

## FEATURES

- SPI interface**
- Supports daisy-chain mode**
- $9.5 \Omega$  on resistance @  $25^\circ C$**
- $1.6 \Omega$  on-resistance flatness**
- Fully specified at  $\pm 15 V$ ,  $+12 V$ ,  $\pm 5 V$**
- 3 V logic-compatible inputs**
- Rail-to-rail operation**
- 24-lead TSSOP and 24-lead  $4 \text{ mm} \times 4 \text{ mm}$  LFCSP**

## APPLICATIONS

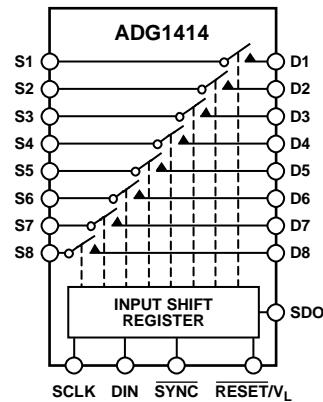

- Automatic test equipment**
- Data acquisition systems**
- Battery-powered systems**
- Sample-and-hold systems**
- Audio signal routing**
- Video signal routing**
- Communication systems**

## GENERAL DESCRIPTION

The ADG1414 is a monolithic complementary metal-oxide semiconductor (CMOS) device containing eight independently selectable switches designed on an industrial CMOS (iCMOS<sup>®</sup>) process. iCMOS is a modular manufacturing process combining high voltage CMOS and bipolar technologies. iCMOS components can tolerate high supply voltages while providing increased performance, dramatically lower power consumption, and reduce the package size.

The ADG1414 is a set of octal SPST (single-pole, single-throw) switches controlled via a 3-wire serial interface. On resistance is closely matched between switches and is very flat over the full signal range. Each switch conducts equally well in both directions and the input signal range extends to the supplies.

## FUNCTIONAL BLOCK DIAGRAM

08497-001

Figure 1.

Data is written to these devices in the form of eight bits; each bit corresponds to one channel.

The ADG1414 utilizes a versatile 3-wire serial interface that operates at clock rates of up to 50 MHz and is compatible with standard SPI, QSPI™, MICROWIRE™, and DSP interface standards. The output of the shift register, SDO, enables a number of these parts to be daisy chained.

On power-up, all switches are in the off condition, and the internal registers contain all zeros.

## PRODUCT HIGHLIGHTS

1. 50 MHz serial interface.
2.  $9.5 \Omega$  on resistance.
3.  $1.6 \Omega$  on-resistance flatness.
4. 24-lead TSSOP and  $4 \text{ mm} \times 4 \text{ mm}$  LFCSP packages.

5 V Dual Supply					
24-Lead TSSOP ( $\theta_{JA} = 112.6^\circ\text{C}/\text{W}$ )	122	76	43	mA max	V <sub>DD</sub> = +4.5 V, V <sub>SS</sub> = -4.5 V
24-Lead LFCSP ( $\theta_{JA} = 30.4^\circ\text{C}/\text{W}$ )	214	114	51	mA max	

<sup>1</sup> Guaranteed by design, not subject to production test.

## TIMING CHARACTERISTICS

All input signals are specified with  $t_R = t_F = 1 \text{ ns/V}$  (10% to 90% of  $V_{DD}$ ) and timed from a voltage level of  $(V_{IL} + V_{IH})/2$  (see Figure 2).  $V_{DD} = 4.5 \text{ V}$  to  $16.5 \text{ V}$ ;  $V_{SS} = -16.5 \text{ V}$  to  $0 \text{ V}$ ;  $V_L = 2.7 \text{ V}$  to  $5.5 \text{ V}$  or  $V_{DD}$  (whichever is less);  $\text{GND} = 0 \text{ V}$ ; all specifications  $T_{MIN}$  to  $T_{MAX}$ , unless otherwise noted.<sup>1</sup>

Table 6.

Parameter	Limit at $T_{MIN}, T_{MAX}$	Unit	Conditions/Comments
$t_1^2$	20	ns min	SCLK cycle time
$t_2$	9	ns min	SCLK high time
$t_3$	9	ns min	SCLK low time
$t_4$	5	ns min	$\overline{\text{SYNC}}$ to SCLK active edge setup time
$t_5$	5	ns min	Data setup time
$t_6$	5	ns min	Data hold time
$t_7$	5	ns min	SCLK active edge to $\overline{\text{SYNC}}$ rising edge
$t_8$	15	ns min	Minimum $\overline{\text{SYNC}}$ high time
$t_9$	5	ns min	$\overline{\text{SYNC}}$ rising edge to next SCLK active edge ignored
$t_{10}$	5	ns min	SCLK active edge to $\overline{\text{SYNC}}$ falling edge ignored
$t_{11}^3$	40	ns max	SCLK rising edge to SDO valid
$t_{12}$	15	ns min	Minimum $\overline{\text{RESET}}$ pulse width

<sup>1</sup> Guaranteed by design and characterization, not production tested.

<sup>2</sup> Maximum SCLK frequency is 50 MHz at  $V_{DD} = 4.5 \text{ V}$  to  $16.5 \text{ V}$ ;  $V_{SS} = -16.5 \text{ V}$  to  $0 \text{ V}$ ,  $V_L = 2.7 \text{ V}$  to  $5.5 \text{ V}$  or  $V_{DD}$  (whichever is less);  $\text{GND} = 0 \text{ V}$ .

<sup>3</sup> Measured with the 1 k $\Omega$  pull-up resistor to  $V_L$  and 20 pF load.  $t_{11}$  determines the maximum SCLK frequency in daisy-chain mode.

## ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ , unless otherwise noted.

Table 7.

Parameter	Rating
$V_{DD}$ to $V_{SS}$	35 V
$V_{DD}$ to GND	-0.3 V to +25 V
$V_{SS}$ to GND	+0.3 V to -25 V
$V_L$ to GND	-0.3 V to +7 V
Analog Inputs <sup>1</sup>	$V_{SS} - 0.3 \text{ V to } V_{DD} + 0.3 \text{ V or } 30 \text{ mA}$ , whichever occurs first
Digital Inputs <sup>1</sup>	GND - 0.3 V to $V_L + 0.3 \text{ V or } 30 \text{ mA}$ , whichever occurs first
Continuous Current, Sx or Dx Pins	Table 4 specifications + 15%
Peak Current, Sx or Dx (Pulsed at 1 ms, 10% Duty Cycle Max)	
TSSOP Package	300 mA
LFCSP Package	400 mA
Operating Temperature Range Industrial (B Version)	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C
Junction Temperature	150°C
Reflow Soldering Peak Temperature, Pb free	260°C
Time at Peak Temperature	10 sec to 40 sec

<sup>1</sup> Overvoltages at the analog and digital inputs are clamped by internal diodes. Limit the current to the maximum ratings given.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Only one absolute maximum rating may be applied at any one time.

## THERMAL RESISTANCE

Table 8. Thermal Resistance

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
24-Lead TSSOP <sup>1</sup>	112.6	50	°C/W
24-Lead LFCSP <sup>2</sup>	30.4		°C/W

<sup>1</sup> 4-layer board.

<sup>2</sup> 4-layer board and exposed paddle soldered to  $V_{SS}$ .

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

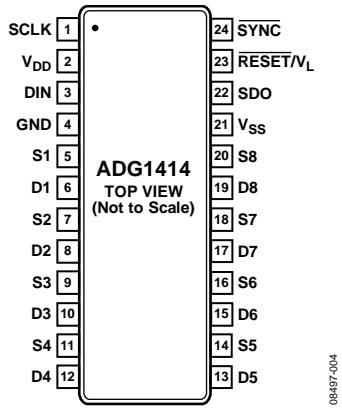

Figure 4. TSSOP Pin Configuration

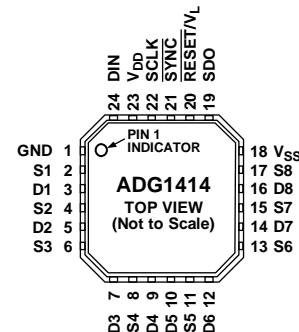

Figure 5. LFCSP Pin Configuration

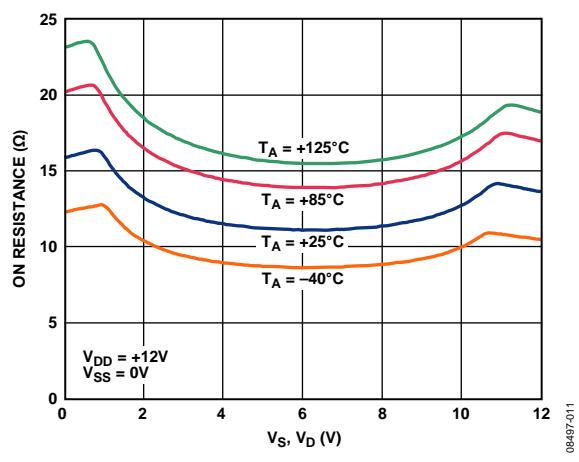

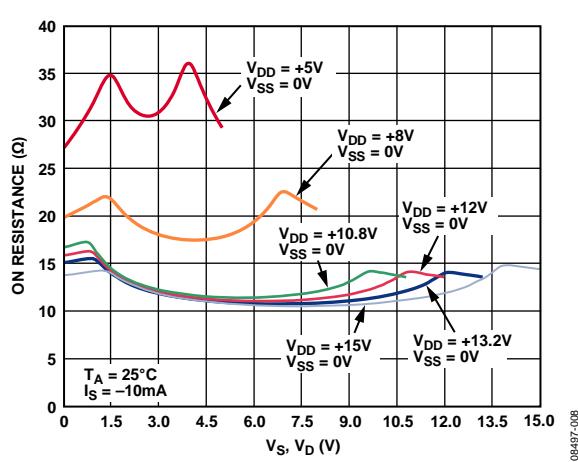

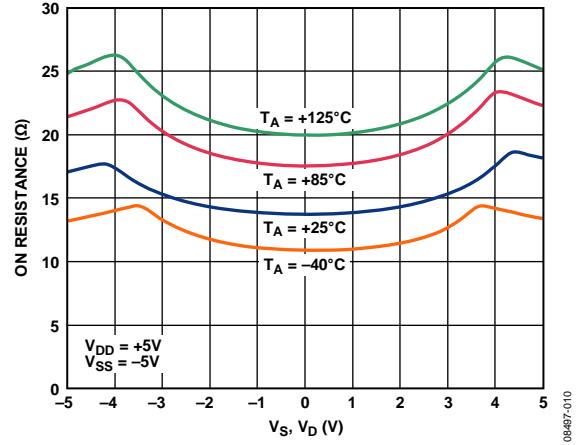

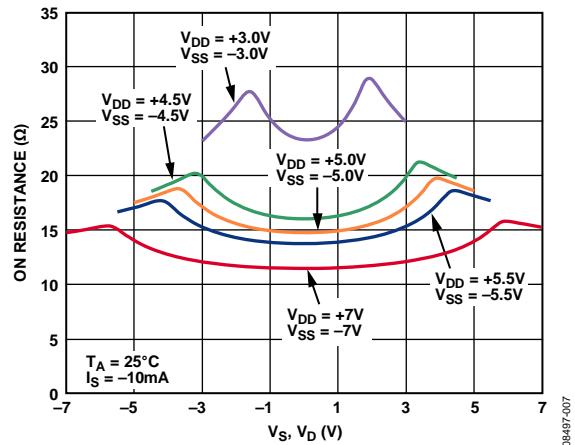

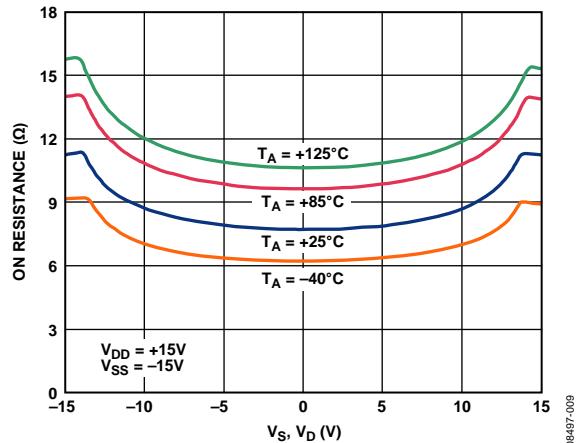

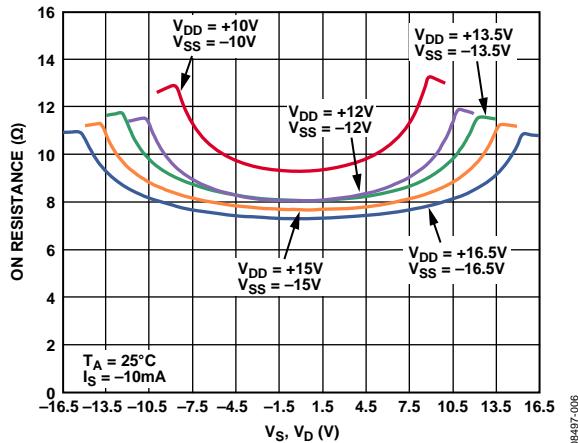

Table 9. Pin Function Descriptions

Pin No.		Mnemonic	Description
TSSOP	LFCSP		
1	22	SCLK	Serial Clock Input. Data is clocked into the input shift register on the falling edge of the serial clock input. Data can be transferred at rates of up to 50 MHz.
2	23	V <sub>DD</sub>	Most Positive Power Supply Potential.
3	24	DIN	Serial Data Input. This device has an 8-bit shift register. Data is clocked into the register on the falling edge of the serial clock input.
4	1	GND	Ground (0 V) Reference.
5	2	S1	Source Terminal 1. This pin can be an input or an output.
6	3	D1	Drain Terminal 1. This pin can be an input or an output.
7	4	S2	Source Terminal 2. This pin can be an input or an output.
8	5	D2	Drain Terminal 2. This pin can be an input or an output.
9	6	S3	Source Terminal 3. This pin can be an input or an output.
10	7	D3	Drain Terminal 3. This pin can be an input or an output.
11	8	S4	Source Terminal 4. This pin can be an input or an output.
12	9	D4	Drain Terminal 4. This pin can be an input or an output.
13	10	D5	Drain Terminal 5. This pin can be an input or an output.
14	11	S5	Source Terminal 5. This pin can be an input or an output.
15	12	D6	Drain Terminal 6. This pin can be an input or an output.
16	13	S6	Source Terminal 6. This pin can be an input or an output.
17	14	D7	Drain Terminal 7. This pin can be an input or an output.
18	15	S7	Source Terminal 7. This pin can be an input or an output.
19	16	D8	Drain Terminal 8. This pin can be an input or an output.
20	17	S8	Source Terminal 8. This pin can be an input or an output.
21	18	V <sub>SS</sub>	Most Negative Power Supply Potential. In single-supply applications, it can be connected to ground.
22	19	SDO	Serial Data Output. This pin can be used for daisy-chaining a number of these devices together or for reading back the data in the shift register for diagnostic purposes. The serial data is transferred on the rising edge of SCLK and is valid on the falling edge of the clock. Pull this open-drain output to the supply with an external resistor.
23	20	RESET/V <sub>L</sub>	RESET/Logic Power Supply Input (V <sub>L</sub> ). Under normal operation, drive the RESET/V <sub>L</sub> pin with a 2.7 V to 5 V supply. Pull the pin low (<0.8 V) for a short period of time (15 ns is sufficient) to complete a hardware reset. All switches are opened, and the appropriate registers are cleared to 0. When using the RESET/V <sub>L</sub> pin to complete a hardware reset, all other SPI pins (SYNC, SCLK, and DIN) should be driven low.

Pin No.		Mnemonic	Description
TSSOP	LFCSP		
24	21	SYNC	Active Low Control Input. This is the frame synchronization signal for the input data. When <u>SYNC</u> goes low, it powers on the SCLK and DIN buffers and enables the input shift register. Data is transferred in on the falling edges of the following clocks. Taking <u>SYNC</u> high updates the switch condition.
N/A <sup>1</sup>	EP	Exposed Pad	Exposed Pad. Exposed pad tied to the substrate, V <sub>ss</sub> .

<sup>1</sup> N/A means not applicable.

## TERMINOLOGY

<b>I<sub>DD</sub></b>	<b>C<sub>D</sub>, C<sub>S</sub> (On)</b>
The positive supply current.	The on switch capacitance, measured with reference to ground.
<b>I<sub>SS</sub></b>	<b>C<sub>IN</sub></b>
The negative supply current.	The digital input capacitance.
<b>V<sub>D</sub> (V<sub>S</sub>)</b>	<b>t<sub>ON</sub></b>
The analog voltage on Terminal Dx or Terminal Sx.	The delay between applying the digital control input and the output switching on. See Figure 30.
<b>R<sub>ON</sub></b>	<b>t<sub>OFF</sub></b>
The ohmic resistance between Terminal Dx and Terminal Sx.	The delay between applying the digital control input and the output switching off. See Figure 30.
<b>Δ R<sub>ON</sub></b>	<b>Charge Injection</b>
The difference between the R <sub>ON</sub> of any two channels.	A measure of the glitch impulse transferred from the digital input to the analog output during switching.
<b>R<sub>FLAT(ON)</sub></b>	<b>Off Isolation</b>
Flatness is defined as the difference between the maximum and minimum value of on resistance, as measured over the specified analog signal range.	A measure of unwanted signal coupling through an off switch.
<b>I<sub>S</sub> (Off)</b>	<b>Crosstalk</b>
The source leakage current with the switch off.	A measure of unwanted signal that is coupled through from one channel to another as a result of parasitic capacitance.
<b>I<sub>D</sub> (Off)</b>	<b>Bandwidth</b>
The drain leakage current with the switch off.	The frequency at which the output is attenuated by 3 dB.
<b>I<sub>D</sub>, I<sub>S</sub> (On)</b>	<b>On Response</b>
The channel leakage current with the switch on.	The frequency response of the on switch.
<b>V<sub>INL</sub></b>	<b>Insertion Loss</b>
The maximum input voltage for Logic 0.	The loss due to the on resistance of the switch.
<b>V<sub>INH</sub></b>	<b>THD + N</b>
The minimum input voltage for Logic 1.	The ratio of the harmonic amplitude plus noise of the signal to the fundamental.
<b>I<sub>INL</sub> (I<sub>INH</sub>)</b>	<b>AC Power Supply Rejection Ratio (ACPSRR)</b>
The input current of the digital input.	A measure of the ability of a part to avoid coupling noise and spurious signals that appear on the supply voltage pin to the output of the switch. The dc voltage on the device is modulated by a sine wave of 0.62 V p-p. The ratio of the amplitude of signal on the output to the amplitude of the modulation is the ACPSRR.
<b>C<sub>S</sub> (Off)</b>	
The off switch source capacitance, measured with reference to ground.	
<b>C<sub>D</sub> (Off)</b>	
The off switch drain capacitance, measured with reference to ground.	

## THEORY OF OPERATION

The ADG1414 is a set of serially controlled, octal SPST switches. Each of the eight bits of the 8-bit write corresponds to one switch of the device. A Logic 1 in the particular bit position turns the switch on, whereas a Logic 0 turns the switch off. Because each switch is independently controlled by an individual bit, this provides the option of having any, all, or none of the switches turned on.

### SERIAL INTERFACE

The ADG1414 has a 3-wire serial interface (SYNC, SCLK, and DIN pins) that is compatible with SPI, QSPI, and MICROWIRE interface standards, as well as most DSPs. See Figure 2 for a timing diagram of a typical write sequence.

The write sequence begins by bringing the SYNC line low. This enables the input shift register. Data from the DIN line is clocked into the 8-bit input shift register on the falling edge of SCLK. The serial clock frequency can be as high as 50 MHz, making the ADG1414 compatible with high speed DSPs.

Data can be written to the shift register in more or less than eight bits. In each case, the shift register retains the last eight bits that were written. When all eight bits have been written into the shift register, the SYNC line is brought high again. The switches are updated with the new configuration, and the input shift register is disabled. With SYNC held high, the input shift register is disabled; therefore, further data or noise on the DIN line has no effect on the shift register.

Data appears on the SDO pin on the rising edge of SCLK suitable for daisy chaining or readback, delayed by eight bits.

### INPUT SHIFT REGISTER

The input shift register is eight bits wide (see Table 10). Each bit controls one switch. These data bits are transferred to the switch register on the rising edge of SYNC.

**Table 10. ADG1414 Input Shift Register Bit Map<sup>1</sup>**

MSB								LSB
DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	
S8	S7	S6	S5	S4	S3	S2	S1	

<sup>1</sup> Logic 0 = switch off and Logic 1 = switch on.

### POWER-ON RESET

The ADG1414 contains a power-on reset circuit. On power-up of the device, all switches are in the off condition and the internal shift register is filled with zeros and remains so until a valid write takes place.

The part also has a RESET/V<sub>L</sub> pin. Under normal operation, drive the RESET/V<sub>L</sub> pin with a 2.7 V to 5 V supply and pull the pin low for short period of time (15 ns is sufficient) to complete the hardware reset.

When using the RESET/V<sub>L</sub> pin to do a hardware reset, drive all other SPI pins (SYNC, SCLK, and DIN) low. This is to prevent current flow due to ESD protection diodes on the V<sub>L</sub> pin to the SPI pins.

When the RESET/V<sub>L</sub> pin is low, all switches are off and the appropriate registers are cleared to 0.

### DAISY CHAINING

For systems that contain several switches, the SDO pin can be used to daisy-chain several devices together. The SDO pin can also be used for diagnostic purposes and provide serial readback, wherein the user can read back the switch contents.

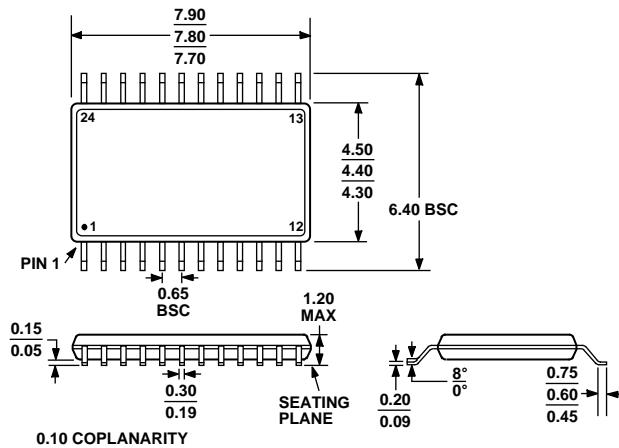

SDO is an open-drain output that should be pulled to the V<sub>L</sub> supply with an external resistor.

The SCLK is continuously applied to the input shift register when SYNC is low. If more than eight clock pulses are applied, the data ripples out of the shift register and appears on the SDO line. This data is clocked out on the rising edge of SCLK and is valid on the falling edge. By connecting this line to the DIN input on the next device in the chain, a multiswitch interface is constructed. Each device in the system requires eight clock pulses; therefore, the total number of clock cycles must equal 8N, where N is the total number of devices in the chain.

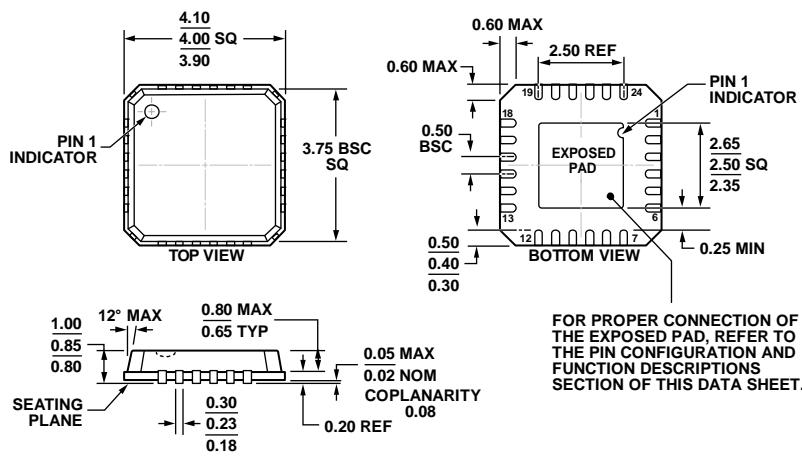

When the serial transfer to all devices is complete, SYNC is taken high. This prevents any further data from being clocked into the input shift register.

The serial clock can be a continuous or a gated clock. A continuous SCLK source can be used only if SYNC can be held low for the correct number of clock cycles. In gated clock mode, a burst clock containing the exact number of clock cycles must be used, and SYNC must be taken high after the final clock to latch the data. Gated clock mode reduces power consumption by reducing the active clock time.

## OUTLINE DIMENSIONS

<sup>1</sup> Z = RoHS Compliant Part.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

#### Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помошь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помошь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
