

MSP430FR263x, MSP430FR253x Mixed-Signal Microcontrollers

1 Device Overview

1.1 Features

- Embedded Microcontroller
 - 16-Bit RISC Architecture
 - Clock Supports Frequencies up to 16 MHz
 - Wide Supply Voltage Range From 1.8 V to 3.6 V ⁽¹⁾
- Optimized Ultra-Low-Power Modes
 - Active Mode: 126 μ A/MHz (Typical)
 - Standby
 - 1.7 μ A/Button Average (Typical) (16 Self-Capacitance Buttons, 8-Hz Scanning)
 - 1.7 μ A/Button Average (Typical) (64 Mutual-Capacitance Buttons, 8-Hz Scanning)
 - LPM3.5 Real-Time Clock (RTC) Counter With 32768-Hz Crystal: 770 nA (Typical)
 - Shutdown (LPM4.5): 15 nA (Typical)
- Low-Power Ferroelectric RAM (FRAM)
 - Up to 15.5KB of Nonvolatile Memory
 - Built-In Error Correction Code (ECC)
 - Configurable Write Protection
 - Unified Memory of Program, Constants, and Storage
 - 10^{15} Write Cycle Endurance
 - Radiation Resistant and Nonmagnetic
 - High FRAM-to-SRAM Ratio, up to 4:1
- Intelligent Digital Peripherals
 - Four 16-Bit Timers
 - Two Timers With Three Capture/Compare Registers Each (Timer_A3)
 - Two Timers With Two Capture/Compare Registers Each (Timer_A2)
 - One 16-Bit Timer Associated With CapTIvate™ Technology
 - One 16-Bit Counter-Only RTC
 - 16-Bit Cyclic Redundancy Check (CRC)
- Enhanced Serial Communications
 - Two Enhanced Universal Serial Communication Interfaces (eUSCI_A) Support UART, IrDA, and SPI
 - One eUSCI (eUSCI_B) Supports SPI and I²C
- High-Performance Analog
 - 8-Channel 10-Bit Analog-to-Digital Converter (ADC)
 - Internal 1.5-V Reference
 - Sample-and-Hold 200 ksp/s
- [CapTIvate Technology](#) – Capacitive Touch
 - Performance
 - Fast Electrode Scanning With Four Simultaneous Scans
 - Support for High-Resolution Sliders With >1024 Points
 - 30-cm Proximity Sensing
 - Reliability
 - Increased Immunity to Power Line, RF, and Other Environmental Noise
 - Built-in Spread Spectrum, Automatic Tuning, Noise Filtering, and Debouncing Algorithms
 - Enables [Reliable Touch Solutions](#) With 10-V RMS Common-Mode Noise, 4-kV Electrical Fast Transients, and 15-kV Electrostatic Discharge, Allowing for IEC-61000-4-6, IEC-61000-4-4, and IEC-61000-4-2 Compliance
 - Reduced RF Emissions to Simplify Electrical Designs
 - Support for Metal Touch and Water Rejection Designs
 - Flexibility
 - Up to 16 Self-Capacitance and 64 Mutual-Capacitance Electrodes
 - Mix and Match [Self- and Mutual-Capacitive Electrodes in the Same Design](#)
 - Supports Multitouch Functionality
 - Wide Range of Capacitance Detection, Wide Electrode Range of 0 to 300 pF
 - Low Power
 - <0.9 μ A/Button in Wake-on-Touch Mode, Where Capacitive Measurement and Touch Detection is Done by Hardware State Machine While CPU is Asleep
 - Wake-on-Touch State Machine Allows Electrode Scanning While CPU is Asleep
 - Hardware Acceleration for Environmental Compensation, Filtering, and Threshold Detection
 - Ease of Use
 - [CapTIvate Design Center](#), PC GUI Lets Engineers Design and Tune Capacitive Buttons in Real Time Without Having to Write Code

(1) Minimum supply voltage is restricted by SVS levels (see V_{SVSH-} and V_{SVSH+} in [Table 5-2](#))

- CapTIvate Software Library in ROM Provides Ample FRAM for Customer Application
- Clock System (CS)
 - On-Chip 32-kHz RC Oscillator (REFO)
 - On-Chip 16-MHz Digitally Controlled Oscillator (DCO) With Frequency-Locked Loop (FLL)
 - $\pm 1\%$ Accuracy With On-Chip Reference at Room Temperature
 - On-Chip Very Low-Frequency 10-kHz Oscillator (VLO)
 - On-Chip High-Frequency Modulation Oscillator (MODOSC)
 - External 32-kHz Crystal Oscillator (LFXT)
 - Programmable MCLK Prescaler of 1 to 128
 - SMCLK Derived from MCLK With Programmable Prescaler of 1, 2, 4, or 8
- General Input/Output and Pin Functionality
 - Total of 19 I/Os on TSSOP-32 Package
 - 16 Interrupt Pins (P1 and P2) Can Wake MCU From Low-Power Modes
- Development Tools and Software
 - Ease-of-Use Ecosystem
 - CapTIvate Design Center – Code Generation, Customizable GUI, Real-Time Tuning
- Free Professional Development Environments
- 12-KB ROM Library Includes CapTIvate Touch Libraries and Driver Libraries
- Family Members (Also See [Section 3](#))
 - MSP430FR2633: 15KB of Program FRAM + 512B of Information FRAM + 4KB of RAM up to 16 Self-Capacitive and 64 Mutual-Capacitive Sensors
 - MSP430FR2533: 15KB of Program FRAM + 512B of Information FRAM + 2KB of RAM up to 16 Self-Capacitive or 16 Mutual-Capacitive Sensors
 - MSP430FR2632: 8KB of Program FRAM + 512B of Information FRAM + 2KB of RAM up to 8 Self-Capacitive or 16 Mutual-Capacitive Sensors
 - MSP430FR2532: 8KB of Program FRAM + 512B of Information FRAM + 1KB of RAM up to 8 Self-Capacitive or 8 Mutual-Capacitive Sensors
- Package Options
 - 32-Pin: VQFN (RHB)
 - 32-Pin: TSSOP (DA)
 - 24-Pin: VQFN (RGE)
- For Complete Module Descriptions, See the *MSP430FR4xx and MSP430FR2xx Family User's Guide* ([SLAU445](#))

1.2 Applications

- Thermostats
- Electronic Access Control
- Lighting Control
- Electronic Door Locks
- White Goods
- Small Appliances
- Personal Electronics

1.3 Description

The MSP430FR263x and MSP430FR253x are FRAM-based ultra-low-power MSP microcontrollers that feature CapTIvate touch technology for buttons, sliders, wheels (BSW), and proximity applications. CapTIvate technology provides the highest resolution capacitive-touch solution in the market with high reliability and noise immunity at the lowest power. CapTIvate technology supports concurrent self-capacitance and mutual-capacitance electrodes on the same design for maximum flexibility. Using the CapTIvate Design Center, engineers can quickly develop BSW applications with an easy-to-use GUI.

The TI MSP family of low-power microcontrollers consists of several devices that feature different sets of peripherals targeted for various applications. The architecture, combined with extensive low-power modes, is optimized to achieve extended battery life in portable measurement applications. The MCU features a powerful 16-bit RISC CPU, 16-bit registers, and constant generators that contribute to maximum code efficiency. The digitally controlled oscillator (DCO) allows the MCU to wake up from low-power modes to active mode typically in less than 10 μ s.

- (1) For the most current part, package, and ordering information, see the *Package Option Addendum* in [Section 9](#), or see the TI website at www.ti.com.
- (2) The sizes shown here are approximations. For the package dimensions with tolerances, see the *Mechanical Data* in [Section 9](#).

CAUTION

System-level ESD protection must be applied in compliance with the device-level ESD specification to prevent electrical overstress or disturbing of data or code memory. See the application report *MSP430 System-Level ESD Considerations* ([SLAA530](#)) for more information.

1.4 Functional Block Diagram

Figure 1-1 shows the functional block diagram.

Figure 1-1. Functional Block Diagram

- The MCU has one main power pair of DVCC and DVSS that supplies digital and analog modules. Recommended bypass and decoupling capacitors are 4.7 μ F to 10 μ F and 0.1 μ F, respectively, with $\pm 5\%$ accuracy.
- VREG is the decoupling capacitor of the CapTIvate regulator. The recommended value for the required decoupling capacitor is 1 μ F, with a maximum ESR of ≤ 200 m Ω .
- P1 and P2 feature the pin interrupt function and can wake the MCU from all LPMs, including LPM3.5 and LPM4.
- Each Timer_A3 has three capture/compare registers. Only CCR1 and CCR2 are externally connected. CCR0 registers can be used only for internal period timing and interrupt generation.
- Each Timer_A2 has two capture/compare registers. Both registers can be used only for internal period timing and interrupt generation.
- In LPM3 mode, the CapTIvate module can be functional while the rest of the peripherals are off.

4.4 Pin Multiplexing

Pin multiplexing for these MCUs is controlled by both register settings and operating modes (for example, if the MCU is in test mode). For details of the settings for each pin and schematics of the multiplexed ports, see [Section 6.11](#).

4.5 Buffer Types

[Table 4-3](#) defines the pin buffer types that are listed in [Table 4-1](#).

Table 4-3. Buffer Types

BUFFER TYPE (STANDARD)	NOMINAL VOLTAGE	HYSTERESIS	PU OR PD	NOMINAL PU OR PD STRENGTH (μ A)	OUTPUT DRIVE STRENGTH (mA)	OTHER CHARACTERISTICS
LVC MOS	3.0 V	$\gamma^{(1)}$	Programmable	See Section 5.11.4	See Section 5.11.4	
Analog	3.0 V	N	N/A	N/A	N/A	See analog modules in Section 5 for details.
Power (DVCC)	3.0 V	N	N/A	N/A	N/A	SVS enables hysteresis on DVCC.
Power (AVCC)	3.0 V	N	N/A	N/A	N/A	

(1) Only for input pins.

4.6 Connection of Unused Pins

[Table 4-4](#) lists the correct termination of unused pins.

Table 4-4. Connection of Unused Pins⁽¹⁾

PIN	POTENTIAL	COMMENT
Px.0 to Px.7	Open	Switched to port function, output direction (PxDIR.n = 1)
$\overline{\text{RST}}/\text{NMI}$	DV _{CC}	47-k Ω pullup or internal pullup selected with 10-nF (or 1.1-nF) pulldown ⁽²⁾
TEST	Open	This pin always has an internal pulldown enabled.
CAP2.x, CAPx.1, CAPx.3	Open	These pins have internal pullup and pulldown resistors, and high impedance is their default setting.

(1) Any unused pin with a secondary function that is shared with general-purpose I/O should follow the Px.0 to Px.7 unused pin connection guidelines.

(2) The pulldown capacitor should not exceed 1.1 nF when using MCUs with Spy-Bi-Wire interface in Spy-Bi-Wire mode with TI tools like FET interfaces or GANG programmers.

5 Specifications

5.1 Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Voltage applied at DVCC pin to V _{SS}	−0.3	4.1	V
Voltage applied to any dedicated CapTivate pin or pin in CapTivate mode ⁽²⁾	−0.3	V _{REG}	V
Voltage applied to any other pin ⁽³⁾	−0.3	V _{CC} + 0.3 (4.1 V Max)	V
Diode current at any device pin		±2	mA
Maximum junction temperature, T _J		85	°C
Storage temperature, T _{stg} ⁽⁴⁾⁽⁵⁾	−40	125	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) This applies to dedicated CapTivate I/Os only or I/Os worked in CapTivate mode.
- (3) All voltages referenced to V_{SS}.
- (4) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.
- (5) Data retention on FRAM cannot be ensured when exceeding the specified maximum storage temperature, T_{stg}. Therefore, programming of devices with user application code should only be performed after soldering.

5.2 ESD Ratings

	VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±2000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±500 V may actually have higher performance.

5.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V _{CC}	Supply voltage applied at DVCC pin ⁽¹⁾⁽²⁾⁽³⁾	1.8		3.6	V
V _{SS}	Supply voltage applied at DVSS pin		0		V
T _A	Operating free-air temperature	−40		85	°C
T _J	Operating junction temperature	−40		85	°C
C _{DVCC}	Recommended capacitor at DVCC ⁽⁴⁾	4.7	10		μF
C _{REG}	External buffer capacitor, ESR ≤ 200 mΩ	0.8	1	1.2	μF
C _{ELECTRODE}	Maximum capacitance of all external electrodes on all CapTivate blocks			300	pF
f _{SYSTEM}	Processor frequency (maximum MCLK frequency) ⁽³⁾⁽⁵⁾	No FRAM wait states (NWAITSx = 0)	0	8	MHz
		With FRAM wait states (NWAITSx = 1) ⁽⁶⁾	0	16 ⁽⁷⁾	
f _{ACLK}	Maximum ACLK frequency			40	kHz
f _{SMCLK}	Maximum SMCLK frequency			16 ⁽⁷⁾	MHz

- (1) Supply voltage changes faster than 0.2 V/μs can trigger a BOR reset even within the recommended supply voltage range.
- (2) Modules may have a different supply voltage range specification. See the specification of the respective module in this data sheet.
- (3) The minimum supply voltage is defined by the SVS levels. Refer to the SVS threshold parameters in [Table 5-2](#).
- (4) A capacitor tolerance of ±20% or better is required.
- (5) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.
- (6) Wait states only occur on actual FRAM accesses (that is, on FRAM cache misses). RAM and peripheral accesses are always executed without wait states.
- (7) If clock sources such as HF crystals or the DCO with frequencies >16 MHz are used, the clock must be divided in the clock system to comply with this operating condition.

f _{Fault, LFXT}	Oscillator fault frequency ⁽⁸⁾	XTS = 0 ⁽⁹⁾	0		3500	Hz

(1) To improve EMI on the LFXT oscillator, observe the following guidelines:

- Keep the trace between the device and the crystal as short as possible.
- Design a good ground plane around the oscillator pins.
- Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
- Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
- Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
- If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.

(2) When LFXTBYPASS is set, LFXT circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger inputs section of this data sheet. Duty cycle requirements are defined by DC_{LFXT, SW}.

(3) Maximum frequency of operation of the entire device cannot be exceeded.

(4) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the LFXTDRIVE settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:

- For LFXTDRIVE = {0}, C_{L,eff} = 3.7 pF
- For LFXTDRIVE = {1}, 6 pF ≤ C_{L,eff} ≤ 9 pF
- For LFXTDRIVE = {2}, 6 pF ≤ C_{L,eff} ≤ 10 pF
- For LFXTDRIVE = {3}, 6 pF ≤ C_{L,eff} ≤ 12 pF

(5) Includes parasitic bond and package capacitance (approximately 2 pF per pin).

(6) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.

(7) Includes start-up counter of 1024 clock cycles.

(8) Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX specifications might set the flag. A static condition or stuck at fault condition sets the flag.

(9) Measured with logic-level input frequency but also applies to operation with crystals.

- (1) The temperature sensor offset can vary significantly. TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor.
- (2) The device descriptor structure contains calibration values for 30°C ±3°C and 85°C ±3°C for each of the available reference voltage levels. The sensor voltage can be computed as $V_{SENSE} = TC_{SENSOR} \times (\text{Temperature, } ^\circ\text{C}) + V_{SENSOR}$, where TC_{SENSOR} and V_{SENSOR} can be computed from the calibration values for higher accuracy.
- (3) The typical equivalent impedance of the sensor is 700 kΩ. The sample time required includes the sensor on time, t_{SENSOR(on)}.

(1) Writing to FRAM does not require a setup sequence or additional power when compared to reading from FRAM. The FRAM read current I_{READ} is included in the active mode current consumption parameter I_{AM,FRAM}.

(2) FRAM does not require a special erase sequence.

(3) Writing into FRAM is as fast as reading.

(4) The maximum read (and write) speed is specified by f_{SYSTEM} using the appropriate wait state settings (NWAITSx).

6 Detailed Description

6.1 Overview

The MSP430FR263x and MSP430FR253x ultra-low-power MCUs are the first FRAM-based MCUs with integrated high-performance charge-transfer CapTIvate technology in ultra-low-power high-reliability high-flexibility MCUs. The MSP430FR263x and MSP430FR253x MCU features up to 16 self-capacitance or 64 mutual-capacitance electrodes, 30-cm proximity sensing, and high accuracy up to 1-fF detection. The MCUs also include four 16-bit timers, eUSCs that support UART, SPI, and I²C, a hardware multiplier, an RTC module with alarm capabilities, and a high-performance 10-bit ADC.

6.2 CPU

The MSP430™ CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter (PC), stack pointer (SP), status register (SR), and constant generator (CG), respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses. Peripherals can be handled with all instructions.

6.3 Operating Modes

The MSP430 has one active mode and several software-selectable low-power modes of operation (see [Table 6-1](#)). An interrupt event can wake the MCU from low-power mode LPM0 or LPM3, service the request, and restore the MCU back to the low-power mode on return from the interrupt program. Low-power modes LPM3.5 and LPM4.5 disable the core supply to minimize power consumption.

(1) The status shown for LPM4 applies to internal clocks only.

(2) Backup memory contains 32 bytes of register space in peripheral memory. See [Table 6-24](#) and [Table 6-43](#) for its memory allocation.

NOTE

XT1CLK and VLOCLK can be active during LPM4 if requested by low-frequency peripherals.

6.4 Interrupt Vector Addresses

The interrupt vectors and the power-up start address are in the address range 0FFFFh to 0FF80h. The vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

6.5 Bootloader (BSL)

The BSL lets users program the FRAM or RAM using either the UART serial interface or the I²C interface. Access to the MCU memory through the BSL is protected by a user-defined password. Use of the BSL requires four pins (see [Table 6-3](#) and [Table 6-4](#)). The BSL entry requires a specific entry sequence on the $\overline{\text{RST}}$ /NMI/SBWTIO and TEST/SBWTCK pins. For the complete description of the feature of the BSL, see the *MSP430FR4xx and MSP430FR2xx Bootloader (BSL) User's Guide* ([SLAU610](#)).

6.6 JTAG Standard Interface

The MSP low-power microcontrollers support the standard JTAG interface, which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin enables the JTAG signals. In addition to these signals, the $\overline{\text{RST}}$ /NMI/SBWTIO is required to interface with MSP430 development tools and device programmers. [Table 6-5](#) lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide* ([SLAU278](#)). For details on using the JTAG interface, see the *MSP430 Programming Via the JTAG Interface User's Guide* ([SLAU320](#)).

6.7 Spy-Bi-Wire Interface (SBW)

The MSP low-power microcontrollers support the 2-wire SBW interface. SBW can be used to interface with MSP development tools and device programmers. [Table 6-6](#) lists the SBW interface pin requirements. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide* ([SLAU278](#)). For details on using the SBW interface, see the *MSP430 Programming Via the JTAG Interface User's Guide* ([SLAU320](#)).

6.8 FRAM

The FRAM can be programmed using the JTAG port, SBW, the BSL, or in-system by the CPU. Features of the FRAM include:

- Byte and word access capability
- Programmable wait state generation
- Error correction coding (ECC)

6.9 Memory Protection

The device features memory protection for user access authority and write protection, including options to:

- Secure the whole memory map to prevent unauthorized access from JTAG port or BSL, by writing JTAG and BSL signatures using the JTAG port, SBW, the BSL, or in-system by the CPU.
- Enable write protection to prevent unwanted write operation to FRAM contents by setting the control bits in the System Configuration 0 register. For detailed information, see the SYS chapter in the *MP430FR4xx and MP430FR2xx Family User's Guide* ([SLAU445](#)).

6.10 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. All peripherals can be handled by using all instructions in the memory map. For complete module description, see the *MP430FR4xx and MP430FR2xx Family User's Guide* (SLAU445).

6.10.1 Power-Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device. The PMM also includes supply voltage supervisor (SVS) and brownout protection. The brownout reset circuit (BOR) is implemented to provide the proper internal reset signal to the device during power on and power off. The SVS circuitry detects if the supply voltage drops below a user-selectable safe level. SVS circuitry is available on the primary supply.

The device contains two on-chip reference: 1.5 V for internal reference and 1.2 V for external reference.

The 1.5-V reference is internally connected to ADC channel 13. DVCC is internally connected to ADC channel 15. When DVCC is set as the reference voltage for ADC conversion, the DVCC can be easily represent as Equation 1 by using ADC sampling 1.5-V reference without any external components support.

$$\text{DVCC} = (1023 \times 1.5 \text{ V}) \div 1.5\text{-V reference ADC result} \quad (1)$$

A 1.2-V reference voltage can be buffered and output to P1.4/MCLK/TCK/A4/VREF+, when EXTREFEN = 1 in the PMMCTL1 register. ADC channel 4 can also be selected to monitor this voltage. For more detailed information, see the *MP430FR4xx and MP430FR2xx Family User's Guide* (SLAU445).

6.10.2 Clock System (CS) and Clock Distribution

The clock system includes a 32-kHz crystal oscillator (XT1), an internal very-low-power low-frequency oscillator (VLO), an integrated 32-kHz RC oscillator (REFO), an integrated internal digitally controlled oscillator (DCO) that may use frequency-locked loop (FLL) locking with internal or external 32-kHz reference clock, and an on-chip asynchronous high-speed clock (MODOSC). The clock system is designed for cost-effective designs with minimal external components. A fail-safe mechanism is included for XT1. The clock system module offers the following clock signals.

- **Main Clock (MCLK):** The system clock used by the CPU and all relevant peripherals accessed by the bus. All clock sources except MODOSC can be selected as the source with a predivider of 1, 2, 4, 8, 16, 32, 64, or 128.
- **Sub-Main Clock (SMCLK):** The subsystem clock used by the peripheral modules. SMCLK derives from the MCLK with a predivider of 1, 2, 4, or 8. This means SMCLK is always equal to or less than MCLK.
- **Auxiliary Clock (ACLK):** This clock is derived from the external XT1 clock or internal REFO clock up to 40 kHz.

All peripherals may have one or several clock sources depending on specific functionality. [Table 6-7](#) lists the clock distribution used in this device.

6.10.3 General-Purpose Input/Output Port (I/O)

Up to 19 I/O ports are implemented.

- P1 and P2 are full 8-bit ports; P3 has 3 bits implemented.
- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Programmable pullup or pulldown on all ports.
- Edge-selectable interrupt and LPM3.5 and LPM4.5 wake-up input capability is available for P1 and P2.
- Read and write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise or word-wise in pairs.
- CapTivate functionality is supported on all CAPx.y pins.

NOTE

Configuration of digital I/Os after BOR reset

To prevent any cross currents during start-up of the device, all port pins are high-impedance with Schmitt triggers and module functions disabled. To enable the I/O functions after a BOR reset, the ports must be configured first and then the LOCKLPM5 bit must be cleared. For details, see the *Configuration After Reset* section in the Digital I/O chapter of the *MP430FR4xx and MP430FR2xx Family User's Guide* ([SLAU445](#))

6.10.4 Watchdog Timer (WDT)

The primary function of the WDT module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as interval timer and can generate interrupts at selected time intervals. [Table 6-8](#) lists the system clocks that can be used to source the WDT.

Table 6-8. WDT Clocks

WDTSEL	NORMAL OPERATION (WATCHDOG AND INTERVAL TIMER MODE)
00	SMCLK
01	ACLK
10	VLOCLK

6.10.5 System (SYS) Module

The SYS module handles many of the system functions within the device. These features include power-on reset (POR) and power-up clear (PUC) handling, NMI source selection and management, reset interrupt vector generators, bootloader entry mechanisms, and configuration management (device descriptors). The SYS module also includes a data exchange mechanism through SBW called a JTAG mailbox mail box that can be used in the application. [Table 6-9](#) summarizes the interrupts that are managed by the SYS module.

6.10.6 Cyclic Redundancy Check (CRC)

The 16-bit cyclic redundancy check (CRC) module produces a signature based on a sequence of data values and can be used for data checking purposes. The CRC generation polynomial is compliant with CRC-16-CCITT standard of $x^{16} + x^{12} + x^5 + 1$.

6.10.7 Enhanced Universal Serial Communication Interface (eUSCI_A0, eUSCI_B0)

The eUSCI modules are used for serial data communications. The eUSCI_A module supports either UART or SPI communications. The eUSCI_B module supports either SPI or I²C communications. Additionally, eUSCI_A supports automatic baud-rate detection and IrDA. [Table 6-10](#) lists the pin configurations that are required for each eUSCI mode.

Table 6-10. eUSCI Pin Configurations

	PIN	UART	SPI

6.10.8 Timers (Timer0_A3, Timer1_A3, Timer2_A2 and Timer3_A2)

The Timer0_A3 and Timer1_A3 modules are 16-bit timers and counters with three capture/compare registers each. Each timer supports multiple captures or compares, PWM outputs, and interval timing (see [Table 6-11](#) and [Table 6-12](#)). Each timer has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers. The CCR0 registers on both Timer0_A3 and Timer1_A3 are not externally connected and can only be used for hardware period timing and interrupt generation. In Up mode, they can be used to set the overflow value of the counter.

The interconnection of Timer0_A3 and Timer1_A3 can be used to modulate the eUSCI_A pin of UCA0TXD/UCA0SIMO in either ASK or FSK mode, with which a user can easily acquire a modulated infrared command for directly driving an external IR diode. The IR functions are fully controlled by SYS configuration registers 1 including IREN (enable), IRPSEL (polarity select), IRMSEL (mode select), IRDSEL (data select), and IRDATA (data) bits. For more information, see the SYS chapter in the *MP430FR4xx and MP430FR2xx Family User's Guide* ([SLAU445](#)).

The Timer2_A2 and Timer3_A2 modules are 16-bit timers and counters with two capture/compare registers each. Each timer supports multiple captures or compares and interval timing (see [Table 6-13](#) and [Table 6-14](#)). Each timer has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture registers. The CCR0 registers on both Timer2_TA2 and Timer3_TA2 are not externally connected and can only be used for hardware period timing and interrupt generation. In Up mode, they can be used to set the overflow value of the counter. The Timer2_A2 and Timer3_A2 are only internal connected and do not support PWM output.

6.10.9 Hardware Multiplier (MPY)

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The MPY module supports signed multiplication, unsigned multiplication, signed multiply-and-accumulate, and unsigned multiply-and-accumulate operations.

6.10.10 Backup Memory (BKMEM)

The BKMEM supports data retention during LPM3.5. This device provides up to 32 bytes that are retained during LPM3.5.

6.10.11 Real-Time Clock (RTC)

The RTC is a 16-bit modulo counter that is functional in AM, LPM0, LPM3, and LPM3.5. This module may periodically wake up the CPU from LPM0, LPM3 and LPM3.5 based on timing from a low-power clock source such as the XT1 and VLO clocks. In AM, RTC can be driven by SMCLK to generate high-frequency timing events and interrupts. The RTC overflow events trigger:

- Timer0_A3 CCR1B
- ADC conversion trigger when ADCSHSx bits are set as 01b

6.10.12 10-Bit Analog-to-Digital Converter (ADC)

The 10-bit ADC module supports fast 10-bit analog-to-digital conversions with single-ended input. The module implements a 10-bit SAR core, sample select control, reference generator and a conversion result buffer. A window comparator with lower and upper limits allows CPU-independent result monitoring with three window comparator interrupt flags.

The ADC supports 10 external inputs and 4 internal inputs (see [Table 6-15](#)).

(1) When A4 is used, the PMM 1.2-V reference voltage can be output to this pin by setting the PMM control register. The 1.2-V voltage can be directly measured by A4 channel.

The analog-to-digital conversion can be started by software or a hardware trigger. [Table 6-16](#) lists the trigger sources that are available.

6.10.13 CapTivate

The CapTivate module detects the capacitance changed with a charge-transfer method and is functional in AM, LPM0, and LPM3. The CapTivate module can periodically wake the CPU from LPM0 or LPM3 based on a timer source such as the ACLK and VLO clocks. The CapTivate module supports the following touch-sensing capability:

- Up to 64 CapTivate sense channels composed of 4 CapTivate blocks. Each block consists of 4 I/Os, and these blocks scan in parallel of 4 electrodes.
- Each block can be individually configured in self or mutual mode. Each CapTivate I/O can be used for either self or mutual electrodes.
- Supports a wake-on-touch state machine.
- Supports synchronized conversion on a zero-crossing event trigger.
- Processing logic to perform filter calculation and threshold detection.

6.10.14 Embedded Emulation Module (EEM)

The EEM supports real-time in-system debugging. The EEM on these devices has the following features:

- Three hardware triggers or breakpoints on memory access
- One hardware trigger or breakpoint on CPU register write access
- Up to four hardware triggers can be combined to form complex triggers or breakpoints
- One cycle counter
- Clock control on module level
- EEM version: S

NOTE

CapTlvate shared with I/Os configuration

The CapTlvate function and GPIOs are powered by different power supplies (1.5 V and 3.3 V, respectively).

To prevent pad damage when changing the function, TI recommends checking the external application circuit of each pad before enabling the alternate function.

6.14 Identification

6.14.1 Revision Identification

The device revision information is included as part of the top-side marking on the device package. The device-specific errata sheet describes these markings (see [Section 8.2](#)).

The hardware revision is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the Hardware Revision entries in [Section 6.12](#).

6.14.2 Device Identification

The device type can be identified from the top-side marking on the device package. The device-specific errata sheet describes these markings (see [Section 8.2](#)).

A device identification value is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the Device ID entries in [Section 6.12](#).

6.14.3 JTAG Identification

Programming through the JTAG interface, including reading and identifying the JTAG ID, is described in detail in the *MSP430 Programming Via the JTAG Interface User's Guide* ([SLAU320](#)).

7 Applications, Implementation, and Layout

NOTE

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

7.1 Device Connection and Layout Fundamentals

This section discusses the recommended guidelines when designing with the MSP430 devices. These guidelines are to make sure that the device has proper connections for powering, programming, debugging, and optimum analog performance.

7.1.1 Power Supply Decoupling and Bulk Capacitors

TI recommends connecting a combination of a 10- μ F plus a 100-nF low-ESR ceramic decoupling capacitor to the DVCC and DVSS pins. Higher-value capacitors may be used but can impact supply rail ramp-up time. Decoupling capacitors must be placed as close as possible to the pins that they decouple (within a few millimeters). Additionally, TI recommends separated grounds with a single-point connection for better noise isolation from digital-to-analog circuits on the board and to achieve high analog accuracy.

Figure 7-1. Power Supply Decoupling

7.1.2 External Oscillator

This device supports only a low-frequency crystal (32 kHz) on the XIN and XOUT pins. External bypass capacitors for the crystal oscillator pins are required.

It is also possible to apply digital clock signals to the XIN input pin that meet the specifications of the respective oscillator if the appropriate XT1BYPASS mode is selected. In this case, the associated XOUT pin can be used for other purposes. If the XIN and XOUT pins are not used, they must be terminated according to [Section 4.6](#).

[Figure 7-2](#) shows a typical connection diagram.

Figure 7-2. Typical Crystal Connection

See the application report *MSP430 32-kHz Crystal Oscillators* (SLAA322) for more information on selecting, testing, and designing a crystal oscillator with the MSP430 devices.

7.1.3 JTAG

With the proper connections, the debugger and a hardware JTAG interface (such as the MSP-FET or MSP-FET430UIF) can be used to program and debug code on the target board. In addition, the connections also support the MSP-GANG production programmers, thus providing an easy way to program prototype boards, if desired. Figure 7-3 shows the connections between the 14-pin JTAG connector and the target device required to support in-system programming and debugging for 4-wire JTAG communication. Figure 7-4 shows the connections for 2-wire JTAG mode (Spy-Bi-Wire).

The connections for the MSP-FET and MSP-FET430UIF interface modules and the MSP-GANG are identical. Both can supply V_{CC} to the target board (through pin 2). In addition, the MSP-FET and MSP-FET430UIF interface modules and MSP-GANG have a V_{CC} sense feature that, if used, requires an alternate connection (pin 4 instead of pin 2). The V_{CC} sense feature detects the local V_{CC} present on the target board (that is, a battery or other local power supply) and adjusts the output signals accordingly. Figure 7-3 and Figure 7-4 show a jumper block that supports both scenarios of supplying V_{CC} to the target board. If this flexibility is not required, the desired V_{CC} connections may be hard-wired to eliminate the jumper block. Pins 2 and 4 must not be connected at the same time.

For additional design information regarding the JTAG interface, see the *MSP430 Hardware Tools User's Guide* (SLAU278).

- If a local target power supply is used, make connection J1. If power from the debug or programming adapter is used, make connection J2.
- The upper limit for C1 is 1.1 nF when using current TI tools.

Figure 7-3. Signal Connections for 4-Wire JTAG Communication

- Make connection J1 if a local target power supply is used, or make connection J2 if the target is powered from the debug or programming adapter.
- The device $\overline{\text{RST}}/\text{NMI}/\text{SBWTIO}$ pin is used in 2-wire mode for bidirectional communication with the device during JTAG access, and any capacitance that is attached to this signal may affect the ability to establish a connection with the device. The upper limit for C1 is 1.1 nF when using current TI tools.

Figure 7-4. Signal Connections for 2-Wire JTAG Communication (Spy-Bi-Wire)

7.1.4 Reset

The reset pin can be configured as a reset function (default) or as an NMI function in the Special Function Register (SFR), SFR_{RPCR} .

In reset mode, the $\overline{\text{RST}}/\text{NMI}$ pin is active low, and a pulse applied to this pin that meets the reset timing specifications generates a BOR-type device reset.

Setting SYSNMI causes the $\overline{\text{RST}}/\text{NMI}$ pin to be configured as an external NMI source. The external NMI is edge sensitive, and its edge is selectable by SYSNMIIES . Setting the NMIIE enables the interrupt of the external NMI. When an external NMI event occurs, the NMIIFG is set.

The $\overline{\text{RST}}/\text{NMI}$ pin can have either a pullup or pulldown that is enabled or not. SYSRSTUP selects either pullup or pulldown, and SYSRSTRE causes the pullup (default) or pulldown to be enabled (default) or not. If the $\overline{\text{RST}}/\text{NMI}$ pin is unused, it is required either to select and enable the internal pullup or to connect an external 47-kΩ pullup resistor to the $\overline{\text{RST}}/\text{NMI}$ pin with a 1.1-nF pulldown capacitor. The pulldown capacitor should not exceed 1.1 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools like FET interfaces or GANG programmers.

See the *MSP430FR4xx and MSP430FR2xx Family User's Guide* (SLAU445) for more information on the referenced control registers and bits.

7.1.5 Unused Pins

For details on the connection of unused pins, see [Section 4.6](#).

7.1.6 General Layout Recommendations

- Proper grounding and short traces for external crystal to reduce parasitic capacitance. See the application report *MSP430 32-kHz Crystal Oscillators* (SLAA322) for recommended layout guidelines.
- Proper bypass capacitors on DVCC and reference pins, if used.
- Avoid routing any high-frequency signal close to an analog signal line. For example, keep digital switching signals such as PWM or JTAG signals away from the oscillator circuit and ADC signals.
- Refer to the *Circuit Board Layout Techniques* design guide (SLOA089) for a detailed discussion of PCB layout considerations. This document is written primarily about op amps, but the guidelines are generally applicable for all mixed-signal applications.
- Proper ESD level protection should be considered to protect the device from unintended high-voltage electrostatic discharge. See the application report *MSP430 System-Level ESD Considerations* (SLAA530) for guidelines.

7.1.7 Do's and Don'ts

During power up, power down, and device operation, DVCC must not exceed the limits specified in [Section 5.1, Absolute Maximum Ratings](#). Exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and FRAM.

7.2 Peripheral- and Interface-Specific Design Information

7.2.1 ADC Peripheral

7.2.1.1 Partial Schematic

Figure 7-5. ADC Grounding and Noise Considerations

7.2.1.2 Design Requirements

As with any high-resolution ADC, appropriate printed-circuit board layout and grounding techniques should be followed to eliminate ground loops, unwanted parasitic effects, and noise.

Ground loops are formed when return current from the ADC flows through paths that are common with other analog or digital circuitry. If care is not taken, this current can generate small unwanted offset voltages that can add to or subtract from the reference or input voltages of the ADC. The general guidelines in [Section 7.1.1](#) combined with the connections shown in [Figure 7-5](#) prevent this.

In addition to grounding, ripple and noise spikes on the power-supply lines that are caused by digital switching or switching power supplies can corrupt the conversion result. TI recommends a noise-free design using separate analog and digital ground planes with a single-point connection to achieve high accuracy.

Figure 7-5 shows the recommended decoupling circuit when an external voltage reference is used. The internal reference module has a maximum drive current as described in the sections *ADC Pin Enable* and *1.2-V Reference Settings* of the *MSP430FR4xx and MSP430FR2xx Family User's Guide* (SLAU445).

The reference voltage must be a stable voltage for accurate measurements. The capacitor values that are selected in the general guidelines filter out the high- and low-frequency ripple before the reference voltage enters the device. In this case, the 10- μ F capacitor buffers the reference pin and filters any low-frequency ripple. A bypass capacitor of 100 nF filters out any high-frequency noise.

7.2.1.3 Layout Guidelines

Components that are shown in the partial schematic (see Figure 7-5) should be placed as close as possible to the respective device pins to avoid long traces, because they add additional parasitic capacitance, inductance, and resistance on the signal.

Avoid routing analog input signals close to a high-frequency pin (for example, a high-frequency PWM), because the high-frequency switching can be coupled into the analog signal.

7.2.2 CapTIvate Peripheral

This section provides a brief introduction to the CapTIvate technology with examples of PCB layout and performance from the design kit. A more detailed description of the CapTIvate technology and the tools needed to be successful, application development tools, hardware design guides, and software library, can be found in the [CapTIvate Technology Design Center](#).

7.2.2.1 Device Connection and Layout Fundamentals

7.2.2.1.1 VREG

The VREG pin requires a 1- μ F capacitor to regulate the 1.5-V LDO internal to the device (Vreg). This capacitor must be placed as close as possible to the microcontroller. Figure 7-6 shows the layout of the CAPTIVATE-FR2633, zooming in on the capacitor connected to the VREG pin.

Figure 7-6. VREG Capacitor and Channel Series Resistors

7.2.2.1.2 ESD Protection

Typically, the laminate overlay provides several kilovolts of breakdown isolation to protect the circuit from ESD strikes. More ESD protection can be added with a series resistor placed on each channel used. A value of 470 Ω is recommended and is found on the development tool.

7.2.2.1.3 Mutual- and Self-Capacitance

CapTivate technology enables both self-mode and mutual-mode capacitance measurements. [Section 7.2.2.1.4](#) and [Section 7.2.2.1.5](#) provide a brief description and examples, taken from the CAPTIVATE-PHONE and CAPTIVATE-BSWP panels found in the design kit, for self- and mutual-mode capacitance measurements, respectively.

7.2.2.1.4 Self-Capacitance

Self-capacitance electrodes are characterized by having only one channel from the IC that both excites and measures the capacitance. The capacitance being measured is between the electrode and earth ground, so any capacitance local to the PCB or outside of the PCB (a touch event) influences the measurement.

PCB layout design guidelines to minimize local parasitic capacitances and maximize the affect of external capacitances (a touch) can be found in the [CapTivate Technology Design Center](#). [Figure 7-7](#), taken from the CAPTIVATE-BSWP panel, shows that the area of the button should be consistent with the touch area, in this case a 400-mil (10.16-mm) diameter circle. To minimize parasitics on the PCB, the ground pour on the bottom layer is hatched and there is no pour directly below the electrode: 50-mil (1.27-mm) spacing between the electrode and ground fill.

Figure 7-7. Self-Capacitance Electrodes

7.2.2.1.5 Mutual Capacitance

Mutual capacitance is characterized by having two channels, receive (Rx) and transmit (Tx), from the IC with the focus being the capacitance between the two. Coupling to earth ground still has an affect, but this is secondary to the mutual capacitance between the Rx and Tx electrodes.

PCB layout design guidelines for mutual capacitance structures can also be found in the [CapTIvate Technology Design Center](#). Figure 7-8, taken from CAPTIVATE-PHONE, shows that the Tx electrode is a copy of the Rx electrode expanded to surround the Rx electrode. Both the Rx and Tx electrodes are in the shape of hollow squares: the Tx electrode is 300 × 300 mils (7.62 × 7.62 mm) and the Rx electrode is 150 × 150 mils (3.81 × 3.81 mm). Both electrodes are 50 mils (1.27 mm) wide.

Figure 7-8. Mutual-Capacitance Electrodes

7.2.2.2 Measurements

The following measurements are taken from the [CapTivate Technology Design Center](#), using the CAPTIVATE-PHONE and CAPTIVATE-BSWP panels. Unless otherwise stated, the settings used are the out-of-box settings, which can be found in the example projects. The intent of these measurements is to show performance in a configuration that is readily available and reproducible.

Figure 7-9. CAPTIVATE-PHONE and CAPTIVATE-BSWP Panels

7.2.2.2.1 SNR

The [CapTivate technology Design Center](#) provides a specific view for analyzing the signal-to-noise ratio of each element. [Figure 7-10](#) shows that the SNR tab can be used to establish a confidence level in the settings that are chosen.

Figure 7-10. SNR Tab

[Table 7-1](#) summarizes the SNR results from the CAPTIVATE-PHONE panel keypad, numericKeypadSensor.

Table 7-1. CAPTIVATE-PHONE SNR Results

E03	38.50	E09	–
E04	34.76	E10	–
E05	39.62	E11	–

Table 7-2 summarizes the SNR results from the CAPTIVATE-BSWP panel keypad, keypadSensor.

Table 7-2. CAPTIVATE-BSWP SNR Results

E01	47.26	E05	29.67
E02	36.79	E06	36.63
E03	33.73	E07	34.07

7.2.2.2.2 Sensitivity

To show sensitivity, in terms of farads, the internal reference capacitor is used as the change in capacitance. In the mutual-capacitance case, the 0.1-pF capacitor is used. In the self-capacitance case, the 1-pF reference capacitor is used. For simplicity, the results for only button 1 on both the CAPTIVATE-PHONE and CAPTIVATE-BSWP panels are reported in Table 7-3.

Table 7-3. Button Sensitivity

CONVERSION COUNT	CONVERSION GAIN	CAPTIVATE-PHONE BUTTON 1		CAPTIVATE-BSWP BUTTON 1	
		CONVERSION TIME (μs)	COUNTS FOR 0.1-pF CHANGE	CONVERSION TIME (μs)	COUNTS FOR 1-pF CHANGE
100	100	25	6	50	8
200	200	50	10	100	16
200	100	50	21	100	31
800	400	200	70	400	112
800	200	200	140	400	202
800	100	200	257	400	333

An alternative measure in sensitivity is the ability to resolve capacitance change over a wide range of base capacitance. Table 7-4 shows example conversion times (for a self-mode measurement of discrete capacitors) that can be used to achieve the desired resolution for a given parasitic load capacitance.

Table 7-4. Button Sensitivity

CAPACITANCE Cp (pF) ⁽¹⁾	CONVERSION COUNT/GAIN	CONVERSION TIME (μs)	COUNTS FOR 0.130-pF CHANGE	COUNTS FOR 0.260-pF CHANGE	COUNTS FOR 0.520-pF CHANGE
23	400/100	200	10	23	35
50	550/100	275	11	24	37

150 ⁽²⁾	1200/200	600	11	23	37
200 ⁽²⁾	1200/150	600	13	26	41

(1) These measurements were taken with the CapTivate MCU processor board with the 470-Ω series resistors replaced with 0-Ω resistors.

(2) 0-V discharge voltage is used.

7.2.2.2.3 Power

The low-power mode LPM3 specifications in [Section 5.7](#) are derived from the CapTivate technology design kit as indicated in the notes.

7.3 Typical Applications

[Table 7-5](#) lists tools that demonstrate the use of the MSP430FR263x devices in various real-world application scenarios. Consult these designs for additional guidance regarding schematics, layout, and software implementation. 8.1.1.2.2 Recommended Hardware Options

All MSP430 MCUs are supported by a wide variety of software and hardware development tools. Tools are available from TI and various third parties. See them all at [MSP430 Tools](#).

8.1.1.2.2.1 Experimenter Boards

Experimenter Boards and Evaluation kits are available for some MSP430 devices. These kits feature additional hardware components and connectivity for full system evaluation and prototyping. See [MSP430 Tools](#) for details.

8.1.1.2.2.2 Debugging and Programming Tools

Hardware programming and debugging tools are available from TI and from its third-party suppliers. See the full list of available tools at [MSP430 Tools](#).

PART NUMBER	PC PORT	FEATURES	PROVIDER
MSP-FET430UIF	USB	MSP430 USB debugging interface. Compatible with 4-wire JTAG and 2-wire Spy-Bi-Wire (SBW) JTAG modes	Texas Instruments
MSP-FET	USB	MSP MCU programmer and debugger. The MSP-FET is compatible with Code Composer Studio v6 and later.	Texas Instruments

8.1.1.2.2.3 Production Programmers

The production programmers expedite loading firmware to devices by programming several devices simultaneously.

PART NUMBER	PC PORT	FEATURES	PROVIDER
MSP-GANG	Serial and USB	Program up to eight devices at a time. Works with a PC or as a stand-alone package.	Texas Instruments

8.1.1.2.3 Recommended Software Options

8.1.1.2.3.1 Integrated Development Environments

Software development tools are available from TI or from third parties. Open-source solutions are also available.

This device is supported by Code Composer Studio™ IDE (CCS).

8.1.1.2.3.2 MSPWare

MSPWare is a collection of code examples, data sheets, and other design resources for all MSP devices delivered in a convenient package. In addition to providing a complete collection of existing MSP design resources, MSPWare also includes a high-level API called MSP430 Driver Library. This library makes it easy to program MSP hardware. MSPWare is available as a component of CCS or as a stand-alone package.

8.1.1.2.3.3 Command-Line Programmer

MSP Flasher is an open-source shell-based interface for programming MSP MCUs through a FET programmer or eZ430 using JTAG or Spy-Bi-Wire (SBW) communication. MSP Flasher can be used to download binary files (.txt or .hex) files directly to the MSP MCU without the need for an IDE.

8.1.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP430 MCUs and support tools. Each MSP430 MCU commercial family member has one of three prefixes: MSP, PMS, or XMS (for example, MSP430FR2633). TI recommends two of three possible prefix designators for its support tools: MSP and MSPX. These prefixes represent evolutionary stages of product development from engineering prototypes (with XMS for devices and MSPX for tools) through fully qualified production devices and tools (with MSP for devices and MSP for tools).

Device development evolutionary flow:

XMS – Experimental device that is not necessarily representative of the electrical specifications of the final device

MSP – Fully qualified production device

Support tool development evolutionary flow:

MSPX – Development-support product that has not yet completed TI internal qualification testing.

MSP – Fully-qualified development-support product

XMS devices and MSPX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices and MSP development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, RHB) and temperature range (for example, T). [Figure 8-1](#) provides a legend for reading the complete device name for any family member.

Processor Family	MSP = Mixed-signal processor XMS = Experimental silicon	
MCU Platform	430 = MSP430 16-bit low-power platform	
Device Type	Memory Type FR = FRAM	
Series	4 = Up to 16 MHz with LCD 2 = Up to 16 MHz without LCD	
Feature Set	First and Second Digits – CapTIvate Performance 63 = 4 CapTIvate blocks with full performance 53 = 4 CapTIvate blocks with downgraded performance	Third Digit – FRAM (KB) / SRAM (KB) 3 = 16 / 4 (16 / 2 for 53 device) 2 = 8 / 2 (8 / 1 for 53 device)

8.2 Documentation Support

The following documents describe the MSP430FR263x and MSP430FR253x MCUs. Copies of these documents are available on the Internet at www.ti.com.

- SLAU445** *MSP430FR4xx and MSP430FR2xx Family User's Guide.* Detailed description of all modules and peripherals available in this device family.
- SLAZ660** *MSP430FR2633 Device Erratasheet.* Describes the known exceptions to the functional specifications for all silicon revisions of this MCU.
- SLAZ661** *MSP430FR2533 Device Erratasheet.* Describes the known exceptions to the functional specifications for all silicon revisions of this MCU.
- SLAZ662** *MSP430FR2632 Device Erratasheet.* Describes the known exceptions to the functional specifications for all silicon revisions of this MCU.
- SLAZ663** *MSP430FR2532 Device Erratasheet.* Describes the known exceptions to the functional specifications for all silicon revisions of this MCU.
- SLAU278** *MSP430 Hardware Tools User's Guide.* This manual describes the hardware of the TI MSP-FET430 Flash Emulation Tool (FET). The FET is the program development tool for the MSP430 ultra-low-power microcontroller. Both available interface types, the parallel port interface and the USB interface, are described.
- SLAU610** *MSP430FR4xx and MSP430FR2xx Bootloader (BSL) User's Guide.* The bootloader (BSL) provides a method to program memory during MSP430 MCU project development and updates. It can be activated by a utility that sends commands using a serial protocol. The BSL enables the user to control the activity of the MSP430 MCU and to exchange data using a personal computer or other device.
- SLAU320** *MSP430 Programming Via the JTAG Interface.* This document describes the functions that are required to erase, program, and verify the memory module of the MSP430 flash-based and FRAM-based microcontroller families using the JTAG communication port. In addition, it describes how to program the JTAG access security fuse that is available on all MSP430 MCUs. This document describes access to the MCU using both the standard 4-wire JTAG interface and the 2-wire JTAG interface, which is also referred to as Spy-Bi-Wire (SBW).
- SLAA322** *MSP430 32-kHz Crystal Oscillators.* Selection of the right crystal, correct load circuit, and proper board layout are important for a stable crystal oscillator. This application report summarizes crystal oscillator function and explains the parameters to select the correct crystal for MSP430 ultra-low power operation. In addition, hints and examples for correct board layout are given. The document also contains detailed information on the possible oscillator tests to ensure stable oscillator operation in mass production.
- SLOA089** *Circuit Board Layout Techniques.* Op amp circuitry is analog circuitry and is very different from digital circuitry. It must be partitioned in its own section of the board using special layout techniques. Printed circuit board effects become most apparent in high-speed analog circuits, but common mistakes described in this chapter can even affect the performance of audio circuits. The purpose of this chapter is to discuss some of the more common mistakes made by designers and how they degrade performance, and to provide simple fixes to avoid the problems.
- SLAA530** *MSP430 System-Level ESD Considerations.* System-Level ESD has become increasingly demanding with silicon technology scaling towards lower voltages and the need for designing cost-effective and ultra-low-power components. This application report addresses three different ESD topics to help board designers and OEMs understand and design robust system-level designs.

8.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.7 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
