

ISL54225

High-Speed USB 2.0 (480Mbps) Multiplexer with Overvoltage Protection (OVP)

FN7627  
Rev 0.00  
July 2, 2010

The ISL54225 is a single supply dual 2:1 multiplexer that can operate from a single 2.7V to 5.25V supply. It contains two SPDT (Single Pole/Double Throw) switches configured as a DPDT. The part was designed for switching or routing of USB High-Speed signals and/or USB Full-speed signals in portable battery powered products.

The 6.5Ω switches were specifically designed to pass USB high speed/full speed data signals. They have high bandwidth and low capacitance to pass USB high speed data signals with minimal DISTORTION.

The ISL54225 has OVP circuitry on the D-/D+ COM pins that opens the USB in-line switches when the voltage at these pins exceeds 3.8V (typ) or goes negative by -0.5V (typ). It isolates fault voltages up to +5.25V or down to -5V from getting passed to the other-side of the switch, thereby protecting the USB transceivers.

The digital logic inputs are 1.8V logic compatible when operated with a 2.7V to 3.6V supply. The ISL54225 has an output enable pin to open all the switches. It can be used to facilitate proper bus disconnect and connection when switching between the USB sources.

The ISL54225 is available in 10 Ld 1.8mmx1.4mm μTQFN and 10 Ld TDFN packages. It operates over a temperature range of -40°C to +85°C.

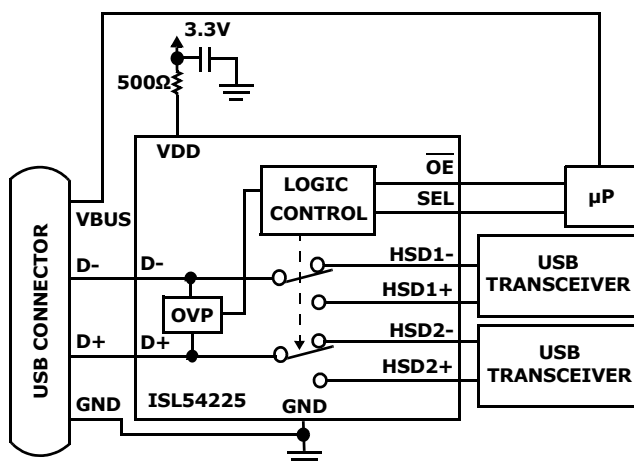

Features

- High-Speed (480Mbps) and Full-Speed (12Mbps) Signaling Capability per USB 2.0
- 1.8V Logic Compatible (2.7V to +3.6V Supply)
- Enable Pin to Open all Switches
- Low Power Mode
- Power OFF Protection
- D-/D+ Pins Overvoltage Protection for +5.25V and -5V Fault Voltages
- -3dB Frequency 780MHz
- Low ON Capacitance @ 240MHz 3.3pF
- Low ON-Resistance 6.5Ω
- Single Supply Operation (V<sub>DD</sub>) 2.7V to 5.25V
- Available in μTQFN and TDFN Packages
- Pb-Free (RoHS Compliant)
- Compliant with USB 2.0 Short Circuit and Overvoltage Requirements Without Additional External Components

Applications\* (see page 16)

- MP3 and other Personal Media Players
- Cellular/Mobile Phones
- PDAs
- Digital Cameras and Camcorders
- USB Switching

Typical Application

USB 2.0 HS Eye Pattern With Switches in the Signal Path

## Pin Configuration

NOTE:

1. Switches Shown for SEL = Logic "1" and  $\overline{OE}$  = Logic "0".

## Pin Descriptions

μTQFN	TDFN	PIN NAME	DESCRIPTION
1	2	HSD2-	USB Data Port Channel 2
2	3	HSD2+	USB Data Port Channel 2
3	4	D+	USB Data COM Port
4	5	GND	Ground Connection
5	6	D-	USB Data COM Port
6	7	HSD1-	USB Data Port Channel 1
7	8	HSD1+	USB Data Port Channel 1
8	9	$\overline{OE}$	Bus Switch Enable
9	10	VDD	Power Supply
10	1	SEL	Select Logic Control Input
-	PD	PD	Thermal Pad. Tie to Ground or Float

## Truth Table

$\overline{OE}$	SEL	HSD1-, HSD1+	HSD2-, HSD2+	STATE
0	0	ON	OFF	Normal
0	1	OFF	ON	Normal
1	0	OFF	OFF	Low Power
1	1	OFF	OFF	Normal

Logic "0" when  $\leq 0.5V$ , Logic "1" when  $\geq 1.4V$  with a 2.7V to 3.6V Supply.

Note: In Low Power mode there is no persistence checking when in OVP condition.

**TABLE 1. USB - OVP POSSIBLE SITUATIONS AND TRIP POINT VOLTAGE**

CODEC SUPPLY	SWITCH SUPPLY ( $V_{DD}$ )	COMs SHORTED TO	PROTECTED	TRIP POINT	
				MIN	MAX
2.7V to 3.3V	2.7V to 5.25V	VBUS	Yes	3.63V	3.95V
2.7V to 3.3V	2.7V to 5.25V	-5V	Yes	-0.76V	-0.29V

## Ordering Information

PART NUMBER	PART MARKING	TEMP. RANGE (°C)	PACKAGE (Pb-Free)	PKG. DWG. #
ISL54225IRUZ-T (Notes 2, 3)	U0	-40 to +85	10 Ld 1.8x1.4mm $\mu$ TQFN (Tape and Reel)	L10.1.8x1.4A
ISL54225IRUZ-T7A (Notes 2, 3)	U0	-40 to +85	10 Ld 1.8x1.4mm $\mu$ TQFN (Tape and Reel)	L10.1.8x1.4A

### NOTES:

- Please refer to [TB347](#) for details on reel specifications.
- These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and NiPdAu plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
- These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
- For Moisture Sensitivity Level (MSL), please see device information page for [ISL54225](#). For more information on MSL please see techbrief [TB363](#).

**Absolute Maximum Ratings**

VDD to GND	-0.3V to 6.5V
VDD to Dx	10.5V
Dx to HSD1x, HSD2x	8.6V
Input Voltages	
HSD2x, HSD1x	-0.3V to 6.5V
SEL, OE	-0.3V to 6.5V
Output Voltages	
D+, D-	-5V to 6.5V
Continuous Current (HSD2x, HSD1x)	±40mA
Peak Current (HSD2x, HSD1x)	
(Pulsed 1ms, 10% Duty Cycle, Max)	±100mA
ESD Rating:	
Human Body Model (Tested per JESD22-A114-F)	>5.5kV
Machine Model (Tested per JESD22-A115-A)	>250V
Charged Device Model (Tested per JESD22-C101-D)	>2kV
Latch-up Tested per JEDEC; Class II Level A	at +85°C

**Thermal Information**

Thermal Resistance (Typical)	$\theta_{JA}$ (°C/W)	$\theta_{JC}$ (°C/W)
10 Ld $\mu$ TQFN Package (Note 6, 7)	210	165
10 Ld TDFN Package (Notes 8, 9)	58	22
Maximum Junction Temperature (Plastic Package)	+150°C	
Maximum Storage Temperature Range	-65°C to +150°C	
Pb-Free Reflow Profile	see link below	
	<a href="http://www.intersil.com/pbfree/Pb-FreeReflow.asp">http://www.intersil.com/pbfree/Pb-FreeReflow.asp</a>	

**Recommended Operating Conditions**

Temperature Range	-40°C to +85°C
VDD Supply Voltage Range	2.7V to 5.25V
Logic Control Input Voltage	0V to 5.25V
Analog Signal Range	
VDD = 2.7V to 5.25V	0V to 3.6V

**CAUTION:** Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

**NOTES:**

- $\theta_{JA}$  is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
- For  $\theta_{JC}$ , the "case temp" location is taken at the package top center.
- $\theta_{JA}$  is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief TB379.
- For  $\theta_{JC}$ , the "case temp" location is the center of the exposed metal pad on the package underside.

**Electrical Specifications - 2.7V to 5.25V Supply**

Test Conditions: VDD = +3.3V, GND = 0V, VSELH = 1.4V, VSELL = 0.5V, VOEH = 1.4V, VOEL = 0.5V, (Note 10), Unless Otherwise Specified. **Boldface limits apply over the operating temperature range, -40°C to +85°C.**

## NOTES:

- $V_{LOGIC}$  = Input voltage to perform proper function.
- The algebraic convention, whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.
- Parameters with MIN and/or MAX limits are 100% tested at +25°C, unless otherwise specified. Temperature limits established by characterization and are not production tested.
- Flatness is defined as the difference between maximum and minimum value of ON-resistance over the specified analog signal range.
- $r_{ON}$  matching between channels is calculated by subtracting the channel with the highest max  $r_{ON}$  value from the channel with lowest max  $r_{ON}$  value, between HSD2+ and HSD2- or between HSD1+ and HSD1-.
- Limits established by characterization and are not production tested.

## Test Circuits and Waveforms

Logic input waveform is inverted for switches that have the opposite logic sense.

## Application Block Diagram

### Detailed Description

The ISL54225 device is a dual single pole/double throw (SPDT) analog switch configured as a DPDT that operates from a single DC power supply in the range of 2.7V to 5.25V.

It was designed to function as a dual 2-to-1 multiplexer to select between two USB high-speed differential data signals in portable battery powered products. It is offered in a TDFN, and a small  $\mu$ TQFN packages for use in MP3 players, cameras, PDAs, cellphones, and other personal media players. The device has an enable pin to open all switches and put the part in a low power state.

The part contains special overvoltage detection and protection (OVP) circuitry on the D-/D+ COM pins. This circuitry acts to open the USB in-line switches when the part senses a voltage on the COM pins that is  $>3.8V$  (typ) or  $<-0.5V$  (typ). It isolates voltages up to 5.25V and down to -5V from getting through to the other side of the switch to protect the USB transceivers connected at the signal pins (HSD1-, HSD1+, HSD2-, HSD2+).

The part consists of four  $6.5\Omega$  high speed (HSx) switches. These switches have high bandwidth and low capacitance to pass USB high-speed (480Mbps) differential data signals with minimal edge and phase distortion. They can also swing from 0V to 3.6V to pass USB full speed (12Mbps) differential data signals with minimal distortion.

The ISL54225 was designed for MP3 players, cameras, cellphones, and other personal media player applications that have multiple high-speed or full-speed transceivers sections and need to multiplex between these USB sources to a single USB host (computer). A typical application block diagram of this functionality is previously shown.

A detailed description of the HS switches is provided in the following section.

### High-Speed (HSx) Data Switches

The HSx switches (HSD1-, HSD1+, HSD2-, HSD2+) are bi-directional switches that can pass USB high-speed and USB full-speed signals when  $V_{DD}$  is in the range of 2.7V to 5.25V.

When powered with a 2.7V supply, these switches have a nominal  $r_{ON}$  of  $6.5\Omega$  over the signal range of 0V to 400mV with a  $r_{ON}$  flatness of  $0.3\Omega$ . The  $r_{ON}$  matching between the HSD1x switches and HSD2x switches over this signal range is only  $0.2\Omega$ , ensuring minimal impact by the switches to USB high-speed signal transitions. As the signal level increases, the  $r_{ON}$  switch resistance increases. At signal level of 3.3V, the switch resistance is nominally  $12\Omega$ . See Figures 9, 10, 11, 12, 13, 14, 15 and 16 in the "Typical Performance Curves" beginning on page 12.

The HSx switches were specifically designed to pass USB 2.0 high-speed (480Mbps) differential signals in the range of 0V to 400mV. They have low capacitance and high bandwidth to pass the USB high-speed signals with minimum edge and phase distortion to meet USB 2.0 high speed signal quality specifications. See Figure 21 in the "Typical Performance Curves" on page 14 for USB High-speed Eye Pattern taken with switch in the signal path.

The HSx switches can also pass USB full-speed signals (12Mbps) with minimal distortion and meet all the USB requirements for USB 2.0 full-speed signaling. See Figure 22 in the "Typical Performance Curves" on page 14 for USB Full-speed Eye Pattern taken with switch in the signal path.

The HS1 channel switches are active (turned ON) whenever the SEL voltage is logic "0"(Low) and the  $\overline{OE}$  voltage is logic "0"(Low).

The HS2 channel switches are active (turned ON) whenever the SEL voltage is logic "1" (High) and the  $\overline{OE}$  voltage is logic "0" (Low).

**OVERVOLTAGE PROTECTION (OVP)**

The maximum normal operating signal range for the HSx switches is from 0V to 3.6V. For normal operation, the signal voltage should not be allowed to exceed these voltage levels or go below ground by more than -0.3V.

However, in the event that a positive voltage > 3.8V (typ) to 5.25V, such as the USB 5V  $V_{BUS}$  voltage, gets shorted to one or both of the COM+ and COM- pins or a negative voltage < -0.5V (typ) to -5V gets shorted to one or both of the COM pins, the ISL54225 has OVP circuitry to detect the overvoltage condition and open the SPDT switches to prevent damage to the USB down-stream transceivers connected at the signal pins (HS1D-, HS1D+, HS2D-, HS2D+).

The OVP and power-off protection circuitry allows the COM pins (D-, D+) to be driven up to 5.25V while the  $V_{DD}$  supply voltage is in the range of 0V to 5.25V. In this condition, the part draws < 100 $\mu$ A of  $I_{COMx}$  and  $I_{DD}$  current and causes no stress to the IC. In addition, the SPDT switches are OFF and the fault voltage is isolated from the other side of the switch.

**External  $V_{DD}$  Series Resistor to Limit  $I_{DD}$  Current during Negative OVP Condition**

A 100 $\Omega$  to 1k $\Omega$  resistor in series with the VDD pin (see Figure 7) is required to limit the  $I_{DD}$  current draw from the system power supply rail during a negative OVP fault event.

With a negative -5V fault voltage at both COM pins, the graph in Figure 8 shows the  $I_{DD}$  current draw for different external resistor values for supply voltages of 2.7V, 3.6V, and 5.25V. With a 500 $\Omega$  resistor, the current draw is limited to around 5mA. When the negative fault voltage is removed, the  $I_{DD}$  current will return to it's normal operation current of 25 $\mu$ A to 45 $\mu$ A.

The series resistor also provides improved ESD and latch-up immunity. During an overvoltage transient event (such as occurs during system level IEC 61000 ESD testing), substrate currents can be generated in the IC that can trigger parasitic SCR structures to turn ON, creating a low impedance path from the VDD power supply to ground. This will result in a significant amount of current flow in the IC, which can potentially create a latch-up state or permanently damage the IC. The external VDD resistor limits the current during this over-stress situation and has been found to prevent latch-up or destructive damage for many overvoltage transient events.

Under normal operation, the low microamp  $I_{DD}$  current of the IC produces an insignificant voltage drop across the series resistor resulting in no impact to switch operation or performance.

**FIGURE 7. VDD SERIES RESISTOR TO LIMIT  $I_{DD}$  CURRENT DURING NEGATIVE OVP AND FOR ENHANCED ESD AND LATCH-UP IMMUNITY**

**FIGURE 8. NEGATIVE OVP  $I_{DD}$  CURRENT vs RESISTOR VALUE vs  $V_{SUPPLY}$**

**ISL54225 Operation**

The following will discuss using the ISL54225 shown in the "Application Block Diagram" on page 9.

**POWER**

The power supply connected at the VDD pin provides the DC bias voltage required by the ISL54225 part for proper operation. The ISL54225 can be operated with a  $V_{DD}$  voltage in the range of 2.7V to 5.25V.

For lowest power consumption you should use the lowest  $V_{DD}$  supply.

A 0.01 $\mu$ F or 0.1 $\mu$ F decoupling capacitor should be connected from the VDD pin to ground to filter out any power supply noise from entering the part. The capacitor should be located as close to the VDD pin as possible.

In a typical application,  $V_{DD}$  will be in the range of 2.8V to 4.3V and will be connected to the battery or LDO of the portable media device.

## LOGIC CONTROL

The state of the ISL54225 device is determined by the voltage at the SEL pin and the  $\overline{OE}$  pin. SEL is only active when the  $\overline{OE}$  pin is logic "0" (Low). Refer to "Truth Table" on page 2.

The ISL54225 logic pins are designed to minimize current consumption when the logic control voltage is lower than the  $V_{DD}$  supply voltage. With  $V_{DD} = 3.6V$  and logic pins at 1.4V, the part typically draws only 25 $\mu$ A. With  $V_{DD} = 4.3V$  and logic pins at 2.6V, the part typically draws only 35 $\mu$ A. Driving the logic pins to the  $V_{DD}$  supply rail minimizes power consumption.

The SEL pin and  $\overline{OE}$  pin have special circuitry that allows them to be driven with a voltage higher than the  $V_{DD}$  supply voltage. These pins can be driven up to 5.25V with a  $V_{DD}$  supply in the range of 2.7V to 5.25V.

The SEL pin is internally pulled low through 4M $\Omega$  resistor to ground. The  $\overline{OE}$  pin is internally pulled high through a 4M $\Omega$  resistor to VDD. These pins can be tri-stated by a  $\mu$ Processor or left floating.

### Logic Control Voltage Levels

TABLE 2. LOGIC CONTROL VOLTAGE LEVELS

V <sub>DD</sub> SUPPLY RANGE	LOGIC = "0" (LOW)		LOGIC = "1" (HIGH)	
	$\overline{OE}$	SEL	$\overline{OE}$	SEL
2.7V to 3.6V	≤ 0.5V	≤ 0.5V or floating	≥ 1.4V or floating	≥ 1.4V
3.7V to 4.2V	≤ 0.7V	≤ 0.7V or floating	≥ 1.7V or floating	≥ 1.7V
4.3V to 5.25V	≤ 0.8V	≤ 0.8V or floating	≥ 2.0V or floating	≥ 2.0V

### HSD1 USB Channel

If the SEL pin = Logic "0" and the  $\overline{OE}$  pin = Logic "0", high-speed Channel 1 will be ON. The HSD1- and HSD1+ switches are ON and the HSD2- and HSD2+ switches are OFF (high impedance).

When a computer or USB hub is plugged into the common USB connector and Channel 1 is active, a link will be established between the USB 1 transceiver section of the media player and the computer. The device will be able to transmit and receive data from the computer.

### HSD2 USB Channel

If the SEL pin = Logic "1" and the  $\overline{OE}$  pin = Logic "0", high-speed Channel 2 will be ON. The HSD2- and HSD2+ switches are ON and the HSD1- and HSD1+ switches are OFF (high impedance).

When a USB cable from a computer or USB hub is connected at the common USB connector and the part has Channel 2 active, a link will be established between

the USB 2 driver section of the media player and the computer. The device will be able to transmit and receive data from the computer.

### All Switches OFF Mode

If the SEL pin = Logic "0" and the  $\overline{OE}$  pin = Logic "1", all of the switches will turn OFF (high impedance) and the part will be put in a low power mode. In this mode, the part draws only 10 $\mu$ A (max) of current across the operating temperature range. In the low power mode, the persistence checking of the OVP circuitry is de-activated.

If the SEL pin = Logic "1" and the  $\overline{OE}$  pin = Logic "1", all of the switches will turn OFF (high impedance). In this state the complete OTV circuitry is activated.

The all OFF state can be used to switch between the two USB sections of the media player. When disconnecting from one USB device to the other USB device, you can momentarily put the ISL54225 switch in the "all off" state in order to get the computer to disconnect from the one device so it can properly connect to the other USB device when that channel is turned ON.

Whenever the ISL54225 senses a fault condition on the COM pins, all switches will be turned OFF regardless of the voltage levels at the SEL and  $\overline{OE}$  pins.

### USB 2.0 V<sub>BUS</sub> Short Requirements

The USB specification in section 7.1.1 states a USB device must be able to withstand a  $V_{BUS}$  short (4.4V to 5.25V) or a -1V short to the D+ or D- signal lines when the device is either powered off or powered on for at least 24 hours.

The ISL54225 part has special power-off protection and OVP detection circuitry to meet these short circuit requirements. This circuitry allows the ISL54225 to provide protection to the USB down-stream transceivers connected at its signal pins (HS1D-, HS1D+, HS2D-, HS2D+) to meet the USB specification short circuit requirements.

The power-off protection and OVP circuitry allows the COM pins (D-, D+) to be driven up to 5.25V or down to -5V while the  $V_{DD}$  supply voltage is in the range of 0V to 5.25V. In these overvoltage conditions with a 500 $\Omega$  external VDD resistor, the part draws < 55 $\mu$ A of current into the COM pins and causes no stress/damage to the IC. In addition, all switches are OFF and the shorted  $V_{BUS}$  voltage will be isolated from getting through to the other side of the switch channels, thereby protecting the USB transceivers.

## Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to [www.intersil.com/products](http://www.intersil.com/products) for a complete list of Intersil product families.

\*For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: [ISL54225](http://www.intersil.com/ISL54225)

4. Dimension applies to the metallized terminal and is measured between 0.15mm and 0.30mm from the terminal tip.
5. Tiebar shown (if present) is a non-functional feature.
6. The configuration of the pin #1 identifier is optional, but must be located within the zone indicated. The pin #1 identifier may be either a mold or mark feature.
7. Compliant to JEDEC MO-229-WEED-3 except exposed pad length (2.30mm).

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
