

## SLLIMM™-nano small low-loss intelligent molded module IPM, 3-phase inverter, 2 A, 1.7 Ω max., 500 V MOSFET

Datasheet - production data

### Features

- IPM 2 A, 500 V,  $R_{DS(on)} = 1.7 \Omega$ , 3-phase MOSFET inverter bridge including control ICs for gate driving
- Optimized for low electromagnetic interference
- 3.3 V, 5 V, 15 V CMOS/TTL input comparators with hysteresis and pull-down/pull-up resistors
- Undervoltage lockout
- Internal bootstrap diode
- Interlocking function
- Smart shutdown function
- Comparator for fault protection against overtemperature and overcurrent
- Op-amp for advanced current sensing
- Optimized pinout for easy board layout
- NTC for temperature control (UL 1434 CA 2 and 4)
- Up to  $\pm 2$  kV ESD protection (HBM  $C = 100$  pF,  $R = 1.5$  k $\Omega$ )

### Applications

- 3-phase inverters for small power motor drives
- Dish washers, refrigerator compressors, heating systems, air-conditioning fans, draining and recirculation pumps

### Description

This SLLIMM (small low-loss intelligent molded module) nano provides a compact, high performance AC motor drive in a simple, rugged design. It is composed of six MOSFETs and three half-bridge HVICs for gate driving, providing low electromagnetic interference (EMI) characteristics with optimized switching speed. The package is optimized for thermal performance and compactness in built-in motor applications, or other low power applications where assembly space is limited. This IPM includes an operational amplifier, completely uncommitted, and a comparator that can be used to design a fast and efficient protection circuit. SLLIMM™ is a trademark of STMicroelectronics.

## 4 Smart shutdown function

The device integrates a comparator for fault sensing purposes. The comparator has an internal voltage reference  $V_{REF}$  connected to the inverting input, while the non-inverting input on pin (CIN) can be connected to an external shunt resistor for overcurrent protection.

When the comparator triggers, the device is set to the shutdown state and both of its outputs are set to the low-level, causing the half-bridge to enter a tri-state.

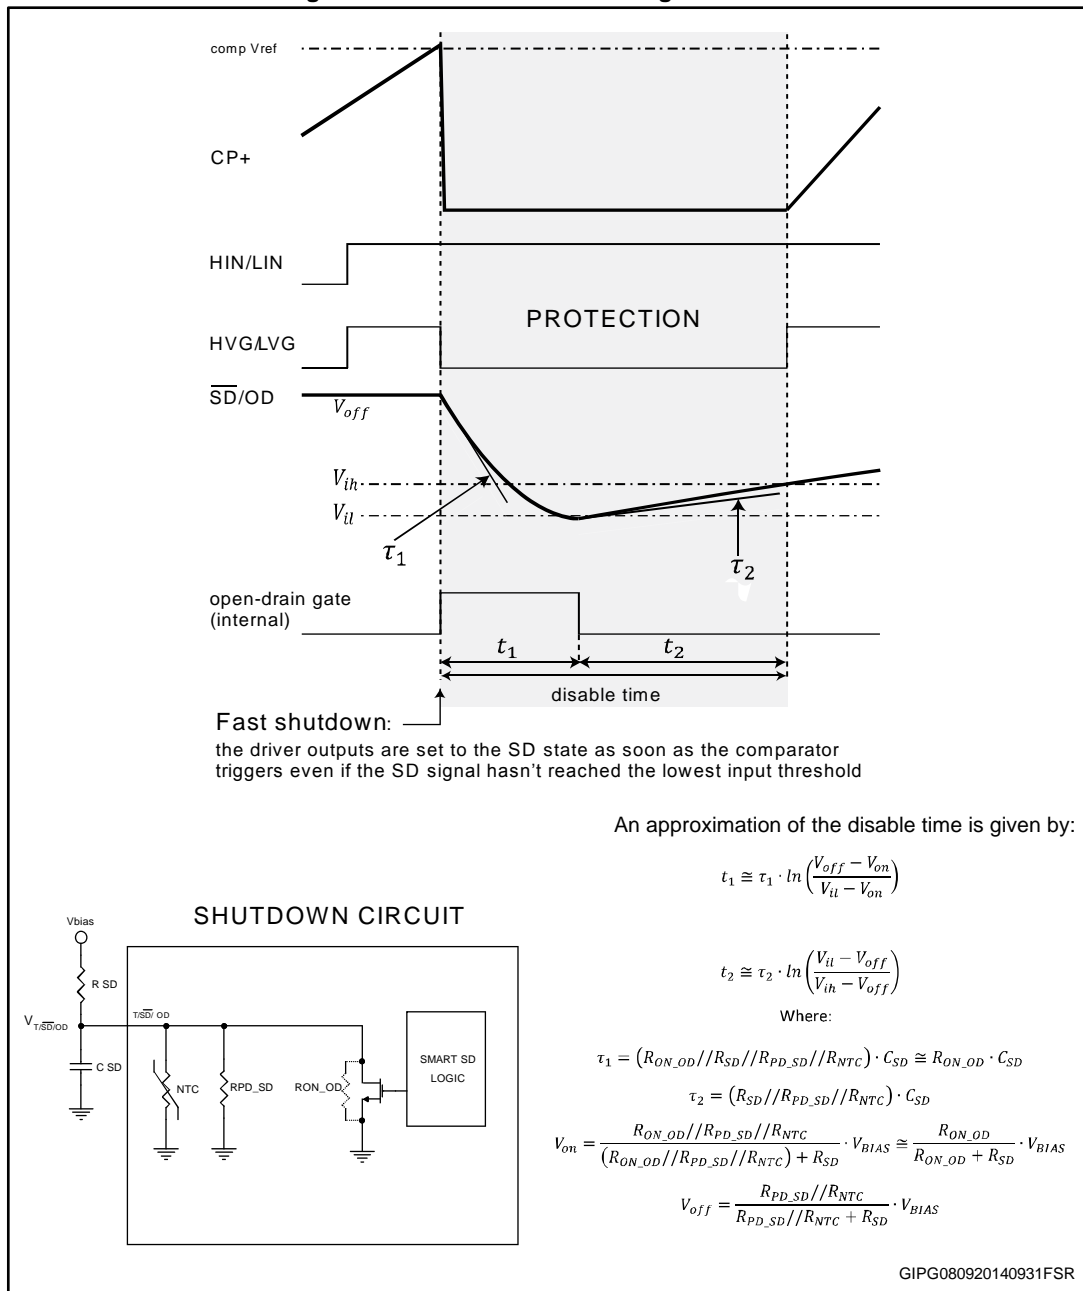

In common overcurrent protection architectures, the comparator output is usually connected to the shutdown input through an RC network so to provide a mono-stable circuit which implements a protection time following to a fault condition.

Our smart shutdown architecture immediately turns off the output gate driver in case of overcurrent through a preferential path for the fault signal which directly switches off the outputs. The time delay between the fault and output shutdown no longer depends on the RC values of the external network connected to the shutdown pin. At the same time, the DMOS connected to the open-drain output (pin T/ $\overline{SD}$ /OD) is turned on by the internal logic, which holds it on until the shutdown voltage is well below the minimum value of logic input threshold ( $V_{il}$ ).

Besides, the smart shutdown function allows the real disable time to be increased while the constant time of the external RC network remains as it is.

An NTC thermistor for temperature monitoring is internally connected in parallel to the  $\overline{SD}$  pin. To avoid undesired shutdown, keep the voltage  $V_{T/\overline{SD}/OD}$  higher than the high level logic threshold by setting the pull-up resistor  $R_{\overline{SD}}$  to 1 k $\Omega$  or 2.2 k $\Omega$  for 3.3 V or 5 V MCU power supplies, respectively.

Figure 10: Smart shutdown timing waveforms

Please refer to [Table 13: "Sense comparator characteristics \(VCC = 15 V unless otherwise specified\)"](#) for internal propagation delay time details.

# 5 Application circuit example

Figure 11: Application circuit example

Application designers are free to use a different scheme according to the specifications of the device.

## 5.1 Guidelines

- Input signals HIN, LIN are active high logic. A 375 k $\Omega$  (typ.) pull-down resistor is built-in for each input. To prevent input signal oscillations, the wiring of each input should be as short as possible and the use of RC filters ( $R_1$ ,  $C_1$ ) on each input signal is suggested. The filters should be with a time constant of about 100 ns and placed as close as possible to the IPM input pins.
- The use of a bypass capacitor  $C_{VCC}$  (aluminum or tantalum) can help to reduce the transient circuit demand on the power supply. Besides, to reduce high frequency switching noise distributed on the power lines, a decoupling capacitor  $C_2$  (100 to 220 nF, with low ESR and low ESL) should be placed as close as possible to  $V_{CC}$  pin and in parallel with the bypass capacitor.
- The use of RC filter (RSF, CSF) is recommended to avoid protection circuit malfunction. The time constant ( $RSF \times CSF$ ) should be set to 1  $\mu$ s and the filter must be placed as close as possible to CIN pin.
- The  $\overline{SD}$  is an input/output pin (open-drain type if it is used as output). A built-in thermistor NTC is internally connected between the  $\overline{SD}$  pin and GND. The voltage VSD-GND decreases as the temperature increases, due to the pull-up resistor  $R_{SD}$ . In order to keep the voltage always higher than the high level logic threshold, the pull-up resistor is suggested to be set to 1 k $\Omega$  or 2.2 k $\Omega$  for 3.3 V or 5 V MCU power supply, respectively. The  $C_{SD}$  capacitor of the filter on  $\overline{SD}$  should be fixed no higher than 3.3 nF in order to assure a  $\overline{SD}$  activation time  $T_1 \leq 500$  ns, and the filter should be placed as close as possible to the  $\overline{SD}$  pin.
- The decoupling capacitor  $C_3$  (from 100 to 220 nF, ceramic with low ESR and low ESL), in parallel with each  $C_{boot}$ , filters high frequency disturbance. Both  $C_{boot}$  and  $C_3$  (if present) should be placed as close as possible to the U, V, W and  $V_{boot}$  pins. Bootstrap negative electrodes should be connected to U, V, W terminals directly and separated from the main output wires.
- To prevent the overvoltage on  $V_{CC}$  pin, a Zener diode (Dz1) can be used. Similarly on the  $V_{boot}$  pin, a Zener diode (Dz2) can be placed in parallel with each  $C_{boot}$ .
- The use of the decoupling capacitor  $C_4$  (100 to 220 nF, with low ESR and low ESL) in parallel with the electrolytic capacitor  $C_{vdc}$  is useful to prevent surge destruction. Both capacitors  $C_4$  and  $C_{vdc}$  should be placed as close as possible to the IPM ( $C_4$  has priority over  $C_{vdc}$ ).
- By integrating an application-specific type HVIC inside the module, direct coupling to the MCU terminals without an optocoupler is possible.
- Use low inductance shunt resistors for phase leg current sensing.
- In order to avoid malfunctions, the wiring on N pins, the shunt resistor and PWR\_GND should be as short as possible.
- The connection of SGN\_GND to PWR\_GND on one point only (close to the shunt resistor terminal) can help to reduce the impact of power ground fluctuation.

These guidelines ensure the specifications of the device for application designs. For further details, please refer to the relevant application note.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
