

Features

- Easy to use capacitive button controller
 - Four-button solution configurable through Hardware straps
 - No software tools or programming required
 - Four general-purpose outputs (GPOs)
 - GPOs linked to CapSense® buttons
 - GPOs support direct LED drive
- Robust noise performance
 - Specifically designed for superior noise immunity to external radiated and conducted noise
 - Low radiated noise emission
- SmartSense™ Auto-Tuning
 - Saves time and effort in device tuning
 - CapSense parameters dynamically set in runtime
 - Maintains optimal button performance even in noisy environment
 - Wide parasitic capacitance C_P range (5 pF–40 pF)
- System Diagnostics of CapSense buttons - reports any faults at device power up
 - Button shorted to Ground
 - Button shorted to V_{DD}
 - Button to button short
 - Improper value of modulator capacitor (C_{MOD})
 - Parasitic capacitance (C_P) out of range
- Advanced features
 - Toggle ON/OFF feature on GPOs
 - Flanking Sensor Suppression (FSS) provides robust sensing even with closely spaced buttons
 - Configurable LED ON time after button release
 - Button output reset if touched for excessive time
 - User-controlled Button Scan Rate
 - Serial Debug Data output
 - Simplifies production line testing and system debug
- Wide operating voltage range
 - 1.71 V to 5.5 V – ideal for both regulated and unregulated battery applications
- Low power consumption
 - Supply current in run mode as low as 15 μA ^[1] per button
 - Deep sleep current: 100 nA
- Industrial temperature range: –40 °C to + 85 °C
- 16-pad quad flat no leads (QFN) package (3 mm × 3 mm × 0.6 mm)

Overview

The CY8CMBR2044 incorporates several innovative features to save time and money to quickly enable a capacitive touch sensing user interface in your design. It is a hardware configurable device and does not require any software tools or coding. This device is enabled with Cypress's revolutionary SmartSense™ Auto-Tuning algorithm. SmartSense™ Auto-Tuning ends the need to manually tune the user interface during development and production ramp. This speeds the time to volume and saves valuable engineering time, test time and production yield loss.

The CY8CMBR2044 CapSense controller supports up to four capacitive touch sensing buttons and four General Purpose Outputs (GPOs). The GPO is an active low output controlled directly by the CapSense input making it ideal for a wide variety of consumer, industrial, and medical applications. The wide operating range of 1.71 V to 5.5 V enables unregulated battery operation, further saving component cost. Also, the same device can be used in different applications with different power supplies, including low power supplies.

This device supports ultra low-power consumption in both run mode and deep sleep mode to stretch battery life. In addition, this device also supports many advanced features which enhance the robustness and user interface of the end solution. Some of the key advanced features include Noise Immunity and FSS. Noise Immunity improves the immunity of the device against radiated and conducted noise, such as audio and radio frequency (RF) noise. FSS provides robust sensing even with closely spaced buttons. FSS is a critical requirement in small form factor applications.

Serial Debug Data output gives the critical information about the design, such as button C_p and Signal-to-Noise Ratio (SNR). This further helps in production line testing.

Note

1. Power consumption calculated with 1.7% touch time, 500 ms scan rate, and C_P of each sensor < 19 pF.

Typical Circuits

Schematic 1: 4-Buttons, 4-LEDs with Auto Reset Enabled

In the above schematic, the device is configured to support:

- CS0–CS3 pins: 560-Ω to CapSense button
 - Four CapSense buttons (CS0–CS3)
- GPO0–GPO3 pins: LED and 560-Ω to V_{DD}
 - CapSense buttons driving 4 LEDs (GPO0–GPO3)
- C_{MOD} pin: 2.2 nF to ground
 - Modulator capacitor
- XRES pin: Floating
 - For external reset

- Toggle/FSS pin: Ground
 - Toggle ON/OFF disabled
 - FSS disabled
- ARST pin: 5 kΩ to Ground
 - Button Auto Reset enabled, 20 second time
- Delay pin: Ground
 - LED ON Time disabled
- ScanRate/Sleep pin: Ground
 - User configured scan rate = 20 ms

To enable Serial Debug Data output, connect a 5.6 kΩ resistor on R9 or R12.

Schematic 2: 3-Buttons, 3-LEDs, 2-Outputs to Master, and Advanced Features Enabled

In the above schematic the device is configured to support:

- CS0–CS2 pins: 560-Ω to CapSense buttons; CS3 pin: Ground
 - Three CapSense buttons (CS0–CS2)
 - CS3 not used in design
- GPO0–GPO2 pins: LED and 560-Ω to VDD; GPO3 floating; GPO0–GPO1 pins interfaced to Master
 - CapSense buttons driving 3 LEDs (GPO0–GPO2)
 - GPO0, GPO1 interfaced to master for direct status read
- C_{MOD} pin: 2.2 nF to ground
 - Modulator capacitor
- XRES pin: Floating
 - For external reset

- Toggle/FSS pin: 5.1 kΩ to Ground
 - Toggle ON/OFF disabled
 - FSS enabled
 - ARST pin: 5 kΩ to Ground
 - Button Auto Reset enabled, Auto Reset period = 20 seconds
 - Delay pin: 4 kΩ to Ground
 - LED ON Time of 1000 ms
 - ScanRate/Sleep pin: 560 Ω to Master
 - User configured scan rate = 30 ms
 - Master to control device operating mode
- To enable Serial Debug Data output, connect a 5.6 kΩ resistor on R11.

Configuring the CY8CMBR2044

The CY8CMBR2044 device features are configured using external resistors.

The resistors on the hardware configurable pins are determined by the device upon power-on.

The [Appendix](#) gives the matrix of features enabled using different external resistor configurations.

To know more about the required settings for your design, refer to the [CY8CMBR2044 Design Guide](#).

Device Features

CapSense Buttons

- Device supports up to four CapSense buttons
- Ground the CSx pin to disable CapSense input
- A 2.2-nF ($\pm 10\%$) capacitor must be connected on the C_{MOD} pin for proper CapSense operation
- The parasitic Capacitance (C_P) of each button must be less than 40 pF for proper CapSense operation

SmartSense Auto Tuning

- Device supports auto tuning of CapSense parameters
- No manual tuning required; all parameters are automatically tuned by the device
- Compensates printed circuit board (PCB) variations, device process variations, and PCB vendor changes
- Ensures portability of the user interface design

General Purpose Outputs

- The GPOx is controlled by the corresponding CSx
- GPOx pins output are in strong drive mode ^[3]
- Active low output – supports sinking configuration
- If CSx is disabled (grounded), then the corresponding GPOx must be left floating
- A 5-ms active LOW pulse is sent after 175 ms after device power-up, on a GPOx after that it is set to Logic HIGH, if the CSx fails the System Diagnostics.
- GPOx pin outputs are in strong drive mode at logic level HIGH in Deep sleep power mode.
- GPOx pins output are in strong drive mode and retain the logic level same as before entering into low power sleep mode based on feature like (Toggle ,etc).
- All GPO pins are placed in a High-impedance state during reset i.e. XRES,POR.

Table 2. Advanced Features supported by CY8CMBR2044

Feature	Benefits
Toggle ON/OFF	Button retains state on touch (ON/OFF)
Flanking Sensor Suppression (FSS)	Helps in distinguishing closely spaced buttons
LED ON Time	Gives an LED effect on button release
Button Auto Reset	Disables false output trigger due to conducting object placed close to button
System Diagnostics	Support for production testing and debugging
Serial Debug Data	Support for production testing and validating design
Low Power Sleep Mode and Deep Sleep Mode	Low power consumption

Note

3. When a pin in in strong drive mode, it is pulled up to V_{DD} when the output is HIGH and pulled down to Ground when the output is LOW. The output cannot be floating.

Toggle ON/OFF

- Toggles the GPO state at each button touch.
- Used for mechanical button replacement. For example, wall switch.

Flanking Sensor Suppression (FSS)

- Helps to distinguish closely spaced buttons.
- Also used in situations when a button can produce opposite effects. For example, an interface with two buttons for brightness control (UP or DOWN).
- FSS action can be explained for the following different scenarios:
 - When only one button is touched, it is reported as ON.
 - When more than one button is detected as ON and previously one of those buttons was touched, then the previously touched button is reported as ON.

LED ON Time

- Provides better visual feedback when a button is released and improves the design’s aesthetic value.
- The GPOx is driven low for a specified interval after the corresponding CSx button is released.
- When a button gets reset, LED ON Time is not applied on the corresponding GPO.
- In [Figure 3 on page 7](#), GPO0 goes high prematurely (prior to LED ON Time) because CS1 button is released. Therefore, the LED ON Time counter is reset. Now, GPO1 remains LOW for LED ON Time after releasing CS1.
- LED ON Time can range from 0–2000 ms.
- LED ON Time resolution is 20 ms.

Figure 1. Example of Toggle Feature on GPO

Figure 2. Button Status with Respect to Finger Touch when FSS is Enabled

Figure 3. Example LED ON timing diagram on GPO0

Figure 4. Example LED ON timing diagram on multiple GPO0 and GPO1

Button Auto Reset

- Prevents button stuck, due to metal object placed close to a button.
- Useful when GPO output to be kept ON only for a specific time.
- If enabled, the GPOx is driven for a maximum of Button Auto Reset period when CSx is continuously touched. See [Figure 5 on page 8](#).

- Button Auto Reset period can be set to 5 or 20 seconds.
- After the Button Auto Reset has been triggered, the CSx hold time of that button after the button has been released is given in [Table 3](#). The hardware configuration is shown in [Table 15 in Appendix](#).

Table 3. Button Hold Time After Auto Reset

Button Press Time after Button Auto Reset	Button Hold Time (ms)
< 2 sec	220
> 2 sec	ScanRate + 200

Figure 5. Example of Button Auto Reset on GP0

System Diagnostics

- A built-in Power-on Self Test (POST) mechanism performs some tests at Power-on Reset (POR), which can be useful in production testing.
- If any button fails these tests, a 5 ms pulse is sent out on the corresponding GPO withing 175 ms after POR.
- Following tests are performed on all the buttons -

Button Shorted to Ground

If any button is found to be shorted to ground, it is disabled. See Figure 6.

Figure 6. Button Shorted to Ground

Button Shorted to V_{DD}

If any button is found to be shorted to V_{DD}, it is disabled. See Figure 7.

Figure 7. Button Shorted to V_{DD}

Button to Button Short

If two or more buttons are found to be shorted to each other, all of these buttons are disabled. See Figure 8.

Figure 8. Button to Button Short

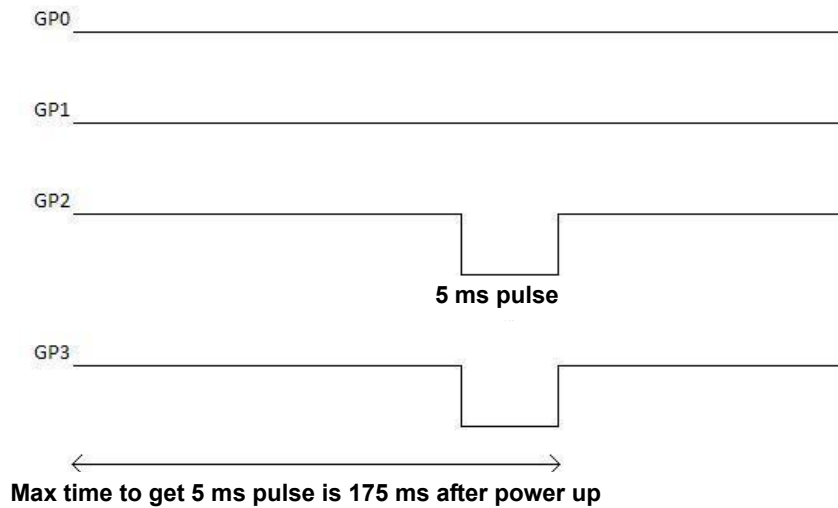

Improper Value of C_{MOD}

- Recommended value of C_{MOD} is 2 nF to 2.4 nF.
- If the value of C_{MOD} is found to be less than 1 nF or greater than 4 nF, all the buttons are disabled.

Button C_P > 40 pF

If the parasitic capacitance (C_P) of any button is found to be more than 40 pF, that button is disabled.

Figure 9. Example Showing CS0 and CS1 Passing the POST and CS2 and CS3 Failing

In Figure 9, CS0 and CS1 buttons are enabled; CS2 and CS3 buttons are disabled because they failed the Power-on Self Test. A 5 ms pulse is observed on GPO2 and GPO3.

Serial Debug Data

- Used to see CapSense data for debug purposes
- If enabled, debug data is transmitted using UART communication protocol.
- To enable this feature pull down any one of the CapSense pins with a 5.6 kΩ resistor to ground. Data is sent out on the same CapSense pin
- If more than one CapSense pin is pulled down, debug data is sent out only on one CapSense pin and the priority is CS0 > CS1 > CS2 > CS3
- The Cypress MultiChart tool can be used to view the data as a graph.
- Serial data is sent out with ~115,200 baud rate
- Firmware revision, CapSense status, GPO status, raw count, baseline, difference count, and parasitic capacitance of all sensors are sent out
- For designs having a maximum of three CapSense buttons, Cypress recommends to take the debug data on a CapSense button that is not used in design
- For designs with four CapSense buttons, Cypress recommends taking debug data on two CapSense buttons. For example, pull down CS0 with a 5.6 kΩ resistor and read data of CS1, CS2, and CS3. Next, pull down CS1 with a 5.6 kΩ resistor and read data of CS0, CS2, and CS3

For more information on Raw Count, Baseline, Difference Count and Parasitic Capacitance, refer to [Getting Started with CapSense](#), section 2. For more information on MultiChart tool, refer to [AN2397 CapSense Data Viewing Tools](#), Method 2.

- MultiChart tool arranges the data in the format as shown in Table 4.
- The Serial Debug Data is sent by the device in the order as per Table 5.

Table 4. Serial Debug Data arranged in MultiChart

S.No.	Raw Count Array		Baseline Array		Signal Array	
	MSB	LSB	MSB	LSB	MSB	LSB
0	0x00	FW_Revision	CS_Status	GPO_Status	0x00	CS2_Cp

Power Consumption and Device Operating Modes

The CY8CMBR2044 is designed to meet the low power requirements of battery powered applications. To design for the lowest operating current -

- Ground all unused CapSense inputs
- Minimize C_p using the design guidelines in [Getting Started with CapSense](#), section 3.7.1.
- Lower the supply voltage.
- Use a higher Button Scan Rate or Deep Sleep operating mode.

To know more about the steps to reduce power consumption, refer to [CY8CMBR2044 Design Guide](#), section 5.

There are two device operating modes:

- Low power sleep mode
- Deep sleep mode

Low Power Sleep Mode

The following flow chart describes the low power sleep mode operation.

Figure 10. Low Power Sleep Mode Operation

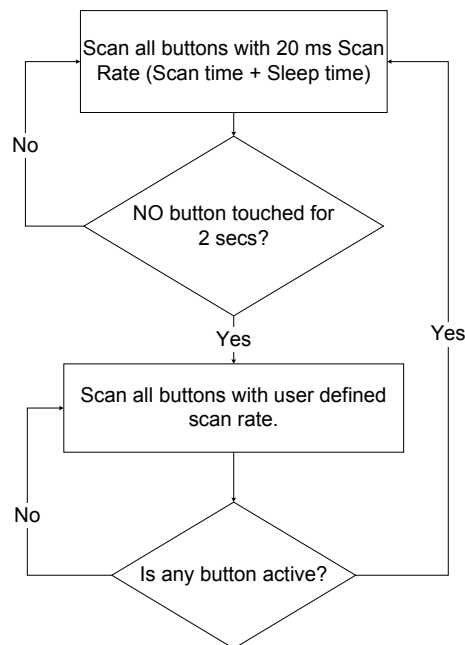

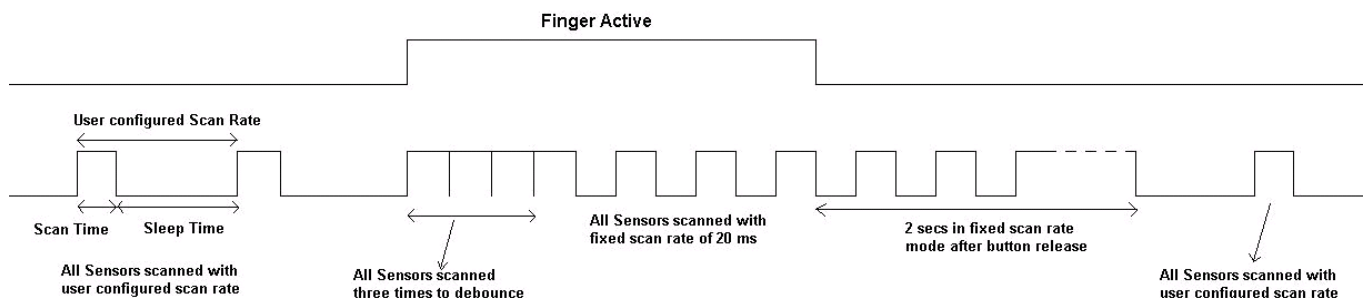

Figure 11. Low Power Sleep Mode Implementation

- To enable low power sleep mode, the hardware configurable pin ScanRate/Sleep should be pulled down to ground with resistor 'R' (1%). The scan rate values for different resistor values are given in Table 15 in Appendix.
- If the ScanRate/Sleep pin is pulled to ground without any resistor, the Button Scan Rate is set to 20 ms. The device operates in low power sleep mode, unless a button is touched.
- The range of scan rate is 20 to 530 ms.

Figure 12. Average Current vs Scan Rate ^[4]

Note

4. Number of sensors = 3, Cp < 19 pF, 0% touch time, V_{DD} = 3 V.

Deep Sleep Mode

Figure 13. ScanRate/Sleep Pin Connection to Enable Deep Sleep Mode

- To enable the deep sleep mode, the hardware configuration pin ScanRate/Sleep should be connected to the master device as shown in [Figure 13](#).
- Host controller should pull the pin to V_{DD} for the device to go into deep sleep.
- The Host controller output pin should be in Strong drive mode, so that the ScanRate/Sleep pin is not left floating.
- In deep sleep mode, all blocks are turned off and the device current consumption is approximately 0.1 μA .
- There is no CapSense scanning in deep sleep mode.
- ScanRate/Sleep pin should be pulled low for the device to wake up from deep sleep.
- When device comes out of deep sleep mode, the CapSense system is reinitialized. Typical time for reinitialization is 8 ms. Any button touch within this time is not reported.
- After the device comes out of deep sleep, the device operates in low power sleep mode.
- If the ScanRate/Sleep pin is pulled high at power on, then the device does not go to deep sleep immediately. The device goes to deep sleep after initializing all internal blocks and scanning all buttons once.
- If the ScanRate/Sleep pin is pulled high at power on, then the button scan rate is calculated when the device is taken out of Deep Sleep by the master.

Additional Components to Enable Advanced Features

S.No.	Feature	Resistors required	Notes
1	Low power sleep and deep sleep	1	Deep sleep is controlled by a master device. When the device comes out of deep sleep, it enters into low power sleep mode based on settings. Resistor is not required if both features are not used.
2	Toggle/FSS	1	To enable both the features only one resistor is required. Resistor is not required if both features are not used.
3	Delay Off	1	Resistor is not required if the feature is not used.
4	Sensor auto reset	1	Resistor is not required if the feature is not used.

Response Time

Response time is the minimum amount of time the button should be touched for the device to detect as valid button press.

Condition	Response time (in ms)
First button press	Button Scan rate value + 20. For button scan rate value, see Table 15 in Appendix .
Consecutive button press after first button press	80

Layout Guidelines and Best Practices

S.No.	Category	Min	Max	Recommendations / Remarks
1	Button shape	–	–	Solid round pattern, round with LED hole, rectangle with round corners
2	Button size	5 mm	15 mm	Refer Design Toolbox
3	Button-button spacing	Equal to Button Ground Clearance	–	8 mm (Y dimension in Button Layout Design on page 16)
4	Button ground clearance	0.5 mm	2 mm	Refer Design Toolbox (X dimension in Button Layout Design on page 16)
5	Ground flood – top layer	–	–	Hatched ground 7 mil trace and 45 mil grid (15% filling)
6	Ground flood – bottom layer	–	–	Hatched ground 7 mil trace and 70 mil grid (10% filling)
7	Trace length from button pad to CapSense controller pins	–	450 mm	Refer Design Toolbox
8	Trace width	0.17 mm	0.20 mm	0.17 mm (7 mil)
9	Trace routing	–	–	Traces should be routed on the non button side. If any non CapSense trace crosses CapSense trace, ensure that intersection is orthogonal
10	Via position for the buttons	–	–	Via should be placed near the edge of the button to reduce trace length thereby increasing sensitivity
11	Via hole size for button traces	–	–	10 mil
12	No. of via on button trace	1	2	1
13	Distance of CapSense series resistor from button pin	–	10 mm	Place CapSense series resistors close to the device for noise suppression. CapSense resistors have highest priority; place them first
14	Distance between any CapSense trace to ground flood	10 mil	20 mil	20 mil
15	Device placement	–	–	Mount the device on the layer opposite to button. The CapSense trace length between the device and buttons should be minimum (see trace length above)
16	Placement of components in two layer PCB	–	–	Top layer – buttons and bottom layer – device, other components and traces
17	Placement of components in four layer PCB	–	–	Top layer – buttons, second layer – CapSense traces and V _{DD} (avoid V _{DD} traces below the buttons), third layer – hatched ground, bottom layer – CapSense IC or device, other components, and non CapSense traces
18	Overlay thickness	0 mm	5 mm	Refer Design Toolbox
19	Overlay material	–	–	Should be non-conductive material. Glass, ABS plastic, formica, wood, and so on. There should be no air gap between PCB and overlay. Use adhesive to stick the PCB and overlay
20	Overlay adhesives	–	–	Adhesive should be non conductive and dielectrically homogenous. 467MP and 468MP adhesives made by 3M are recommended
21	LED back lighting	–	–	Cut a hole in the button pad and use rear mountable LEDs. Refer to Example PCB Layout Design with Four CapSense Buttons and Four LEDs on page 17
22	Board thickness	–	–	Standard board thickness for CapSense FR4 based designs is 1.6 mm.

Electrical Specifications

This section presents the DC and AC electrical specifications of the CY8CMBR2044 device.

Absolute Maximum Ratings

Table 6. Absolute Maximum Ratings

Parameter	Description	Min	Typ	Max	Unit	Notes
T _{STG}	Storage temperature	-55	25	+125	°C	Higher storage temperatures reduce data retention time. Recommended storage temperature is +25 °C ± 25 °C. Extended duration storage temperatures above 85 °C degrades reliability.
V _{DD}	Supply voltage relative to V _{SS}	-0.5	-	+6.0	V	
V _{IO}	DC voltage on CapSense inputs and digital output pins	V _{SS} - 0.5	-	V _{DD} + 0.5	V	
I _{MIG}	Maximum current into any GPO output pin	-25	-	+50	mA	
ESD	Electro static discharge voltage	2000	-	-	V	Human body model ESD
LU	Latch up current	-	-	200	mA	In accordance with JESD78 standard

Operating Temperature

Table 7. Operating Temperature

Parameter	Description	Min	Typ	Max	Unit	Notes
T _A	Ambient temperature	-40	-	+85	°C	
T _J	Operational die temperature	-40	-	+100	°C	

DC Electrical Characteristics
DC Chip Level Specifications

The following table lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Table 8. DC Chip Level Specifications

Parameter	Description	Min	Typ	Max	Unit	Notes
V_{DD} [5, 6, 7]	Supply voltage	1.71	–	5.5	V	
I_{DD}	Supply current	–	2.88	4.0	mA	Conditions are $V_{DD} = 3.0$ V, $T_A = 25$ °C
I_{DA}	Active current	–	2.88	4.0	mA	Conditions are $V_{DD} = 3.0$ V, $T_A = 25$ °C, continuous sensor scan
I_{DS}	Deep sleep current	–	0.1	0.5	μA	Conditions are $V_{DD} = 3.0$ V, $T_A = 25$ °C
I_{AV1}	Average current	–	40	–	μA	Conditions are $V_{DD} = 3.0$ V, $T_A = 25$ °C, 4 – buttons used, 0% touch time, C_P of all sensors < 19 pF and scan rate = 530 ms
I_{AV2}	Average current	–	63	–	μA	Conditions are $V_{DD} = 3.0$ V, $T_A = 25$ °C, 4 – buttons used, 0% touch time, C_P of all sensors > 19 pF and scan rate = 530 ms
I_{AV3}	Average current	–	1	–	mA	Conditions are $V_{DD} = 3.0$ V, $T_A = 25$ °C, 4 – buttons used, 100% touch time, C_P of all sensors < 19 pF and scan rate = 20 ms
I_{AV4}	Average current	–	1.6	–	mA	Conditions are $V_{DD} = 3.0$ V, $T_A = 25$ °C, 4 – buttons used, 100% touch time, C_P of all sensors > 19 pF and < 40 pF, scan rate = 20 ms

Notes

- When V_{DD} remains in the range from 1.75 V to 1.9 V for more than 50 μs, the slew rate when moving from the 1.75 V to 1.9 V range to greater than 2 V must be slower than 1 V/500 μs. This helps to avoid triggering POR. The only other restriction on slew rates for any other voltage range or transition is the SR_{POWER_UP} parameter.
- After power down, ensure that V_{DD} falls below 100 mV before powering backup.
- For proper CapSense block functionality, if the drop in V_{DD} exceeds 5% of the base V_{DD} , the rate at which V_{DD} drops should not exceed 200 mV/s. Base V_{DD} can be between 1.8 V and 5.5 V

DC General Purpose I/O Specifications

These tables list guaranteed maximum and minimum specifications for the voltage and temperature ranges: 3.0 V to 5.5 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, 2.4 V to 3.0 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, or 1.71 V to 2.4 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, respectively. Typical parameters apply to 5 V and 3.3 V at 25 °C and are for design guidance only.

Table 9. 3.0 V to 5 V DC General Purpose I/O Specifications

Parameter ^[8]	Description	Min	Typ	Max	Unit	Notes
V _{OH1}	High output voltage on GP0, GP1, GP2, GP3	V _{DD} - 0.2	–	–	V	I _{OH} < 10 μA, maximum of 40 μA source current in all I/Os
V _{OH2}	High output voltage on GP0, GP1	V _{DD} - 0.9	–	–	V	I _{OH} = 1 mA, maximum of 2 mA source current in all I/Os
V _{OH3}	High output voltage on GP2, GP3	V _{DD} - 0.9	–	–	V	I _{OH} = 5 mA, maximum of 10 mA source current in all I/Os
V _{OL}	Low output voltage	–	–	0.75	V	I _{OL} = 25 mA/pin, V _{DD} > 3.30, maximum of 60 mA sink current on GPO0, GPO1, GPO2, GPO3

Table 10. 2.4 V to 3.0 V DC General Purpose I/O Specifications

Parameter ^[8]	Description	Min	Typ	Max	Unit	Notes
V _{OH1}	High output voltage on GP0, GP1, GP2, GP3	V _{DD} - 0.2	–	–	V	I _{OH} < 10 μA, maximum of 40 μA source current in all I/Os
V _{OH2}	High output voltage on GP0, GP1	V _{DD} - 0.4	–	–	V	I _{OH} = 0.2 mA, maximum of 0.4 mA source current in all I/Os
V _{OH3}	High output voltage on GP2, GP3	V _{DD} - 0.5	–	–	V	I _{OH} = 2 mA, maximum of 4 mA source current in all I/Os
V _{OL}	Low output voltage	–	–	0.72	V	I _{OL} = 10 mA/pin, maximum of 30 mA sink current on GPO0, GPO1, GPO2, GPO3

Table 11. 1.71 V to 2.4 V DC General Purpose I/O Specifications

Parameter ^[8]	Description	Min	Typ	Max	Unit	Notes
V _{OH1}	High output voltage on GP0, GP1	V _{DD} - 0.2	–	–	V	I _{OH} = 10 μA, maximum of 20 μA source current in all I/Os
V _{OH2}	High output voltage on GP0, GP1	V _{DD} - 0.5	–	–	V	I _{OH} = 0.5 mA, maximum of 1 mA source current in all I/Os
V _{OH3}	High output voltage on GP2, GP3	V _{DD} - 0.2	–	–	V	I _{OH} = 100 μA, maximum of 200 μA source current in all I/Os
V _{OH4}	High output voltage on GP2, GP3	V _{DD} - 0.5	–	–	V	I _{OH} = 2 mA, maximum of 4 mA source current in all I/Os
V _{OL}	Low output voltage	–	–	0.4	V	I _{OL} = 5 mA/pin, maximum of 20 mA sink current on GPO0, GPO1, GPO2, GPO3

Note

8. XRES pin input voltage ranges at various DC Specifications (VDD) listed below:
 Minimum Input voltage for reset is 2V at 3.0 V to 5.5 V.
 Minimum Input voltage for reset is 1.4V at 2.4 V to 3.0 V.
 Minimum Input voltage for reset is 0.65 × VDD at 1.71 V to 2.4 V.

AC Electrical Specifications

AC Chip-Level Specifications

The following table lists guaranteed maximum and minimum specifications for the entire voltage and temperature ranges.

Parameter	Description	Min	Max	Unit	Notes
SR _{POWER_UP}	Power supply slew rate	–	250	V/ms	V _{DD} slew rate during power up
T _{XRST}	External reset pulse width at power up	1	–	ms	After supply voltage is valid
T _{XRST2}	External reset pulse width after power-up	10	–	μs	Applies after part has booted

AC General Purpose I/O Specifications

Parameter	Description	Min	Typ	Max	Unit	Notes
TRise1	Rise time on GPO0 and GPO1, Cload = 50 pF	15	–	80	ns	V _{DD} = 3.0 to 3.6 V, 10% – 90%
TRise2	Rise time on GPO2 and GPO3, Cload = 50 pF	10	–	50	ns	V _{DD} = 3.0 to 3.6 V, 10% – 90%
TRise3	Rise time on GPO0 and GPO1, Cload = 50 pF	15	–	80	ns	V _{DD} = 1.71 to 3.0V, 10% – 90%
TRise2	Rise time on GPO2 and GPO3, Cload = 50 pF	10	–	80	ns	V _{DD} = 1.71 to 3.0 V, 10% – 90%
TRise4	Fall time, Cload=50 pF all GPO outputs	10	–	50	ns	V _{DD} = 3.0 to 3.6 V, 90% – 10%
TFall2	Fall time, Cload=50 pF all GPO outputs	10	–	70	ns	V _{DD} = 1.71 to 3.0 V, 90% – 10%

CapSense Specifications

Parameter	Description	Min	Typ	Max	Unit	Notes
C _P	Parasitic capacitance	5.0	–	(C _P +C _F)<40	pF	C _P is the total capacitance seen by the pin when no finger is present. C _P is sum of C _{BUTTON} , C _{TRACE} , and Capacitance of the vias and C _{PIN}
C _F	Finger capacitance	0.25	–	(C _P +C _F)<40	pF	C _F is the capacitance added by the finger touch
C _{PIN}	Capacitive load on pins as input	0.5	1.7	7	pF	
C _{MOD}	External modulator capacitor	2	2.2	2.4	nF	Mandatory for CapSense to work
Rs	Series resistor between pin and the sensor	–	560	616	Ω	Reduces the RF noise

Ordering Information

Ordering Code	Package Type	Operating Temperature	CapSense Inputs	GPOs	XRES Pin
CY8CMBR2044-24LKXI	16-pin QFN (3 × 3 × 0.6 mm)	Industrial	4	4	Yes
CY8CMBR2044-24LKXIT	16-pin QFN (3 × 3 × 0.6 mm) (Tape and Reel)	Industrial	4	4	Yes

Ordering Code Definitions

Package Diagram

Figure 19. 16-pin Chip On Lead (3 × 3 × 0.6 mm) LG16A/LD16A (Sawn) Package Outline, 001-09116

NOTES

1. REFERENCE JEDEC # MO-220
2. PACKAGE WEIGHT: 14 ± 1 mg
3. ALL DIMENSIONS ARE IN MILLIMETERS

001-09116 *G

Package Information

Table 12. Thermal Impedances by Package

Package	Typical θ_{JA} ^[9]
16-pin QFN	32.7 °C/W

Table 13. Solder Reflow Peak Temperature

Package	Minimum Peak Temperature ^[10]	Maximum Peak Temperature
16-pin QFN	240 °C	260 °C

Notes

9. $T_J = T_A + \text{Power} \times \theta_{JA}$
10. Higher temperatures may be required based on the solder melting point. Typical temperatures for solder are 220 ± 5 °C with Sn-Pb or 245 ± 5 °C with Sn-Ag-Cu paste. Refer to the solder manufacturer specifications.

Appendix

Table 14. Device Features vs. Resistor Configuration Matrix

Features	Comments		Pin Configuration	Device Pin Name
Button Auto Reset	Enabled, Auto Reset Period = 5 ms		Ground / Floating	ARST
	Enabled, Auto Reset Period = 20 ms		5.1 kΩ (±5%) to ground	
	Disabled		VDD	
LED ON Time	0 ms		Ground	Delay
	20 ms		120 Ω (±1%) to ground	
	40 ms		200 Ω (±1%) to ground	
	60 ms		280 Ω (±1%) to ground	
	
	1980 ms		7060 Ω (±1%) to ground	
	2000 ms		8040 Ω (±1%) to ground	
	2000 ms		> 8040 Ω (±1%) to ground	
	2000 ms		VDD / Floating	
Toggle ON/OFF / Flanking Sensor Suppression (FSS)	Toggle ON/OFF	FSS		Toggle/FSS
	Disabled	Disabled	Ground / Floating	
	Enabled	Disabled	1.5 kΩ (±5%) to ground	
	Disabled	Enabled	5.1 kΩ (±5%) to ground	
	Enabled	Enabled	VDD	

Table 15. ScanRate/Sleep Pin Hardware Configuration

Resistor R (1%) in ohms	Approximate ScanRate (in ms)	Resistor R (1%) in ohms	Approximate ScanRate (in ms)
60	20	4060	209
185	22	4185	217
310	24	4310	226
435	27	4435	235
560	30	4560	244

3935	200	7935	531

Acronyms

Acronym	Description
AC	alternating current
AI	analog input
AIO	analog input/output
AIDO	analog input/digital output
DO	digital output
P	power pins
C _F	finger capacitance
C _P	parasitic capacitance
CS	capsense
FSS	flanking sensor suppression
GPO	general purpose output
LSB	least significant bit
MSB	most significant bit
PCB	printed circuit board
POR	power on reset
POST	power on self test
RF	radio frequency

Document Conventions

Units of Measure

Symbol	Unit of Measure
°C	degree Celsius
kΩ	kilohm
μA	microampere
μs	microsecond
mA	milliampere
ms	millisecond
mV	millivolt
nA	nanoampere
Ω	ohm
pF	picofarad
V	volt

Numeric Naming

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (for example, '01010100b' or '01000011b'). Numbers not indicated by an 'h', 'b', or 0x are decimal.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
