

MAX44244/MAX44245/MAX44248

36V, Precision, Low-Power, 90 μ A, Single/Quad/Dual Op Amps

General Description

The MAX44244/MAX44245/MAX44248 family of parts provide ultra-precision, low-noise, zero-drift single/quad/dual operational amplifiers featuring very low-power operation with a wide supply range. The devices incorporate a patented auto-zero circuit that constantly measures and compensates the input offset to eliminate drift over time and temperature as well as the effect of 1/f noise. These devices also feature integrated EMI filters to reduce high-frequency signal demodulation on the output. The op amps operate from either a single 2.7V to 36V supply or dual ± 1.35 V to ± 18 V supply. The devices are unity-gain stable with a 1MHz gain-bandwidth product and a low 90 μ A supply current per amplifier.

The low offset and noise specifications and high supply range make the devices ideal for sensor interfaces and transmitters.

The devices are available in μ MAX®, SO, SOT23, and TSSOP packages and are specified over the -40°C to +125°C automotive operating temperature range.

Applications

Sensors Interfaces
4mA to 20mA and 0 to 10V Transmitters
PLC Analog I/O Modules
Weight Scales
Portable Medical Devices

Benefits and Features

- ◆ Reduces Power for Sensitive Precision Applications
Low 90 μ A Quiescent Current per Amplifier
- ◆ Eliminates the Cost of Calibration with Increased Accuracy with Maxim's Patented Autozero Circuitry
Very Low Input Voltage Offset 7.5 μ V (max)
Low 30nV/NC Offset Drift (max)
- ◆ Low Noise Ideal for Sensor Interfaces and Transmitters
50nV/ $\sqrt{\text{Hz}}$ at 1kHz
0.5 μ V_{p-p} from 0.1Hz to 10Hz
- ◆ 1MHz Gain-Bandwidth Product
EMI Suppression Circuitry
- ◆ Rail-to-Rail Output
- ◆ Wide Supply for High-Voltage Front Ends
2.7V to 36V Supply Range
- ◆ μ MAX, SO, SOT23, TSSOP Packages

Ordering Information appears at end of data sheet.

μ MAX is a registered trademark of Maxim Integrated Products, Inc.

MAX44244/MAX44245/MAX44248

36V, Precision, Low-Power, 90µA, Single/Quad/Dual Op Amps

ABSOLUTE MAXIMUM RATINGS

V_{DD} to V_{SS}	-0.3V to +40V	Operating Temperature Range	-40°C to +125°C
Common-Mode Input Voltage	($V_{SS} - 0.3V$) to ($V_{DD} + 0.3V$)	Storage Temperature	-65°C to +150°C
Differential Input Voltage IN_+ , IN_-	6V	Junction Temperature	+150°C
Continuous Input Current Into Any Pin	±20mA	Lead Temperature (soldering, 10s)	+300°C
Output Voltage to V_{SS} (OUT_-)	- 0.3V to ($V_{DD} + 0.3V$)	Soldering Temperature (reflow)	+260°C
Output Short-Circuit Duration (OUT_-)	1s		

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PACKAGE THERMAL CHARACTERISTICS (Note 1)

SO-8	Junction-to-Ambient Thermal Resistance (θ_{JA})	132°C/W	Junction-to-Ambient Thermal Resistance (θ_{JA})	110°C/W
	Junction-to-Case Thermal Resistance (θ_{JC})	38°C/W	Junction-to-Case Thermal Resistance (θ_{JC})	30°C/W
SO-14	Junction-to-Ambient Thermal Resistance (θ_{JA})	120°C/W	Junction-to-Ambient Thermal Resistance (θ_{JA})	206.3°C/W
	Junction-to-Case Thermal Resistance (θ_{JC})	37°C/W	Junction-to-Case Thermal Resistance (θ_{JC})	42°C/W
SOT23	Junction-to-Ambient Thermal Resistance (θ_{JA})	324.3°C/W		
	Junction-to-Case Thermal Resistance (θ_{JC})	82°C/W		

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

ELECTRICAL CHARACTERISTICS

Detailed Description

The MAX44244/MAX44245/MAX44248 are high-precision amplifiers with less than 2 μ V (typ) input-referred offset and low input voltage-noise density at 10Hz. 1/f noise, in fact, is eliminated to improve the performance in low-frequency applications. These characteristics are achieved through an auto-zeroing technique that cancels the input offset voltage and 1/f noise of the amplifier.

External Noise Suppression in EMI Form

These devices have input EMI filters to prevent effects of radio frequency interference on the output. The EMI filters comprise passive devices that present significant higher impedance to higher frequency signals. See the EMIRR vs. Frequency graph in the *Typical Operating Characteristics* section for details.

High Supply Voltage Range

The devices feature 90 μ A current consumption per channel and a voltage supply range from either 2.7V to 36V single supply or \pm 1.35V to \pm 18V split supply.

Applications Information

The devices feature ultra-high precision operational amplifiers with a high supply voltage range designed for load cell, medical instrumentation, and precision instrument applications.

4–20mA Current-Loop Communication

Industrial environments typically have a large amount of broadcast electromagnetic interference (EMI) from high-voltage transients and switching motors. This combined with long cables for sensor communication leads to high-voltage noise on communication lines. Current-Loop communication is resistant to this noise because the EMI induced current is low. This configuration also allows for low-power sensor applications to be powered from the communication lines.

The *Typical Operating Circuit* shows how the device can be used to make a current loop driver.

The circuit uses low-power components such as the MAX44244 op amp, the 16-bit MAX5216 DAC, and the high-precision 60 μ A-only MAX6033 reference. In this

MAX44244/MAX44245/MAX44248

36V, Precision, Low-Power, 90 μ A, Single/Quad/Dual Op Amps

circuit, both the DAC and the reference are referred to the local ground. The MAX44244 op-amp inputs are capable of swinging to the negative supply (which is the local ground in this case). R3 acts as a current mirror with R_{SENSE}. Therefore, if R_{SENSE} = 50 Ω (i.e. 20mA will drop 1V) and if the current through R3 is 10 μ A when I_{OUT} is 20mA (0.05% error) then R3 = 100k Ω . R1 is chosen along with the reference voltage to provide the 4mA offset. R2 = 512k Ω for 20mA full scale or R2 = 614k Ω for 20% over-range. R_{SENSE} is ratiometric with R3, R1 independently sets the offset current and R2 independently sets the DAC scaling.

Driving High-Performance ADCs

The MAX44244/MAX44245/MAX44248's low input offset voltage and low noise make these amplifiers ideal for ADC buffering. Weight scale applications require a low-noise, precision amplifier in front of an ADC. [Figure 1](#) details an example of a load cell and amplifier driven from the same 5V supply, along with a 16-bit delta sigma ADC such as the MAX11205.

The MAX11205 is an ultra-low-power (< 300 μ A, max active current), high-resolution, serial output ADC. It provides the highest resolution per unit power in the industry and is optimized for applications that require very high dynamic range with low power such as sensors on a 4–20mA industrial control loop. The devices provide

a high-accuracy internal oscillator that requires no external components.

Layout Guidelines

The MAX44244/MAX44245/MAX44248 feature ultra-low input offset voltage and noise. Therefore, to get optimum performance follow the layout guidelines.

Avoid temperature gradients at the junction of two dissimilar metals. The most common dissimilar metals used on a PCB are solder-to-component lead and solder-to-board trace. Dissimilar metals create a local thermocouple. A variation in temperature across the board can cause an additional offset due to Seebeck effect at the solder junctions. To minimize the Seebeck effect, place the amplifier away from potential heat sources on the board, if possible. Orient the resistors such that both the ends are heated equally. It is a good practice to match the input signal path to ensure that the type and number of thermoelectric junctions remain the same. For example, consider using dummy 0 Ω resistors oriented in such a way that the thermoelectric source, due to the real resistors in the signal path, are cancelled. It is recommended to flood the PCB with ground plane. The ground plane ensures that heat is distributed uniformly reducing the potential offset voltage degradation due to Seebeck effect.

Revision History

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
0	7/12	Initial release	—
1	6/13	Added the MAX44244/MAX44245 to data sheet. Updated the <i>Electrical Characteristics, Absolute Maximum Ratings, Pin Description, and Pin Configurations</i> .	1–13
2	9/13	Released the MAX44244 for introduction. Revised the <i>Electrical Characteristics</i>	2–5, 13
3	6/14	Corrected Figure 1 and <i>Package Information</i>	12, 13
4	12/14	Updated <i>Benefits and Features</i> section	1

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the Electrical Characteristics table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
