

HIGH EFFICIENCY, SMALL PACKAGES, STEP-UP DC/DC CONVERTERS

NO.EA-260-150910

OUTLINE

RP401x Series are high efficiency, step-up DC/DC converter ICs packaged in compact 5pin SOT23-5 or 6pin DFN(PLP)1820-6. This IC can start up from low voltage (Typ.0.6V), therefore, it is suitable for using with single or 2 serial alkaline batteries, or a nickel-metal-hydrate (NiMH) battery, or one-cell Lithium-ion (Li+) battery.

This IC consists of an oscillator, a reference voltage unit with soft start, a chip enable circuit, an error amplifier, phase compensation circuits, a slope circuit, a PWM control circuit, a start-up circuit, a PWM/VFM mode control circuit, internal switches and a protection circuit.

A low ripple high efficiency step-up DC/DC converter can be composed of the RP401x with only an inductor, a diode, (resistors for adjustable type), and capacitors. The output voltage of the RP401K001s is adjustable, and others are fixed internally. The output voltage range is from 1.8V to 5.5V. RP401Kxx1A/B series have a MODE pin to alternate between PWM fix and PWM/VFM automatic shift to improve the efficiency at light load. If MODE pin is set "H", the mode is PWM fix, and when the MODE pin is set "L", PWM/VFM automatic shift. The RP401xxx1C and D do not have MODE pin. The RP401xxx1C is PWM/PFM alternative type, and the RP401xxx1D is PWM fixed type.

FEATURES

- Low Start-up Voltage guaranteedTyp. 0.6V
- Input Voltage Range0.6V ~ 5.5V
- High Efficiency86% (100mA / 3.3V, $V_{IN} = 1.5V$, 25°C)
- Output current500mA / 1.8V ($V_{IN} = 1.5V$) / 5.0V ($V_{IN} = 3.3V$)
- Built-in Lx switchNMOS: 0.4Ω ($V_{OUT} = 3.3V$, 25°C)
- PWM Oscillator Frequency1.2MHz
- Output Voltage RangeFixed type: 1.8V to 5.5V with 0.1V Stepwise
Adjustable: 1.8V ~ 5.5V
(Recommendation range of output voltage)
- Lx peak current limit functionTyp. 1.0A
- Latch protection delay time3.3ms (Only applied to A version)
- Small PackagesDFN(PLP)1820-6, SOT23-5

APPLICATIONS

- MP3 players, PDA, cellular phones
- Digital Still Cameras
- LCD Bias Supplies
- Portable blood pressure meter
- Wireless Handset
- GPS

| T _{stg} | Storage Temp Range | -55 to +125 | | °C |

*) As for Power Dissipation, refer to PACKAGE INFORMATION.

ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the lifetime and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

ELECTRICAL CHARACTERISTICS

Adjustable types (RP401K001C/D)

*3) Applied to A/B version

*4) Applied to A version.

APPLICATION NOTES

Fixed Output Voltage Type (RP401Kxx1A/B)

Adjustable output type (RP401K001C/D)

Fixed output type (RP401Nxx1C/D)

External components

Capacitor C_{IN}: C1608JB0J106M (TDK), C_{OUT}:

| V _{OUT} [V] | I _{Lmax} <700mA | I _{Lmax} ≥700mA |
|---------------------------|------------------------------|------------------------------|
| 1.8≤V _{OUT} <3.3 | C1608JB0J106M×2 (10µF×2,TDK) | |
| 3.3≤V _{OUT} ≤5.5 | C1608JB0J106M (10µF,TDK) | C1608JB0J106M×2 (10µF×2,TDK) |

Diode: I_{Lmax}<700mA, CRS10I30A (TOSHIBA). I_{Lmax}≥700mA, CMS06 (TOSHIBA)

Inductor: SLF7028T-4R7M1R5-PF (TDK), depending on the conditions, smaller L can be used with.
(ex. VLS2012: TDK)

● Setting of Output Voltage for RP401K001C/D

Output voltage can be set with divider resistors for voltage setting, R1 and R2 as shown in the typical application. Refer to the next formula.

$$\text{Output Voltage} = V_{FB} \times (R1 + R2) / R1 \quad (V_{FB} = 0.6V)$$

Recommended value of resistors: Choose R1 and R2 so as to become (R1 + R2) being lower than 100kΩ.

Make sufficient power supply and ground. The large switching current may flow through the power line and GND line. If their impedance is high, the internal voltage of the IC may shift by the switching current and unstable operation may result. At turning off the built-in Lx switch, an over-shoot spike on the output may be generated by the inductor, therefore voltage rating of the output capacitor and the diode is 1.5 or more times as much as setting output voltage.

Use a diode of a low Vf Schottky type with high switching speed, low reverse current, and the current rating.

The RP401x uses the V_{OUT} voltage as the main power supply after start-up. Therefore the capacitor between Vout and GND has a role of the bypass capacitor for this IC. Use capacitors with a capacity of 10µF or more for

RP401x

V_{OUT} pin. Consider the bias shift, choose the enough capacity of the capacitor. A ceramic capacitor ($10\mu\text{F}$) between V_{IN} and ground should be set.

The inductor value recommendation is $4.7\mu\text{H}$. Choose an inductor that has small D.C. resistance and large enough permissible current and hard to reach magnetic saturation.

If the spike noise on Lx pin is large, put a snub circuit (CR serial connection etc.) in parallel with the diode and reduce the spike noise. The time constants of CR depends on the PCB and have an impact on the efficiency, therefore fully evaluation is necessary. (Basic value is 10ohm and 300pF)

The MODE pin is controlled with a logic voltage. To make it "H", 1.0V or more must be forced to the MODE pin. If power supply is less than 1.0V , MODE pin must be pulled up to V_{OUT} .

The RP401xxxxA can reset the latch protection with CE signal. If C_{IN} is too large, and V_{IN} does not reach 0.8V , even if the IC starts up with CE signal, the latch operation may not be reset correctly. The sequence of V_{IN} and CE must be cared. In the case of CE pin pulled-up to V_{IN} pin or V_{OUT} pin, the operation of latch protection reset may not work correctly.

*The performance of power circuit using those lcs extremely depends upon the peripheral circuits. Pay attention in the selection of the peripheral circuits. In particular, design the peripheral circuits in a way that the values such as voltage, current, and power of each component, PCB patterns and the IC do not exceed their respected rated values. (such as the voltage, current , and power)

OUTPUT CURRENT OF STEP-UP CIRCUIT AND EXTERNAL COMPONENTS

<Basic Circuit>

<Current through L>

There are two modes, or discontinuous mode and continuous mode for the PWM step-up switching regulator depending on the continuous characteristic of inductor current. During on time of the transistor, when the voltage added on to the inductor is described as V_{IN} , the current is $V_{IN} \times t / L$.

Therefore, the electric power, P_{ON} , which is supplied with input side, can be described as in the next formula.

$$P_{ON} = \int_0^{ton} V_{IN}^2 \times t/L dt \dots\dots\dots \text{Formula 1}$$

With the step-up circuit, electric power is supplied from power source also during off time. In this case, input current is described as $(V_{OUT} - V_{IN}) \times t / L$, therefore electric power, P_{OFF} is described as in the next formula.

$$P_{OFF} = \int_0^{toff} V_{IN} \times (V_{OUT} - V_{IN})t/L dt \dots\dots\dots \text{Formula 2}$$

In this formula, t_f means the time of which the energy saved in the inductance is being emitted. Thus average electric power, P_{AV} is described as in the next formula.

$$P_{AV} = 1/(ton + toff) \times \left\{ \int_0^{ton} V_{IN}^2 \times t/L dt + \int_0^{toff} V_{IN} \times (V_{OUT} - V_{IN})t/L dt \right\} \dots\dots\dots \text{Formula 3}$$

In PWM control, when $t_f = t_{off}$ is true, the inductor current becomes continuous, then the operation of switching regulator becomes continuous mode. In the continuous mode, the deviation of the current is equal between on time and off time.

$$V_{IN} \times t_{on} / L = (V_{OUT} - V_{IN}) \times t_{off} / L \dots\dots\dots \text{Formula 4}$$

Further, the electric power, PAV is equal to the output electric power, $V_{OUT} \times I_{OUT}$, thus,

$$I_{OUT} = f_{osc} \times V_{IN}^2 \times t_{on}^2 / \{2 \times L (V_{OUT} - V_{IN})\} = V_{IN}^2 \times t_{on} / (2 \times L \times V_{OUT}) \dots\dots\dots \text{Formula 5}$$

When I_{OUT} becomes more than $V_{IN} \times t_{on} \times t_{off} / (2 \times L \times (t_{on} + t_{off}))$, the current flows through the inductor and the mode becomes continuous. The continuous current through the inductor is described as I_{const} , then,

$$I_{OUT} = f_{osc} \times V_{IN}^2 \times t_{on}^2 / (2 \times L \times (V_{OUT} - V_{IN})) + V_{IN} \times I_{const} / V_{OUT} \dots\dots\dots \text{Formula 6}$$

In this moment, the peak current, I_{lxmax} flowing through the inductor and the driver Tr. Is described as follows:

$$I_{lxmax} = I_{const} + V_{IN} \times t_{on} / L \dots\dots\dots \text{Formula 7}$$

With the formula 4, 6 and I_{lxmax} is

$$I_{lxmax} = V_{OUT} / V_{IN} \times I_{OUT} + V_{IN} \times t_{on} / (2 \times L) \dots\dots\dots \text{Formula 8}$$

However, $t_{on} = (1 - V_{IN} / V_{OUT}) / f_{osc}$

Therefore, peak current is more than I_{OUT} . Considering the value of I_{lxmax} , the condition of input and output, and external components should be selected.

In the formula 7, peak current I_{lxmax} at discontinuous mode can be calculated. Put $I_{const} = 0$ in the formula.

The explanation above is based on the ideal calculation, and the loss caused by Lx switch and external components is not included.

Select the inductor and the diode with considering the peak current of the (Formula 8).

TIMING CHART

Soft start operation and Latch protection operation

*1) Applied to A/B/C version. (MODE="L" for version A/B)

*2) Applied to A version only.

<Start-up> When the CE pin becomes from "L" to "H", then the DC/DC converter starts up. In the RP401 series, low input voltage (Typ. 0.6V) operation is possible due to the low-boost mode. Until the output voltage reaches 1.65V (Typ.) the mode is low-boost mode. When the output voltage becomes 1.65V or more, to suppress the inrush current, soft start operation starts and boosts the output voltage to set value.

*) At the low-boost mode, the oscillator frequency is reduced to 200kHz (Typ.), therefore, compared with the normal operation frequency 1.2MHz, the boost capability is worse. Therefore, step-up ratio and load current must be cared.

*) Soft-start time depends on the set output voltage, input voltage, temperature, and the load current. Refer to the next graphs.

Soft Start Period vs. Input Voltage RP401xxx1x
 $I_{OUT}=1mA$

Soft Start Period vs. Temperature RP401xxx1x
 $V_{IN}=V_{SET}\times 0.5, RL=1k\Omega$

<Over-current protection operation>

If the Lx peak current reaches 1.0A (Typ.), then Lx peak current limit circuit operates and control the duty ratio of Lx switch.

<Latch Protection Operation> applied to A version only

If over current state continues for a protection delay time (t_{PROT}), then latch protection function starts and latch the internal driver switch being off and the operation of DC/DC converter will stop.

To release the latch protection circuit, toggled input for CE pin is necessary.

Lx current limit(I_{LXPEAK}) and the protection delay time (t_{prot}) are influenced by the self-heating, heat radiation environment at mounting on board. If short circuit may happen, input voltage (V_{IN}) drops largely or becomes unstable, the protection operation and the delay time will be influenced.

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment.

Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
