Low Dropout Linear Regulator

FEATURES

- Low Dropout Voltage of 130mV at 100mA Output Current (AIC2951/2951D-50).
- Guaranteed 150mA /300mA Output Current.
- Internal 1.3Ω P-MOSFET Draws no Base Current.
- Low Ground Current at 55μA.
- 1% Accuracy Output of 3V/3.3V/5V.
- Error Flag Warns of Output Dropout.
- 1μA Supply Current in Shutdown Mode.
- Output Programmable from 1.235V~11V.
- Fast Transient Response.
- Needs only 1μF for Stability.
- Current and Thermal Limiting.

APPLICATIONS

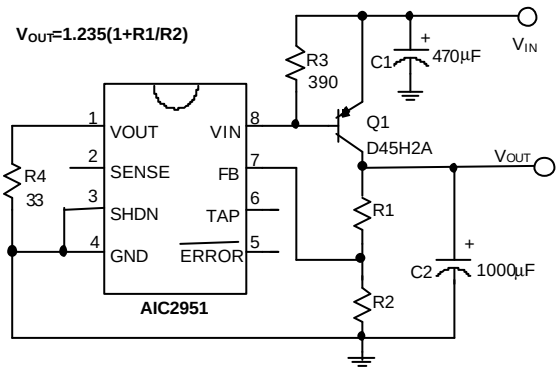

- Voltage Regulator for Pentium® CPUs.
- Wireless Communication System.
- Battery Powered Systems.

DESCRIPTION

The AIC2951/ 2951D series is the enhanced CMOS version of the LP2951. The superior characteristics of the AIC2951/ 2951D series include zero base current loss, very low dropout voltage, and 1% accuracy output voltage. Typical ground current remains approximately 55μA, from no load to maximum loading conditions. Dropout voltage at 100mA output current is significantly lower than its bipolar counterpart: 130mV for the AIC2951-50/2951D-50, 180mV for the AIC2951-33/ 2951D-33, and 200mV for the AIC2951-30/ 2951D-30. Output current limiting and thermal limiting are built in to provide maximal protection to the AIC2951/2951D series from fault conditions.

An error flag output, indicating when output voltage drops out of regulation, often due to the falling batteries on the input, can be used for a power-on reset. A logic-controlled shutdown input enables the regulator to be switched on and off. The part may be configured for a fixed output voltage or programmed from 1.235V to 11V with an external pair of resistors. The part comes in 8-pin DIP or SO packages.

Note 1: Guaranteed by design.
Note 2: Regulation is measured at constant junction temperature, using pulse testing with a low ON time.
Note 3: Current limit is measured by pulsing a short time.
Note 4: Dropout voltage is defined as the input to output differential at which the output voltage drops 100mV below the value measured with a 1V differential.

PIN DESCRIPTIONS

PIN 1: VOUT - Output pin.

PIN 2: SENSE -Remote sense input, connected to internal resistor divider.

PIN 3: SHDN - Shutdown input.

PIN 4: GND - Power GND.

PIN 5: $\overline{\text{ERROR}}$ - Open drain output of error flag warns.

PIN 6: TAP - Center output of internal resistor divider.

PIN 7: FB - Error amplifier positive feedback (see Block Diagram)

PIN 8: VIN - Power supply input

APPLICATION INFORMATIONS

Output Filter Capacitors

A 1μF (or greater) capacitor is required between the AIC2951/AIC2951D output and ground for stability. Without this capacitor the part will oscillate. Even though most types of capacitor may work, if Aluminum electrolytic type is used, the equivalent series resistance (ESR) should be held to 5Ω or less. Many Aluminum electrolytics have electrolytes that freeze at about -30°C, so solid tantalums are recommended for operation below -25°C. The value of this capacitor may be increased without limit.

The output capacitance required for stability varies with output voltage (smaller for higher output voltage) and output current (smaller for lower output currents). At the worst-case situation of a 150mA load at 1.235V output (output shorted to FB pin) a 3.3 μF or greater capacitor should be used.

A 0.1μF capacitor should be placed from the AIC2951/2951D input to ground if the lead inductance between the input and power source exceeds 500nH (approximately 10 inches of trace). Noise injection into the feedback terminal of the AIC2951/2951D from nearby noise sources can also upset the output. This may especially be a problem when using high value external resistors to set the output voltage. Adding a 100pF capacitor between output and feedback and increasing the output capacitor to at least 3.3μF will cure this problem.

Programming the Output Voltage

The AIC2951/2951D series can be set to deliver any output voltage from 1.235V to 11V by using an external voltage divider. In addition, internal voltage

dividers are provided for 3.0V/3.3V/5.0V output versions. To use the internal voltage divider, connect the SENSE pin to output and the TAP pin to the FB pin. When using an external divider the SENSE and TAP pins are left open, and the divider is installed from the output to ground, with its center connected to the FB pin (see Fig. 1). When using an external voltage divider, resistance can be calculated from the following formula:

$$V_{OUT} = V_{REF} \times (1 + \frac{R1}{R2}) + I_{FB} \times R1$$

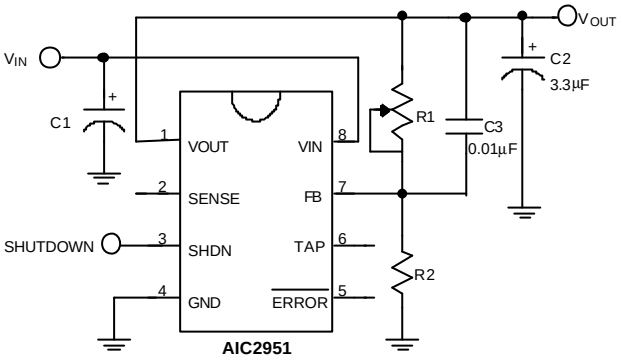

Fig. 1 Adjustable Regulator

Where V_{REF} is the nominal 1.235V reference voltage and I_{FB} is the feedback pin bias current, nominally -20nA. The minimum recommended load current of 1µA forces an upper limit of 1.2MΩ on the value of R2. Using a 1.2MΩ resistor for R2, the bias current will already cause a 2% shift in output voltage. For better accuracy, choosing R2=100KΩ reduces this error to 0.17% at the price of merely increasing the resistor programming current to 12µA.

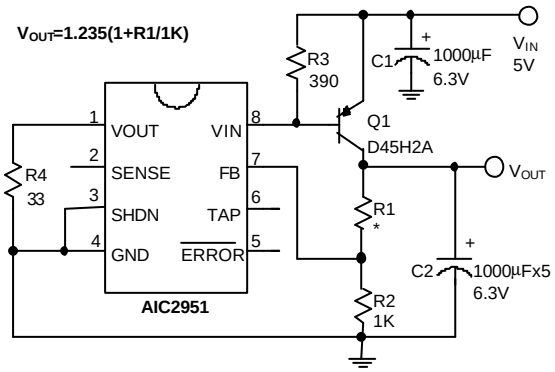

Reducing Output Noise

In reference applications it may be advantageous to reduce the AC noise present at the output. One method is to reduce the regulator bandwidth by increasing the size of the output capacitor. Another, noise can be reduced by bypassing the upper resistor in the feedback divider with a small capacitor, since the capacitor provides a more direct path for AC feedback. The size of this capacitor can be calculated from the formula:

$$C_{BYPASS} \cong 1/(2\pi \times R1 \times f_{CORNER})$$

Where R_1 is the upper resistor of the feedback divider and f_{CORNOR} is the frequency above which the increased AC feedback is to become active. The reduction of the output noise at high frequency will be proportional to the ratio of the two resistors in the feedback divider, R2/(R1+R2). In order to maintain regulator stability when using a noise-reducing bypass capacitor, it will also be necessary to increase the size of the output filter capacitor by the same ratio.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
