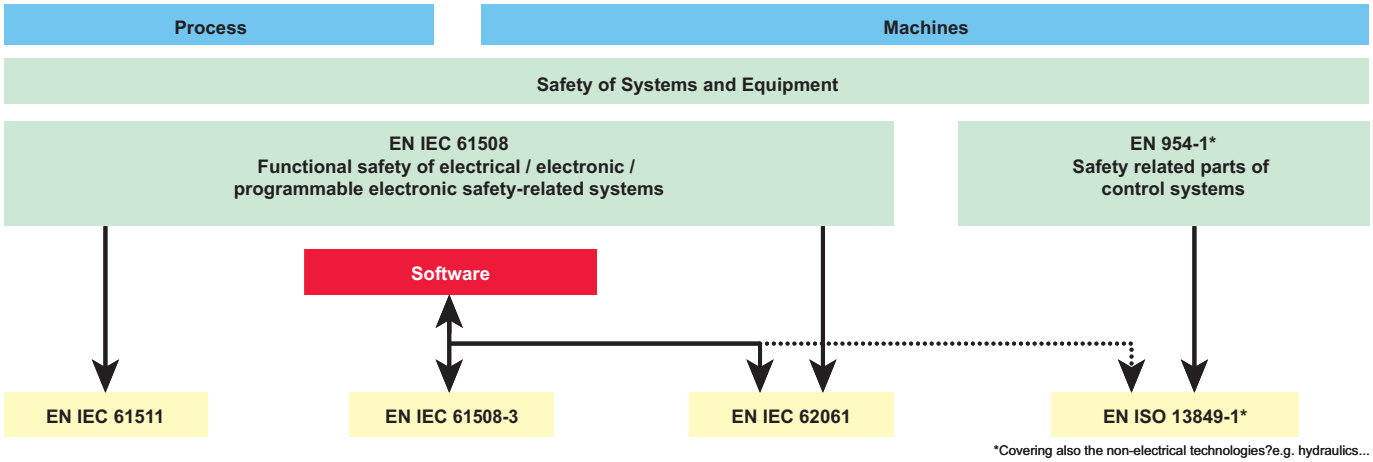
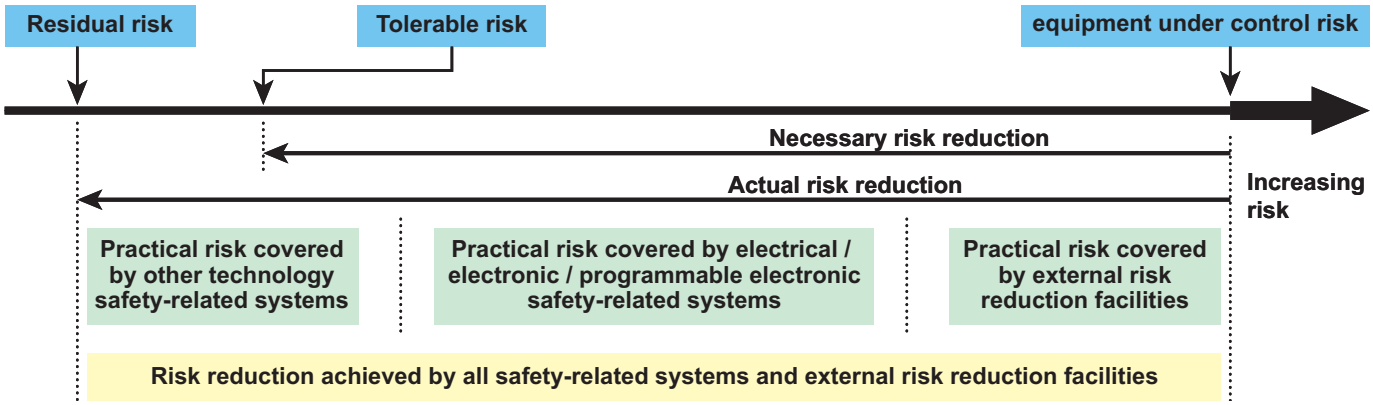
Functional Safety and Safety Integrity Level (SIL)



Risk reduction according to EN IEC 61508

- **Safety** is achieved by risk reduction (for those hazards that cannot be designed-out).
- **Residual risk** is the risk remaining after protective measures have been taken.
- **Protective measures** realised by E/E/PE safety related systems contribute to risk reduction.



For machinery, the probability of dangerous failures per hour of a control system is denoted in EN IEC 62061 as the PFHD

- The rate of failures λ can be expressed as follows:

$$\lambda = \lambda_s + \lambda_{dd} + \lambda_{du}$$

- The calculation of the PFHD for a system or subsystem depends on several parameters:
  - the dangerous failure rate (λ_d) of the subsystem elements
  - the fault tolerance (e.g. redundancy) of the system
  - the diagnostic test interval (T2)
  - the proof test interval (T1) or lifetime whichever is smaller
  - the susceptibility to common cause failures (β)
- For each of the four different logical architectures A to D there is a different formula to calculate the PFHD. (see EN IEC 62061)
  (The principal relationship is: PFHD = λ_d x 1h)

λ_s = rate of safe failures,
λ_{dd} = rate of detected dangerous failures,
λ_{du} = rate of undetected dangerous failures

In practice, detected dangerous failure are dealt with by fault reaction functions

Safety integrity level **SIL**	High demand or continuous mode of operation (Probability of a dangerous failure per hour) **PFHD**
3	10^{-8} to < 10^{-7}
2	10^{-7} to < 10^{-6}
1	10^{-6} to < 10^{-5}

Machinery: Risk estimation and SIL assignment of EN IEC 62061
Given as an example in an informative Annex

Risk related to the identified hazard = **Severity of the possible harm** **and**

Comments

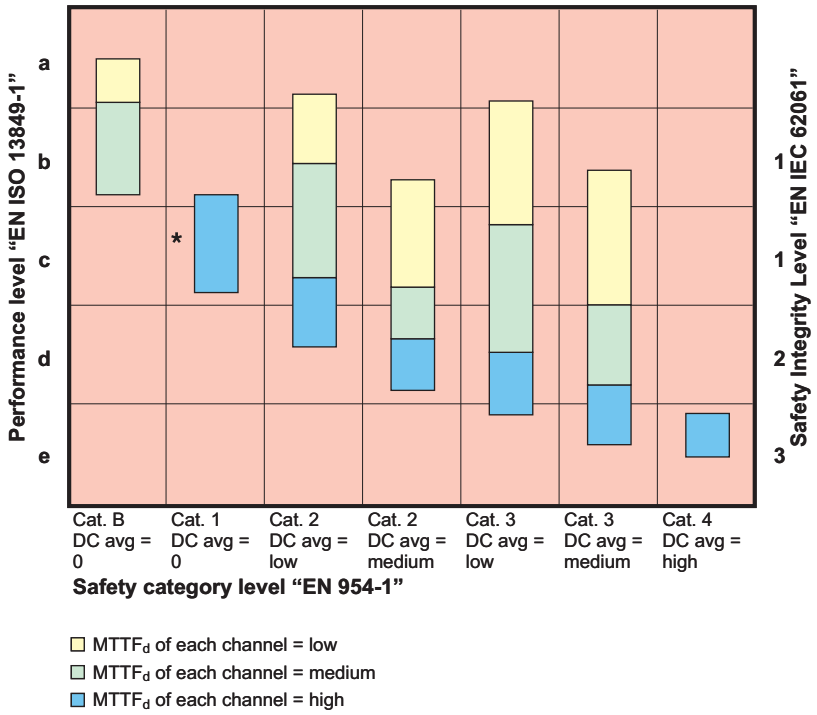
Safety of Machinery: *EN ISO 13849-1, definition of $MTTF_d$

■ **The parameter for the failure rate in EN ISO 13849-1 is the Mean Time To Failure (MTTF). This time value indicates the number of years in which the first failure probably occurs.**

- **MTTF = mean time to failure** [years]
  – The mean time after installation of devices to any first failure.
  – The general relation between λ and MTTF is:

$$MTTF = 1/\lambda$$

- **MTBF = mean time between failures**
  – Not relevant for devices which are not repaired.
- **$MTTF_d$ = mean time to *dangerous* failure**
  – The $MTTF_d$ is defined in EN ISO 13849-1 as the expectation of the mean time to dangerous failure of a safety related part of a control system.



* In several application the realisation of performance level c by category 1 may not be sufficient. In this case a higher category e.g. 2 or 3 should be chosen.

Safety of Machinery: *EN ISO 13849-1 Risk graph and parameters

S = Severity of injury

S1 = Slight (normally reversible injury)
S2 = Serious (normally irreversible) injury including death

F = Frequency and/or exposure time to the hazard

F1 = Seldom to less often and/or the exposure time is short
F2 = Frequent to continuous and/or the exposure time is long
