

## 2.5 A single high-side smart power switch

Datasheet - production data

### Features

- Operating voltage range ( $V_S$ ) 9.5 V to 35 V
- Up to  $I_{out} = 2.5$  A operating current
- $R_{DS(on)}$ : 0.1 Ω
- Internal current limit
- Thermal shutdown
- Open ground protection
- Internal negative voltage clamping for fast demagnetization ( $V_{demag} = V_s - 50$  V)
- Differential inputs with large common mode range and threshold hysteresis
- Undervoltage lockout with hysteresis
- Open load detection
- Two diagnostic outputs
- Output status LED driver
- Non-dissipative short-circuit protection
- Surge and transient protection (IEC61000-4-5)
- Burst transient immunity (IEC61000-4-4)
- ESD protection (human body model ±2 kV)

### Applications

- Programmable logic controller
- Industrial PC peripheral input/output
- Numerical control machines
- Drivers for all loads (resistive, capacitive, inductive load)

### Description

The L6370Q is a monolithic intelligent power switch in BCDmultipower technology to drive inductive or resistive loads. An internal clamping diode enables the fast demagnetization of inductive loads. Diagnostic for CPU feedback and extensive use of electrical protections make this device extremely rugged and especially suitable for industrial automation applications.

1. A cold lamp filament, or a capacitive load may activate the current limiting circuit of the IPS, when the IPS is initially turned on.

### 3.2 Input section

The input section is a high impedance differential stage with high common and differential mode range. Built-in offset of +1.4 V (typical value) and a hysteresis of 400 mV (maximum value) assure high noise immunity.

### 3.3 Diagnostic logic

The operating conditions of the device are permanently monitored and the following occurrences are indicated by DIAG1/DIAG2 open drain output pins:

- Short-circuit versus ground. A current limit circuit fixes  $I_{sc} = 3.2$  A (typical value) the maximum current that can be sourced from the OUTPUT pin (for more details see [Section 3.4: Short-circuit operation](#))
- Short-circuit versus  $V_s$
- Undervoltage (UV)
- Overtemperature (OVT)
- Open load, if the output current is less than 3 mA (typical value)
- Output DMOS open according to [Table 7](#)

### 3.4 Short-circuit operation

In order to minimize the power dissipation when the output is shorted-to-ground, an innovative, non-dissipative short-circuit protection (patent pending) is implemented, avoiding the thermal protection.

Whenever the output is shorted-to-ground, or, an overcurrent is sunked by the load, the output devices are driven to linear mode, sourcing the  $I_{sc}$  current (3.2 A typ.) for a time interval ( $t_{ON}$ ) defined by the external  $C_{ON}$  capacitor connected between the ON-DELAY pin and GND. If the short-circuit increases within the  $t_{ON}$  interval the DIAG2 output status is not affected, acting as a programmable diagnostic delay.

This function allows the device to drive a capacitive load or a filament lamp (that exhibits a very low resistance during the initial heating phase) without the diagnostic. If the short-circuit lasts for the whole  $t_{ON}$  interval, the output DMOS is switched off and the DIAG2 goes low, for a time interval  $t_{OFF}$  lasting  $t_{ON}$  64 times.

At the end of the  $t_{OFF}$  interval if the short-circuit condition is still present, the output DMOS is turned on (and the DIAG2 goes high - see [Figure 7](#)) for another  $t_{ON}$  interval and the sequence starts again, otherwise, the normal condition operation is resumed.

The  $t_{ON}$  interval can be set to last between 64 ms and 2.56 ms for a  $C_{ON}$  capacitor value ranging between 50 pF and 2 nF:

#### Equation 1

$$t_{ON} (\mu s) = 1.28 C_{ON} (pF)$$

If the ON-DELAY pin is grounded, the non-dissipative short-circuit protection is disabled and the  $I_{sc}$  current is delivered until the overtemperature protection shuts the device off. The behavior of the DIAG2 output is, in this situation, showed in [Table 7](#).

### 3.5 Overtemperature protection (OVT)

If the chip temperature exceeds  $\Theta_{lim}$  (measured in a central position in the chip) the chip deactivates itself.

The following actions are taken:

- the output stage is switched off
- the signal DIAG2 is activated (active low)

Normal operation is resumed as soon as (after some seconds) the chip temperature monitored goes back below  $\Theta_{lim}-\Theta_{th}$ .

The different thresholds with hysteretic behavior assure that any intermittent condition can be generated.

### 3.6 Undervoltage protection (UV)

The supply voltage is expected to range from 9.5 V to 35 V, even if its reference value is 24 V.

In this range, the device operates correctly. Below 9.5 V the overall system is not reliable.

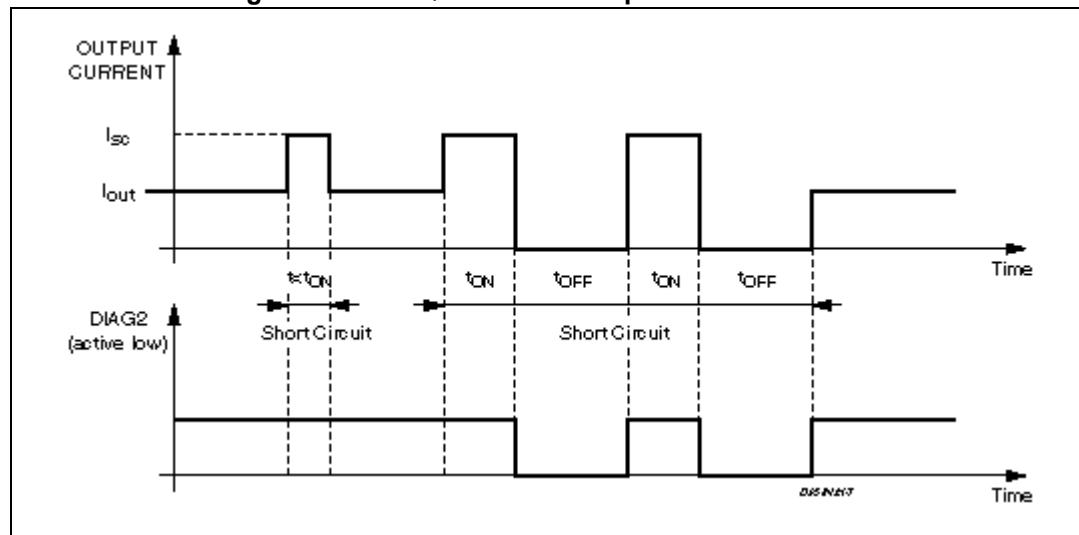

Protection shuts off the output whenever the supply voltage falls below the mask fixed by  $V_{sth1}$ (9 V typ.) and  $V_{sth2}$  (8.5 V typ.).

The hysteresis (see [Figure 4](#)) assures a non-intermittent behavior at low supply voltage with a superimposed ripple. The undervoltage status is indicated by the DIAG1 and DIAG2 outputs (see [Table 7](#)).

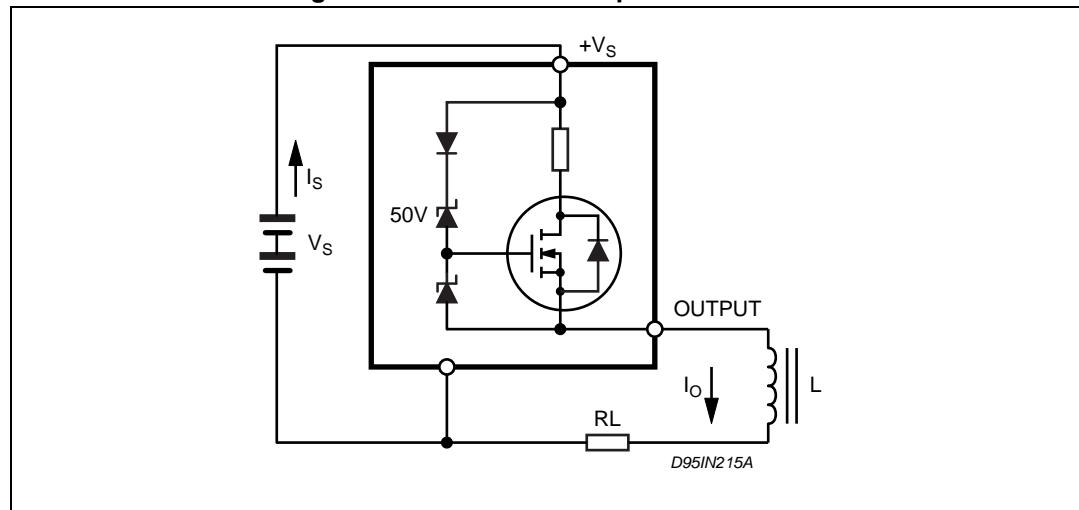

### 3.7 Demagnetization of inductive loads

An internal Zener diode, limiting the voltage across the power MOSFET between 50 and 60 V ( $V_{cl}$ ), provides safe and fast demagnetization of inductive loads without external clamping devices. The maximum energy that can be absorbed by an inductive load is specified in [Table 3](#).

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

#### Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помошь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помошь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
