
8-Bit Serial Input Constant-Current Latched LED Driver

Last Time Buy

This part is in production but has been determined to be LAST TIME BUY. This classification indicates that the product is obsolete and notice has been given. Sale of this device is currently restricted to existing customer applications. The device should not be purchased for new design applications because of obsolescence in the near future. Samples are no longer available.

Date of status change: November 1, 2010

Deadline for receipt of LAST TIME BUY orders: April 30, 2011

Recommended Substitutions:

For existing customer transition, and for new customers or new applications, refer to the [A6279](#).

NOTE: For detailed information on purchasing options, contact your local Allegro field applications engineer or sales representative.

Allegro MicroSystems, Inc. reserves the right to make, from time to time, revisions to the anticipated product life cycle plan for a product to accommodate changes in production capabilities, alternative product availabilities, or market demand. The information included herein is believed to be accurate and reliable. However, Allegro MicroSystems, Inc. assumes no responsibility for its use; nor for any infringements of patents or other rights of third parties which may result from its use.

8-Bit Serial Input Constant-Current Latched LED Driver

Features and Benefits

- Up to 90 mA constant-current outputs
- Undervoltage lockout
- Low-power CMOS logic and latches
- High data-input rate
- Pin-compatible with TB62705CP

Packages

16-pin DIP
(A package)

16-pin SOICW
(LW package)

Not to scale

Description

The A6275 is specifically designed for LED display applications. Each BiCMOS device includes an 8-bit CMOS shift register, accompanying data latches, and eight NPN constant-current sink drivers.

The CMOS shift register and latches allow direct interfacing with microprocessor-based systems. With a 5 V logic supply, typical serial data-input rates are up to 20 MHz. The LED drive current is determined by the user selection of a single resistor. A CMOS serial data output permits cascade connections in applications requiring additional drive lines. For inter-digit blanking, all output drivers can be disabled with an ENABLE input high. A similar 150 mA output device is available as the A6277; a similar 16-bit device is available as the A6276.

Two package styles are provided: a through-hole DIP (suffix A) and a surface-mount SOICW (suffix LW). Under normal applications, copper leadframes and low logic-power dissipation allow these devices to sink maximum rated current through all outputs continuously over the operating temperature range (90 mA, 0.9 V drop, 85°C). Both packages are lead (Pb) free, with 100% matte tin leadframe plating.

	I_{OL}	SERIAL DATA OUT	–	–	1.0	mA
Logic Input Voltage	V_{IH}		$0.7V_{DD}$	–	$V_{DD} + 0.3$	V
	V_{IL}		-0.3	–	$0.3V_{DD}$	V
Clock Frequency	f_{CK}	Cascade operation	–	–	10	MHz

TIMING REQUIREMENTS and SPECIFICATIONS

(Logic Levels are V_{DD} and Ground)

Dwg. WP-029-1

Dwg. WP-030-1A

- A. Data Active Time Before Clock Pulse
(Data Set-Up Time), $t_{su(D)}$ **50 ns**
- B. Data Active Time After Clock Pulse
(Data Hold Time), $t_{h(D)}$ **20 ns**
- C. Clock Pulse Width, $t_{w(CK)}$ **50 ns**
- D. Time Between Clock Activation
and Latch Enable, $t_{su(L)}$ **100 ns**
- E. Latch Enable Pulse Width, $t_{w(L)}$ **100 ns**
- F. Output Enable Pulse Width, $t_{w(OE)}$ **4.5 μ s**

NOTE: Timing is representative of a 10 MHz clock. Significantly higher speeds are attainable.

Max. Clock Transition Time, t_r or t_f **10 μ s**

Serial data present at the input is transferred to the shift register on the logic 0-to-logic 1 transition of the CLOCK input pulse. On succeeding CLOCK pulses, the registers shift data information towards the SERIAL DATA OUTPUT. The serial data must appear at the input prior to the rising edge of the CLOCK input waveform.

Information present at any register is transferred to the respective latch when the LATCH ENABLE is high (serial-to-parallel conversion). The latches continue to accept new data as

long as the LATCH ENABLE is held high. Applications where the latches are bypassed (LATCH ENABLE tied high) will require that the OUTPUT ENABLE input be high during serial data entry.

When the OUTPUT ENABLE input is high, the output sink drivers are disabled (OFF). The information stored in the latches is not affected by the OUTPUT ENABLE input. With the OUTPUT ENABLE input low, the outputs are controlled by the state of their respective latches.

Package A

Diagram of Package A (left): A 16-pin package with the following connections:

- Pin 1: GROUND
- Pin 2: SERIAL DATA IN
- Pin 3: CLOCK (CK)
- Pin 4: LATCH ENABLE (L)
- Pin 5: OUT₀
- Pin 6: OUT₁
- Pin 7: OUT₂
- Pin 8: OUT₃
- Pin 9: OUT₄
- Pin 10: OUT₅
- Pin 11: OUT₆
- Pin 12: OUT₇
- Pin 13: OUTPUT ENABLE ($\overline{\text{OE}}$)
- Pin 14: SERIAL DATA OUT
- Pin 15: R_{EXT}
- Pin 16: LOGIC SUPPLY (V_{DD})

Internal components include a 3.3V REGULATOR, a REGISTER, and LATCHES.

Package LW

Diagram of Package LW (right): A 16-pin package with the following connections:

- Pin 1: GROUND
- Pin 2: SERIAL DATA IN
- Pin 3: CLOCK (CK)
- Pin 4: LATCH ENABLE (L)
- Pin 5: OUT₀
- Pin 6: OUT₁
- Pin 7: OUT₂
- Pin 8: OUT₃
- Pin 9: OUT₄
- Pin 10: OUT₅
- Pin 11: OUT₆
- Pin 12: OUT₇
- Pin 13: OUTPUT ENABLE ($\overline{\text{OE}}$)
- Pin 14: SERIAL DATA OUT
- Pin 15: R_{EXT}
- Pin 16: LOGIC SUPPLY (V_{DD})

Internal components include a 1.8V REGULATOR, a REGISTER, and LATCHES.

Terminal No.	Terminal Name	Function
1	GND	Reference terminal for control logic.
2	SERIAL DATA IN	Serial-data input to the shift-register.
3	CLOCK	Clock input terminal for data shift on rising edge.
4	LATCH ENABLE	Data strobe input terminal; serial data is latched with high-level input.
5-12	OUT ₀₋₇	The eight current-sinking output terminals.
13	OUTPUT ENABLE	When (active) low, the output drivers are enabled; when high, all output drivers are turned OFF (blanked).
14	SERIAL DATA OUT	CMOS serial-data output to the following shift-register.
15	R _{EXT}	An external resistor at this terminal establishes the output current for all sink drivers.
16	SUPPLY	(V _{DD}) The logic supply voltage (typically 5 V).

Applications Information

The load current per bit (I_O) is set by the external resistor (R_{EXT}) as shown in the figure below.

Package Power Dissipation (P_D). The maximum allowable package power dissipation is determined as

$$P_{D(\max)} = (150 - T_A) / R_{\theta JA}$$

The actual package power dissipation is

$$P_{D(\text{act})} = dc(V_{CE} \times I_O \times 8) + (V_{DD} \times I_{DD})$$

When the load supply voltage is greater than 3 V to 5 V, considering the package power dissipating limits of these devices, or if $P_{D(\text{act})} > P_{D(\max)}$, an external voltage reducer (V_{DROP}) should be used.

Load Supply Voltage (V_{LED}). These devices are designed to operate with driver voltage drops (V_{CE}) of 0.4 V to 0.7 V with LED forward voltages (V_F) of 1.2 V to 4.0 V. If higher voltages are dropped across the driver, package power dissipation will be increased significantly. To minimize package power dissipation, it is recommended to use the lowest possible load supply voltage or to set any series dropping voltage (V_{DROP}) as

$$V_{DROP} = V_{LED} - V_F - V_{CE}$$

with $V_{DROP} = I_O \times R_{DROP}$ for a single driver, or a Zener diode (V_Z), or a series string of diodes (approximately

0.7 V per diode) for a group of drivers. If the available voltage source will cause unacceptable dissipation and series resistors or diode(s) are undesirable, a regulator such as the Sanken Series SAI or Series SI can be used to provide supply voltages as low as 3.3 V.

For reference, typical LED forward voltages are:

White	3.5 – 4.0 V
Blue	3.0 – 4.0 V
Green	1.8 – 2.2 V
Yellow	2.0 – 2.1 V
Amber	1.9 – 2.65 V
Red	1.6 – 2.25 V
Infrared	1.2 – 1.5 V

Pattern Layout. This device has a common logic-ground and power-ground terminal. If ground pattern layout contains large common-mode resistance, and the voltage between the system ground and the LATCH ENABLE or CLOCK terminals exceeds 2.5 V (because of switching noise), these devices may not operate correctly.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
