RP502x SERIES

Step-down DC/DC Converter with Synchronous Rectifier

NO.EA-189-160706

OUTLINE

The RP502x Series are CMOS-based step-down DC/DC converters with synchronous rectifier.

Each of these ICs consists of an oscillator, a reference voltage unit, an error amplifier, a switching control circuit, a soft-start circuit, protection circuits, an UVLO circuit, and switching transistors. By adopting the synchronous rectification with built-in switching transistors, high efficient step-down DC/DC converter can be composed of only an inductor and capacitors.

As protection circuits, the current limit circuit and the latch protection circuit are built into the ICs. The current limit circuit controls the peak current of L_X at each clock cycle. Latch protection circuit maintains the built-in driver in OFF state if the load current exceeds the limit value for a certain period of time. To cancel the latch protection, disable the ICs with a chip enable circuit and then enable it again or make the power supply voltage lower than UVLO.

The setting voltage for the RP502x Series is the output voltage fixed type with built-in feedback resistance that is adjustable in 0.1V step with the accuracy of ± 1.5% or ±24mV. The packages for the ICs are WLCSP-6-P2 and DFN1616-6, which enable the high-density mounting. The switching mode for the ICs is selectable from the PWM/VFM auto switching type, which achieves the high efficiency at the light load condition or PWM fixed type, which switches at the fixed frequency.

FEATURES

- Supply Current ....Typ. 750μA (at normal)
  Typ. 180μA (at light road)
- Input Voltage Range ....2.5V to 5.5V(V_{OUT}≥1.0V)
  2.5V to 4.5V(V_{OUT}<1.0V)
- Absolute Maximum Ratings 6.0V
- Output Voltage Range...0.8V to 3.3V (0.1V steps)
- Output Voltage Accuracy.......................................±1.5% (V_{OUT}≥1.6V)
  ±24mV (V_{OUT}<1.6V)
- Oscillator Frequency ....Typ. 3.3MHz
- Maximum Duty ....Min. 100%
- Built-in Driver ON Resistance ....Typ. Pch. 0.5Ω, Nch. 0.5Ω(V_{IN}=3.6V)
- UVLO Detector Threshold......................................Typ. 2.2V
- Soft Start Time...Typ. 0.12ms
- Lx Current Limit...Typ. 900mA(V_{OUT}≥1.2V)
  Typ. 800mA(V_{OUT}<1.2V)
- Latch type Protection Circuit ....Typ. 1.5ms
- Chip Enable Function.."H" Active
- Packages WLCSP-6-P2, DFN1616-6
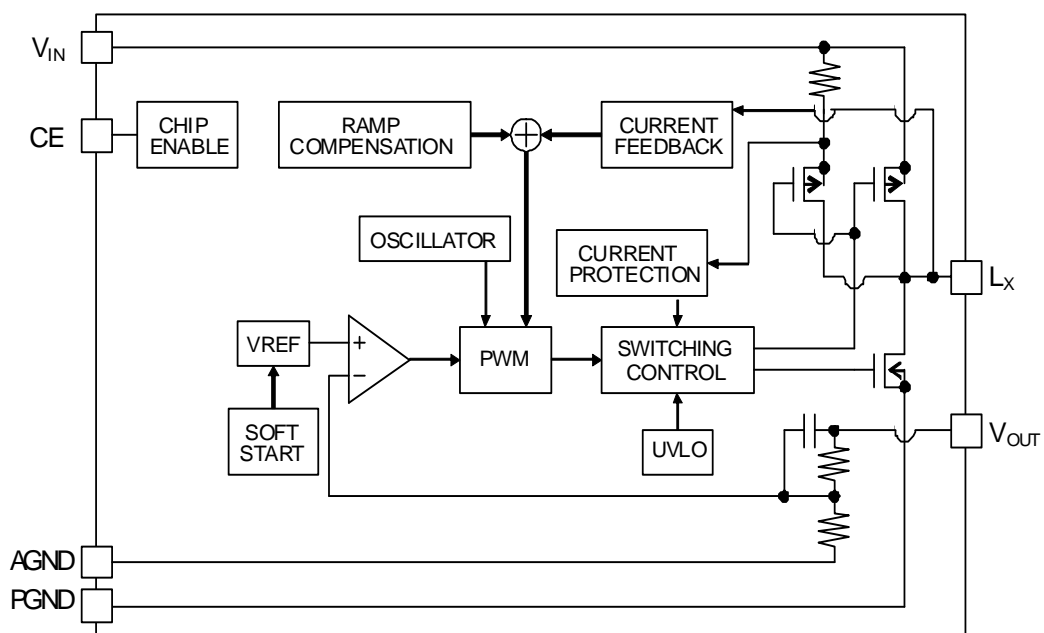

APPLICATIONS

- Power source for battery-powered equipments.
- Power source for hand-held communication equipments, cameras, VCRs, camcorders.
- Power source for HDDs, portable equipments.

SELECTION GUIDE

In the RP502 Series, output voltage, switching mode, and auto discharge function for the ICs are selectable at the user's request.

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
RP502Zxx∗B-E2-F	WLCSP-6-P2	5,000 pcs	Yes	Yes
RP502Lxx∗B-TR	DFN1616-6	5,000 pcs	Yes	Yes

xx: The output voltage can be designated in the range of 0.8V(08) to 3.3V(33) in 0.1V steps[∗1].
  (For other voltages, please refer to MARK INFORMATIONS.)

∗ : The switching mode and auto discharge function can be designated as shown below.

Code	PWM/VFM auto switching	Auto discharge function
1	Yes	No
2	No	No
3	Yes	Yes
4	No	Yes

Auto-discharge function quickly lowers the output voltage to 0V, when the chip enable signal is switched from the active mode to the standby mode, by releasing the electrical charge accumulated in the external capacitor.

∗1) 0.05V step is also available as a custom code.

Tstg	Storage Temperature Range	-55 to 125	°C

∗) For Power Dissipation, please refer to PACKAGE INFORMATION.

ABSOLUTE MAXIMUM RATINGS
Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the lifetime and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)
All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

TECHNICAL NOTES

When using the R502x Series, consider the following points:

· Set AGND in the same level as PGND.
· Set external components such as an inductor, C_{IN}, and C_{OUT} as close as possible to the ICs. V_{IN}, C_{IN} and PGND have to be wired as close as possible. If the impedances of V_{IN} line and PGND line are high, the switching current will fluctuate the electric potential of the inside the ICs. As a result, the operation may become unstable. The impedances of power supply line and PGND line must be as low as possible. Please note that a large current caused by the switching current flows into V_{IN}, PGND, Inductor, L_X, and V_{OUT}. Separate the wiring between V_{OUT} pin and inductor from the wiring of load.
· For C_{IN}, use a ceramic capacitor with a low ESR. The recommended condenser capacity for C_{IN} is 4.7μF or more. Also, the recommended condenser capacity for C_{OUT} is 4.7μF.
· Choose an inductor from the range of 1.0 to 2.2μH. The internal phase compensation has been determined based on the above-mentioned inductor value and the C_{OUT} value. For stable operation, these conditions are necessary. Choose an inductor that is low DC resistance, has enough permissive current, and is strong against magnetic saturation. Decide the inductance value with consideration of the load current under the condition of use. If the inductance value is low, the peak value of L_X current may increase along with the increase of the load current. As a result, the peak value of L_X may reach to the "L_X Limit Current" and may trigger the overcurrent protection circuit.
· Please note that overcurrent protection circuit may be affected by self-heating and heat radiation environment.

∗ The performance of power source circuits using these ICs largely depends upon the peripheral circuits.
 Pay attention to the setting of the peripheral components. In particular, when designing the peripheral circuit, the constant values (voltage, current and power) for each part, PCB pattern and the ICs should not be exceeded.

Operation of step-down DC/DC converter and Output Current

The step-down DC/DC converter charges energy in the inductor when the Lx transistor is turned on, and discharges the energy when the Lx transistor is turned off. The step-down DC/DC converter also controls with the less energy loss and supplies the lower output voltage than the input voltage. The operation of the DC/DC converter will be explained with the following diagrams:

<Basic Circuit>   **<Inductor Current >**
· Step 1: Pch Tr. turns on and current IL (=i1) flows. Then, L and CL are charged with energy. At this moment, IL (=i1) increases from ILmin (=0) to ILmax in proportion to the On-time period (ton) of Pch Tr.
· Step 2: When Pch Tr. turns off, Synchronous rectifier Nch Tr. turns on and IL(=i2) flows in order to maintain IL at ILmax.
· Step 3: IL (=i2) starts to decrease gradually when topen time period starts. IL reaches to ILmin (IL=ILmin=0) when topen time period ends and then Nch Tr. turns off. In the continuous mode, toff time period runs out before IL becomes ILmin (IL=ILmin=0). The next cycle starts. Pch Tr. turns on and Nch Tr, turns off. Since toff time period runs out before IL becomes ILmin (IL=ILmin=0), ILmin (>0) is still remaining. In this case, IL starts increasing from ILmin (>0).

In the case of PWM control system, the output voltage is maintained constant by keeping the switching time (fosc) per unit constant, and by controlling the On-time period (ton).

When the step-down operation is constant and stable, as shown in the above "Inductor Current", the maximum inductor current (ILmax) will be same as the on-time period of Pch Tr. (ton) and the minimum inductor current (ILmin) will be same as the on-time period of Pch Tr. (toff).
The difference between ILmax and ILmin is described as ΔI:

$$\Delta I = ILmax - ILmin = V_{OUT} \times topen / L = (V_{IN} - V_{OUT}) \times ton / L \quad .... Equation 1$$

Wherein,
$$T = 1 / fosc = ton + toff$$
$$duty\ (\%) = ton / T \times 100 = ton \times fosc \times 100$$
$$topen \leqq toff$$

In Equation 1, "$V_{OUT} \times topen / L$" shows the amount of current change at the on-time. "$(V_{IN} - V_{OUT}) \times ton / L$" shows the amount of current change at the off-time".

RICOH

Discontinuous mode and Continuous mode

As the following diagram shows, when the output current (I_{OUT}) is relatively small, topen will be smaller than toff (topen < toff). In this case, the all energy charged in the inductor during the time period of ton will be discharged during the time period of toff. As a result, IL will be ILmin (=0). If I_{OUT} is gradually increased, eventually topen will be equal to toff (topen=toff). If I_{OUT} is further increased, ILmin will be larger than zero (ILmin>0). The former mode (topen<toff) is referred to as "discontinuous mode" and the latter mode (topen=toff) is referred to as "continuous mode".

Discontinuous mode   **Continuous mode**
In the continuous mode, solve the equation 1 for ton, and assume that the solution is tonc.

$$tonc = T \times V_{OUT} / V_{IN} \quad .... \text{Equation 2}$$

If ton is smaller than tonc (ton<tonc), it is discontinuous mode. If ton is equal to tonc (ton=tonc), it is continuous mode.

RICOH

13

Output Current and selection of External components

The relation between the output current and external components is as follows:

When Pch Tr. of L_X is turned on:

(Ripple Current p-p value is described as I_{RP}, On Resistances of Pch Tr. and Nch Tr. are respectively described as R_{ONP} and R_{ONN}. Also, the DC resistor of the inductor is described as R_L.)

The time period of L_X Pch Tr. being "ON" is described as ton.

$$V_{IN} = V_{OUT} + (R_{ONP} + R_L) \times I_{OUT} + L \times I_{RP} / ton \dots\dots\dots\dots\dots\dots\text{Equation 3}$$

The time period of Lx Pch Tr. being "OFF" is described as toff. (Nch Tr. is "ON"):

$$L \times IRP / toff = R_{ONN} \times I_{OUT} + V_{OUT} + R_L \times I_{OUT} \dots\dots\dots\dots\dots\dots\text{Equation 4}$$

Substitute Equation 4 into Equation 3 to solve for ON duty of Pch Tr.: (D_{ON} = ton / (toff + ton).

$$D_{ON} = (V_{OUT} + R_{ONN} \times I_{OUT} + R_L \times I_{OUT}) / (V_{IN} + R_{ONN} \times I_{OUT} - R_{ONP} \times I_{OUT}) \dots\dots\text{Equation 5}$$

Ripple Current is solved by the following equation:

$$I_{RP} = (V_{IN} - V_{OUT} - R_{ONP} \times I_{OUT} - R_L \times I_{OUT}) \times D_{ON} / fosc / L \dots\dots\dots\dots\text{Equation 6}$$

Wherein, peak current that flows through L and L_X Tr. is solved by the following equation:

$$ILxmax = I_{OUT} + I_{RP} / 2 \dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\text{Equation 7}$$

It is necessary to consider ILxmax when deciding the input/output conditions and selecting the peripheral components.

∗The above calculation is based on the ideal operation of the ICs in continuous mode.

RICOH

TIMING CHART
(1) Soft-Start Time

● **In the case of starting the ICs with CE**

The ICs start to operate when the CE pin voltage (V_{CE}) exceeds the threshold voltage. The threshold voltage is set between CE "H" input voltage (V_{CEH}) and CE "L" input voltage (V_{CEL}).

When the ICs start to operate, the soft-start circuit also starts to operate. After a certain period of time, the reference voltage (V_{REF}) of the inside the ICs gradually rise up to the specified value.
Soft-start time is the time period from when the soft-start circuit started to when the reference voltage reached to the specified value.

∗ Soft-start time may not always equal to the actual start-up time of DC/DC converter.
Start-up peed could be affected by the power supply capacity, the output current value, the inductor value and capacitor value.

● **In the case of starting with power supply**

After starting up with power supply, the ICs starts to operate when the input voltage (V_{IN}) exceeds the UVLO released voltage (V_{UVL02}). The soft-start circuit starts to operate and then the reference voltage (V_{REF}) of the inside the ICs gradually rise up to the specified value.

Soft-start time is the time period from when the soft-start circuit started to when the reference voltage reached to the specified value.
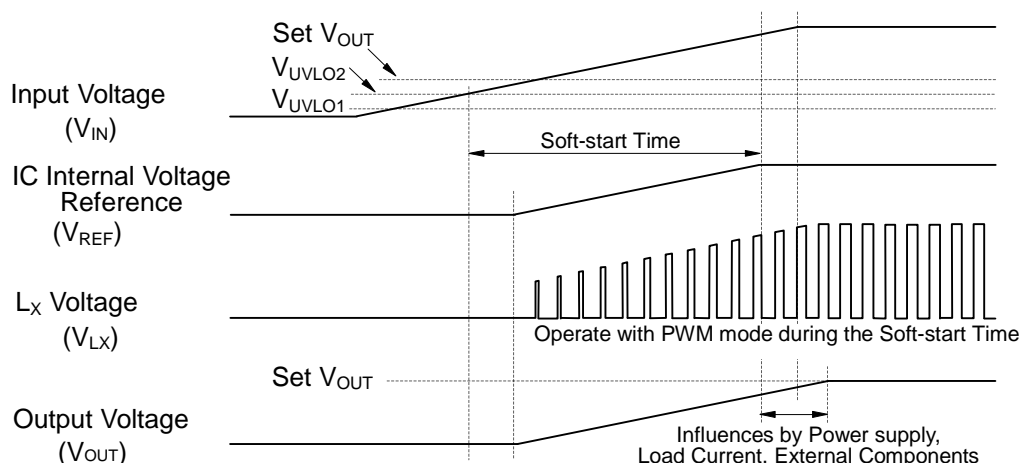

∗The start-up speed of the output voltage could be affected by the following elements.
(a) The start-up speed of the input voltage (V_{IN}), which is determined by the power supply for the ICs and also by the input capacitor (C_{IN}).
(b) The output capacitor (C_{OUT}) value and the output current value.

RICOH

15

(2) Under Voltage Lockout (UVLO) Circuit

The step-down DC/DC converter stops and ON duty becomes 100%, if input voltage (V_{IN}) becomes less than the set output voltage (Set V_{OUT}), the output voltage (V_{OUT}) gradually drops according to the input voltage (V_{IN}).

If the input voltage drops more and becomes less than UVLO detector threshold (V_{UVLO1}), the under voltage lockout circuit (UVLO) operates, the IC internal reference voltage (V_{REF}) stops, switching transistors turn off and the output voltage drops according to the load and output capacitor C_{OUT} value.

To restart the normal operation, the input voltage (V_{IN}) must be more than the UVLO released voltage (V_{UVLO2}).

The timing chart below describes the operation with varying the input voltage (V_{IN}).
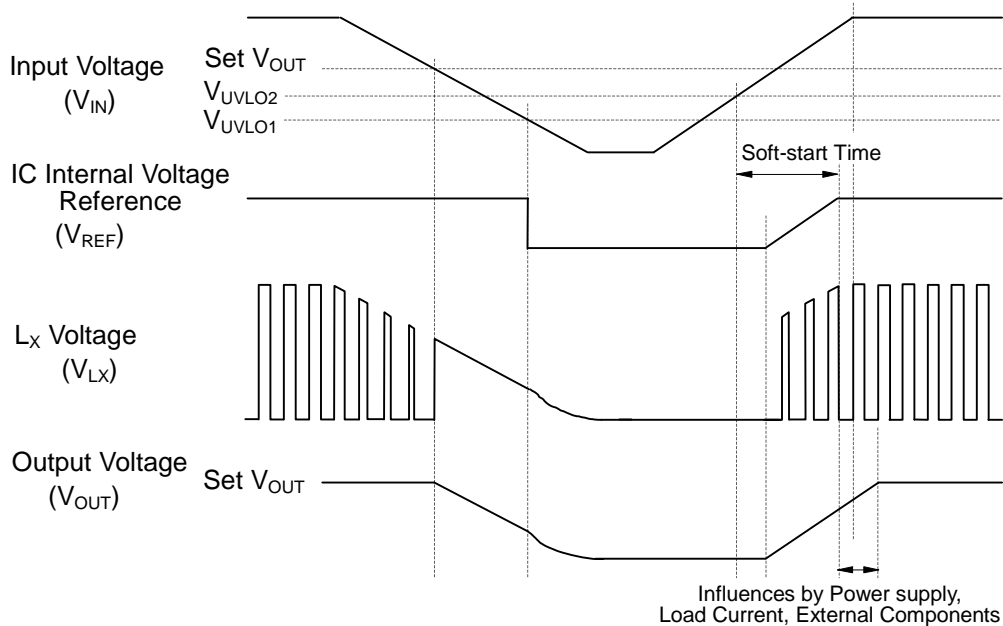

* The start-up speeds of V_{OUT} at operation and recovery or the default voltage and the output current of C_{OUT}. Could affect on the waveform in the above chart. Therefore, the actual waveform could be slightly different from the waveform in the above chart.

RICOH

(3) Overcurrent Protection Circuit, Latch Type Protection Circuit

Overcurrent protection circuit supervises the peak current of the inductor (The current passing through Pch Tr.) at each switching cycle. If the peak current exceeds the L_X current limit (I_{LXLIM}), the overcurrent protection circuit turns off the Pch transistor. The L_X current limit of the RP502x Series is set at Typ. 900mA ($V_{OUT} \geq 1.2V$), and Typ. 800mA ($V_{OUT} < 1.2V$).

Latch type protection circuit latches the built-in driver in OFF state to stop the operation of the ICs if the overcurrent status continues more than the protection delay time (tprot).

∗L_X limit current (I_{LXLIM}) and the protection delay time (tprot) could be easily affected by self-heating and ambient environment. The drastic drop of input voltage (V_{IN}) or the unstable input voltage caused by the short-circuiting in the output (V_{OUT}) may affect on the protection operation and the delay time.
To release the latch type protection circuit, reset the ICs by inputting "L" into CE pin or make the input voltage lower than the UVLO detector threshold (V_{UVLO1}).

As the following timing chart shows, the changing process of input voltage flows as follows: start-up, stable operation, high load condition, CE reset, stable operation, input voltage drop, input voltage recovery, and stable operation.

If the ICs enters the high load condition due to short-circuit or such, after the protection delay time (tprot), the built-in driver is latched in OFF state. V_{LX} becomes "L" and then the output voltage turns off. There are two ways of releasing the latch type protection: CE reset and UVLO reset.

(1) CE reset makes the CE signal to "L" once and then turns the CE signal back to "H" again.

(2) UVLO rest makes the input voltage lower than the UVLO voltage (V_{UVLO1}).

RP502x121B/123B

V_IN=3.6V

Output Current 200mA --> 500mA

Output Voltage

RP502x121B/123B

V_IN=3.6V

Output Current 500mA --> 200mA

Output Voltage

RP502x181B/183B

V_IN=3.6V

Output Current 1mA --> 300mA

Output Voltage

RP502x181B/183B

V_IN=3.6V

Output Current 300mA --> 1mA

Output Voltage

RP502x181B/183B

V_IN=3.6V

Output Current 200mA --> 500mA

Output Voltage

RP502x181B/183B

V_IN=3.6V

Output Current 500mA --> 200mA

Output Voltage

RICOH

27

RP502x182B/184B

V_{IN}=3.6V

Output Current 1mA --> 300mA

Output Voltage

RP502x182B/184B

V_{IN}=3.6V

Output Current 300mA --> 1mA

Output Voltage

RP502x182B/184B

V_{IN}=3.6V

Output Current 200mA --> 500mA

Output Voltage

RP502x182B/184B

V_{IN}=3.6V

Output Current 500mA --> 200mA

Output Voltage

RP502x332B/334B

V_{IN}=5.0V

Output Current 1mA --> 300mA

Output Voltage

RP502x332B/334B

V_{IN}=5.0V

Output Current 300mA --> 1mA

Output Voltage

RICOH

RP502x332B/334B

V_{IN}=5.0V

Output Current 200mA --> 500mA

Output Voltage

Output Voltage V_{OUT} (V) / Output Current I_{OUT} (mA) / Time t (µs)

RP502x332B/334B

V_{IN}=5.0V

Output Current 500mA --> 200mA

Output Voltage

Output Voltage V_{OUT} (V) / Output Current I_{OUT} (mA) / Time t (µs)

RICOH

RoHS Compliant
Halogen Free

Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment.
Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012.

Sales & Support Offices

Ricoh Electronic Devices Co., Ltd.
Shin-Yokohama Office (International Sales)
2-3, Shin-Yokohama 3-chome, Kohoku-ku, Yokohama-shi, Kanagawa, 222-8530, Japan
Phone: +81-50-3814-7687 Fax: +81-45-474-0074

Ricoh Americas Holdings, Inc.
675 Campbell Technology Parkway, Suite 200 Campbell, CA 95008, U.S.A.
Phone: +1-408-610-3105

Ricoh Europe (Netherlands) B.V.
Semiconductor Support Centre
Prof. W.H. Keesomlaan 1, 1183 DJ Amstelveen, The Netherlands
Phone: +31-20-5474-309

Ricoh International B.V. - German Branch
Semiconductor Sales and Support Centre
Oberrather Strasse 6, 40472 Düsseldorf, Germany
Phone: +49-211-6546-0

Ricoh Electronic Devices Korea Co., Ltd.
3F, Haesung Bldg, 504, Teheran-ro, Gangnam-gu, Seoul, 135-725, Korea
Phone: +82-2-2135-5700 Fax: +82-2-2051-5713

Ricoh Electronic Devices Shanghai Co., Ltd.
Room 403, No.2 Building, No.690 Bibo Road, Pu Dong New District, Shanghai 201203, People's Republic of China
Phone: +86-21-5027-3200 Fax: +86-21-5027-3299

Ricoh Electronic Devices Shanghai Co., Ltd.
Shenzhen Branch
1205, Block D(Jinlong Building), Kingkey 100, Hongbao Road, Luohu District, Shenzhen, China
Phone: +86-755-8348-7600 Ext 225

Ricoh Electronic Devices Co., Ltd.
Taipei office
Room 109, 10F-1, No.51, Hengyang Rd., Taipei City, Taiwan (R.O.C.)
Phone: +886-2-2313-1621/1622 Fax: +886-2-2313-1623

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
