## GENERAL DESCRIPTION

The ADV7403 is a high quality, single chip, multiformat video decoder and graphics digitizer. This multiformat decoder supports the conversion of PAL, NTSC, and SECAM standards in the form of composite or S-video into a digital ITU-R BT.656 format. The ADV7403 also supports the decoding of a component RGB/YPrPb video signal into a digital YCrCb or RGB pixel output stream. The support for component video includes standards such as 525i, 625i, 525p, 625p, 720p, 1080i, 1250i, and many other HD and SMPTE standards. Graphic digitization is also supported by the ADV7403; it is capable of digitizing RGB graphics signals from VGA to SXGA rates and converting them into a digital RGB or YCrCb pixel output stream. SCART and overlay functionality are enabled by the ADV7403's ability to simultaneously process CVBS and standard definition RGB signals. The mixing of these signals is controlled by the fast blank pin.

The ADV7403 contains two main processing sections. The first is the standard definition processor (SDP), which processes all PAL, NTSC, and SECAM signal types. The second is the component processor (CP), which processes YPrPb and RGB component formats, including RGB graphics. For more specific descriptions of the ADV7403 features, see the Detailed Functionality and Detailed Description sections.

## STRESS RATINGS

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## PACKAGE THERMAL PERFORMANCE

To reduce power consumption when using the part the user is advised to turn off any unused ADCs .

The junction temperature must always stay below the maximum junction temperature ($T_{J\,MAX}$) of 125°C. This equation shows how to calculate the junction temperature:

$$T_J = T_{A\,Max} + (\theta_{JA} \times W_{Max})$$

where:
$T_{A\,Max}$ = 85°C.
$\theta_{JA}$ = 30°C/W.
$W_{Max} = ((AVDD \times IAVDD)+(DVDD \times IDVDD)+ (DVDDIO \times IDVDDIO) + (PVDD \times IPVDD))$.

## THERMAL SPECIFICATIONS

**Table 6.**

| Thermal Characteristics | Symbol | Test Conditions | Typ | Unit |
|---|---|---|---|---|
| Junction-to-Case Thermal Resistance | $\theta_{JC}$ | 4-layer PCB with solid ground plane | 7 | °C/W |
| Junction-to-Ambient Thermal Resistance | $\theta_{JA}$ | 4-layer PCB with solid ground plane (still air) | 30 | °C/W |

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

# DETAILED DESCRIPTION

## ANALOG FRONT END

The ADV7403 analog front end comprises four Noise Shaped Video, 12-bit ADCs that digitize the analog video signal before applying it to the SDP or CP (See Table 8 for sampling rates). The analog front end uses differential channels to each ADC to ensure high performance in a mixed-signal application.

The front end also includes a 12-channel input mux that enables multiple video signals to be applied to the ADV7403. Current and voltage clamps are positioned in front of each ADC to ensure that the video signal remains within the range of the converter. Fine clamping of the video signals is performed downstream by digital fine clamping either in the CP or SDP.

Optional antialiasing filters are positioned in front of each ADC. These filters can be used to band-limit standard definition video signals, removing spurious, out-of-band noise.

The ADCs are configured to run in 4× oversampling mode when decoding composite and S-video inputs; 2× oversampling is performed for component 525i, 625i, 525p, and 625p sources. All other video standards are 1× oversampled. Oversampling the video signals reduces the cost and complexity of external anti-aliasing filters with the benefit of an increased signal-to-noise ratio (SNR).

The ADV7403 can support simultaneous processing of CVBS and RGB standard definition signals to enable SCART compatibility and overlay functionality. A combination of CVBS and RGB inputs can be mixed and output under control of I²C registers and the fast blank pin.

## STANDARD DEFINITION PROCESSOR

The SDP section is capable of decoding a large selection of baseband video signals in composite S-video and YUV formats. The video standards supported by the SDP include PAL B/D/I/G/H, PAL60, PAL M, PAL N, NTSC M/J, NTSC 4.43, and SECAM B/D/G/K/L. The ADV7403 can automatically detect the video standard and process it accordingly.

The SDP has a 5-line super adaptive 2-D comb filter that gives superior chrominance and luminance separation when decoding a composite video signal. This highly adaptive filter automatically adjusts its processing mode according to video standard and signal quality with no user intervention required. The SDP has an IF filter block that compensates for attenuation in the high frequency luma spectrum due to tuner SAW filter.

The SDP has specific luminance and chrominance parameter control for brightness, contrast, saturation, and hue.

The ADV7403 implements a patented adaptive-digital-line-length-tracking (ADLLT) algorithm to track varying video line lengths from sources such as a VCR. ADLLT enables the ADV7403 to track and decode poor quality video sources such as VCRs, noisy sources from tuner outputs, VCD players, and camcorders. The SDP also contains a chroma transient improvement (CTI) processor. This processor increases the edge rate on chroma transitions, resulting in a sharper video image.

The SDP can process a variety of VBI data services, such as TeleText, closed captioning (CC), wide screen signaling (WSS), video programming system (VPS), vertical interval time codes (VITC), copy generation management system (CGMS), Gemstar 1×/2×, and extended data service (XDS). The ADV7403 SDP section has a Macrovision 7.1 detection circuit that allows it to detect Types I, II, and III protection levels. The decoder is also fully robust to all Macrovision signal inputs.

## COMPONENT PROCESSOR

The CP section is capable of decoding/digitizing a wide range of component video formats in any color space. Component video standards supported by the CP are 525i, 625i, 525p, 625p, 720p, 1080i, 1250i, VGA up to SXGA @ 75 Hz, (ADV7403KSTZ-140 only) and many other standards not listed here.

The CP section of the ADV7403 contains an AGC block. When no embedded sync is present, the video gain can be set manually. The AGC section is followed by a digital clamp circuit that ensures the video signal is clamped to the correct blanking level. Automatic adjustments within the CP include gain (contrast) and offset (brightness); manual adjustment controls are also supported.

A fully programmable any-to-any, 3 × 3 color space conversion matrix is placed between the analog front end and the CP section. This enables YPrPb-to-RGB and RGB-to-YCrCb conversions. Many other standards of color space can be implemented using the color space converter.

The output section of the CP is highly flexible. It can be configured in single data rate mode (SDR) with one data packet per clock cycle or in a double data rate (DDR) mode where data is presented on the rising and falling edges of the clock. In SDR mode, a 16-/20-bit 4:2:2 or 24-/30-bit 4:4:4 output is possible. In these modes, HS, VS, and FIELD/DE (where applicable) timing reference signals are provided. In DDR mode, the ADV7403 can be configured in an 8-/10-bit 4:2:2 YcrCb or 12-bit 4:4:4 RGB/YcrCb pixel output interface with corresponding timing signals.

The ADV7403 is capable of supporting an external DVI/HDMI receiver. The digital interface expects 24-bit 4:4:4 or 16-/20-bit 4:2:2 bit data (either graphics RGB or component video YcrCb), accompanied by HS, VS, DE, and a fully synchronous clock signal. The data is processed in the CP and output as 16-bit 4:2:2 YcrCb data.

The CP section contains circuitry to enable the detection of Macrovision encoded YPrPb signals for 525i, 625i, 525p, and 625p. It is designed to be fully robust when decoding these types of signals.

VBI extraction of CGMS data is performed by the CP section of the ADV7403 for interlaced, progressive, and high definition scanning rates. The data extracted can be read back over the I²C interface.
