Functional Description

The CY7C148 is a high-performance CMOS static RAMs organized as 1024 by 4 bits. Easy memory expansion is provided by an active LOW chip select ($\overline{CS}$) input and three-state outputs. The CY7C148 remains in a low-power mode as long as the device remains unselected; i.e., ($\overline{CS}$) is HIGH, thus reducing the average power requirements of the device.

Writing to the device is accomplished when the chip select ($\overline{CS}$) and write enable ($\overline{WE}$) inputs are both LOW. Data on the I/O pins (I/O_0 through I/O_3) is written into the memory locations specified on the address pins (A_0 through A_9).

Reading the device is accomplished by taking chip select ($\overline{CS}$) LOW while write enable ($\overline{WE}$) remains HIGH. Under these conditions, the contents of the location specified on the address pins will appear on the four data I/O pins.

The I/O pins remain in a high-impedance state when chip select ($\overline{CS}$) is HIGH or write enable ($\overline{WE}$) is LOW.

Notes

1. A pull-up resistor to V_{CC} on the $\overline{\text{CS}}$ input is required to keep the device deselected during V_{CC} power-up. Otherwise current will exceed values given (CY7C148 only).
2. For test purposes, not more than 1 output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.
3. Tested initially and after any design or process changes that may affect these parameters.

t _{AW}	Address Valid to End of Write	30		ns

Notes:

- Chip deselected greater than 25 ns prior to selection.
- Chip deselected less than 25 ns prior to selection.
- At any given temperature and voltage condition, t_{HZ} is less than t_{LZ} for all devices. Transition is measured ± 500 mV from steady-state voltage with specified loading in part (b) of AC Test Loads.
- The internal write time of the memory is defined by the overlap of $\overline{CS}$ LOW and $\overline{WE}$ LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going high. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.

Switching Waveforms

Read Cycle No.1 [8,9]

Read Cycle No.2 [8,10]

Write Cycle No.1 (WE Controlled)

Notes

8. WE is HIGH for read cycle.
9. Device is continuously selected, $\overline{CS} = V_{IL}$.
10. Address valid prior to or coincident with $\overline{CS}$ transition LOW.

Switching Waveforms (continued)

Note:

11. If $\overline{\text{CS}}$ goes HIGH simultaneously with $\overline{\text{WE}}$ HIGH, the output remains in a high-impedance state.
