

Precision Zero Drift Current Sense Amplifier

DESCRIPTION

Demonstration circuit 1536 is a General Purpose High-Side Current-Sense Amplifier featuring the LTC6102-1.

This demo board amplifies an on-board current-sense resistor voltage-drop, providing a precision uni-polar output voltage proportional to load current through the sense resistor.

The demo circuit includes scaling resistors that program the gain of the circuit to 33.3V/V. The LTC6102-1 is powered from the same supply that the sense resistor is connected to and provides a ground referenced output. The LTC6102-1 can perform current measurements on supplies ranging from 4V to 60V. Since the output voltage is a function of a controlled current through R_{out} , ground-loop errors can be eliminated by simply locating R_{out} at the destination point (subsequent signal process-

ing such as A/D conversion). Remote positioning of R_{out} can be evaluated by simply removing the on board R_{out} resistor (R_3).

The key performance characteristics of the LTC6102-1 and DC1536 are shown in the Performance Summary below. The LTC6102-1 is the same as the LTC6102 but has an Enable feature at pin 3. On the Demo Board this pin is pulled up by a $1M\Omega$ resistor so the default setting is the LTC6102-1 is Enabled.

Design files for this circuit board are available. Call the LTC factory.

PERFORMANCE SUMMARY

Specifications are at $T_A = 25^\circ C$

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{IN}	Monitored Supply Input Range		4	5...48	60	V
V_{MON}	Measurement Output Signal	$I_{OUT} = 10A$		2.0		V
I_{MON}	Measurement Output Signal (current mode)	$I_{OUT} = 10A$, R_3 removed		400		μA
I_{OUT}	Output Load Current Range	Thermal limit of R_{SENSE}			12	A
I_{INQ}	V_{IN} Quiescent Current	$V_{IN} = 12V$, $I_{OUT} = 0A$		230		μA
t_R	V_{MON} step-response time	I_{OUT} step from 0A to 10A		4		μs

OPERATING PRINCIPLES

The LTC6102-1 operates by amplifying the voltage drop across a sense resistor placed in series with the power source of the load to be monitored. The sense inputs of the amplifier differentially measure the sense-resistor drop to control an internal variable current source that allows translation of the input information to a level referenced to V_- (ground in this demo circuit). The circuit gain is established by the ratio of the output resistor to

the input resistor and is essentially as accurate as the resistors used. In DC1536 as shipped, the sense resistor installed is $6m\Omega$ and the resistor ratio sets the gain to 33.3V/V, so the nominal output scaling is 200mV per Ampere of load current. Other scaling can be produced by resistor replacement on the demo circuit.

The DC1536 Schematic diagram is shown in Figure 2.

QUICK START PROCEDURE

Demonstration circuit 1536 is easy to set up to evaluate the performance of the LTC6102-1. Refer to Figure 1 for proper measurement equipment setup and follow the procedure below:

1. With power off, connect the power supply positive to IN and the common to GND. This supply should be in the range of 4V to 60V. If this supply is not equipped with an accurate current readout, a DMM (set to measure Amperes) may be connected in series with the supply as shown in Figure 1.

NOTE. Be sure that the current capacity of the DMM is adequate to handle the intended load current. The Load Resistor must have the appropriate power rating.

2. Connect a voltmeter or oscilloscope probe to the MON terminal, with the common connection or ground clip tied to GND.
3. Connect a load to the OUT terminal (positive) and return (negative) to the common of the power supply. The load may be a power resistor, active load instrument, or other circuit of interest.
4. Turn on the power supply.
5. Measure an output voltage that corresponds to the load current. $V_{MON} = 0.2 \times I_{OUT}$ for the factory installed resistors.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помошь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помошь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
