth external trigger is available to each mode.

Regardless of the trigger used, it will be taken into account at the following active edge of the selected clock. This means that the counter value can be read differently from zero just after a trigger, especially when a low frequency signal is selected as the clock.

The following triggers are common to both modes:

- Software Trigger: Each channel has a software trigger, available by setting TC\_CCR.SWTRG.
- SYNC: Each channel has a synchronization signal SYNC. When asserted, this signal has the same effect as a software trigger. The SYNC signals of all channels are asserted simultaneously by writing TC\_BCR with SYNC set.
- Compare RC Trigger: RC is implemented in each channel and can provide a trigger when the counter value matches the RC value if TC\_CMRx.CPCTRG is set .

The channel can also be configured to have an external trigger. In Capture mode, the external trigger signal can be selected between TIOAx and TIOBx. In Waveform mode, an external event can be programmed on one of the following signals: TIOBx, XC0, XC1 or XC2. This external event can then be programmed to perform a trigger by setting TC\_CMRx.ENETRIG.

If an external trigger is used, the duration of the pulses must be longer than the peripheral clock period in order to be detected.

### 53.6.7 Capture Mode

Capture mode is entered by clearing TC\_CMRx.WAVE.

Capture mode allows the TC channel to perform measurements such as pulse timing, frequency, period, duty cycle and phase on TIOAx and TIOBx signals which are considered as inputs.

Figure 53-6 shows the configuration of the TC channel when programmed in Capture mode.

### 53.6.8 Capture Registers A and B

Registers A and B (TC\_RA and TC\_RB) are used as capture registers. They can be loaded with the counter value when a programmable event occurs on the signal TIOAx.

TC\_CMRx.LDRA defines the TIOAx selected edge for the loading of TC\_RA, and TC\_CMRx.LDRB defines the TIOAx selected edge for the loading of TC\_RB.

The subsampling ratio defined by TC\_CMRx.SBSMPLR is applied to these selected edges, so that the loading of Register A and Register B occurs once every 1, 2, 4, 8 or 16 selected edges.

TC\_RA is loaded only if it has not been loaded since the last trigger or if TC\_RB has been loaded since the last loading of TC\_RA.

TC\_RB is loaded only if TC\_RA has been loaded since the last trigger or the last loading of TC\_RB.

Loading TC\_RA or TC\_RB before the read of the last value loaded sets TC\_SR.LOVRS. In this case, the old value is overwritten.

When DMA is used, the Register AB (TC\_RAB) address must be configured as source address of the transfer. TC\_RAB provides the next unread value from TC\_RA and TC\_RB. It may be read by the DMA after a request has been triggered upon loading TC\_RA or TC\_RB.

### 53.6.9 Transfer with DMAC in Capture Mode

The DMAC can perform access from the TC to system memory in Capture mode only.

The following figure illustrates how TC\_RA and TC\_RB can be loaded in the system memory without processor intervention.

**Figure 53-5. Example of Transfer with DMAC in Capture Mode**

ETRGEDG = 1, LDRA = 1, LDRB = 2, ABETRG = 0

T1, T2, T3, T4 = System Bus load dependent ( $t_{\min} = 8$  Peripheral Clocks)

ETRGEDG = 3, LDRA = 3, LDRB = 0, ABETRG = 0

T1, T2, T3, T4 = System Bus load dependent ( $t_{\min} = 8$  Peripheral Clocks)

### 53.6.10 Trigger Conditions

In addition to the SYNC signal, the software trigger and the RC compare trigger, an external trigger can be defined.

The ABETRG bit in the TC\_CMCR selects TIOAx or TIOBx input signal as an external trigger or the trigger signal from the output comparator of the PWM module. The External Trigger Edge Selection parameter (ETRGEDG field in TC\_CMCR) defines the edge (rising, falling, or both) detected to generate an external trigger. If ETRGEDG = 0 (none), the external trigger is disabled.

**Figure 53-6. Capture Mode**

### 53.6.11 Waveform Mode

Waveform mode is entered by setting the TC\_CMRx.WAVE bit.

In Waveform mode, the TC channel generates one or two PWM signals with the same frequency and independently programmable duty cycles, or generates different types of one-shot or repetitive pulses.

In this mode, TIOAx is configured as an output and TIOBx is defined as an output if it is not used as an external event (EEVT parameter in TC\_CMR).

[Waveform Mode](#) shows the configuration of the TC channel when programmed in Waveform operating mode.

### 53.6.12 Waveform Selection

Depending on the WAVSEL parameter in TC\_CMR, the behavior of TC\_CV varies.

With any selection, TC\_RA, TC\_RB and TC\_RC can all be used as compare registers.

RA Compare is used to control the TIOAx output, RB Compare is used to control the TIOBx output (if correctly configured) and RC Compare is used to control TIOAx and/or TIOBx outputs.

**Figure 53-7. Waveform Mode**

### 53.6.12.1 WAVSEL = 00

When WAVSEL = 00, the value of TC\_CV is incremented from 0 to  $2^{32}-1$ . Once  $2^{32}-1$  has been reached, the value of TC\_CV is reset. Incrementation of TC\_CV starts again and the cycle continues.

An external event trigger or a software trigger can reset the value of TC\_CV. It is important to note that the trigger may occur at any time.

Refer to the figures below.

RC Compare cannot be programmed to generate a trigger in this configuration. At the same time, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

**Figure 53-8. WAVSEL = 00 without Trigger**

**Figure 53-9. WAVSEL = 00 with Trigger**

### 53.6.12.2 WAVSEL = 10

When WAVSEL = 10, the value of TC\_CV is incremented from 0 to the value of RC, then automatically reset on a RC Compare. Once the value of TC\_CV has been reset, it is then incremented and so on.

It is important to note that TC\_CV can be reset at any time by an external event or a software trigger if both are programmed correctly.

Refer to the figures below.

In addition, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

**Figure 53-10. WAVSEL = 10 without Trigger**

**Figure 53-11. WAVSEL = 10 with Trigger**

### 53.6.12.3 WAVSEL = 01

When WAVSEL = 01, the value of TC\_CV is incremented from 0 to  $2^{32}-1$ . Once  $2^{32}-1$  is reached, the value of TC\_CV is decremented to 0, then reincremented to  $2^{32}-1$  and so on.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments.

Refer to the figures below.

RC Compare cannot be programmed to generate a trigger in this configuration.

At the same time, RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 53-12. WAVSEL = 01 without Trigger**

**Figure 53-13. WAVSEL = 01 with Trigger**

### 53.6.12.4 WAVSEL = 11

When WAVSEL = 11, the value of TC\_CV is incremented from 0 to RC. Once RC is reached, the value of TC\_CV is decremented to 0, then reincremented to RC and so on.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments.

Refer to the figures below.

RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 53-14. WAVSEL = 11 without Trigger**

**Figure 53-15. WAVSEL = 11 with Trigger**

### 53.6.13 External Event/Trigger Conditions

An external event can be programmed to be detected on one of the clock sources (XC0, XC1, XC2) or TIOBx. The external event selected can then be used as a trigger.

The event trigger is selected using TC\_CMRE.EEVT. The trigger edge (rising, falling or both) for each of the possible external triggers is defined in TC\_CMRE.EEVTEDG. If EEVTEDG is cleared (none), no external event is defined.

If TIOBx is defined as an external event signal (EEVT = 0), TIOBx is no longer used as an output and the compare register B is not used to generate waveforms and subsequently no IRQs. In this case, the TC channel can only generate a waveform on TIOAx.

When an external event is defined, it can be used as a trigger by setting TC\_CMRE.ENETRGE.

As in Capture mode, the SYNC signal and the software trigger are also available as triggers. RC Compare can also be used as a trigger depending on the parameter WAVSEL.

### 53.6.14 Synchronization with PWM

The inputs TIOAx/TIOBx can be bypassed, and thus channel trigger/capture events can be directly driven by the independent PWM module.

PWM comparator outputs (internal signals without dead-time insertion - OCx), respectively source of the PWMH/L[2:0] outputs, are routed to the internal TC inputs. These specific TC inputs are multiplexed with TIOA/B input signal to drive the internal trigger/capture events.

The selection is made in the Extended Mode register (TC\_EMR) fields TRIGSRCA and TRIGSRCB (see [“TC Extended Mode Register”](#)).

Each channel of the TC module can be synchronized by a different PWM channel as described in the following figure.

**Figure 53-16. Synchronization with PWM**

### 53.6.15 Output Controller

The output controller defines the output level changes on TIOAx and TIOBx following an event. TIOBx control is used only if TIOBx is defined as output (not as an external event).

The following events control TIOAx and TIOBx:

- Software trigger

- External event
- RC compare

RA Compare controls TIOAx, and RB Compare controls TIOBx. Each of these events can be programmed to set, clear or toggle the output as defined in the corresponding parameter in TC\_CMx.

### 53.6.16 Quadrature Decoder

#### 53.6.16.1 Description

The quadrature decoder (QDEC) is driven by TIOA0, TIOB0 and TIOB1 input pins and drives the timer counter of channel 0 and 1. Channel 2 can be used as a time base in case of speed measurement requirements (refer to [Predefined Connection of the Quadrature Decoder with Timer Counters](#)).

When writing a '0' to TC\_BMR.QDEN, the QDEC is bypassed and the IO pins are directly routed to the timer counter function.

TIOA0 and TIOB0 are to be driven by the two dedicated quadrature signals from a rotary sensor mounted on the shaft of the off-chip motor.

A third signal from the rotary sensor can be processed through pin TIOB1 and is typically dedicated to be driven by an index signal if it is provided by the sensor. This signal is not required to decode the quadrature signals PHA, PHB.

TC\_CMx.TCCLKS must be configured to select XC0 input (i.e., 0x101). Field TC0XC0S has no effect as soon as the QDEC is enabled.

Either speed or position/revolution can be measured. Position channel 0 accumulates the edges of PHA, PHB input signals giving a high accuracy on motor position whereas channel 1 accumulates the index pulses of the sensor, therefore the number of rotations. Concatenation of both values provides a high level of precision on motion system position.

In Speed mode, position cannot be measured but revolution can be measured.

Inputs from the rotary sensor can be filtered prior to downstream processing. Accommodation of input polarity, phase definition and other factors are configurable.

Interruptions can be generated on different events.

A compare function (using TC\_RC) is available on channel 0 (speed/position) or channel 1 (rotation) and can generate an interrupt by means of TC\_SRx.CPCS.

**Figure 53-17. Predefined Connection of the Quadrature Decoder with Timer Counters**

### 53.6.16.2 Input Preprocessing

Input preprocessing consists of capabilities to take into account rotary sensor factors such as polarities and phase definition followed by configurable digital filtering.

Each input can be negated and swapping PHA, PHB is also configurable.

TC\_BMR. MAXFILT is used to configure a minimum duration for which the pulse is stated as valid. When the filter is active, pulses with a duration lower than  $(MAXFILT + 1) \times t_{\text{peripheral clock}}$  are not passed to downstream logic.

The value of  $(MAXFILT + 1) \times t_{\text{peripheral clock}}$  must not be greater than 10% of the minimum pulse on PHA, PHB or index when the rotary encoder speed is at its maximum. This speed depends on the application.

**Figure 53-18. Input Stage**

Input filtering can efficiently remove spurious pulses that might be generated by the presence of particulate contamination on the optical or magnetic disk of the rotary sensor.

Spurious pulses can also occur in environments with high levels of electromagnetic interference. Or, simply if vibration occurs even when rotation is fully stopped and the shaft of the motor is in such a position that the beginning of one of the reflective or magnetic bars on the rotary sensor disk is aligned with the light or magnetic (Hall) receiver cell of the rotary sensor. Any vibration can make the PHA, PHB signals toggle for a short duration.

**Figure 53-19. Filtering Examples**

### 53.6.16.3 Direction Status and Change Detection

After filtering, the quadrature signals are analyzed to extract the rotation direction and edges of the two quadrature signals detected in order to be counted by TC logic downstream.

The direction status can be directly read at anytime in the TC\_QISR. The polarity of the direction flag status depends on the configuration written in TC\_BMR. INVA, INVB, INVIDX, SWAP modify the polarity of DIR flag.

Any change in rotation direction is reported in the TC\_QISR and can generate an interrupt.

The direction change condition is reported as soon as two consecutive edges on a phase signal have sampled the same value on the other phase signal and there is an edge on the other signal. The two consecutive edges of one phase signal sampling the same value on other phase signal is not sufficient to declare a direction change, as particulate contamination may mask one or more reflective bars on the optical or magnetic disk of the sensor. Refer to the following figure for waveforms.

**Figure 53-20. Rotation Change Detection**

The direction change detection is disabled when TC\_BMR.QDTRANS is set. In this case, the DIR flag report must not be used.

A quadrature error is also reported by the QDEC via TC\_QISR.QERR. This error is reported if the time difference between two edges on PHA, PHB is lower than a predefined value. This predefined value is configurable and corresponds to  $(TC\_BMR.MAXFILT + 1) \times t_{\text{peripheral clock}}$  ns. After being filtered, there is no reason to have two edges closer than  $(TC\_BMR.MAXFILT + 1) \times t_{\text{peripheral clock}}$  ns under normal mode of operation.

**Figure 53-21. Quadrature Error Detection**

MAXFILT must be tuned according to several factors such as the peripheral clock frequency, type of rotary sensor and rotation speed to be achieved.

### 53.6.16.4 Position and Rotation Measurement

When TC\_BMR.POSEN is set, the motor axis position is processed on channel 0 (by means of the PHA, PHB edge detections) and the number of motor revolutions are recorded on channel 1 if the IDX signal is provided on the TIOB1 input. If no IDX signal is available, the internal counter can be cleared for each revolution if the number of counts per revolution is configured in TC\_RC0.RC and the TC\_CMR.CPCTRG bit is written to '1'. The position measurement can be read in the TC\_CV0 register and the rotation measurement can be read in the TC\_CV1 register.

Channel 0 and 1 must be configured in Capture mode (TC\_CMR0.WAVE = 0). 'Rising edge' must be selected as the External Trigger Edge (TC\_CMR.ETRGDGE = 0x01) and 'TIOAx' must be selected as the External Trigger (TC\_CMR.ABETRG = 0x1). The process must be started by configuring TC\_CCR.CLKEN and TC\_CCR.SWTRG.

In parallel, the number of edges are accumulated on TC channel 0 and can be read on the TC\_CV0 register.

Therefore, the accurate position can be read on both TC\_CV registers and concatenated to form a 32-bit word.

The TC channel 0 is cleared for each increment of IDX count value.

---

Depending on the quadrature signals, the direction is decoded and allows to count up or down in TC channels 0 and 1. The direction status is reported on TC\_QISR.

### 53.6.16.5 Speed Measurement

When TC\_BMR.SPEEDEN is set, the speed measure is enabled on channel 0.

A time base must be defined on channel 2 by writing the TC\_RC2 period register. Channel 2 must be configured in Waveform mode (WAVE bit set) in TC\_CMR2. The WAVSEL field must be defined with 0x10 to clear the counter by comparison and matching with TC\_RC value. Field ACPC must be defined at 0x11 to toggle TIOAx output.

This time base is automatically fed back to TIOAx of channel 0 when QDEN and SPEEDEN are set.

Channel 0 must be configured in Capture mode (WAVE = 0 in TC\_CMR0). TC\_CMR0.ABETRG must be configured at 1 to select TIOAx as a trigger for this channel.

EDGTRG must be set to 0x01, to clear the counter on a rising edge of the TIOAx signal and field LDRA must be set accordingly to 0x01, to load TC\_RA0 at the same time as the counter is cleared (LDRB must be set to 0x01). As a consequence, at the end of each time base period the differentiation required for the speed calculation is performed.

The process must be started by configuring bits CLKEN and SWTRG in the TC\_CCR.

The speed can be read on field RA in TC\_RA0.

Channel 1 can still be used to count the number of revolutions of the motor.

### 53.6.16.6 Detecting a Missing Index Pulse

To detect a missing index pulse due contamination, dust, etc., the TC\_SR0.CPCS flag can be used. It is also possible to assert the interrupt line if the TC\_SR0.CPCS flag is enabled as a source of the interrupt by writing a '1' to TC\_IER0.CPCS.

The TC\_RC0.RC field must be written with the nominal number of counts per revolution provided by the rotary encoder, plus a margin to eliminate potential noise (e.g., if nominal count per revolution is 1024, then TC\_RC0.RC=1026).

If the index pulse is missing, the timer value is not cleared and the nominal value is exceeded, then the comparator on the RC triggers an event, TC\_SR0.CPCS=1, and the interrupt line is asserted if TC\_IER0.CPCS=1.

The missing index pulse detection is only valid if the bit TC\_QISR.DIRCHG=0.

### 53.6.16.7 Detecting Contamination/Dust at Rotary Encoder Low Speed

The contamination/dust that can be filtered when the rotary encoder speed is high may not be filtered at low speed, thus creating unsolicited direction change, etc.

At low speed, even a minor contamination may appear as a long pulse, and thus not filtered and processed as a standard quadrature encoder pulse.

This contamination can be detected by using the similar method as the missing index detection.

A contamination exists on a phase line if TC\_SR.CPCS = 1 and TC\_QISR.DIRCHG = 1 when there is no solicited change of direction.

### 53.6.16.8 Missing Pulse Detection and Autocorrection

The QDEC is equipped with a circuitry which detects and corrects some errors that may result from contamination on optical disks or other materials producing the quadrature phase signals.

The detection and autocorrection only works if the Count mode is configured for both phases (EDGPHA = 1 in TC\_BMR) and is enabled (AUTOC = 1 in TC\_BMR).

If a pulse is missing on a phase signal, it is automatically detected and the pulse count reported in the CV field of the TC\_CV0/1 is automatically corrected.

There is no detection if both phase signals are affected at the same location on the device providing the quadrature signals because the detection requires a valid phase signal to detect the contamination on the other phase signal.

**Figure 53-22. Detection and Autocorrection of Missing Pulses**

If a quadrature device is undamaged, the number of pulses counted for a predefined period of time must be the same with or without detection and autocorrection feature.

Therefore, if the measurement results differ, a contamination exists on the device producing the quadrature signals.

This does not substitute the measurements of the number of pulses between two index pulses (if available) but provides a complementary method to detect damaged quadrature devices.

When the device providing quadrature signals is severely damaged, potentially leading to a number of consecutive missing pulses greater than 1, the downstream processing may be affected. It is possible to define the maximum admissible number of consecutive missing pulses before issuing a Missing Pulse Error flag (MPE in TC\_QISR). The threshold triggering an MPE flag report can be configured in TC\_BMR.MAXCMP. If the field MAXCMP is cleared, MPE never rises. The flag MAXCMP can trigger an interrupt while the QDEC is operating, thus providing a real time report of a potential problem on the quadrature device.

### 53.6.17 2-bit Gray Up/Down Counter for Stepper Motor

Each channel can be independently configured to generate a 2-bit Gray count waveform on corresponding TIOAx, TIOBx outputs by means of TC\_SMMRx.GCEN.

Up or Down count can be defined by writing TC\_SMMRx.DOWN.

It is mandatory to configure the channel in Waveform mode in the TC\_CMR.

The period of the counters can be programmed in TC\_RCx.

**Figure 53-23. 2-bit Gray Up/Down Counter**

### 53.6.18 Fault Mode

At any time, the TC\_RCx registers can be used to perform a comparison on the respective current channel counter value (TC\_CVx) with the value of TC\_RCx register.

The CPCSx flags can be set accordingly and an interrupt can be generated.

This interrupt is processed but requires an unpredictable amount of time to be achieved the required action.

It is possible to trigger the FAULT output of the TIMER1 with CPCS from TC\_SR0 and/or CPCS from TC\_SR1. Each source can be independently enabled/disabled in the TC\_FMR.

This can be useful to detect an overflow on speed and/or position when QDEC is processed and to act immediately by using the FAULT output.

**Figure 53-24. Fault Output Generation**

### 53.6.19 Register Write Protection

To prevent any single software error from corrupting TC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [TC Write Protection Mode Register \(TC\\_WPMR\)](#).

The Timer Counter clock of the first channel must be enabled to access TC\_WPMR.

The following registers can be write-protected when WPEN is set:

- [TC Block Mode Register](#)
- [TC Channel Mode Register Capture Mode](#)
- [TC Channel Mode Register Waveform Mode](#)
- [TC Fault Mode Register](#)
- [TC Stepper Motor Mode Register](#)
- [TC Register A](#)
- [TC Register B](#)
- [TC Register C](#)
- [TC Extended Mode Register](#)

### 53.7 Register Summary

**Note:** The register TC\_CMCR has two modes, Capture Mode and Waveform Mode. In this register summary, both modes are displayed

| Offset | Name     | Bit Pos. |              |             |            |           |             |              |              |        |
|--------|----------|----------|--------------|-------------|------------|-----------|-------------|--------------|--------------|--------|
| 0x00   | TC_CCR0  | 7:0      |              |             |            |           |             | SWTRG        | CLKDIS       | CLKEN  |
|        |          | 15:8     |              |             |            |           |             |              |              |        |
|        |          | 23:16    |              |             |            |           |             |              |              |        |
|        |          | 31:24    |              |             |            |           |             |              |              |        |
| 0x04   | TC_CMCR0 | 7:0      | LDBDIS       | LDBSTOP     | BURST[1:0] | CLKI      | TCCLKS[2:0] |              |              |        |
|        |          | 15:8     | WAVE         | CPCTRG      |            |           | ABETRG      | ETRGEDG[1:0] |              |        |
|        |          | 23:16    | SBSMPLR[2:0] |             |            | LDRB[1:0] |             | LDRA[1:0]    |              |        |
|        |          | 31:24    |              |             |            |           |             |              |              |        |
| 0x04   | TC_CMCR0 | 7:0      | CPCDIS       | CPCSTOP     | BURST[1:0] | CLKI      | TCCLKS[2:0] |              |              |        |
|        |          | 15:8     | WAVE         | WAVSEL[1:0] |            | ENETRG    | EEVT[1:0]   |              | EEVTEDG[1:0] |        |
|        |          | 23:16    | ASWTRG[1:0]  |             | AEEVT[1:0] |           | ACPC[1:0]   |              | ACPA[1:0]    |        |
|        |          | 31:24    | BSWTRG[1:0]  |             | BEEVT[1:0] |           | BCPC[1:0]   |              | BCPB[1:0]    |        |
| 0x08   | TC_SMMR0 | 7:0      |              |             |            |           |             | DOWN         | GCEN         |        |
|        |          | 15:8     |              |             |            |           |             |              |              |        |
|        |          | 23:16    |              |             |            |           |             |              |              |        |
|        |          | 31:24    |              |             |            |           |             |              |              |        |
| 0x0C   | TC_RAB0  | 7:0      | RAB[7:0]     |             |            |           |             |              |              |        |
|        |          | 15:8     | RAB[15:8]    |             |            |           |             |              |              |        |
|        |          | 23:16    | RAB[23:16]   |             |            |           |             |              |              |        |
|        |          | 31:24    | RAB[31:24]   |             |            |           |             |              |              |        |
| 0x10   | TC_CV0   | 7:0      | CV[7:0]      |             |            |           |             |              |              |        |
|        |          | 15:8     | CV[15:8]     |             |            |           |             |              |              |        |
|        |          | 23:16    | CV[23:16]    |             |            |           |             |              |              |        |
|        |          | 31:24    | CV[31:24]    |             |            |           |             |              |              |        |
| 0x14   | TC_RA0   | 7:0      | RA[7:0]      |             |            |           |             |              |              |        |
|        |          | 15:8     | RA[15:8]     |             |            |           |             |              |              |        |

| Access |   |   |   |   |   | W     | W      | W     |
| Reset  |   |   |   |   |   | –     | –      | –     |

#### Bit 2 – SWTRG Software Trigger Command

| Value | Description                                                                     |
|-------|---------------------------------------------------------------------------------|
| 0     | No effect.                                                                      |
| 1     | A software trigger is performed: the counter is reset and the clock is started. |

#### Bit 1 – CLKDIS Counter Clock Disable Command

| Value | Description         |
|-------|---------------------|
| 0     | No effect.          |
| 1     | Disables the clock. |

#### Bit 0 – CLKEN Counter Clock Enable Command

| Value | Description                           |
|-------|---------------------------------------|
| 0     | No effect.                            |
| 1     | Enables the clock if CLKDIS is not 1. |

### 53.7.2 TC Channel Mode Register: Capture Mode

**Name:** TC\_CM Rx  
**Offset:** 0x04 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can be written only if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |        |              |            |     |           |             |              |     |

| Reset  | 0      | 0            | 0          | 0   | 0         | 0           | 0            | 0   |

#### Bits 22:20 – SBSMPLR[2:0] Loading Edge Subsampling Ratio

| Value | Name      | Description                                      |
|-------|-----------|--------------------------------------------------|
| 0     | ONE       | Load a Capture register each selected edge.      |
| 1     | HALF      | Load a Capture register every 2 selected edges.  |
| 2     | FOURTH    | Load a Capture register every 4 selected edges.  |
| 3     | EIGHTH    | Load a Capture register every 8 selected edges.  |
| 4     | SIXTEENTH | Load a Capture register every 16 selected edges. |

#### Bits 19:18 – LDRB[1:0] RB Loading Edge Selection

| Value | Name    | Description           |
|-------|---------|-----------------------|
| 0     | NONE    | None                  |
| 1     | RISING  | Rising edge of TIOAx  |
| 2     | FALLING | Falling edge of TIOAx |
| 3     | EDGE    | Each edge of TIOAx    |

#### Bits 17:16 – LDRA[1:0] RA Loading Edge Selection

| Value | Name | Description |
|-------|------|-------------|
| 0     | NONE | None        |

| Value | Name    | Description           |
|-------|---------|-----------------------|
| 1     | RISING  | Rising edge of TIOAx  |
| 2     | FALLING | Falling edge of TIOAx |
| 3     | EDGE    | Each edge of TIOAx    |

### Bit 15 – WAVE Waveform Mode

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | Capture mode is enabled.                             |
| 1     | Capture mode is disabled (Waveform mode is enabled). |

### Bit 14 – CPCTRG RC Compare Trigger Enable

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | RC Compare has no effect on the counter and its clock.      |
| 1     | RC Compare resets the counter and starts the counter clock. |

### Bit 10 – ABETRG TIOAx or TIOBx External Trigger Selection

| Value | Description                           |
|-------|---------------------------------------|
| 0     | TIOBx is used as an external trigger. |
| 1     | TIOAx is used as an external trigger. |

### Bits 9:8 – ETRGEDG[1:0] External Trigger Edge Selection

| Value | Name    | Description                                   |
|-------|---------|-----------------------------------------------|
| 0     | NONE    | The clock is not gated by an external signal. |
| 1     | RISING  | Rising edge                                   |
| 2     | FALLING | Falling edge                                  |
| 3     | EDGE    | Each edge                                     |

### Bit 7 – LBDIS Counter Clock Disable with RB Loading

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | Counter clock is not disabled when RB loading occurs. |
| 1     | Counter clock is disabled when RB loading occurs.     |

### Bit 6 – LDBSTOP Counter Clock Stopped with RB Loading

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | Counter clock is not stopped when RB loading occurs. |
| 1     | Counter clock is stopped when RB loading occurs.     |

### Bits 5:4 – BURST[1:0] Burst Signal Selection

| Value | Name | Description                                   |
|-------|------|-----------------------------------------------|
| 0     | NONE | The clock is not gated by an external signal. |
| 1     | XC0  | XC0 is ANDed with the selected clock.         |
| 2     | XC1  | XC1 is ANDed with the selected clock.         |
| 3     | XC2  | XC2 is ANDed with the selected clock.         |

### Bit 3 – CLKI Clock Invert

# SAMA5D2 Series

## Timer Counter (TC)

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | Counter is incremented on rising edge of the clock.  |
| 1     | Counter is incremented on falling edge of the clock. |

### Bits 2:0 – TCCLKS[2:0] Clock Selection

To operate at maximum peripheral clock frequency, refer to [“TC Extended Mode Register”](#).

| Value | Name         | Description                                                                      |
|-------|--------------|----------------------------------------------------------------------------------|
| 0     | TIMER_CLOCK1 | Clock selected: internal GCLK[35], GCLK[36] clock signal (from PMC)              |
| 1     | TIMER_CLOCK2 | Clock selected: internal System bus clock divided by 8 clock signal (from PMC)   |
| 2     | TIMER_CLOCK3 | Clock selected: internal System bus clock divided by 32 clock signal (from PMC)  |
| 3     | TIMER_CLOCK4 | Clock selected: internal System bus clock divided by 128 clock signal (from PMC) |
| 4     | TIMER_CLOCK5 | Clock selected: internal slow_clock clock signal (from PMC)                      |
| 5     | XC0          | Clock selected: XC0                                                              |
| 6     | XC1          | Clock selected: XC1                                                              |
| 7     | XC2          | Clock selected: XC2                                                              |

### 53.7.3 TC Channel Mode Register: Waveform Mode

**Name:** TC\_CMRx  
**Offset:** 0x04 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

| 2     | UP_RC     | UP mode with automatic trigger on RC Compare        |
| 3     | UPDOWN_RC | UPDOWN mode with automatic trigger on RC Compare    |

### Bit 12 – ENETRГ External Event Trigger Enable

Whatever the value programmed in ENETRГ, the selected external event only controls the TIOAx output and TIOBx if not used as input (trigger event input or other input used).

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | The external event has no effect on the counter and its clock.      |
| 1     | The external event resets the counter and starts the counter clock. |

### Bits 11:10 – EEVT[1:0] External Event Selection

Signal selected as external event.

| Value | Name | Description | TIOB Direction |
|-------|------|-------------|----------------|
| 0     | TIOB | TIOB        | Input          |
| 1     | XC0  | XC0         | Output         |
| 2     | XC1  | XC1         | Output         |
| 3     | XC2  | XC2         | Output         |

**Note:** If TIOB is chosen as the external event signal, it is configured as an input and no longer generates waveforms and subsequently no IRQs.

### Bits 9:8 – EEVTEDG[1:0] External Event Edge Selection

| Value | Name    | Description  |
|-------|---------|--------------|
| 0     | NONE    | None         |
| 1     | RISING  | Rising edge  |
| 2     | FALLING | Falling edge |
| 3     | EDGE    | Each edge    |

### Bit 7 – CPCDIS Counter Clock Disable with RC Compare

| Value | Description                                            |
|-------|--------------------------------------------------------|
| 0     | Counter clock is not disabled when counter reaches RC. |
| 1     | Counter clock is disabled when counter reaches RC.     |

### Bit 6 – CPCSTOP Counter Clock Stopped with RC Compare

| Value | Description                                           |
|-------|-------------------------------------------------------|
| 0     | Counter clock is not stopped when counter reaches RC. |
| 1     | Counter clock is stopped when counter reaches RC.     |

### Bits 5:4 – BURST[1:0] Burst Signal Selection

| Value | Name | Description                                   |
|-------|------|-----------------------------------------------|
| 0     | NONE | The clock is not gated by an external signal. |
| 1     | XC0  | XC0 is ANDed with the selected clock.         |
| 2     | XC1  | XC1 is ANDed with the selected clock.         |
| 3     | XC2  | XC2 is ANDed with the selected clock.         |

**Bit 3 – CLKI** Clock Invert

| Value | Description                                          |
|-------|------------------------------------------------------|
| 0     | Counter is incremented on rising edge of the clock.  |
| 1     | Counter is incremented on falling edge of the clock. |

**Bits 2:0 – TCCLKS[2:0]** Clock Selection

To operate at maximum peripheral clock frequency, refer to [“TC Extended Mode Register”](#).

| Value | Name         | Description                                                                      |
|-------|--------------|----------------------------------------------------------------------------------|
| 0     | TIMER_CLOCK1 | Clock selected: internal GCLK[35], GCLK[36] clock signal (from PMC)              |
| 1     | TIMER_CLOCK2 | Clock selected: internal System bus clock divided by 8 clock signal (from PMC)   |
| 2     | TIMER_CLOCK3 | Clock selected: internal System bus clock divided by 32 clock signal (from PMC)  |
| 3     | TIMER_CLOCK4 | Clock selected: internal System bus clock divided by 128 clock signal (from PMC) |
| 4     | TIMER_CLOCK5 | Clock selected: internal slow_clock clock signal (from PMC)                      |
| 5     | XC0          | Clock selected: XC0                                                              |
| 6     | XC1          | Clock selected: XC1                                                              |
| 7     | XC2          | Clock selected: XC2                                                              |

### 53.7.4 TC Stepper Motor Mode Register

**Name:** TC\_SMMRx  
**Offset:** 0x08 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|

|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |   |   |      |      |
|--------|---|---|---|---|---|---|------|------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1    | 0    |
|        |   |   |   |   |   |   | DOWN | GCEN |
| Access |   |   |   |   |   |   | R/W  | R/W  |
| Reset  |   |   |   |   |   |   | 0    | 0    |

#### Bit 1 – DOWN Down Count

| Value | Description   |
|-------|---------------|
| 0     | Up counter.   |
| 1     | Down counter. |

#### Bit 0 – GCEN Gray Count Enable

| Value | Description                                                                    |
|-------|--------------------------------------------------------------------------------|
| 0     | TIOAx [x=0..2] and TIOBx [x=0..2] are driven by internal counter of channel x. |
| 1     | TIOAx [x=0..2] and TIOBx [x=0..2] are driven by a 2-bit Gray counter.          |

### 53.7.5 TC Register AB

**Name:** TC\_RABx  
**Offset:** 0x0C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

|        | RAB[23:16] |    |    |    |    |    |    |    |
| Access | R          | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | RAB[15:8]  |    |    |    |    |    |    |    |
| Access | R          | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7          | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | RAB[7:0]   |    |    |    |    |    |    |    |
| Access | R          | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0          | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – RAB[31:0] Register A or Register B

RAB contains the next unread capture Register A or Register B value in real time. It is usually read by the DMA after a request due to a valid load edge on TIOAx.

When DMA is used, the RAB register address must be configured as source address of the transfer.

### 53.7.6 TC Counter Value Register

**Name:** TC\_CVx  
**Offset:** 0x10 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

|        |           |    |    |    |    |    |    |    |
|--------|-----------|----|----|----|----|----|----|----|
| Bit    | 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | CV[31:24] |    |    |    |    |    |    |    |
| Access | R         | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | CV[23:16] |    |    |    |    |    |    |    |
| Access | R         | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | CV[15:8]  |    |    |    |    |    |    |    |
| Access | R         | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | CV[7:0]   |    |    |    |    |    |    |    |
| Access | R         | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 31:0 – CV[31:0] Counter Value**  
 CV contains the counter value in real time.

**Important:**

### 53.7.7 TC Register A

**Name:** TC\_RAx  
**Offset:** 0x14 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register has access Read-only if TC\_CMRx.WAVE = 0, Read/Write if TC\_CMRx.WAVE = 1.  
This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | RA[31:24] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23        | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | RA[23:16] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15        | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | RA[15:8]  |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | RA[7:0]   |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – RA[31:0] Register A**  
RA contains the Register A value in real time.

**Important:**

### 53.7.8 TC Register B

**Name:** TC\_RBx  
**Offset:** 0x18 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register has access Read-only if TC\_CMRx.WAVE = 0, Read/Write if TC\_CMRx.WAVE = 1.  
This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        | RB[31:24] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 23        | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | RB[23:16] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15        | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | RB[15:8]  |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | RB[7:0]   |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 31:0 – RB[31:0] Register B**  
RB contains the Register B value in real time.

**Important:**

### 53.7.9 TC Register C

**Name:** TC\_RCx  
**Offset:** 0x1C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |           |    |    |    |    |    |    |    |
|--------|-----------|----|----|----|----|----|----|----|
| Bit    | 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | RC[31:24] |    |    |    |    |    |    |    |
| Access |           |    |    |    |    |    |    |    |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | RC[23:16] |    |    |    |    |    |    |    |
| Access |           |    |    |    |    |    |    |    |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | RC[15:8]  |    |    |    |    |    |    |    |
| Access |           |    |    |    |    |    |    |    |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | RC[7:0]   |    |    |    |    |    |    |    |
| Access |           |    |    |    |    |    |    |    |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 31:0 – RC[31:0] Register C

RC contains the Register C value in real time.

**Important:**

### 53.7.10 TC Interrupt Status Register

**Name:** TC\_SRx  
**Offset:** 0x20 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

|        |       |       |       |      |      |       |       |        |
|--------|-------|-------|-------|------|------|-------|-------|--------|
| Bit    | 31    | 30    | 29    | 28   | 27   | 26    | 25    | 24     |
|        |       |       |       |      |      |       |       |        |
| Access |       |       |       |      |      |       |       |        |

| Reset  | 0     | 0     | 0     | 0    | 0    | 0     | 0     | 0      |

#### Bit 18 – MTIOB TIOBx Mirror

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | TIOBx is low. If TC_CMRx.WAVE = 0, TIOBx pin is low. If TC_CMRx.WAVE = 1, TIOBx is driven low.    |
| 1     | TIOBx is high. If TC_CMRx.WAVE = 0, TIOBx pin is high. If TC_CMRx.WAVE = 1, TIOBx is driven high. |

#### Bit 17 – MTIOA TIOAx Mirror

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | TIOAx is low. If TC_CMRx.WAVE = 0, TIOAx pin is low. If TC_CMRx.WAVE = 1, TIOAx is driven low.    |
| 1     | TIOAx is high. If TC_CMRx.WAVE = 0, TIOAx pin is high. If TC_CMRx.WAVE = 1, TIOAx is driven high. |

#### Bit 16 – CLKSTA Clock Enabling Status

| Value | Description        |
|-------|--------------------|
| 0     | Clock is disabled. |
| 1     | Clock is enabled.  |

### Bit 7 – ETRGS External Trigger Status (cleared on read)

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | External trigger has not occurred since the last read of the Status Register. |
| 1     | External trigger has occurred since the last read of the Status Register.     |

### Bit 6 – LDRBS RB Loading Status (cleared on read)

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | RB Load has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1. |
| 1     | RB Load has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 0.    |

### Bit 5 – LDRAS RA Loading Status (cleared on read)

| Value | Description                                                                               |
|-------|-------------------------------------------------------------------------------------------|
| 0     | RA Load has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1. |
| 1     | RA Load has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 0.    |

### Bit 4 – CPCS RC Compare Status (cleared on read)

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | RC Compare has not occurred since the last read of the Status Register. |
| 1     | RC Compare has occurred since the last read of the Status Register.     |

### Bit 3 – CPBS RB Compare Status (cleared on read)

| Value | Description                                                                                  |
|-------|----------------------------------------------------------------------------------------------|
| 0     | RB Compare has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 0. |
| 1     | RB Compare has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 1.    |

### Bit 2 – CPAS RA Compare Status (cleared on read)

| Value | Description                                                                                  |
|-------|----------------------------------------------------------------------------------------------|
| 0     | RA Compare has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 0. |
| 1     | RA Compare has occurred since the last read of the Status Register, if TC_CM Rx.WAVE = 1.    |

### Bit 1 – LOVRS Load Overrun Status (cleared on read)

| Value | Description                                                                                                                                               |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Load overrun has not occurred since the last read of the Status Register or TC_CM Rx.WAVE = 1.                                                            |
| 1     | RA or RB have been loaded at least twice without any read of the corresponding register since the last read of the Status Register, if TC_CM Rx.WAVE = 0. |

### Bit 0 – COVFS Counter Overflow Status (cleared on read)

# SAMA5D2 Series

## Timer Counter (TC)

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | No counter overflow has occurred since the last read of the Status Register. |
| 1     | A counter overflow has occurred since the last read of the Status Register.  |

### 53.7.11 TC Interrupt Enable Register

**Name:** TC\_IERx  
**Offset:** 0x24 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

|        |       |       |       |      |      |      |       |       |
|--------|-------|-------|-------|------|------|------|-------|-------|
| Bit    | 31    | 30    | 29    | 28   | 27   | 26   | 25    | 24    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 23    | 22    | 21    | 20   | 19   | 18   | 17    | 16    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 15    | 14    | 13    | 12   | 11   | 10   | 9     | 8     |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 7     | 6     | 5     | 4    | 3    | 2    | 1     | 0     |
|        | ETRGS | LDRBS | LDRAS | CPCS | CPBS | CPAS | LOVRS | COVFS |
| Access | W     | W     | W     | W    | W    | W    | W     | W     |
| Reset  | –     | –     | –     | –    | –    | –    | –     | –     |

**Bit 7 – ETRGS** External Trigger

**Bit 6 – LDRBS** RB Loading

**Bit 5 – LDRAS** RA Loading

**Bit 4 – CPCS** RC Compare

**Bit 3 – CPBS** RB Compare

**Bit 2 – CPAS** RA Compare

**Bit 1 – LOVRS** Load Overrun

**Bit 0 – COVFS** Counter Overflow

### 53.7.12 TC Interrupt Disable Register

**Name:** TC\_IDRx  
**Offset:** 0x28 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

|        |       |       |       |      |      |      |       |       |
|--------|-------|-------|-------|------|------|------|-------|-------|
| Bit    | 31    | 30    | 29    | 28   | 27   | 26   | 25    | 24    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 23    | 22    | 21    | 20   | 19   | 18   | 17    | 16    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 15    | 14    | 13    | 12   | 11   | 10   | 9     | 8     |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 7     | 6     | 5     | 4    | 3    | 2    | 1     | 0     |
|        | ETRGS | LDRBS | LDRAS | CPCS | CPBS | CPAS | LOVRS | COVFS |
| Access | W     | W     | W     | W    | W    | W    | W     | W     |
| Reset  | –     | –     | –     | –    | –    | –    | –     | –     |

**Bit 7 – ETRGS** External Trigger

**Bit 6 – LDRBS** RB Loading

**Bit 5 – LDRAS** RA Loading

**Bit 4 – CPCS** RC Compare

**Bit 3 – CPBS** RB Compare

**Bit 2 – CPAS** RA Compare

**Bit 1 – LOVRS** Load Overrun

**Bit 0 – COVFS** Counter Overflow

### 53.7.13 TC Interrupt Mask Register

**Name:** TC\_IMRx  
**Offset:** 0x2C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

|        |       |       |       |      |      |      |       |       |
|--------|-------|-------|-------|------|------|------|-------|-------|
| Bit    | 31    | 30    | 29    | 28   | 27   | 26   | 25    | 24    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 23    | 22    | 21    | 20   | 19   | 18   | 17    | 16    |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 15    | 14    | 13    | 12   | 11   | 10   | 9     | 8     |
|        |       |       |       |      |      |      |       |       |
| Access |       |       |       |      |      |      |       |       |
| Reset  |       |       |       |      |      |      |       |       |
| Bit    | 7     | 6     | 5     | 4    | 3    | 2    | 1     | 0     |
|        | ETRGS | LDRBS | LDRAS | CPCS | CPBS | CPAS | LOVRS | COVFS |

| Reset  | 0     | 0     | 0     | 0    | 0    | 0    | 0     | 0     |

**Bit 7 – ETRGS** External Trigger

**Bit 6 – LDRBS** RB Loading

**Bit 5 – LDRAS** RA Loading

**Bit 4 – CPCS** RC Compare

**Bit 3 – CPBS** RB Compare

**Bit 2 – CPAS** RA Compare

**Bit 1 – LOVRS** Load Overrun

**Bit 0 – COVFS** Counter Overflow

### 53.7.14 TC Extended Mode Register

**Name:** TC\_EMRx  
**Offset:** 0x30 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |    |    |               |     |    |    |               |          |

| Reset  |    |    | 0             | 0   |    |    | 0             | 0        |

**Bit 8 – NODIVCLK** No Divided Clock

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | The selected clock is defined by field TCCLKS in TC_CMRx.                        |
| 1     | The selected clock is peripheral clock and TCCLKS field (TC_CMRx) has no effect. |

**Bits 5:4 – TRIGSRCB[1:0]** Trigger Source for Input B

| Value | Name           | Description                                                                                                                                                                                                                                                              |
|-------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | EXTERNAL_TIOBx | The trigger/capture input B is driven by external pin TIOBx                                                                                                                                                                                                              |
| 1     | PWMx           | For TC0 to TC10: The trigger/capture input B is driven internally by the comparator output (see <a href="#">Synchronization with PWM</a> ) of the PWMx.<br>For TC11: The trigger/capture input B is driven internally by the GTSUCOMP signal of the Ethernet MAC (GMAC). |

**Bits 1:0 – TRIGSRCA[1:0]** Trigger Source for Input A

| Value | Name           | Description                                                 |
|-------|----------------|-------------------------------------------------------------|
| 0     | EXTERNAL_TIOAx | The trigger/capture input A is driven by external pin TIOAx |
| 1     | PWMx           | The trigger/capture input A is driven internally by PWMx    |

### 53.7.15 TC Block Control Register

**Name:** TC\_BCR  
**Offset:** 0xC0  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |   |   |   |      |
|--------|---|---|---|---|---|---|---|------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0    |
|        |   |   |   |   |   |   |   | SYNC |
| Access |   |   |   |   |   |   |   | W    |
| Reset  |   |   |   |   |   |   |   | –    |

#### Bit 0 – SYNC Synchro Command

| Value | Description                                                                                         |
|-------|-----------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                          |
| 1     | Asserts the SYNC signal which generates a software trigger simultaneously for each of the channels. |

### 53.7.16 TC Block Mode Register

**Name:** TC\_BMR  
**Offset:** 0xC4  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |              |      |              |        |              |         |              |      |
|--------|--------------|------|--------------|--------|--------------|---------|--------------|------|
| Bit    | 31           | 30   | 29           | 28     | 27           | 26      | 25           | 24   |
|        |              |      | MAXCMP[3:0]  |        |              |         | MAXFILT[5:4] |      |
| Access |              |      | R/W          | R/W    | R/W          | R/W     | R/W          | R/W  |
| Reset  |              |      | 0            | 0      | 0            | 0       | 0            | 0    |
| Bit    | 23           | 22   | 21           | 20     | 19           | 18      | 17           | 16   |
|        | MAXFILT[3:0] |      |              |        |              | AUTOC   | IDXPB        | SWAP |
| Access | R/W          | R/W  | R/W          | R/W    |              | R/W     | R/W          | R/W  |
| Reset  | 0            | 0    | 0            | 0      |              | 0       | 0            | 0    |
| Bit    | 15           | 14   | 13           | 12     | 11           | 10      | 9            | 8    |
|        | INVIDX       | INVB | INVA         | EDGPHA | QDTRANS      | SPEEDEN | POSEN        | QDEN |
| Access | R/W          | R/W  | R/W          | R/W    | R/W          | R/W     | R/W          | R/W  |
| Reset  | 0            | 0    | 0            | 0      | 0            | 0       | 0            | 0    |
| Bit    | 7            | 6    | 5            | 4      | 3            | 2       | 1            | 0    |
|        |              |      | TC2XC2S[1:0] |        | TC1XC1S[1:0] |         | TC0XC0S[1:0] |      |
| Access |              |      | R/W          | R/W    | R/W          | R/W     | R/W          | R/W  |
| Reset  |              |      | 0            | 0      | 0            | 0       | 0            | 0    |

#### Bits 29:26 – MAXCMP[3:0] Maximum Consecutive Missing Pulses

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | The flag MPE in TC_QISR never rises.                                   |
| 1–15  | Defines the number of consecutive missing pulses before a flag report. |

#### Bits 25:20 – MAXFILT[5:0] Maximum Filter

Pulses with a period shorter than MAXFILT+1 peripheral clock cycles are discarded. For more details on MAXFILT constraints, see [“Input Preprocessing”](#)

| Value | Description                         |
|-------|-------------------------------------|
| 1–63  | Defines the filtering capabilities. |

#### Bit 18 – AUTOC AutoCorrection of missing pulses

0 (DISABLED): The detection and autocorrection function is disabled.

1 (ENABLED): The detection and autocorrection function is enabled.

#### Bit 17 – IDXPB Index Pin is PHB Pin

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | IDX pin of the rotary sensor must drive TIOA1. |

| Value | Description                                    |
|-------|------------------------------------------------|
| 1     | IDX pin of the rotary sensor must drive TIOB0. |

### Bit 16 – SWAP Swap PHA and PHB

| Value | Description                                             |
|-------|---------------------------------------------------------|
| 0     | No swap between PHA and PHB.                            |
| 1     | Swap PHA and PHB internally, prior to driving the QDEC. |

### Bit 15 – INVIDX Inverted Index

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | IDX (TIOA1) is directly driving the QDEC. |
| 1     | IDX is inverted before driving the QDEC.  |

### Bit 14 – INVB Inverted PHB

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | PHB (TIOB0) is directly driving the QDEC. |
| 1     | PHB is inverted before driving the QDEC.  |

### Bit 13 – INVA Inverted PHA

| Value | Description                               |
|-------|-------------------------------------------|
| 0     | PHA (TIOA0) is directly driving the QDEC. |
| 1     | PHA is inverted before driving the QDEC.  |

### Bit 12 – EDGPHA Edge on PHA Count Mode

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | Edges are detected on PHA only.         |
| 1     | Edges are detected on both PHA and PHB. |

### Bit 11 – QDTRANS Quadrature Decoding Transparent

| Value | Description                                                                                                             |
|-------|-------------------------------------------------------------------------------------------------------------------------|
| 0     | Full quadrature decoding logic is active (direction change detected).                                                   |
| 1     | Quadrature decoding logic is inactive (direction change inactive) but input filtering and edge detection are performed. |

### Bit 10 – SPEEDEN Speed Enabled

| Value | Description                                                                        |
|-------|------------------------------------------------------------------------------------|
| 0     | Disabled.                                                                          |
| 1     | Enables the speed measure on channel 0, the time base being provided by channel 2. |

### Bit 9 – POSEN Position Enabled

| Value | Description                                      |
|-------|--------------------------------------------------|
| 0     | Disable position.                                |
| 1     | Enables the position measure on channel 0 and 1. |

### Bit 8 – QDEN Quadrature Decoder Enabled

Quadrature decoding (direction change) can be disabled using QDTRANS bit.

One of the POSEN or SPEEDEN bits must be also enabled.

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | Disabled.                                                          |
| 1     | Enables the QDEC (filter, edge detection and quadrature decoding). |

### Bits 5:4 – TC2XC2S[1:0] External Clock Signal 2 Selection

| Value | Name  | Description                    |
|-------|-------|--------------------------------|
| 0     | TCLK2 | Signal connected to XC2: TCLK2 |
| 1     | –     | Reserved                       |
| 2     | TIOA0 | Signal connected to XC2: TIOA0 |
| 3     | TIOA1 | Signal connected to XC2: TIOA1 |

### Bits 3:2 – TC1XC1S[1:0] External Clock Signal 1 Selection

| Value | Name  | Description                    |
|-------|-------|--------------------------------|
| 0     | TCLK1 | Signal connected to XC1: TCLK1 |
| 1     | –     | Reserved                       |
| 2     | TIOA0 | Signal connected to XC1: TIOA0 |
| 3     | TIOA2 | Signal connected to XC1: TIOA2 |

### Bits 1:0 – TC0XC0S[1:0] External Clock Signal 0 Selection

| Value | Name  | Description                    |
|-------|-------|--------------------------------|
| 0     | TCLK0 | Signal connected to XC0: TCLK0 |
| 1     | –     | Reserved                       |
| 2     | TIOA1 | Signal connected to XC0: TIOA1 |
| 3     | TIOA2 | Signal connected to XC0: TIOA2 |

### 53.7.17 TC QDEC Interrupt Enable Register

**Name:** TC\_QIER  
**Offset:** 0xC8  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |     |      |        |     |
|--------|---|---|---|---|-----|------|--------|-----|
| Bit    | 7 | 6 | 5 | 4 | 3   | 2    | 1      | 0   |
|        |   |   |   |   | MPE | QERR | DIRCHG | IDX |
| Access |   |   |   |   | W   | W    | W      | W   |
| Reset  |   |   |   |   | –   | –    | –      | –   |

#### Bit 3 – MPE Consecutive Missing Pulse Error

| Value | Description                                                                                |
|-------|--------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                 |
| 1     | Enables the interrupt when an occurrence of MAXCMP consecutive missing pulses is detected. |

#### Bit 2 – QERR Quadrature Error

| Value | Description                                                       |
|-------|-------------------------------------------------------------------|
| 0     | No effect.                                                        |
| 1     | Enables the interrupt when a quadrature error occurs on PHA, PHB. |

#### Bit 1 – DIRCHG Direction Change

| Value | Description                                                            |
|-------|------------------------------------------------------------------------|
| 0     | No effect.                                                             |
| 1     | Enables the interrupt when a change on rotation direction is detected. |

#### Bit 0 – IDX Index

| Value | Description |
|-------|-------------|
| 0     | No effect.  |

## SAMA5D2 Series

### Timer Counter (TC)

| Value | Description                                                   |
|-------|---------------------------------------------------------------|
| 1     | Enables the interrupt when a rising edge occurs on IDX input. |

### 53.7.18 TC QDEC Interrupt Disable Register

**Name:** TC\_QIDR  
**Offset:** 0xCC  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|
| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|

#### Bit 3 – MPE Consecutive Missing Pulse Error

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | No effect.                                                                                        |
| 1     | Disables the interrupt when an occurrence of MAXCMP consecutive missing pulses has been detected. |

#### Bit 2 – QERR Quadrature Error

| Value | Description                                                        |
|-------|--------------------------------------------------------------------|
| 0     | No effect.                                                         |
| 1     | Disables the interrupt when a quadrature error occurs on PHA, PHB. |

#### Bit 1 – DIRCHG Direction Change

| Value | Description                                                             |
|-------|-------------------------------------------------------------------------|
| 0     | No effect.                                                              |
| 1     | Disables the interrupt when a change on rotation direction is detected. |

#### Bit 0 – IDX Index

| Value | Description |
|-------|-------------|
| 0     | No effect.  |

## SAMA5D2 Series

### Timer Counter (TC)

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 1     | Disables the interrupt when a rising edge occurs on IDX input. |

### 53.7.19 TC QDEC Interrupt Mask Register

**Name:** TC\_QIMR  
**Offset:** 0xD0  
**Reset:** 0x00000000  
**Property:** Read-only

**Bit 8 – DIR** Direction  
Returns an image of the current rotation direction.

**Bit 3 – MPE** Consecutive Missing Pulse Error

| Value | Description                                                                                                                    |
|-------|--------------------------------------------------------------------------------------------------------------------------------|
| 0     | The number of consecutive missing pulses has not reached the maximum value specified in MAXCMP since the last read of TC_QISR. |
| 1     | An occurrence of MAXCMP consecutive missing pulses has been detected since the last read of TC_QISR.                           |

**Bit 2 – QERR** Quadrature Error

| Value | Description                                                 |
|-------|-------------------------------------------------------------|
| 0     | No quadrature error since the last read of TC_QISR.         |
| 1     | A quadrature error occurred since the last read of TC_QISR. |

**Bit 1 – DIRCHG** Direction Change

| Value | Description                                                     |
|-------|-----------------------------------------------------------------|
| 0     | No change on rotation direction since the last read of TC_QISR. |
| 1     | The rotation direction changed since the last read of TC_QISR.  |

---

**Bit 0 – IDX** Index

---

| Value | Description                                               |
|-------|-----------------------------------------------------------|
| 0     | No Index input change since the last read of TC_QISR.     |
| 1     | The IDX input has changed since the last read of TC_QISR. |

### 53.7.21 TC Fault Mode Register

**Name:** TC\_FMR  
**Offset:** 0xD8  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

|        |    |    |    |    |    |    |       |       |

| Access |              |    |    |    |    |    |    | R/W  |
| Reset  |              |    |    |    |    |    |    | 0    |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                          |
|----------|--------|------------------------------------------------------------------------------------------------------|
| 0x54494D | PASSWD | Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0. |

#### Bit 0 – WPEN Write Protection Enable

The Timer Counter clock of the first channel must be enabled to access this register.

See [“Register Write Protection”](#) for a list of registers that can be write-protected and Timer Counter clock conditions.

| Value | Description                                                                      |
|-------|----------------------------------------------------------------------------------|
| 0     | Disables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII). |
| 1     | Enables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII).  |

## 54. Pulse Density Modulation Interface Controller (PDMIC)

### 54.1 Description

The Pulse Density Modulation Interface Controller (PDMIC) is a PDM interface controller and decoder that support mono PDM format. It integrates a clock generator driving the PDM microphone and embeds filters which decimate the incoming bitstream to obtain most common audio rates.

### 54.2 Embedded Characteristics

- 16-bit Resolution
- DMA Controller Support
- Up to 4 Conversions Stored
- PDM Clock Source can be Independent from Core Clock
- Register Write Protection

### 54.3 Block Diagram

Figure 54-1. PDMIC Block Diagram

### 54.4 Signal Description

Table 54-1. PDMIC Pin Description

| Pin Name  | Description                                       | Type   |
|-----------|---------------------------------------------------|--------|
| PDMIC_CLK | Pulse Density Modulation Bitstream Sampling Clock | Output |
| PDMIC_DAT | Pulse Density Modulation Data                     | Input  |

## **54.5 Product Dependencies**

### **54.5.1 I/O Lines**

The pins used for interfacing the PDMIC are multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the peripheral functions to PDMIC pins.

### **54.5.2 Power Management**

The PDMIC is not continuously clocked. The user must first enable the PDMIC peripheral clocks (PDMIC Channel 0 and PDMIC Channel 1) and the PDMIC Generic Clock in the Power Management Controller (PMC) before using the controller.

### **54.5.3 Interrupt Sources**

The PDMIC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PDMIC interrupt requires the Interrupt Controller to be programmed first.

## **54.6 Functional Description**

### **54.6.1 PDM Interface**

#### **54.6.1.1 Description**

The PDM clock (PDMIC\_CLK) is used to sample the PDM bitstream.

The PDMIC\_CLK frequency range is between peripheral clock/2 and peripheral clock/256 or between GCLK clock/2 and GCLK clock/256, depending on the selected clock source.

The GCLK clock frequency must always be at least three times lower than the peripheral clock frequency.

The field PRESCAL in the Mode Register (PDMIC\_MR) must be programmed in order to provide a PDMIC\_CLK frequency compliant with the microphone parameters.

#### **54.6.1.2 Start-up Sequence**

To start processing the bitstream coming from the PDM interface, follow the steps below:

1. Clear all bits in the Control Register (PDMIC\_CR) or compute a soft reset using the SWRST bit of PDMIC\_CR.
2. Configure the PRESCAL field in PDMIC\_MR according to the microphone specifications.
3. Enable the PDM mode and start the conversions using the ENPDM bit in PDMIC\_CR.

### **54.6.2 Digital Signal Processing (Digital Filter)**

#### **54.6.2.1 Description**

The PDMIC includes a DSP section containing a decimation filter, a droop compensation filter, a sixth-order low pass filter, a first-order high pass filter and an offset and gain compensation stage. A block diagram of the DSP section is represented in [Figure 54-2](#).

Data processed by the filtering section are two's complement signals defined on 24 bits.

The filtering of the decimation stage is performed by a fourth-order sinc-based filter whose zeros are placed in order to minimize aliasing effects of the decimation. The decimation ratio of this filter is either 32 or 64. The droop induced by this filter can be compensated by the droop compensation stage.

The sixth-order low pass filter is used to decimate the sinc filter output by a ratio of 2.

An optional first-order high pass filter is implemented in order to eliminate the DC component of the incoming signal.

The overall decimation ratio of this DSP section is either 64 or 128. This fits an audio sampling rate of 48 kHz with a PDM microphone sampling frequency of either 3.072 or 6.144 MHz. The frequency response of the filters optimizes the gain flatness between 0 and 20 kHz (when the droop compensation filter is implemented and the high pass filter is bypassed) and highly reduces the aliasing effects of the decimation.

**Figure 54-2. DSP Block Diagram**

### 54.6.2.2 Decimation Filter

The sigma-delta architecture of the PDM microphone implies a filtering and a decimation of the bitstream at the output of the microphone bitstream. The decimation filter decimates the bitstream by either 32 or 64. To perform this operation, a fourth-order sinc filter with an Over-Sampling Ratio (OSR) of 32 or 64 is implemented with the following transfer function:

$$H(z) = \frac{1}{OSR^4} \left( \sum_{i=0}^{OSR-1} z^{-i} \right)^4$$

The DC gain of this filter is unity and does not depend on its OSR. However, as it generates a fourth-order zero at  $F_s/OSR$  frequency multiples ( $F_s$  being the sampling frequency of the microphone), the frequency response of the decimation filter depends on the OSR parameter. See [54.6.2.3 Droop Compensation](#) for frequency plots.

Its non-flat frequency response can be compensated over the 0 to 20 kHz band by using the droop compensation filter when the decimated frequency is set to 48 kHz. See [54.6.2.3 Droop Compensation](#).

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

In [Figure 54-3](#) and [Figure 54-4](#),  $F_s$  is the sampling rate of the PDM microphone.

**Figure 54-3. Spectral mask of an OSR = 32,  $F_s$  = 6.144 MHz, Fourth-Order Sinc Filter: Overall Response (continuous line) and 0 to 20 kHz Bandwidth Response (dashed line)**

The zeros of this filter are located at multiples of  $F_s/32$

**Figure 54-4. Spectral Mask of an OSR = 64,  $F_s = 3.072$  MHz, Fourth-order Sinc Filter: Overall Response (continuous line) and 0 to 20 kHz Bandwidth Response (dashed line)**

The zeros of this filter are located at multiples of  $F_s/64$ .

#### 54.6.2.3 Droop Compensation

The droop effect introduced by the sinc filter can be compensated in the 0 to 20 kHz by the droop compensation filter (see [Figure 54-5](#)). This is a second-order IIR filter which is applied on the signal output by the sinc. The default coefficients of the droop compensation filter are computed to optimize the droop of the sinc filter with the decimated frequency equal to 48 kHz.

This filter compensates the droop of the sinc filter regardless of the OSR value.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

This filter can be bypassed by setting the SINBYP bit in the [PDMIC DSP Configuration Register 0](#) (PDMIC\_DSPR0).

**Figure 54-5. Droop Compensation Filter Overall Frequency Response**

**Figure 54-6. Droop Compensation Filter 0 to 20 kHz Band Flatness**

### 54.6.2.4 Low Pass Filter

The PDMIC includes a sixth-order IIR filter that performs a low pass transfer function and decimates by 2 the output of the sinc filter. The coefficients are computed for a decimated sampling rate of 48 kHz and optimize the 0 to 20 kHz band flatness while rejecting the aliasing of the PDM microphone by at least 60 dB in the 28 to 48 kHz band.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

Figure 54-7 and Figure 54-8 are drawn for an output sampling frequency of 48 kHz.

**Figure 54-7. Low Pass Filter Spectral Mask**

**Figure 54-8. Low Pass Filter Ripple in the 0 to 20 kHz Band**

### 54.6.2.5 High Pass Filter

The PDMIC includes an optional first-order IIR filter performing a high pass transfer function after the low pass filter and before the decimation. The coefficients are computed for a decimated sampling rate of 48 kHz to obtain a -3dB cutoff frequency at 15 Hz.

If the decimated sampling rate is modified, the frequency response of this filter is scaled proportionally to the new frequency.

This filter can be bypassed by setting the HPFBYP bit in PDMIC\_DSPR0 (see 54.7.8 PDMIC\_DSPR0).

Figure 54-9 is drawn for an output sampling frequency of 48 kHz.

**Figure 54-9. High Pass Filter Spectral Mask in the 0 to 100 Hz Band****54.6.2.6 Gain and Offset Compensation**

An offset, a gain, a scaling factor and a shift can be applied to a converted PDM microphone value using the following operation:

$$\text{data} = \frac{(\text{data}_0 + \text{offset} \times 2^8) \times \text{dgain}}{2^{\text{scale} + \text{shift} + 8}}$$

where:

- $\text{data}_0$  is a signed integer defined on 24 bits. It is the output of the filtering channel.
- $\text{offset}$  is a signed integer defined on 16 bits (see [PDMIC DSP Configuration Register 1](#)). It is multiplied by  $2^8$  to have the same weight as  $\text{data}_0$ .
- $\text{dgain}$  is an unsigned integer defined on 15 bits (see [PDMIC DSP Configuration Register 1](#)). Only the 32 MSBs of the multiplication operation are used for scaling and shifting operations.  $\text{dgain}$  defaults to 0 after reset, which forces CDR to 0. It must be programmed to a non-zero value to read non-zero data into the PDMIC\_CDR register.
- $\text{scale}$  is an unsigned integer defined on 4 bits (see [PDMIC DSP Configuration Register 0](#)). It shifts the multiplication operation result by  $\text{scale}$  bits to the right. Maximum allowed value is 15.
- $\text{shift}$  is an unsigned integer defined on 4 bits (see [PDMIC DSP Configuration Register 0](#)). It shifts the multiplication operation result by  $\text{shift}$  bits to the right. Maximum allowed value is 15.

If the data transfer is configured in 32-bit mode (see [PDMIC DSP Configuration Register 0](#)), the  $2^{\text{shift}}$  division is not performed and the 32-bit result of the remaining operation is sent.

If the data transfer is configured in 16-bit mode, the  $2^{\text{shift}}$  division is performed. The result is then saturated to be within  $\pm(2^{15}-1)$  and the 16 LSBs of this saturation operation are sent to the controller as the result of the PDM microphone conversion.

Default parameters are defined to output a 16-bit result whatever the data transfer configuration may be.

**54.6.3 Conversion Results**

When a conversion is completed, the resulting 16-bit digital value is stored in the PDMIC Converted Data Register (PDMIC\_CDR).

The DRDY bit in the Interrupt Status Register (PDMIC\_ISR) is set. In the case of a connected DMA Controller channel, DRDY rising triggers a data transfer request. In any case, DRDY can trigger an interrupt.

Reading PDMIC\_CDR clears the DRDY flag.

**Figure 54-10. DRDY Flag Behavior**

If PDMIC\_CDR is not read before further incoming data is converted, the Overrun Error (OVRE) flag is set in PDMIC\_ISR. Likewise, new data converted when DRDY is high sets the OVRE bit (Overrun Error) in PDMIC\_ISR. In case of overrun, the newly converted data is lost.

The OVRE flag is automatically cleared when PDMIC\_ISR is read.

#### 54.6.4 Register Write Protection

To prevent any single software error from corrupting PDMIC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [PDMIC Write Protection Mode Register](#) (PDMIC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [PDMIC Write Protection Status Register](#) (PDMIC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading PDMIC\_WPSR.

The following registers can be write-protected:

- [PDMIC Mode Register](#)
- [PDMIC DSP Configuration Register 0](#)
- [PDMIC DSP Configuration Register 1](#)

**Bit 4 – ENPDM** Enable PDM

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | Disables the PDM and stops the conversions. |
| 1     | Enables the PDM and starts the conversions. |

**Bit 0 – SWRST** Software Reset

Warning: The read value of this bit is always 0.

| Value | Description                                    |
|-------|------------------------------------------------|
| 0     | No effect.                                     |
| 1     | Resets the PDMIC, simulating a hardware reset. |

## 54.7.2 PDMIC Mode Register

**Name:** PDMIC\_MR  
**Offset:** 0x04  
**Reset:** 0x00F00000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PDMIC Write Protection Mode Register](#).

|        |    |              |     |      |     |     |     |     |
|--------|----|--------------|-----|------|-----|-----|-----|-----|
| Bit    | 31 | 30           | 29  | 28   | 27  | 26  | 25  | 24  |
|        |    |              |     |      |     |     |     |     |
| Access |    |              |     |      |     |     |     |     |
| Reset  |    |              |     |      |     |     |     |     |
| Bit    | 23 | 22           | 21  | 20   | 19  | 18  | 17  | 16  |
|        |    |              |     |      |     |     |     |     |
| Access |    |              |     |      |     |     |     |     |
| Reset  |    |              |     |      |     |     |     |     |
| Bit    | 15 | 14           | 13  | 12   | 11  | 10  | 9   | 8   |
|        |    | PRESCAL[6:0] |     |      |     |     |     |     |
| Access |    | R/W          | R/W | R/W  | R/W | R/W | R/W | R/W |
| Reset  |    | 0            | 0   | 0    | 0   | 0   | 0   | 0   |
| Bit    | 7  | 6            | 5   | 4    | 3   | 2   | 1   | 0   |
|        |    |              |     | CLKS |     |     |     |     |
| Access |    |              |     | R/W  |     |     |     |     |
| Reset  |    |              |     | 0    |     |     |     |     |

**Bits 14:8 – PRESCAL[6:0]** Prescaler Rate Selection

PRESCAL determines the frequency of the PDM bitstream sampling clock (PDMIC\_CLK):

$$\text{PRESCAL} = \frac{\text{SELCK}}{2 \times f_{\text{PDMIC\_CLK}}} - 1$$

where SELCK is either  $f_{\text{peripheral clock}}$  or  $f_{\text{GCLK clock}}$  depending on the value of bit CLKS ( $f_{\text{peripheral clock}}$  or  $f_{\text{GCLK clock}}$  is the clock frequency in Hz).

**Bit 4 – CLKS** Clock Source Selection

| Value | Description                                                                        |
|-------|------------------------------------------------------------------------------------|
| 0     | Peripheral clock selected                                                          |
| 1     | GCLK clock selected (This clock source can be independent of the processor clock.) |

## 54.7.3 PDMIC Converted Data Register

Name: PDMIC\_CDR

Offset: 0x14

Reset: 0x00000000

Property: Read-only

|        |             |    |    |    |    |    |    |    |
|--------|-------------|----|----|----|----|----|----|----|
| Bit    | 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        | DATA[31:24] |    |    |    |    |    |    |    |
| Access | R           | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 23          | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | DATA[23:16] |    |    |    |    |    |    |    |

| Reset  | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

**Bits 31:0 – DATA[31:0] Data Converted**

The filtered output data is placed into this register at the end of a conversion and remains until it is read.

**54.7.4 PDMIC Interrupt Enable Register**

**Name:** PDMIC\_IER  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25   | 24   |
|--------|----|----|----|----|----|----|------|------|
|        |    |    |    |    |    |    | OVRE | DRDY |
| Access |    |    |    |    |    |    | W    | W    |
| Reset  |    |    |    |    |    |    | –    | –    |

| Bit    | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|--------|----|----|----|----|----|----|----|----|
|        |    |    |    |    |    |    |    |    |
| Access |    |    |    |    |    |    |    |    |
| Reset  |    |    |    |    |    |    |    |    |

| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|--------|----|----|----|----|----|----|---|---|
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

**Bit 25 – OVRE** General Overrun Error Interrupt Mask

**Bit 24 – DRDY** Data Ready Interrupt Mask

## 54.7.7 PDMIC Interrupt Status Register

**Name:** PDMIC\_ISR  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read-only

|        |    |    |    |    |    |    |      |      |
|--------|----|----|----|----|----|----|------|------|
| Bit    | 31 | 30 | 29 | 28 | 27 | 26 | 25   | 24   |
|        |    |    |    |    |    |    | OVRE | DRDY |
| Access |    |    |    |    |    |    | R    | R    |
| Reset  |    |    |    |    |    |    | 0    | 0    |

|        |              |    |    |    |    |    |    |    |
|--------|--------------|----|----|----|----|----|----|----|
| Bit    | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | FIFOCNT[7:0] |    |    |    |    |    |    |    |
| Access | R            | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0            | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

|        |    |    |    |    |    |    |   |   |
|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |   |   |   |   |
|--------|---|---|---|---|---|---|---|---|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|        |   |   |   |   |   |   |   |   |
| Access |   |   |   |   |   |   |   |   |
| Reset  |   |   |   |   |   |   |   |   |

**Bit 25 – OVRE** Overrun Error (cleared on read)

| Value | Description                                                               |
|-------|---------------------------------------------------------------------------|
| 0     | No overrun error has occurred since the last read of PDMIC_ISR.           |
| 1     | At least one overrun error has occurred since the last read of PDMIC_ISR. |

**Bit 24 – DRDY** Data Ready (cleared by reading PDMIC\_CDR)

| Value | Description                                                         |
|-------|---------------------------------------------------------------------|
| 0     | No data has been converted since the last read of PDMIC_CDR.        |
| 1     | At least one data has been converted and is available in PDMIC_CDR. |

**Bits 23:16 – FIFOCNT[7:0]** FIFO Count

Number of conversions available in the FIFO (not a source of interrupt).

## 54.7.8 PDMIC DSP Configuration Register 0

**Name:** PDMIC\_DSPR0  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PDMIC Write Protection Mode Register](#).

|        |            |          |     |     |            |        |        |     |
|--------|------------|----------|-----|-----|------------|--------|--------|-----|
| Bit    | 31         | 30       | 29  | 28  | 27         | 26     | 25     | 24  |
|        |            |          |     |     |            |        |        |     |
| Access |            |          |     |     |            |        |        |     |
| Reset  |            |          |     |     |            |        |        |     |
| Bit    | 23         | 22       | 21  | 20  | 19         | 18     | 17     | 16  |
|        |            |          |     |     |            |        |        |     |
| Access |            |          |     |     |            |        |        |     |
| Reset  |            |          |     |     |            |        |        |     |
| Bit    | 15         | 14       | 13  | 12  | 11         | 10     | 9      | 8   |
|        | SHIFT[3:0] |          |     |     | SCALE[3:0] |        |        |     |
| Access | R/W        | R/W      | R/W | R/W | R/W        | R/W    | R/W    | R/W |
| Reset  | 0          | 0        | 0   | 0   | 0          | 0      | 0      | 0   |
| Bit    | 7          | 6        | 5   | 4   | 3          | 2      | 1      | 0   |
|        |            | OSR[2:0] |     |     | SIZE       | SINBYP | HPFBYP |     |
| Access |            | R/W      | R/W | R/W | R/W        | R/W    | R/W    |     |
| Reset  |            | 0        | 0   | 0   | 0          | 0      | 0      |     |

**Bits 15:12 – SHIFT[3:0]** Data Shift

Shifts the scaled result by SHIFT bits to the right.

**Bits 11:8 – SCALE[3:0]** Data Scale

Shifts the multiplication operation result by SCALE bits to the right.

**Bits 6:4 – OSR[2:0]** Global Oversampling Ratio

Values not listed are reserved.

| Value | Name | Description                                                             |
|-------|------|-------------------------------------------------------------------------|
| 0     | 128  | Global Oversampling ratio is 128 (SINC filter oversampling ratio is 64) |
| 1     | 64   | Global Oversampling ratio is 64 (SINC filter oversampling ratio is 32)  |

**Bit 3 – SIZE** Data Size

| Value | Description                     |
|-------|---------------------------------|
| 0     | Converted data size is 16 bits. |
| 1     | Converted data size is 32 bits. |

**Bit 2 – SINBYP** SINCC Filter Bypass

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | Droop compensation filter enabled.      |
| 1     | Bypasses the droop compensation filter. |

**Bit 1 – HPFBYP** High-Pass Filter Bypass

| Value | Description                    |
|-------|--------------------------------|
| 0     | High-pass filter enabled.      |
| 1     | Bypasses the high-pass filter. |

**54.7.9 PDMIC DSP Configuration Register 1**

**Name:** PDMIC\_DSPR1  
**Offset:** 0x5C  
**Reset:** 0x00000001  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PDMIC Write Protection Mode Register](#).

DGAIN and OFFSET values can be determined using the formula in [54.6.2.6 Gain and Offset Compensation](#).

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS** Write Protection Violation Status

| Value | Description                                                                                                                                                                                                     |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of PDMIC_WPSR.                                                                                                                                   |
| 1     | A write protection violation has occurred since the last read of PDMIC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

## **55. Pulse Width Modulation Controller (PWM)**

### **55.1 Description**

The Pulse Width Modulation Controller (PWM) generates output pulses on 4 channels independently according to parameters defined per channel. Each channel controls two complementary square output waveforms. Characteristics of the output waveforms such as period, duty-cycle, polarity and dead-times (also called dead-bands or non-overlapping times) are configured through the user interface. Each channel selects and uses one of the clocks provided by the clock generator. The clock generator provides several clocks resulting from the division of the PWM peripheral clock. External triggers can be managed to allow output pulses to be modified in real time.

All accesses to the PWM are made through registers mapped on the peripheral bus. All channels integrate a double buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum, the duty-cycle or the dead-times.

Channels can be linked together as synchronous channels to be able to update their duty-cycle or dead-times at the same time.

The update of duty-cycles of synchronous channels can be performed by the DMA Controller channel which offers buffer transfer without processor intervention.

The PWM includes a spread-spectrum counter to allow a constantly varying period (only for Channel 0). This counter may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

The PWM provides 1 independent comparison units capable of comparing a programmed value to the counter of the synchronous channels (counter of channel 0). These comparisons are intended to generate software interrupts, to trigger pulses on the 2 independent event lines (in order to synchronize ADC conversions with a lot of flexibility independently of the PWM outputs) and to trigger DMA Controller transfer requests.

PWM outputs can be overridden synchronously or asynchronously to their channel counter.

The PWM provides a fault protection mechanism with 6 fault inputs, capable to detect a fault condition and to override the PWM outputs asynchronously (outputs forced to '0', '1' or Hi-Z).

For safety usage, some configuration registers are write-protected.

### **55.2 Embedded Characteristics**

- 4 Channels
- Common Clock Generator Providing Thirteen Different Clocks
  - A Modulo n Counter Providing Eleven Clocks
  - Two Independent Linear Dividers Working on Modulo n Counter Outputs
- Independent Channels
  - Independent 16-bit Counter for Each Channel
  - Independent Complementary Outputs with 16-bit Dead-Time Generator (Also Called Dead-Band or Non-Overlapping Time) for Each Channel
  - Independent Push-Pull Mode for Each Channel
  - Independent Enable Disable Command for Each Channel

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

- Independent Clock Selection for Each Channel
  - Independent Period, Duty-Cycle and Dead-Time for Each Channel
  - Independent Double Buffering of Period, Duty-Cycle and Dead-Times for Each Channel
  - Independent Programmable Selection of The Output Waveform Polarity for Each Channel, with Double Buffering
  - Independent Programmable Center- or Left-aligned Output Waveform for Each Channel
  - Independent Output Override for Each Channel
  - Independent Interrupt for Each Channel, at Each Period for Left-Aligned or Center-Aligned Configuration
  - Independent Update Time Selection of Double Buffering Registers (Polarity, Duty Cycle) for Each Channel, at Each Period for Left-Aligned or Center-Aligned Configuration
- External Trigger Input Management (e.g., for DC/DC or Lighting Control)
  - External PWM Reset Mode
  - External PWM Start Mode
  - Cycle-By-Cycle Duty Cycle Mode
  - Leading-Edge Blanking
- Two 2-bit Gray Up/Down Channels for Stepper Motor Control
- Spread Spectrum Counter to Allow a Constantly Varying Duty Cycle (only for Channel 0)
- Synchronous Channel Mode
  - Synchronous Channels Share the Same Counter
  - Mode to Update the Synchronous Channels Registers after a Programmable Number of Periods
  - Synchronous Channels Supports Connection of one DMA Controller Channel Which Offers Buffer Transfer Without Processor Intervention To Update Duty-Cycle Registers
- 2 Independent Events Lines Intended to Synchronize ADC Conversions
  - Programmable delay for Events Lines to delay ADC measurements
- 1 Comparison Units Intended to Generate Interrupts, Pulses on Event Lines and DMA Controller Transfer Requests
- 6 Programmable Fault Inputs Providing an Asynchronous Protection of PWM Outputs
  - 2 User Driven through PIO Inputs
  - PMC Driven when Crystal Oscillator Clock Fails
  - ADC Controller Driven through Configurable Comparison Function
  - Timer/Counter Driven through Configurable Comparison Function
- Register Write Protection

### 55.3 Block Diagram

Figure 55-1. Pulse Width Modulation Controller Block Diagram

**Note:** For a more detailed illustration of the fault protection circuitry, refer to [55.6.2.7 Fault Protection](#).

### 55.4 I/O Lines Description

Each channel outputs two complementary external I/O lines.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

**Table 55-1. I/O Line Description**

| Name      | Description                            | Type   |
|-----------|----------------------------------------|--------|
| PWMHx     | PWM Waveform Output High for channel x | Output |
| PWMLx     | PWM Waveform Output Low for channel x  | Output |
| PWMFlx    | PWM Fault Input x                      | Input  |
| PWMEXTRGy | PWM Trigger Input y                    | Input  |

## 55.5 Product Dependencies

### 55.5.1 I/O Lines

The pins used for interfacing the PWM are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the desired PWM pins to their peripheral function. If I/O lines of the PWM are not used by the application, they can be used for other purposes by the PIO controller.

All of the PWM outputs may or may not be enabled. If an application requires only four channels, then only four PIO lines are assigned to PWM outputs.

### 55.5.2 Power Management

The PWM is not continuously clocked. The programmer must first enable the PWM clock in the Power Management Controller (PMC) before using the PWM. However, if the application does not require PWM operations, the PWM clock can be stopped when not needed and be restarted later. In this case, the PWM will resume its operations where it left off.

### 55.5.3 Interrupt Sources

The PWM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PWM interrupt requires the Interrupt Controller to be programmed first.

### 55.5.4 Fault Inputs

The PWM has the fault inputs connected to the different modules. Refer to the implementation of these modules within the product for detailed information about the fault generation procedure. The PWM receives faults from:

- PIO inputs
- the PMC
- the ADC controller
- Timer/Counters

**Table 55-2. Fault Inputs**

| Fault Generator | External PWM Fault Input Number | Polarity Level <sup>(1)</sup> | Fault Input ID |
|-----------------|---------------------------------|-------------------------------|----------------|
| PB2             | PWMFI0                          | User-defined                  | 0              |
| PB9             | PWMFI1                          | User-defined                  | 1              |
| PMC             | —                               | To be configured to 1         | 2              |

.....continued

| Fault Generator | External PWM Fault Input Number | Polarity Level <sup>(1)</sup> | Fault Input ID |
|-----------------|---------------------------------|-------------------------------|----------------|
| ADC             | —                               | To be configured to 1         | 3              |
| Timer0          | —                               | To be configured to 1         | 4              |
| Timer1          | —                               | To be configured to 1         | 5              |

**Note:**

1. FPOL field in PWMC\_FMR.

## 55.6 Functional Description

The PWM controller is primarily composed of a clock generator module and 4 channels.

- Clocked by the peripheral clock, the clock generator module provides 13 clocks.
- Each channel can independently choose one of the clock generator outputs.
- Each channel generates an output waveform with attributes that can be defined independently for each channel through the user interface registers.

### 55.6.1 PWM Clock Generator

**Figure 55-2. Functional View of the Clock Generator Block Diagram**

The PWM peripheral clock is divided in the clock generator module to provide different clocks available for all channels. Each channel can independently select one of the divided clocks.

The clock generator is divided into different blocks:

- a modulo n counter which provides 11 clocks:
  - $f_{\text{peripheral clock}}$
  - $f_{\text{peripheral clock}}/2$
  - $f_{\text{peripheral clock}}/4$
  - $f_{\text{peripheral clock}}/8$
  - $f_{\text{peripheral clock}}/16$
  - $f_{\text{peripheral clock}}/32$
  - $f_{\text{peripheral clock}}/64$
  - $f_{\text{peripheral clock}}/128$
  - $f_{\text{peripheral clock}}/256$
  - $f_{\text{peripheral clock}}/512$
  - $f_{\text{peripheral clock}}/1024$
- two linear dividers (1, 1/2, 1/3, ... 1/255) that provide two separate clocks: clkA and clkB

Each linear divider can independently divide one of the clocks of the modulo n counter. The selection of the clock to be divided is made according to the PREA (PREB) field of the PWM Clock register (PWM\_CLK). The resulting clock clkA (clkB) is the clock selected divided by DIVA (DIVB) field value.

After a reset of the PWM controller, DIVA (DIVB) and PREA (PREB) are set to '0'. This implies that after reset clkA (clkB) are turned off.

At reset, all clocks provided by the modulo n counter are turned off except the peripheral clock. This situation is also true when the PWM peripheral clock is turned off through the Power Management Controller.

**CAUTION** Before using the PWM controller, the programmer must first enable the peripheral clock in the Power Management Controller (PMC).

---

### 55.6.2 PWM Channel

#### 55.6.2.1 Channel Block Diagram

Figure 55-3. Functional View of the Channel Block Diagram

Each of the 4 channels is composed of six blocks:

- A clock selector which selects one of the clocks provided by the clock generator (described in [PWM Clock Generator](#)).
- A counter clocked by the output of the clock selector. This counter is incremented or decremented according to the channel configuration and comparators matches. The size of the counter is 16 bits.
- A comparator used to compute the OCx output waveform according to the counter value and the configuration. The counter value can be the one of the channel counter or the one of the channel 0 counter according to SYNCx bit in the [PWM Sync Channels Mode Register](#) (PWM\_SCM).
- A 2-bit configurable Gray counter enables the stepper motor driver. One Gray counter drives 2 channels.
- A dead-time generator providing two complementary outputs (DTHx/DTOLx) which allows to drive external power control switches safely.
- An output override block that can force the two complementary outputs to a programmed value (OOHx/OOLx).
- An asynchronous fault protection mechanism that has the highest priority to override the two complementary outputs (PWMHx/PWMLx) in case of fault detection (outputs forced to '0', '1' or Hi-Z).

#### 55.6.2.2 Comparator

The comparator continuously compares its counter value with the channel period defined by CPRD in the [PWM Channel Period Register](#) (PWM\_CPRDx) and the duty-cycle defined by CDTY in the [PWM Channel Duty Cycle Register](#) (PWM\_CDTYx) to generate an output signal OCx accordingly.

The different properties of the waveform of the output OCx are:

- the clock selection. The channel counter is clocked by one of the clocks provided by the clock generator described in the previous section. This channel parameter is defined in the CPRE field of the [PWM Channel Mode Register](#) (PWM\_CMRx). This field is reset at '0'.

- the waveform period. This channel parameter is defined in the CPRD field of the PWM\_CPRDx register.

If the waveform is left-aligned, then the output waveform period depends on the counter source clock and can be calculated:

By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the counter source clock and can be calculated:

By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or }$$

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

- the waveform duty-cycle. This channel parameter is defined in the CDTY field of the PWM\_CDTYx register.

If the waveform is left-aligned, then:

$$\text{duty cycle} = \frac{(\text{period} - 1/f_{\text{channel\_x\_clock}} \times \text{CDTY})}{\text{period}}$$

If the waveform is center-aligned, then:

$$\text{duty cycle} = \frac{((\text{period}/2) - 1/f_{\text{channel\_x\_clock}} \times \text{CDTY})}{(\text{period}/2)}$$

- the waveform polarity. At the beginning of the period, the signal can be at high or low level. This property is defined in the CPOL bit of PWM\_CMRx. By default, the signal starts by a low level. The DPOLI bit in PWM\_CMRx defines the PWM polarity when the channel is disabled (CHIDx = 0 in PWM\_SR). For more details, see the figure *Waveform Properties*.
  - DPOLI = 0: PWM polarity when the channel is disabled is the same as the one defined for the beginning of the PWM period.

- DPOLI = 1: PWM polarity when the channel is disabled is inverted compared to the one defined for the beginning of the PWM period.
- the waveform alignment. The output waveform can be left- or center-aligned. Center-aligned waveforms can be used to generate non-overlapped waveforms. This property is defined in the CALG bit of PWM\_CMRx. The default mode is left-aligned.

**Figure 55-4. Non-Overlapped Center-Aligned Waveforms**

**Note:** See the figure [Figure 55-5](#) for a detailed description of center-aligned waveforms.

When center-aligned, the channel counter increases up to CPRD and decreases down to 0. This ends the period.

When left-aligned, the channel counter increases up to CPRD and is reset. This ends the period.

Thus, for the same CPRD value, the period for a center-aligned channel is twice the period for a left-aligned channel.

Waveforms are fixed at 0 when:

- CDTY = CPRD and CPOL = 0 (Note that if TRGMODE = MODE3, the PWM waveform switches to 1 at the external trigger event (see [Cycle-By-Cycle Duty Mode](#))).
- CDTY = 0 and CPOL = 1

Waveforms are fixed at 1 (once the channel is enabled) when:

- CDTY = 0 and CPOL = 0
- CDTY = CPRD and CPOL = 1 (Note that if TRGMODE = MODE3, the PWM waveform switches to 0 at the external trigger event (see [Cycle-By-Cycle Duty Mode](#))).

The waveform polarity must be set before enabling the channel. This immediately affects the channel output level.

Modifying CPOL in [PWM Channel Mode Register](#) while the channel is enabled can lead to an unexpected behavior of the device being driven by PWM.

In addition to generating the output signals OCx, the comparator generates interrupts depending on the counter value. When the output waveform is left-aligned, the interrupt occurs at the end of the counter period. When the output waveform is center-aligned, the bit CES of PWM\_CMRx defines when the channel counter interrupt occurs. If CES is set to '0', the interrupt occurs at the end of the counter period. If CES is set to '1', the interrupt occurs at the end of the counter period and at half of the counter period.

The figure below illustrates the counter interrupts depending on the configuration.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

**Figure 55-5. Waveform Properties**

### 55.6.2.3 Trigger Selection for Timer Counter

The PWM controller can be used as a trigger source for the Timer Counter (TC) to achieve the two application examples described below.

#### 55.6.2.3.1 Delay Measurement

To measure the delay between the channel x comparator output (OCx) and the feedback from the bridge driver of the MOSFETs (see the figure below), the bit TCTS in the [PWM Channel Mode Register](#) must be at 0. This defines the comparator output of the channel x as the TC trigger source. The TIOB trigger (TC internal input) is used to start the TC; the TIOA input (from PAD) is used to capture the delay.

**Figure 55-6. Triggering the TC: Delay Measurement**

#### 55.6.2.3.2 Cumulated ON Time Measurement

To measure the cumulated “ON” time of MOSFETs (see the figure below), the bit TCTS of the [PWM Channel Mode Register](#) must be set to 1 to define the counter event (see the figure *Waveform Properties*) as the Timer Counter trigger source.

**Figure 55-7. Triggering the TC: Cumulated “ON” Time Measurement**

### 55.6.2.4 2-bit Gray Up/Down Counter for Stepper Motor

A pair of channels may provide a 2-bit Gray count waveform on two outputs. Dead-time generator and other downstream logic can be configured on these channels.

Up or Down Count mode can be configured on-the-fly by means of **PWM\_SMMR** configuration registers.

When GCEN0 is set to '1', channels 0 and 1 outputs are driven with a Gray counter.

**Figure 55-8. 2-bit Gray Up/Down Counter**

### 55.6.2.5 Dead-Time Generator

The dead-time generator uses the comparator output OCx to provide the two complementary outputs DTOHx and DTOLx, which allows the PWM macrocell to drive external power control switches safely. When the dead-time generator is enabled by setting the bit DTE to 1 or 0 in the [PWM Channel Mode Register](#) (PWM\_CMRx), dead-times (also called dead-bands or non-overlapping times) are inserted between the edges of the two complementary outputs DTOHx and DTOLx. Note that enabling or disabling the dead-time generator is allowed only if the channel is disabled.

The dead-time is adjustable by the [PWM Channel Dead Time Register](#) (PWM\_DTx). Each output of the dead-time generator can be adjusted separately by DTH and DTL. The dead-time values can be updated synchronously to the PWM period by using the [PWM Channel Dead Time Update Register](#) (PWM\_DTUPDx).

The dead-time is based on a specific counter which uses the same selected clock that feeds the channel counter of the comparator. Depending on the edge and the configuration of the dead-time, DTOHx and DTOLx are delayed until the counter has reached the value defined by DTH or DTL. An inverted configuration bit (DTHI and DTLI bit in PWM\_CMRx) is provided for each output to invert the dead-time outputs. The following figure shows the waveform of the dead-time generator.

**Figure 55-9. Complementary Output Waveforms**

### 55.6.2.5.1 PWM Push-Pull Mode

When a PWM channel is configured in Push-Pull mode, the dead-time generator output is managed alternately on each PWM cycle. The polarity of the PWM line during the idle state of the Push-Pull mode is defined by the DPOLI bit in the [PWM Channel Mode Register](#) (PWM\_CMRx). The Push-Pull mode can be enabled separately on each channel by writing a one to bit PPM in the [PWM Channel Mode Register](#).

**Figure 55-10. PWM Push-Pull Mode**

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

**Figure 55-11. PWM Push-Pull Waveforms: Left-Aligned Mode**

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

**Figure 55-12. PWM Push-Pull Waveforms: Center-Aligned Mode**

The PWM Push-Pull mode can be useful in transformer-based power converters, such as a half-bridge converter. The Push-Pull mode prevents the transformer core from being saturated by any direct current.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

**Figure 55-14. Half-Bridge Converter Application: Feedback Regulation**

### 55.6.2.6 Output Override

The two complementary outputs DTHx and DTOLx of the dead-time generator can be forced to a value defined by the software.

**Figure 55-15. Override Output Selection**

The fields OSHx and OSLx in the [PWM Output Selection Register](#) (PWM\_OS) allow the outputs of the dead-time generator DTHx and DTOLx to be overridden by the value defined in the fields OOVHx and OOVx in the [PWM Output Override Value Register](#) (PWM\_OOV).

## SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

The set registers [PWM Output Selection Set Register](#) (PWM\_OSS) and [PWM Output Selection Set Update Register](#) (PWM\_OSSUPD) enable the override of the outputs of a channel regardless of other channels. In the same way, the clear registers [PWM Output Selection Clear Register](#) (PWM\_OSC) and [PWM Output Selection Clear Update Register](#) (PWM\_OSCUPD) disable the override of the outputs of a channel regardless of other channels.

By using buffer registers PWM\_OSSUPD and PWM\_OSCUPD, the output selection of PWM outputs is done synchronously to the channel counter, at the beginning of the next PWM period.

By using registers PWM\_OSS and PWM\_OSC, the output selection of PWM outputs is done asynchronously to the channel counter, as soon as the register is written.

The value of the current output selection can be read in PWM\_OS.

While overriding PWM outputs, the channel counters continue to run, only the PWM outputs are forced to user defined values.

### 55.6.2.7 Fault Protection

6 inputs provide fault protection which can force any of the PWM output pairs to a programmable value. This mechanism has priority over output overriding.

### Figure 55-16. Fault Protection

The polarity level of the fault inputs is configured by the FPOL field in the [PWM Fault Mode Register](#) (PWM\_FMR). For fault inputs coming from internal peripherals such as ADC or Timer Counter, the polarity level must be FPOL = 1. For fault inputs coming from external GPIO pins the polarity level depends on the user's implementation.

The configuration of the Fault Activation mode (FMOD field in PWMC\_FMR) depends on the peripheral generating the fault. If the corresponding peripheral does not have “Fault Clear” management, then the

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

FMOD configuration to use must be FMOD = 1, to avoid spurious fault detection. Refer to the corresponding peripheral documentation for details on handling fault generation.

Fault inputs may or may not be glitch-filtered depending on the FFIL field in PWM\_FMR. When the filter is activated, glitches on fault inputs with a width inferior to the PWM peripheral clock period are rejected.

A fault becomes active as soon as its corresponding fault input has a transition to the programmed polarity level. If the corresponding bit FMOD is set to '0' in PWM\_FMR, the fault remains active as long as the fault input is at this polarity level. If the corresponding FMOD field is set to '1', the fault remains active until the fault input is no longer at this polarity level and until it is cleared by writing the corresponding bit FCLR in the [PWM Fault Clear Register](#) (PWM\_FCR). In the [PWM Fault Status Register](#) (PWM\_FSR), the field FIV indicates the current level of the fault inputs and the field FIS indicates whether a fault is currently active.

Each fault can be taken into account or not by the fault protection mechanism in each channel. To be taken into account in the channel x, the fault y must be enabled by the bit FPEX[y] in the PWM Fault Protection Enable registers (PWM\_FPE1). However, synchronous channels (see [Synchronous Channels](#)) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[y]).

The fault protection on a channel is triggered when this channel is enabled and when any one of the faults that are enabled for this channel is active. It can be triggered even if the PWM peripheral clock is not running but only by a fault input that is not glitch-filtered.

When the fault protection is triggered on a channel, the fault protection mechanism resets the counter of this channel and forces the channel outputs to the values defined by the fields FPDVHx and FPDVLx in the [PWM Fault Protection Value Register 1](#) (PWM\_FPV) and fields FPZHx/FPZLx in the [PWM Fault Protection Value Register 2](#), as shown in the table below. The output forcing is made asynchronously to the channel counter.

**Table 55-3. Forcing Values of PWM Outputs by Fault Protection**

| FPZH/Lx | FPVH/Lx | Forcing Value of PWMH/Lx    |
|---------|---------|-----------------------------|
| 0       | 0       | 0                           |
| 0       | 1       | 1                           |
| 1       | —       | High impedance state (Hi-Z) |

### ⚠ CAUTION

- To prevent any unexpected activation of the status flag FSY in PWM\_FSR, the FMODY bit can be set to '1' only if the FPOLy bit has been previously configured to its final value.
- To prevent any unexpected activation of the Fault Protection on the channel x, the bit FPEX[y] can be set to '1' only if the FPOLy bit has been previously configured to its final value.

If a comparison unit is enabled (see [PWM Comparison Units](#)) and if a fault is triggered in the channel 0, then the comparison cannot match.

As soon as the fault protection is triggered on a channel, an interrupt (different from the interrupt generated at the end of the PWM period) can be generated but only if it is enabled and not masked. The interrupt is reset by reading the interrupt status register, even if the fault which has caused the trigger of the fault protection is kept active.

### 55.6.2.7.1 Recoverable Fault

The PWM provides a Recoverable Fault mode on fault 1 and 2 (see figure *Fault Protection*).

The recoverable fault signal is an internal signal generated as soon as an external trigger event occurs (see [PWM External Trigger Mode](#)).

When the fault 1 or 2 is defined as a recoverable fault, the corresponding fault input pin is ignored and bits FFIL1/2, FMOD1/2 and FFIL1/2 are not taken into account.

The fault 1 is managed as a recoverable fault by the PWMEXTRG1 input trigger when PWM\_ETRG1.RFEN = 1, PWM\_ENA.CHID1 = 1, and PWM\_ETRG1.TRGMODE ≠ 0.

The fault 2 is managed as a recoverable fault by the PWMEXTRG2 input trigger when PWM\_ETRG2.RFEN = 1, PWM\_ENA.CHID2 = 1, and PWM\_ETRG2.TRGMODE ≠ 0.

Recoverable fault 1 and 2 can be taken into account by all channels by enabling the bit FPEX[1/2] in the PWM Fault Protection Enable registers (PWM\_FPEX). However the synchronous channels (see [Synchronous Channels](#)) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[1/2]).

When a recoverable fault is triggered (according to the PWM\_ETRGx.TRGMODE setting), the PWM counter of the affected channels is not cleared (unlike in the classic fault protection mechanism) but the channel outputs are forced to the values defined by the fields FPVHx and FVLx in the [PWM Fault Protection Value Register 1](#) (PWM\_FPV), as per table *Forcing Values of PWM Outputs by Fault Protection*. The output forcing is made asynchronously to the channel counter and lasts from the recoverable fault occurrence to the end of the next PWM cycle (if the recoverable fault is no longer present) (see the figure below).

The recoverable fault does not trigger an interrupt. The Fault Status FSy (with y = 1 or 2) is not reported in the [PWM Fault Status Register](#) when the fault y is a recoverable fault.

**Figure 55-17. Recoverable Fault Management**

### 55.6.2.8 Spread Spectrum Counter

The PWM macrocell includes a spread spectrum counter allowing the generation of a constantly varying duty cycle on the output PWM waveform (only for the channel 0). This feature may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

This is achieved by varying the effective period in a range defined by a spread spectrum value which is programmed by the field **SPRD** in the [PWM Spread Spectrum Register](#) (**PWM\_SSPR**). The effective

period of the output waveform is the value of the spread spectrum counter added to the programmed waveform period CPRD in the [PWM Channel Period Register](#) (PWM\_CPRD0).

It will cause the effective period to vary from  $CPRD - SPRD$  to  $CPRD + SPRD$ . This leads to a constantly varying duty cycle on the PWM output waveform because the duty cycle value programmed is unchanged.

The value of the spread spectrum counter can change in two ways depending on the bit SPRDM in PWM\_SSPR.

If  $SPRDM = 0$ , the Triangular mode is selected. The spread spectrum counter starts to count from  $-SPRD$  when the channel 0 is enabled or after reset and counts upwards at each period of the channel counter. When it reaches  $SPRD$ , it restarts to count from  $-SPRD$  again.

If  $SPRDM = 1$ , the Random mode is selected. A new random value is assigned to the spread spectrum counter at each period of the channel counter. This random value is between  $-SPRD$  and  $+SPRD$  and is uniformly distributed.

**Figure 55-18. Spread Spectrum Counter**

### 55.6.2.9 Synchronous Channels

Some channels can be linked together as synchronous channels. They have the same source clock, the same period, the same alignment and are started together. In this way, their counters are synchronized together.

The synchronous channels are defined by the SYNCx bits in the [PWM Sync Channels Mode Register](#) (PWM\_SCM). Only one group of synchronous channels is allowed.

When a channel is defined as a synchronous channel, the channel 0 is also automatically defined as a synchronous channel. This is because the channel 0 counter configuration is used by all the synchronous channels.

If a channel x is defined as a synchronous channel, the fields/bits for the channel 0 are used instead of those of channel x:

- CPRE in PWM\_CMRO instead of CPRE in PWM\_CMRx (same source clock)
- CPRD in PWM\_CPRD0 instead of CPRD in PWM\_CPRDx (same period)
- CALG in PWM\_CMRO instead of CALG in PWM\_CMRx (same alignment)

Modifying the fields CPRE, CPRD and CALG of for channels with index greater than 0 has no effect on output waveforms.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

Because counters of synchronous channels must start at the same time, they are all enabled together by enabling the channel 0 (by the CHID0 bit in PWM\_ENA register). In the same way, they are all disabled together by disabling channel 0 (by the CHID0 bit in PWM\_DIS register). However, a synchronous channel x different from channel 0 can be enabled or disabled independently from others (by the CHIDx bit in PWM\_ENA and PWM\_DIS registers).

Defining a channel as a synchronous channel while it is an asynchronous channel (by writing the bit SYNCx to '1' while it was at '0') is allowed only if the channel is disabled at this time (CHIDx = 0 in PWM\_SR). In the same way, defining a channel as an asynchronous channel while it is a synchronous channel (by writing the SYNCx bit to '0' while it was '1') is allowed only if the channel is disabled at this time.

The UPDM field (Update Mode) in the PWM\_SCM register selects one of the three methods to update the registers of the synchronous channels:

- Method 1 (UPDM = 0): The period value, the duty-cycle values and the dead-time values must be written by the processor in their respective update registers (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx). The update is triggered at the next PWM period as soon as the bit UPDULOCK in the [PWM Sync Channels Update Control Register](#) (PWM\_SCUC) is set to '1'.
- Method 2 (UPDM = 1): The period value, the duty-cycle values, the dead-time values and the update period value must be written by the processor in their respective update registers (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPD). The update of the period value and of the dead-time values is triggered at the next PWM period as soon as the bit UPDULOCK in the PWM\_SCUC register is set to '1'. The update of the duty-cycle values and the update period value is triggered automatically after an update period defined by the field UPR in the [PWM Sync Channels Update Period Register](#) (PWM\_SCUP).
- Method 3 (UPDM = 2): Same as Method 2 apart from the fact that the duty-cycle values of ALL synchronous channels are written by the DMA Controller. The user can choose to synchronize the DMA Controller transfer request with a comparison match (see [Section 7.3 "PWM Comparison Units"](#)), by the fields PTRM and PTRCS in the PWM\_SCM register. The DMA destination address must be configured to access only the [PWM DMA Register](#) (PWM\_DMAR). The DMA buffer data structure must consist of sequentially repeated duty cycles. The number of duty cycles in each sequence corresponds to the number of synchronized channels. Duty cycles in each sequence must be ordered from the lowest to the highest channel index. The size of the duty cycle is 16 bits.

**Table 55-4. Summary of the Update of Registers of Synchronous Channels**

| Register                         | UPDM = 0                                                                             | UPDM = 1 | UPDM = 2 |
|----------------------------------|--------------------------------------------------------------------------------------|----------|----------|
| Period Value<br>(PWM_CPRDUPDx)   | Write by the processor                                                               |          |          |
|                                  | Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1' |          |          |
| Dead-Time Values<br>(PWM_DTUPDx) | Write by the processor                                                               |          |          |
|                                  | Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1' |          |          |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.6.2.9.1 Method 1: Manual write of duty-cycle values and manual trigger of the update

In this mode, the update of the period value, the duty-cycle values and the dead-time values must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx).

To trigger the update, the user must use the bit UPDULOCK in the PWM\_SCUC register which allows to update synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

Sequence for Method 1:

1. Select the manual write of duty-cycle values and the manual update by setting the UPDM field to '0' in the PWM\_SCM register.
2. Define the synchronous channels by the SYNCx bits in the PWM\_SCM register.
3. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
4. If an update of the period value and/or the duty-cycle values and/or the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_CDTYUPDx and PWM\_DTUPDx).
5. Set UPDULOCK to '1' in PWM\_SCUC.
6. The update of the registers will occur at the beginning of the next PWM period. When the UPDULOCK bit is reset, go to [Step 4.](#) for new values.

**Figure 55-19. Method 1 (UPDM = 0)**

### 55.6.2.9.2 Method 2: Manual write of duty-cycle values and automatic trigger of the update

In this mode, the update of the period value, the duty-cycle values, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_CDTYUPDx, PWM\_DTUPDx and PWM\_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK in the PWM\_SCUC register, which updates synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the update period by the UPR field in the PWM\_SCUP register. The PWM controller waits UPR+1 period of synchronous channels before updating automatically the duty values and the update period value.

The status of the duty-cycle value write is reported in the [PWM Interrupt Status Register 2](#) (PWM\_ISR2) by the following flags:

- **WRDY**: this flag is set to '1' when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to '0' when the PWM\_ISR2 register is read.

Depending on the interrupt mask in the [PWM Interrupt Mask Register 2](#) (PWM\_IMR2), an interrupt can be generated by these flags.

Sequence for Method 2:

1. Select the manual write of duty-cycle values and the automatic update by setting the field UPDM to '1' in the PWM\_SCM register
2. Define the synchronous channels by the bits SYNCx in the PWM\_SCM register.
3. Define the update period by the field UPR in the PWM\_SCUP register.
4. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
5. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_DTUPDx), else go to [Step 8](#).
6. Set UPDULOCK to '1' in PWM\_SCUC.

7. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDULOCK is reset, go to [Step 5.](#) for new values.
8. If an update of the duty-cycle values and/or the update period is required, check first that write of new update values is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM\_ISR2.
9. Write registers that need to be updated (PWM\_CDTYUPDx, PWM\_SCUPUPD).
10. The update of these registers will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to [Step 8.](#) for new values.

**Figure 55-20. Method 2 (UPDM = 1)**

### 55.6.2.9.3 Method 3: Automatic write of duty-cycle values and automatic trigger of the update

In this mode, the update of the duty cycle values is made automatically by the DMA Controller. The update of the period value, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM\_CPRDUPDx, PWM\_DTUPDx and PWM\_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK which allows to update synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period value is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the Update Period by the field UPR in the PWM\_SCUP register. The PWM controller waits UPR+1 periods of synchronous channels before updating automatically the duty values and the update period value.

Using the DMA Controller removes processor overhead by reducing its intervention during the transfer. This significantly reduces the number of clock cycles required for a data transfer, which improves microcontroller performance.

The DMA Controller must write the duty-cycle values in the synchronous channels index order. For example if the channels 0, 1 and 3 are synchronous channels, the DMA Controller must write the duty-

cycle of the channel 0 first, then the duty-cycle of the channel 1, and finally the duty-cycle of the channel 3.

The status of the DMA Controller transfer is reported in PWM\_ISR2 by the following flags:

- **WRDY:** this flag is set to '1' when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to '0' when PWM\_ISR2 is read. The user can choose to synchronize the WRDY flag and the DMA Controller transfer request with a comparison match (see [PWM Comparison Units](#)), by the fields PTRM and PTRCS in the PWM\_SCM register.
- **UNRE:** this flag is set to '1' when the update period defined by the UPR field has elapsed while the whole data has not been written by the Peripheral DMA Controller. It is reset to '0' when PWM\_ISR2 is read.

Depending on the interrupt mask in PWM\_IMR2, an interrupt can be generated by these flags.

Sequence for Method 3:

1. Select the automatic write of duty-cycle values and automatic update by setting the field UPDM to 2 in the PWM\_SCM register.
2. Define the synchronous channels by the bits SYNCx in the PWM\_SCM register.
3. Define the update period by the field UPR in the PWM\_SCUP register.
4. Define when the WRDY flag and the corresponding DMA Controller transfer request must be set in the update period by the PTRM bit and the PTRCS field in the PWM\_SCM register (at the end of the update period or when a comparison matches).
5. Define the DMA Controller transfer settings for the duty-cycle values and enable it in the DMA Controller registers
6. Enable the synchronous channels by writing CHID0 in the PWM\_ENA register.
7. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM\_CPRDUPDx, PWM\_DTUPDx), else go to [Step 10](#).
8. Set UPDULOCK to '1' in PWM\_SCUC.
9. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDULOCK is reset, go to [Step 7](#). for new values.
10. If an update of the update period value is required, check first that write of a new update value is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM\_ISR2, else go to [Step 14](#).
11. Write the register that needs to be updated (PWM\_SCUPUPD).
12. The update of this register will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to [Step 10](#). for new values.
13. Wait for the DMA status flag indicating that the buffer transfer is complete. If the transfer has ended, define a new DMA transfer for new duty-cycle values. Go to [Step 5](#).

14. **Figure 55-21. Method 3 (UPDM = 2 and PTRM = 0)**

**Figure 55-22. Method 3 (UPDM = 2 and PTRM = 1 and PTRCS = 0)**

### 55.6.2.10 Update Time for Double-Buffering Registers

All channels integrate a double-buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum value, the polarity, the duty-cycle, the dead-times, the output override, and the synchronous channels update period.

This double-buffering system comprises the following update registers:

- [PWM Sync Channels Update Period Update Register](#)
- [PWM Output Selection Set Update Register](#)
- [PWM Output Selection Clear Update Register](#)
- [PWM Spread Spectrum Update Register](#)
- [PWM Channel Duty Cycle Update Register](#)
- [PWM Channel Period Update Register](#)
- [PWM Channel Dead Time Update Register](#)
- [PWM Channel Mode Update Register](#)

When one of these update registers is written to, the write is stored, but the values are updated only at the next PWM period border. In Left-aligned mode (CALG = 0), the update occurs when the channel counter reaches the period value CPRD. In Center-aligned mode, the update occurs when the channel counter value is decremented and reaches the 0 value.

In Center-aligned mode, it is possible to trigger the update of the polarity and the duty-cycle at the next half period border. This mode concerns the following update registers:

- [PWM Channel Duty Cycle Update Register](#)
- [PWM Channel Mode Update Register](#)

The update occurs at the first half period following the write of the update register (either when the channel counter value is incrementing and reaches the period value CPRD, or when the channel counter value is decrementing and reaches the 0 value). To activate this mode, the user must write a one to the bit UPDS in the [PWM Channel Mode Register](#).

### 55.6.3 PWM Comparison Units

The PWM provides 1 independent comparison units able to compare a programmed value with the current value of the channel 0 counter (which is the channel counter of all synchronous channels, “[Synchronous Channels](#)”). These comparisons are intended to generate pulses on the event lines (used to synchronize ADC, see [PWM Event Lines](#)), to generate software interrupts and to trigger DMA Controller transfer requests for the synchronous channels (see [Method 3: Automatic write of duty-cycle values and automatic trigger of the update](#)).

**Figure 55-23. Comparison Unit Block Diagram**

The comparison x matches when it is enabled by the bit CEN in the [PWM Comparison x Mode Register](#) (PWM\_CMPMx for the comparison x) and when the counter of the channel 0 reaches the comparison value defined by the field CV in [PWM Comparison x Value Register](#) (PWM\_CMPVx for the comparison x). If the counter of the channel 0 is center-aligned (CALG = 1 in [PWM Channel Mode Register](#)), the bit CVM in PWM\_CMPVx defines if the comparison is made when the counter is counting up or counting down (in Left-alignment mode CALG = 0, this bit is useless).

If a fault is active on the channel 0, the comparison is disabled and cannot match (see [Fault Protection](#)).

The user can define the periodicity of the comparison x by the fields CTR and CPR in PWM\_CMPMx. The comparison is performed periodically once every CPR+1 periods of the counter of the channel 0, when

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

the value of the comparison period counter CPRCNT in PWM\_CMPMx reaches the value defined by CTR. CPR is the maximum value of the comparison period counter CPRCNT. If CPR = CTR = 0, the comparison is performed at each period of the counter of the channel 0.

The comparison x configuration can be modified while the channel 0 is enabled by using the [PWM Comparison x Mode Update Register](#) (PWM\_CMPMUPDx registers for the comparison x). In the same way, the comparison x value can be modified while the channel 0 is enabled by using the [PWM Comparison x Value Update Register](#) (PWM\_CMPVUPDx registers for the comparison x).

The update of the comparison x configuration and the comparison x value is triggered periodically after the comparison x update period. It is defined by the field CUPR in PWM\_CMPMx. The comparison unit has an update period counter independent from the period counter to trigger this update. When the value of the comparison update period counter CUPRCNT (in PWM\_CMPMx) reaches the value defined by CUPR, the update is triggered. The comparison x update period CUPR itself can be updated while the channel 0 is enabled by using the PWM\_CMPMUPDx register.

The write of PWM\_CMPVUPDx must be followed by a write of PWM\_CMPMUPDx.

The comparison match and the comparison update can be source of an interrupt, but only if it is enabled and not masked. These interrupts can be enabled by the [PWM Interrupt Enable Register 2](#) and disabled by the [PWM Interrupt Disable Register 2](#). The comparison match interrupt and the comparison update interrupt are reset by reading the [PWM Interrupt Status Register 2](#).

**Figure 55-24. Comparison Waveform**

### 55.6.4 PWM Event Lines

The PWM provides 2 independent event lines intended to trigger actions in other peripherals (e.g., for the Analog-to-Digital Converter (ADC)).

A pulse (one cycle of the peripheral clock) is generated on an event line, when at least one of the selected comparisons is matching. The comparisons can be selected or unselected independently by the CSEL bits in the [PWM Event Line x Register](#) (PWM\_ELMRx for the Event Line x).

An example of event generation is provided in the figure [Event Line Generation Waveform \(Example\)](#).

**Figure 55-25. Event Line Block Diagram**

**Figure 55-26. Event Line Generation Waveform (Example)**

### 55.6.5 PWM External Trigger Mode

The PWM channels 1 and 2 can be configured to use an external trigger for generating specific PWM signals. The external trigger source can be selected through the bit TRGSRC of the [PWM External Trigger Register](#) (see the table below).

**Table 55-5. External Event Source Selection**

| Channel | Trigger Source Selection | Trigger Source                    |
|---------|--------------------------|-----------------------------------|
| 1       | PWM_ETRG1.TRGSRC = 0     | From PWMEXTRG1 input              |
|         | PWM_ETRG1.TRGSRC = 1     | From Analog Comparator Controller |
| 2       | PWM_ETRG2.TRGSRC = 0     | From PWMEXTRG2 input              |
|         | PWM_ETRG2.TRGSRC = 1     | From Analog Comparator Controller |

Each external trigger source can be filtered by writing a one to the TRGFILT bit in the corresponding [PWM External Trigger Register](#) (PWM\_ETRGx).

Each time an external trigger event is detected, the corresponding PWM channel counter value is stored in the MAXCNT field of the PWM\_ETRGx register if it is greater than the previously stored value. Reading the PWM\_ETRGx register will clear the MAXCNT value.

Three different modes are available for channels 1 and 2 depending on the value of the TRGMODE field of the PWM\_ETRGx register:

- TRGMODE = 1: External PWM Reset Mode
- TRGMODE = 2: External PWM Start Mode
- TRGMODE = 3: Cycle-By-Cycle Duty Mode

See the following sections.

This feature is disabled when TRGMODE = 0.

This feature should only be enabled if the corresponding channel is left-aligned (CALG = 0 in [PWM Channel Mode Register](#) of channel 1 or 2) and not managed as a synchronous channel (SYNCx = 0 in [PWM Sync Channels Mode Register](#) where x = 1 or 2). Programming the channel to be center-aligned or synchronous while TRGMODE is not 0 could lead to unexpected behavior.

### 55.6.5.1 External PWM Reset Mode

External PWM Reset mode is selected by programming TRGMODE = 1 in the PWM\_ETRGx register.

In this mode, when an edge is detected on the PWMEXTRGx input, the internal PWM counter is cleared and a new PWM cycle is restarted. The edge polarity can be selected by programming the TRGEDGE bit in the PWM\_ETRGx register. If no trigger event is detected when the internal channel counter has reached the CPRD value in the [PWM Channel Period Register](#), the internal counter is cleared and a new PWM cycle starts.

Note that this mode does not guarantee a constant  $t_{ON}$  or  $t_{OFF}$  time.

**Figure 55-27. External PWM Reset Mode**

### 55.6.5.1.1 Application Example

The external PWM Reset mode can be used in power factor correction applications.

In the example below, the external trigger input is the PWMEXTRG1 (therefore the PWM channel used for regulation is the channel 1). The PWM channel 1 period (CPRD in the [PWM Channel Period Register](#) of the channel 1) must be programmed so that the TRGIN1 event always triggers before the PWM channel 1 period elapses.

In the figure below, an external circuit (not shown) is required to sense the inductor current  $I_L$ . The internal PWM counter of the channel 1 is cleared when the inductor current falls below a specific threshold ( $I_{REF}$ ). This starts a new PWM period and increases the inductor current.

**Figure 55-28. External PWM Reset Mode: Power Factor Correction Application**

### 55.6.5.2 External PWM Start Mode

External PWM Start mode is selected by programming TRGMODE = 2 in the PWM\_ETRGx register.

In this mode, the internal PWM counter can only be reset once it has reached the CPRD value in the [PWM Channel Period Register](#) and when the correct level is detected on the corresponding external trigger input. Both conditions have to be met to start a new PWM period. The active detection level is defined by the bit TRGEDGE of the PWM\_ETRGx register.

Note that this mode guarantees a constant  $t_{ON}$  time and a minimum  $t_{OFF}$  time.

**Figure 55-29. External PWM Start Mode**

### 55.6.5.2.1 Application Example

The external PWM Start mode generates a modulated frequency PWM signal with a constant active level duration ( $t_{ON}$ ) and a minimum inactive level duration (minimum  $t_{OFF}$ ).

The  $t_{ON}$  time is defined by the CDTY value in the [PWM Channel Duty Cycle Register](#). The minimum  $t_{OFF}$  time is defined by CDTY - CPRD ([PWM Channel Period Register](#)). This mode can be useful in Buck DC/DC Converter applications.

When the output voltage  $V_{OUT}$  is above a specific threshold ( $V_{ref}$ ), the PWM inactive level is maintained as long as  $V_{OUT}$  remains above this threshold. If  $V_{OUT}$  is below this specific threshold, this mode guarantees a minimum  $t_{OFF}$  time required for MOSFET driving (see the figure below).

**Figure 55-30. External PWM Start Mode: Buck DC/DC Converter**

### 55.6.5.3 Cycle-By-Cycle Duty Mode

#### 55.6.5.3.1 Description

Cycle-by-cycle duty mode is selected by programming  $TRGMODE = 3$  in  $PWM\_ETRGx$ .

In this mode, the PWM frequency is constant and is defined by the CPRD value in the [PWM Channel Period Register](#).

An external trigger event has no effect on the PWM output if it occurs while the internal PWM counter value is above the CDTY value of the [PWM Channel Duty Cycle Register](#).

If the internal PWM counter value is below the value of CDTY of the [PWM Channel Duty Cycle Register](#), an external trigger event makes the PWM output inactive.

The external trigger event can be detected on rising or falling edge according to the TRGEDGE bit in  $PWM\_ETRGx$ .

**Figure 55-31. Cycle-By-Cycle Duty Mode**

### 55.6.5.3.2 Application Example

The figure below illustrates an application example of the Cycle-by-cycle Duty mode.

In an LED string control circuit, Cycle-by-cycle Duty mode can be used to automatically limit the current in the LED string.

**Figure 55-32. Cycle-By-Cycle Duty Mode: LED String Control**

#### 55.6.5.4 Leading-Edge Blanking (LEB)

PWM channels 1 and 2 support leading-edge blanking. Leading-edge blanking masks the external trigger input when a transient occurs on the corresponding PWM output. It masks potential spurious external events due to power transistor switching.

The blanking delay on each external trigger input is configured by programming the LEBDELAYx in the [PWM Leading-Edge Blanking Register](#).

The LEB can be enabled on both the rising and the falling edges for the PWMH and PWML outputs through the bits PWMLFEN, PWMLREN, PWMHFEN, PWMHREN.

Any event on the PWMEPTRGx input which occurs during the blanking time is ignored.

**Figure 55-33. Leading-Edge Blanking**

## 55.6.6 PWM Controller Operations

### 55.6.6.1 Initialization

Before enabling the channels, they must be configured by the software application as described below:

- Unlock User Interface by writing the WPCMD field in PWM\_WPCR.
- Configuration of the clock generator (DIVA, PREA, DIVB, PREB in the PWM\_CLK register if required).
- Selection of the clock for each channel (CPRE field in PWM\_CMRx)
- Configuration of the waveform alignment for each channel (CALG field in PWM\_CMRx)
- Selection of the counter event selection (if CALG = 1) for each channel (CES field in PWM\_CMRx)
- Configuration of the output waveform polarity for each channel (CPOL bit in PWM\_CMRx)
- Configuration of the period for each channel (CPRD in the PWM\_CPRDx register). Writing in PWM\_CPRDx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_CPRDUPDx register to update PWM\_CPRDx as explained below.
- Configuration of the duty-cycle for each channel (CDTY in the PWM\_CDTYx register). Writing in PWM\_CDTYx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_CDTYUPDx register to update PWM\_CDTYx as explained below.
- Configuration of the dead-time generator for each channel (DTH and DTL in PWM\_DTx) if enabled (DTE bit in PWM\_CMRx). Writing in the PWM\_DTx register is possible while the channel is disabled. After validation of the channel, the user must use PWM\_DTUPDx register to update PWM\_DTx
- Selection of the synchronous channels (SYNCx in the PWM\_SCM register)
- Selection of the moment when the WRDY flag and the corresponding DMA Controller transfer request are set (PTRM and PTRCS in the PWM\_SCM register)
- Configuration of the Update mode (UPDM in PWM\_SCM register)
- Configuration of the update period (UPR in PWM\_SCUP register) if needed
- Configuration of the comparisons (PWM\_CMPVx and PWM\_CMPMx)
- Configuration of the event lines (PWM\_ELMRx)
- Configuration of the fault inputs polarity (FPOL in PWM\_FMR)

- Configuration of the fault protection (FMOD and FFIL in PWM\_FMR, PWM\_FPV and PWM\_FPE1)
- Enable of the interrupts (writing CHIDx and FCHIDx in PWM\_IER1, and writing WRDY, UNRE, CMPMx and CMPUx in PWM\_IER2)
- Enable of the PWM channels (writing CHIDx in the PWM\_ENA register)

#### 55.6.6.2 Source Clock Selection Criteria

The large number of source clocks can make selection difficult. The relationship between the value in the [PWM Channel Period Register](#) (PWM\_CPRDx) and the [PWM Channel Duty Cycle Register](#) (PWM\_CDTYx) helps the user select the appropriate clock. The event number written in the Period Register gives the PWM accuracy. The Duty-Cycle quantum cannot be lower than 1/CPRDx value. The higher the value of PWM\_CPRDx, the greater the PWM accuracy.

For example, if the user sets 15 (in decimal) in PWM\_CPRDx, the user is able to set a value from between 1 up to 14 in PWM\_CDTYx. The resulting duty-cycle quantum cannot be lower than 1/15 of the PWM period.

#### 55.6.6.3 Changing the Duty-Cycle, the Period and the Dead-Times

It is possible to modulate the output waveform duty-cycle, period and dead-times.

To prevent unexpected output waveform, the user must use the [PWM Channel Duty Cycle Update Register](#) (PWM\_CDTYUPDx), the [PWM Channel Period Update Register](#) (PWM\_CPRDUPDx) and the [PWM Channel Dead Time Update Register](#) (PWM\_DTUPDx) to change waveform parameters while the channel is still enabled.

- If the channel is an asynchronous channel (SYNCx = 0 in [PWM Sync Channels Mode Register](#) (PWM\_SCM)), these registers hold the new period, duty-cycle and dead-times values until the end of the current PWM period and update the values for the next period.
- If the channel is a synchronous channel and update method 0 is selected (SYNCx = 1 and UPDM = 0 in PWM\_SCM register), these registers hold the new period, duty-cycle and dead-times values until the bit UPDULOCK is written at '1' (in [PWM Sync Channels Update Control Register](#) (PWM\_SCUC)) and the end of the current PWM period, then update the values for the next period.
- If the channel is a synchronous channel and update method 1 or 2 is selected (SYNCx = 1 and UPDM = 1 or 2 in PWM\_SCM register):
  - registers PWM\_CPRDUPDx and PWM\_DTUPDx hold the new period and dead-times values until the bit UPDULOCK is written at '1' (in PWM\_SCUC) and the end of the current PWM period, then update the values for the next period.
  - register PWM\_CDTYUPDx holds the new duty-cycle value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in [PWM Sync Channels Update Period Register](#) (PWM\_SCUP)) and the end of the current PWM period, then updates the value for the next period.

**Note:** If the update registers PWM\_CDTYUPDx, PWM\_CPRDUPDx and PWM\_DTUPDx are written several times between two updates, only the last written value is taken into account.

**Figure 55-34. Synchronized Period, Duty-Cycle and Dead-Time Update**

#### 55.6.6.4 Changing the Update Period of Synchronous Channels

It is possible to change the update period of synchronous channels while they are enabled. See [Method 2: Manual write of duty-cycle values and automatic trigger of the update](#) and [Method 3: Automatic write of duty-cycle values and automatic trigger of the update](#).

To prevent an unexpected update of the synchronous channels registers, the user must use the [PWM Sync Channels Update Period Update Register](#) (PWM\_SCUPUPD) to change the update period of synchronous channels while they are still enabled. This register holds the new value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in PWM\_SCUP) and the end of the current PWM period, then updates the value for the next period.

#### Note:

1. If the update register PWM\_SCUPUPD is written several times between two updates, only the last written value is taken into account.
2. Changing the update period does make sense only if there is one or more synchronous channels and if the update method 1 or 2 is selected (UPDM = 1 or 2 in [PWM Sync Channels Mode Register](#)).

**Figure 55-35. Synchronized Update of Update Period Value of Synchronous Channels**

#### 55.6.6.5 Changing the Comparison Value and the Comparison Configuration

It is possible to change the comparison values and the comparison configurations while the channel 0 is enabled (see [PWM Comparison Units](#)).

To prevent unexpected comparison match, the user must use the [PWM Comparison x Value Update Register](#) (PWM\_CMPVUPDx) and the [PWM Comparison x Mode Update Register](#) (PWM\_CMPMUPDx) to change, respectively, the comparison values and the comparison configurations while the channel 0 is still enabled. These registers hold the new values until the end of the comparison update period (when CUPRCNT is equal to CUPR in [PWM Comparison x Mode Register](#) (PWM\_CMPMx) and the end of the current PWM period, then update the values for the next period.

The write of the register PWM\_CMPVUPDx must be followed by a write of the register PWM\_CMPMUPDx.

**Note:** If the update registers PWM\_CMPVUPDx and PWM\_CMPMUPDx are written several times between two updates, only the last written value are taken into account.

**Figure 55-36. Synchronized Update of Comparison Values and Configurations**

### 55.6.6.6 Interrupt Sources

Depending on the interrupt mask in PWM\_IMR1 and PWM\_IMR2, an interrupt can be generated at the end of the corresponding channel period (CHIDx in the PWM Interrupt Status Register 1 (PWM\_ISR1)), after a fault event (FCHIDx in PWM\_ISR1), after a comparison match (CMPMx in PWM\_ISR2), after a comparison update (CMPUx in PWM\_ISR2) or according to the Transfer mode of the synchronous channels (WRDY and UNRE in PWM\_ISR2).

If the interrupt is generated by the flags CHIDx or FCHIDx, the interrupt remains active until a read operation in PWM\_ISR1 occurs.

If the interrupt is generated by the flags WRDY or UNRE or CMPMx or CMPUx, the interrupt remains active until a read operation in PWM\_ISR2 occurs.

**A channel interrupt is enabled by setting the corresponding bit in PWM\_IER1 and PWM\_IER2. A channel interrupt is disabled by setting the corresponding bit in PWM\_IDR1 and PWM\_IDR2.**

### 55.6.7 Register Write Protection

To prevent any single software error that may corrupt PWM behavior, the registers listed below can be write-protected by writing the field WPCMD in the [PWM Write Protection Control Register](#) (PWM\_WPCR). They are divided into six groups:

- Register group 0:
  - [PWM Clock Register](#)
- Register group 1:
  - [PWM Disable Register](#)
- Register group 2:
  - [PWM Sync Channels Mode Register](#)
  - [PWM Channel Mode Register](#)
  - [PWM Stepper Motor Mode Register](#)
  - [PWM Fault Protection Value Register 2](#)

- [PWM Leading-Edge Blanking Register](#)
  - [PWM Channel Mode Update Register](#)
- Register group 3:
  - [PWM Spread Spectrum Register](#)
  - [PWM Spread Spectrum Update Register](#)
  - [PWM Channel Period Register](#)
  - [PWM Channel Period Update Register](#)
- Register group 4:
  - [PWM Channel Dead Time Register](#)
  - [PWM Channel Dead Time Update Register](#)
- Register group 5:
  - [PWM Fault Mode Register](#)
  - [PWM Fault Protection Value Register 1](#)

There are two types of write protection:

- SW write protection—can be enabled or disabled by software
- HW write protection—can be enabled by software but only disabled by a hardware reset of the PWM controller

Both types of write protection can be applied independently to a particular register group by means of the WPCMD and WPRGx fields in PWM\_WPCR. If at least one type of write protection is active, the register group is write-protected. The value of field WPCMD defines the action to be performed:

- 0: Disables SW write protection of the register groups of which the bit WPRGx is at '1'
- 1: Enables SW write protection of the register groups of which the bit WPRGx is at '1'
- 2: Enables HW write protection of the register groups of which the bit WPRGx is at '1'

At any time, the user can determine whether SW or HW write protection is active in a particular register group by the fields WPSWS and WPHWS in the [PWM Write Protection Status Register](#) (PWM\_WPSR).

If a write access to a write-protected register is detected, the WPVS flag in PWM\_WPSR is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS and WPVSR fields are automatically cleared after reading PWM\_WPSR.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7 Register Summary

| Offset | Name     | Bit Pos. |                |  |  |      |           |        |           |        |
|--------|----------|----------|----------------|--|--|------|-----------|--------|-----------|--------|
| 0x00   | PWM_CLK  | 7:0      | DIVA[7:0]      |  |  |      |           |        |           |        |

## Pulse Width Modulation Controller (PWM)

### 55.7.1 PWM Clock Register

**Name:** PWM\_CLK  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS0 and WPHWS0 are cleared in the [PWM Write Protection Status Register](#).

|        |           |     |     |     |           |     |     |     |
|--------|-----------|-----|-----|-----|-----------|-----|-----|-----|
| Bit    | 31        | 30  | 29  | 28  | 27        | 26  | 25  | 24  |

#### Bits 27:24 – PREB[3:0] CLKB Source Clock Selection

| Value | Name        | Description           |
|-------|-------------|-----------------------|
| 0     | CLK         | Peripheral clock      |
| 1     | CLK_DIV2    | Peripheral clock/2    |
| 2     | CLK_DIV4    | Peripheral clock/4    |
| 3     | CLK_DIV8    | Peripheral clock/8    |
| 4     | CLK_DIV16   | Peripheral clock/16   |
| 5     | CLK_DIV32   | Peripheral clock/32   |
| 6     | CLK_DIV64   | Peripheral clock/64   |
| 7     | CLK_DIV128  | Peripheral clock/128  |
| 8     | CLK_DIV256  | Peripheral clock/256  |
| 9     | CLK_DIV512  | Peripheral clock/512  |
| 10    | CLK_DIV1024 | Peripheral clock/1024 |
| Other | —           | Reserved              |

#### Bits 23:16 – DIVB[7:0] CLKB Divide Factor

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Name      | Description                                                 |
|-------|-----------|-------------------------------------------------------------|
| 0     | CLKB_POFF | CLKB clock is turned off                                    |
| 1     | PREB      | CLKB clock is clock selected by PREB                        |
| 2–255 | PREB_DIV  | CLKB clock is clock selected by PREB divided by DIVB factor |

### Bits 11:8 – PREA[3:0] CLKA Source Clock Selection

| Value | Name        | Description           |
|-------|-------------|-----------------------|
| 0     | CLK         | Peripheral clock      |
| 1     | CLK_DIV2    | Peripheral clock/2    |
| 2     | CLK_DIV4    | Peripheral clock/4    |
| 3     | CLK_DIV8    | Peripheral clock/8    |
| 4     | CLK_DIV16   | Peripheral clock/16   |
| 5     | CLK_DIV32   | Peripheral clock/32   |
| 6     | CLK_DIV64   | Peripheral clock/64   |
| 7     | CLK_DIV128  | Peripheral clock/128  |
| 8     | CLK_DIV256  | Peripheral clock/256  |
| 9     | CLK_DIV512  | Peripheral clock/512  |
| 10    | CLK_DIV1024 | Peripheral clock/1024 |
| Other | –           | Reserved              |

### Bits 7:0 – DIVA[7:0] CLKA Divide Factor

| Value | Name      | Description                                                 |
|-------|-----------|-------------------------------------------------------------|
| 0     | CLKA_POFF | CLKA clock is turned off                                    |
| 1     | PREA      | CLKA clock is clock selected by PREA                        |
| 2–255 | PREA_DIV  | CLKA clock is clock selected by PREA divided by DIVA factor |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.2 PWM Enable Register

**Name:** PWM\_ENA  
**Offset:** 0x04  
**Reset:** –  
**Property:** Write-only

|        |    |    |    |    |       |       |       |       |
|--------|----|----|----|----|-------|-------|-------|-------|
| Bit    | 31 | 30 | 29 | 28 | 27    | 26    | 25    | 24    |
|        |    |    |    |    |       |       |       |       |
| Access |    |    |    |    |       |       |       |       |
| Reset  |    |    |    |    |       |       |       |       |
| Bit    | 23 | 22 | 21 | 20 | 19    | 18    | 17    | 16    |
|        |    |    |    |    |       |       |       |       |
| Access |    |    |    |    |       |       |       |       |
| Reset  |    |    |    |    |       |       |       |       |
| Bit    | 15 | 14 | 13 | 12 | 11    | 10    | 9     | 8     |
|        |    |    |    |    |       |       |       |       |
| Access |    |    |    |    |       |       |       |       |
| Reset  |    |    |    |    |       |       |       |       |
| Bit    | 7  | 6  | 5  | 4  | 3     | 2     | 1     | 0     |
|        |    |    |    |    | CHID3 | CHID2 | CHID1 | CHID0 |
| Access |    |    |    |    | W     | W     | W     | W     |
| Reset  |    |    |    |    | 0     | 0     | 0     | –     |

#### Bits 0, 1, 2, 3 – CHIDx Channel ID

| Value | Description                      |
|-------|----------------------------------|
| 0     | No effect.                       |
| 1     | Enable PWM output for channel x. |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.3 PWM Disable Register

**Name:** PWM\_DIS  
**Offset:** 0x08  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS1 and WPHWS1 are cleared in the [PWM Write Protection Status Register](#).

|        |    |    |    |    |       |       |       |       |
|--------|----|----|----|----|-------|-------|-------|-------|
| Bit    | 31 | 30 | 29 | 28 | 27    | 26    | 25    | 24    |
|        |    |    |    |    |       |       |       |       |
| Access |    |    |    |    |       |       |       |       |
| Reset  |    |    |    |    |       |       |       |       |
| Bit    | 23 | 22 | 21 | 20 | 19    | 18    | 17    | 16    |
|        |    |    |    |    |       |       |       |       |
| Access |    |    |    |    |       |       |       |       |
| Reset  |    |    |    |    |       |       |       |       |
| Bit    | 15 | 14 | 13 | 12 | 11    | 10    | 9     | 8     |

| Bit    | 15 | 14 | 13 | 12 | 11     | 10     | 9      | 8      |
|        |    |    |    |    |        |        |        |        |
| Access |    |    |    |    |        |        |        |        |
| Reset  |    |    |    |    |        |        |        |        |
| Bit    | 7  | 6  | 5  | 4  | 3      | 2      | 1      | 0      |
|        |    |    |    |    | CHID3  | CHID2  | CHID1  | CHID0  |
| Access |    |    |    |    | R      | R      | R      | R      |
| Reset  |    |    |    |    | 0      | 0      | 0      | 0      |

**Bits 16, 17, 18, 19 – FCHIDx** Fault Protection Trigger on Channel x

| Value | Description                                                                   |
|-------|-------------------------------------------------------------------------------|
| 0     | No new trigger of the fault protection since the last read of PWM_ISR1.       |
| 1     | At least one trigger of the fault protection since the last read of PWM_ISR1. |

**Bits 0, 1, 2, 3 – CHIDx** Counter Event on Channel x

| Value | Description                                                              |
|-------|--------------------------------------------------------------------------|
| 0     | No new counter event has occurred since the last read of PWM_ISR1.       |
| 1     | At least one counter event has occurred since the last read of PWM_ISR1. |

### 55.7.9 PWM Sync Channels Mode Register

**Name:** PWM\_SCM  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the [PWM Write Protection Status Register](#).

|        |    |    |    |    |    |    |    |    |

| Reset  |   |   |   |   | 0     | 0     | 0     | 0     |

**Bits 23:21 – PTRCS[2:0]** DMA Controller Transfer Request Comparison Selection  
 Selection of the comparison used to set the flag WRDY and the corresponding DMA Controller transfer request.

**Bit 20 – PTRM** DMA Controller Transfer Request Mode

| UPDM | PTRM | WRDY Flag and DMA Controller Transfer Request                                                                                                                                    |
|------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | x    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are never set to '1'.                                                              |
| 1    | x    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> is set to '1' as soon as the update period is elapsed, the DMA Controller transfer request is never set to '1'. |
| 2    | 0    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the update period is elapsed.                            |
|      | 1    | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the selected comparison matches.                         |

**Bits 17:16 – UPDM[1:0]** Synchronous Channels Update Mode

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Name  | Description                                                                                                                                           |
|-------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | MODE0 | Manual write of double buffer registers and manual update of synchronous channels 1 <sup>(1)</sup> .                                                  |
| 1     | MODE1 | Manual write of double buffer registers and automatic update of synchronous channels 2 <sup>(2)</sup> .                                               |
| 2     | MODE2 | The WRDY flag in <a href="#">PWM Interrupt Status Register 2</a> and the DMA transfer request are set to '1' as soon as the update period is elapsed. |

**Note:**

1. The update occurs at the beginning of the next PWM period, when the UPDULOCK bit in [PWM Sync Channels Update Control Register](#) is set.
2. The update occurs when the Update Period is elapsed.

**Bits 0, 1, 2, 3 – SYNCx** Synchronous Channel x

| Value | Description                             |
|-------|-----------------------------------------|
| 0     | Channel x is not a synchronous channel. |
| 1     | Channel x is a synchronous channel.     |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.10 PWM DMA Register

**Name:** PWM\_DMAR  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

Only the first 16 bits (channel counter size) are significant.

|        |                |    |    |    |    |    |    |    |

| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | –  |

#### Bits 23:0 – DMADUTY[23:0] Duty-Cycle Holding Register for DMA Access

Each write access to PWM\_DMAR sequentially updates PWM\_CDTYUPDx.CDTYUPD with DMADUTY (only for channel configured as synchronous). See [“Method 3: Automatic write of duty-cycle values and automatic trigger of the update”](#).

### 55.7.11 PWM Sync Channels Update Control Register

**Name:** PWM\_SCUC  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |    |    |    |    |    |    |    |    |
|--------|----|----|----|----|----|----|----|----|

|--------|----|----|----|----|----|----|---|---|
| Bit    | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
|        |    |    |    |    |    |    |   |   |
| Access |    |    |    |    |    |    |   |   |
| Reset  |    |    |    |    |    |    |   |   |

|        |   |   |   |   |   |   |   |          |
|--------|---|---|---|---|---|---|---|----------|
| Bit    | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0        |
|        |   |   |   |   |   |   |   | UPDULOCK |
| Access |   |   |   |   |   |   |   | R/W      |
| Reset  |   |   |   |   |   |   |   | 0        |

#### Bit 0 – UPDULOCK Synchronous Channels Update Unlock

This bit is automatically reset when the update is done.

| Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No effect                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 1     | If the UPDM field is set to '0' in <a href="#">PWM Sync Channels Mode Register</a> , writing the UPDULOCK bit to '1' triggers the update of the period value, the duty-cycle and the dead-time values of synchronous channels at the beginning of the next PWM period. If the field UPDM is set to '1' or '2', writing the UPDULOCK bit to '1' triggers only the update of the period value and of the dead-time values of synchronous channels. |

### 55.7.12 PWM Sync Channels Update Period Register

**Name:** PWM\_SCUP  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read/Write

|        |             |     |     |     |          |     |     |     |
|--------|-------------|-----|-----|-----|----------|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27       | 26  | 25  | 24  |
|        |             |     |     |     |          |     |     |     |
| Access |             |     |     |     |          |     |     |     |
| Reset  |             |     |     |     |          |     |     |     |
| Bit    | 23          | 22  | 21  | 20  | 19       | 18  | 17  | 16  |
|        |             |     |     |     |          |     |     |     |
| Access |             |     |     |     |          |     |     |     |
| Reset  |             |     |     |     |          |     |     |     |
| Bit    | 15          | 14  | 13  | 12  | 11       | 10  | 9   | 8   |
|        |             |     |     |     |          |     |     |     |
| Access |             |     |     |     |          |     |     |     |
| Reset  |             |     |     |     |          |     |     |     |
| Bit    | 7           | 6   | 5   | 4   | 3        | 2   | 1   | 0   |
|        | UPRCNT[3:0] |     |     |     | UPR[3:0] |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W      | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0        | 0   | 0   | 0   |

**Bits 7:4 – UPRCNT[3:0]** Update Period Counter  
 Reports the value of the update period counter.

**Bits 3:0 – UPR[3:0]** Update Period  
 Defines the time between each update of the synchronous channels if automatic trigger of the update is activated (UPDM = 1 or UPDM = 2 in [PWM Sync Channels Mode Register](#)). This time is equal to UPR+1 periods of the synchronous channels.

### 55.7.13 PWM Sync Channels Update Period Update Register

**Name:** PWM\_SCUPUPD  
**Offset:** 0x30  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the UPR value. This prevents an unexpected automatic trigger of the update of synchronous channels.

|        |    |    |    |    |             |    |    |    |
|--------|----|----|----|----|-------------|----|----|----|

**Bit 3 – UNRE** Synchronous Channels Update Underrun Error Interrupt Mask

**Bit 0 – WRDY** Write Ready for Synchronous Channels Update Interrupt Mask

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.17 PWM Interrupt Status Register 2

**Name:** PWM\_ISR2  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read-only

Reading PWM\_ISR2 automatically clears flags WRDY, UNRE and CMPSx.

| Reset  |       |       |       |       | 0     |       |       | 0     |

**Bits 16, 17, 18, 19, 20, 21, 22, 23 – CMPUx** Comparison x Update

| Value | Description                                                                                       |
|-------|---------------------------------------------------------------------------------------------------|
| 0     | The comparison x has not been updated since the last read of the PWM_ISR2 register.               |
| 1     | The comparison x has been updated at least one time since the last read of the PWM_ISR2 register. |

**Bits 8, 9, 10, 11, 12, 13, 14, 15 – CMPMx** Comparison x Match

| Value | Description                                                                                  |
|-------|----------------------------------------------------------------------------------------------|
| 0     | The comparison x has not matched since the last read of the PWM_ISR2 register.               |
| 1     | The comparison x has matched at least one time since the last read of the PWM_ISR2 register. |

**Bit 3 – UNRE** Synchronous Channels Update Underrun Error

| Value | Description                                                                                                  |
|-------|--------------------------------------------------------------------------------------------------------------|
| 0     | No Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register.           |
| 1     | At least one Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register. |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

**Bit 0 – WRDY** Write Ready for Synchronous Channels Update

| Value | Description                                                                         |
|-------|-------------------------------------------------------------------------------------|
| 0     | New duty-cycle and dead-time values for the synchronous channels cannot be written. |
| 1     | New duty-cycle and dead-time values for the synchronous channels can be written.    |

### 55.7.24 PWM Fault Mode Register

**Name:** PWM\_FMR  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

See [Fault Inputs](#) for details on fault generation.

To prevent an unexpected activation of the status flag FSY in the [PWM Fault Status Register](#), the bit FMODY can be set to '1' only if the FPOLy bit has been previously configured to its final value.

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|

| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 23:16 – FFIL[7:0] Fault Filtering

For each bit y of FFIL, where y is the fault input number:

0: The fault input y is not filtered.

1: The fault input y is filtered.

#### Bits 15:8 – FMOD[7:0] Fault Activation Mode

For each bit y of FMOD, where y is the fault input number:

0: The fault y is active until the fault condition is removed at the peripheral<sup>(1)</sup> level.

1: The fault y stays active until the fault condition is removed at the peripheral level<sup>(1)</sup> AND until it is cleared in the [PWM Fault Clear Register](#).

**Note:**

1. The peripheral generating the fault.

**Bits 7:0 – FPOL[7:0] Fault Polarity**

For each bit y of FPOL, where y is the fault input number:

0: The fault y becomes active when the fault input y is at 0.

1: The fault y becomes active when the fault input y is at 1.

### 55.7.25 PWM Fault Status Register

**Name:** PWM\_FSR  
**Offset:** 0x60  
**Reset:** 0x00000000  
**Property:** Read-only

Refer to [Fault Inputs](#) for details on fault generation.

|        |          |    |    |    |    |    |    |    |
|--------|----------|----|----|----|----|----|----|----|

| Access | R        | R  | R  | R  | R  | R  | R  | R  |
| Reset  | 0        | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

#### Bits 15:8 – FS[7:0] Fault Status

For each bit y of FS, where y is the fault input number:

0: The fault y is not currently active.

1: The fault y is currently active.

#### Bits 7:0 – FIV[7:0] Fault Input Value

For each bit y of FIV, where y is the fault input number:

0: The current sampled value of the fault input y is 0 (after filtering if enabled).

1: The current sampled value of the fault input y is 1 (after filtering if enabled).

### 55.7.26 PWM Fault Clear Register

**Name:** PWM\_FCR  
**Offset:** 0x64  
**Reset:** –  
**Property:** Write-only

See [Fault Inputs](#) for details on fault generation.

|        |           |    |    |    |    |    |    |    |

|        |           |    |    |    |    |    |    |    |
| Access |           |    |    |    |    |    |    |    |
| Reset  |           |    |    |    |    |    |    |    |
| Bit    | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | FCLR[7:0] |    |    |    |    |    |    |    |
| Access | W         | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0         | 0  | 0  | 0  | 0  | 0  | 0  | –  |

#### Bits 7:0 – FCLR[7:0] Fault Clear

For each bit y of FCLR, where y is the fault input number:

0: No effect.

1: If bit y of FMODE field is set to '1' and if the fault input y is not at the level defined by the bit y of FPOL field, the fault y is cleared and becomes inactive (FMODE and FPOL fields belong to [PWM Fault Mode Register](#)), else writing this bit to '1' has no effect.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.27 PWM Fault Protection Value Register 1

**Name:** PWM\_FPV1  
**Offset:** 0x68  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

See [Fault Inputs](#) for details on fault generation.

|        |    |    |    |    |       |       |       |       |

**Bits 16, 17, 18, 19 – FPVLx** Fault Protection Value for PWML output on channel x

This bit is taken into account only if the bit FPZLx is set to '0' in [PWM Fault Protection Value Register 2](#).

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | PWML output of channel x is forced to '0' when fault occurs. |
| 1     | PWML output of channel x is forced to '1' when fault occurs. |

**Bits 0, 1, 2, 3 – FPVHx** Fault Protection Value for PWMH output on channel x

This bit is taken into account only if the bit FPZHx is set to '0' in [PWM Fault Protection Value Register 2](#).

| Value | Description                                                  |
|-------|--------------------------------------------------------------|
| 0     | PWMH output of channel x is forced to '0' when fault occurs. |
| 1     | PWMH output of channel x is forced to '1' when fault occurs. |

### 55.7.28 PWM Fault Protection Enable Register

**Name:** PWM\_FPE  
**Offset:** 0x6C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the [PWM Write Protection Status Register](#).

Only the first 6 bits (number of fault input pins) of the register fields are significant.

Refer to [Section 6.4 “Fault Inputs”](#) for details on fault generation.

|        |           |     |     |     |     |     |     |     |

| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

**Bits 0:7, 8:15, 16:23, 24:31 – FPE<sub>x</sub>** Fault Protection Enable for channel x

For each bit y of FPE<sub>x</sub>, where y is the fault input number:

0: Fault y is not used for the fault protection of channel x.

1: Fault y is used for the fault protection of channel x.

To prevent an unexpected activation of the fault protection, the bit y of FPE<sub>x</sub> field can be set to ‘1’ only if the corresponding FPOL field has been previously configured to its final value in [PWM Fault Mode Register](#).

## Pulse Width Modulation Controller (PWM)

### 55.7.30 PWM Spread Spectrum Register

**Name:** PWM\_SSPR  
**Offset:** 0xA0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

Only the first 16 bits (channel counter size) are significant.

|        |    |    |    |    |    |    |    |       |

|        |           |     |     |     |     |     |     |     |
|--------|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 7         | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | SPRD[7:0] |     |     |     |     |     |     |     |
| Access | R/W       | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0         | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bit 24 – SPRDM Spread Spectrum Counter Mode

| Value | Description                                                                                                                                                                                                |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | Triangular mode. The spread spectrum counter starts to count from -SPRD when the channel 0 is enabled and counts upwards at each PWM period. When it reaches +SPRD, it restarts to count from -SPRD again. |
| 1     | Random mode. The spread spectrum counter is loaded with a new random value at each PWM period. This random value is uniformly distributed and is between -SPRD and +SPRD.                                  |

#### Bits 23:0 – SPRD[23:0] Spread Spectrum Limit Value

The spread spectrum limit value defines the range for the spread spectrum counter. It is introduced in order to achieve constant varying PWM period for the output waveform.

### 55.7.31 PWM Spread Spectrum Update Register

**Name:** PWM\_SSPUP  
**Offset:** 0xA4  
**Reset:** –  
**Property:** Write-only

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

This register acts as a double buffer for the SPRD value. This prevents an unexpected waveform when modifying the spread spectrum limit value.

Only the first 16 bits (channel counter size) are significant.

|        |    |    |    |    |    |    |    |    |

**Bits 16, 17, 18, 19 – FPZLx** Fault Protection to Hi-Z for PWML output on channel x

| Value | Description                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | When fault occurs, PWML output of channel x is forced to value defined by the bit FPVLx in <a href="#">PWM Fault Protection Value Register 1</a> . |
| 1     | When fault occurs, PWML output of channel x is forced to high-impedance state.                                                                     |

**Bits 0, 1, 2, 3 – FPZHx** Fault Protection to Hi-Z for PWMH output on channel x

| Value | Description                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | When fault occurs, PWMH output of channel x is forced to value defined by the bit FPVHx in <a href="#">PWM Fault Protection Value Register 1</a> . |
| 1     | When fault occurs, PWMH output of channel x is forced to high-impedance state.                                                                     |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.34 PWM Write Protection Control Register

**Name:** PWM\_WPCR  
**Offset:** 0xE4  
**Reset:** –  
**Property:** Write-only

See [Register Write Protection](#) for the list of registers that can be write-protected.

|        |              |       |       |       |       |       |            |    |

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

| Value    | Name   | Description                                                                                               |
|----------|--------|-----------------------------------------------------------------------------------------------------------|
| 0x50574D | PASSWD | Writing any other value in this field aborts the write operation of the WPCMD field.<br>Always reads as 0 |

#### Bits 2, 3, 4, 5, 6, 7 – WPRGx Write Protection Register Group x

| Value | Description                                              |
|-------|----------------------------------------------------------|
| 0     | The WPCMD command has no effect on the register group x. |
| 1     | The WPCMD command is applied to the register group x.    |

#### Bits 1:0 – WPCMD[1:0] Write Protection Command

This command is performed only if the WPKEY corresponds to 0x50574D (“PWM” in ASCII).

| Value | Name            | Description                                                                                     |
|-------|-----------------|-------------------------------------------------------------------------------------------------|
| 0     | DISABLE_SW_PROT | Disables the software write protection of the register groups of which the bit WPRGx is at ‘1’. |
| 1     | ENABLE_SW_PROT  | Enables the software write protection of the register groups of which the bit WPRGx is at ‘1’.  |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Name           | Description                                                                                                                                                                                                                                                                                                           |
|-------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2     | ENABLE_HW_PROT | Enables the hardware write protection of the register groups of which the bit WPRGx is at '1'. Only a hardware reset of the PWM controller can disable the hardware write protection. Moreover, to meet security requirements, the PIO lines associated with the PWM can not be configured through the PIO interface. |

| Access |             |    | R      | R      | R      | R      | R      | R      |
| Reset  |             |    | 0      | 0      | 0      | 0      | 0      | 0      |
| Bit    | 7           | 6  | 5      | 4      | 3      | 2      | 1      | 0      |
|        | WPVS        |    | WPSWS5 | WPSWS4 | WPSWS3 | WPSWS2 | WPSWS1 | WPSWS0 |
| Access | R           |    | R      | R      | R      | R      | R      | R      |
| Reset  | 0           |    | 0      | 0      | 0      | 0      | 0      | 0      |

#### Bits 31:16 – WPVSR[15:0] Write Protect Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bits 8, 9, 10, 11, 12, 13 – WPHWSx Write Protect HW Status

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | The HW write protection x of the register group x is disabled. |
| 1     | The HW write protection x of the register group x is enabled.  |

#### Bit 7 – WPVS Write Protect Violation Status

| Value | Description                                                                                                                                                                                                              |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | No write protection violation has occurred since the last read of PWM_WPSR.                                                                                                                                              |
| 1     | At least one write protection violation has occurred since the last read of PWM_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR. |

#### Bits 0, 1, 2, 3, 4, 5 – WPSWSx Write Protect SW Status

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | The SW write protection x of the register group x is disabled. |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Description                                                   |
|-------|---------------------------------------------------------------|
| 1     | The SW write protection x of the register group x is enabled. |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.36 PWM Comparison x Value Register

**Name:** PWM\_CMPVx  
**Offset:** 0x0130 + x\*0x10 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

Only the first 16 bits (channel counter size) of field CV are significant.

|        |    |    |    |    |    |    |    |     |

#### Bit 24 – CVM Comparison x Value Mode

| Value | Description                                                                                                                                                                                                                                                                     |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is incrementing.                                                                                                                                                |
| 1     | The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is decrementing.<br><br>Note: This bit is not relevant if the counter of the channel 0 is left-aligned (CALG = 0 in <a href="#">PWM Channel Mode Register</a> ) |

#### Bits 23:0 – CV[23:0] Comparison x Value

Define the comparison x value to be compared with the counter of the channel 0.

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.37 PWM Comparison x Value Update Register

**Name:** PWM\_CMPVUPDx  
**Offset:** 0x0134 + x\*0x10 [x=0..7]  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the CV and CVM values. This prevents an unexpected comparison x match.

Only the first 16 bits (channel counter size) of field CVUPD are significant.

The write of the register PWM\_CMPVUPDx must be followed by a write of the register PWM\_CMPMUPDx.

**Bits 23:20 – CUPRCNT[3:0]** Comparison x Update Period Counter

Reports the value of the comparison x update period counter.

Note: The field CUPRCNT is read-only

**Bits 19:16 – CUPR[3:0]** Comparison x Update Period

Defines the time between each update of the comparison x mode and the comparison x value. This time is equal to CUPR+1 periods of the channel 0 counter.

**Bits 15:12 – CPRCNT[3:0]** Comparison x Period Counter

Reports the value of the comparison x period counter.

Note: The field CPRCNT is read-only

**Bits 11:8 – CPR[3:0]** Comparison x Period

CPR defines the maximum value of the comparison x period counter (CPRCNT). The comparison x value is performed periodically once every CPR+1 periods of the channel 0 counter.

**Bits 7:4 – CTR[3:0]** Comparison x Trigger

The comparison x is performed when the value of the comparison x period counter (CPRCNT) reaches the value defined by CTR.

**Bit 0 – CEN** Comparison x Enable

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Description                                     |
|-------|-------------------------------------------------|
| 0     | The comparison x is disabled and can not match. |
| 1     | The comparison x is enabled and can match.      |

### 55.7.39 PWM Comparison x Mode Update Register

**Name:** PWM\_CMPMUPD<sub>x</sub>  
**Offset:** 0x013C + x\*0x10 [x=0..7]  
**Reset:** –  
**Property:** W

This register acts as a double buffer for the CEN, CTR, CPR and CUPR values. This prevents an unexpected comparison x match.

|        |             |    |    |    |              |    |    |        |

## Pulse Width Modulation Controller (PWM)

### 55.7.40 PWM Channel Mode Register

**Name:** PWM\_CMRx  
**Offset:** 0x0200 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the [PWM Write Protection Status Register](#).

|        |    |    |      |       |      |           |      |      |
|--------|----|----|------|-------|------|-----------|------|------|
| Bit    | 31 | 30 | 29   | 28    | 27   | 26        | 25   | 24   |
|        |    |    |      |       |      |           |      |      |
| Access |    |    |      |       |      |           |      |      |
| Reset  |    |    |      |       |      |           |      |      |
| Bit    | 23 | 22 | 21   | 20    | 19   | 18        | 17   | 16   |
|        |    |    |      |       | PPM  | DTLI      | DTHI | DTE  |
| Access |    |    |      |       | R/W  |           |      |      |
| Reset  |    |    |      |       | 0    | 0         | 0    | 0    |
| Bit    | 15 | 14 | 13   | 12    | 11   | 10        | 9    | 8    |
|        |    |    | TCTS | DPOLI | UPDS | CES       | CPOL | CALG |
| Access |    |    |      |       | R/W  | R/W       | R/W  | R/W  |
| Reset  |    |    | 0    | 0     | 0    | 0         | 0    | 0    |
| Bit    | 7  | 6  | 5    | 4     | 3    | 2         | 1    | 0    |
|        |    |    |      |       |      | CPRE[3:0] |      |      |
| Access |    |    |      |       | R/W  | R/W       | R/W  | R/W  |
| Reset  |    |    |      |       | 0    | 0         | 0    | 0    |

#### Bit 19 – PPM Push-Pull Mode

The Push-Pull mode is enabled for channel x.

| Value | Description                                   |
|-------|-----------------------------------------------|
| 0     | The Push-Pull mode is disabled for channel x. |
| 1     | The Push-Pull mode is enabled for channel x.  |

#### Bit 18 – DTLI Dead-Time PWMLx Output Inverted

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | The dead-time PWMLx output is not inverted. |
| 1     | The dead-time PWMLx output is inverted.     |

#### Bit 17 – DTHI Dead-Time PWMHx Output Inverted

| Value | Description                                 |
|-------|---------------------------------------------|
| 0     | The dead-time PWMHx output is not inverted. |
| 1     | The dead-time PWMHx output is inverted.     |

#### Bit 16 – DTE Dead-Time Generator Enable

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Description                          |
|-------|--------------------------------------|
| 0     | The dead-time generator is disabled. |
| 1     | The dead-time generator is enabled.  |

### Bit 13 – TCTS Timer Counter Trigger Selection

| Value | Description                                                                                     |
|-------|-------------------------------------------------------------------------------------------------|
| 0     | The comparator of the channel x (OCx) is used as the trigger source for the Timer Counter (TC). |
| 1     | The counter events of the channel x is used as the trigger source for the Timer Counter (TC).   |

### Bit 12 – DPOLI Disabled Polarity Inverted

| Value | Description                                                                                                                              |
|-------|------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | When the PWM channel x is disabled (CHIDx(PWM_SR) = 0), the OCx output waveform is the same as the one defined by the CPOL bit.          |
| 1     | When the PWM channel x is disabled (CHIDx(PWM_SR) = 0), the OCx output waveform is inverted compared to the one defined by the CPOL bit. |

### Bit 11 – UPDS Update Selection

If the PWM period is center-aligned (CALG=1):

0: The update occurs at the next end of the PWM period after writing the update register(s).

1: The update occurs at the next end of the PWM half period after writing the update register(s).

If the PWM period is left-aligned (CALG=0), the update always occurs at the end of the PWM period after writing the update register(s).

### Bit 10 – CES Counter Event Selection

If the PWM period is center-aligned (CALG=1):

0: The channel counter event occurs at the end of the PWM period.

1: The channel counter event occurs at the end of the PWM period and at half the PWM period.

If the PWM period is left-aligned (CALG=0), the channel counter event occurs at the end of the period and the CES bit has no effect.

### Bit 9 – CPOL Channel Polarity

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | The OCx output waveform (output from the comparator) starts at a low level.  |
| 1     | The OCx output waveform (output from the comparator) starts at a high level. |

### Bit 8 – CALG Channel Alignment

| Value | Description                   |
|-------|-------------------------------|
| 0     | The period is left-aligned.   |
| 1     | The period is center-aligned. |

### Bits 3:0 – CPRE[3:0] Channel Prescaler

| Value | Name | Description      |
|-------|------|------------------|
|       | MCK  | Peripheral clock |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

| Value | Name         | Description           |
|-------|--------------|-----------------------|
| 1     | MCK_DIV_2    | Peripheral clock/2    |
| 2     | MCK_DIV_4    | Peripheral clock/4    |
| 3     | MCK_DIV_8    | Peripheral clock/8    |
| 4     | MCK_DIV_16   | Peripheral clock/16   |
| 5     | MCK_DIV_32   | Peripheral clock/32   |
| 6     | MCK_DIV_64   | Peripheral clock/64   |
| 7     | MCK_DIV_128  | Peripheral clock/128  |
| 8     | MCK_DIV_256  | Peripheral clock/256  |
| 9     | MCK_DIV_512  | Peripheral clock/512  |
| 10    | MCK_DIV_1024 | Peripheral clock/1024 |
| 11    | CLKA         | Clock A               |
| 12    | CLKB         | Clock B               |

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.41 PWM Channel Duty Cycle Register

**Name:** PWM\_CDTYx  
**Offset:** 0x0204 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Only the first 16 bits (channel counter size) are significant.

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |             |     |     |     |     |     |     |     |
| Access |             |     |     |     |     |     |     |     |
| Reset  |             |     |     |     |     |     |     |     |
| Bit    | 23          | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
|        | CDTY[23:16] |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 15          | 14  | 13  | 12  | 11  | 10  | 9   | 8   |
|        | CDTY[15:8]  |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| Bit    | 7           | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|        | CDTY[7:0]   |     |     |     |     |     |     |     |
| Access | R/W         | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Reset  | 0           | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

#### Bits 23:0 – CDTY[23:0] Channel Duty-Cycle

Defines the waveform duty-cycle. This value must be defined between 0 and CPRD (PWM\_CPRDx).

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

### 55.7.42 PWM Channel Duty Cycle Update Register

**Name:** PWM\_CDTYUPDx  
**Offset:** 0x0208 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register acts as a double buffer for the CDTY value. This prevents an unexpected waveform when modifying the waveform duty-cycle.

Only the first 16 bits (channel counter size) are significant.

|        |                |    |    |    |    |    |    |    |
|--------|----------------|----|----|----|----|----|----|----|
| Bit    | 31             | 30 | 29 | 28 | 27 | 26 | 25 | 24 |
|        |                |    |    |    |    |    |    |    |
| Access |                |    |    |    |    |    |    |    |
| Reset  |                |    |    |    |    |    |    |    |
| Bit    | 23             | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|        | CDTYUPD[23:16] |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 15             | 14 | 13 | 12 | 11 | 10 | 9  | 8  |
|        | CDTYUPD[15:8]  |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | 0  |
| Bit    | 7              | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|        | CDTYUPD[7:0]   |    |    |    |    |    |    |    |
| Access | W              | W  | W  | W  | W  | W  | W  | W  |
| Reset  | 0              | 0  | 0  | 0  | 0  | 0  | 0  | –  |

#### Bits 23:0 – CDTYUPD[23:0] Channel Duty-Cycle Update

Defines the waveform duty-cycle. This value must be defined between 0 and CPRD (PWM\_CPRDx).

### 55.7.43 PWM Channel Period Register

**Name:** PWM\_CPRDx  
**Offset:** 0x020C + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the [PWM Write Protection Status Register](#).

Only the first 16 bits (channel counter size) are significant.

|        |             |     |     |     |     |     |     |     |
|--------|-------------|-----|-----|-----|-----|-----|-----|-----|
| Bit    | 31          | 30  | 29  | 28  | 27  | 26  | 25  | 24  |
|        |             |     |     |     |     |     |     |     |
| Access |             |     |     |     |     |     |     |     |

#### Bits 23:0 – CPRD[23:0] Channel Period

If the waveform is left-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

– By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:

# SAMA5D2 Series

## Pulse Width Modulation Controller (PWM)

---

– By using the PWM peripheral clock divided by a given prescaler value “X” (where  $X = 2^{\text{PREA}}$  is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \text{CPRD})}{f_{\text{peripheral clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(2 \times X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

## 55.7.44 PWM Channel Period Update Register

**Name:** PWM\_CPRDUPDx  
**Offset:** 0x0210 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only
