

NCP2817

NOCAP™ LongPlay Headphone Amplifier

NCP2817 is a dual LongPlay true ground headphone amplifier designed for portable communication device applications such as mobile phones. This part is capable of delivering typical 27 mW of continuous average power into a 32 Ω load from a 1.8 V power supply with a THD+N of 1%.

Based on the power supply delivered to the device, an internal power management block generates a symmetrical positive and negative voltage. Thus, the internal amplifiers provide outputs referenced to Ground and the losses are reduced which helps to increase the battery life. In this NOCAP configuration, the two external heavy coupling capacitors can be removed. It offers significant space and cost savings compared to a typical stereo application.

NCP2817 is available with internal gain of -1.5 V/V. It reaches a superior -100 dB PSRR and noise floor. Thus, it offers high fidelity audio sound, as well as a direct connection to the battery. It contains circuitry to prevent from “Pop & Click” noise that would otherwise occur during turn-on and turn-off transitions. The device is available in 12 bump CSP package (1.62 x 1.22, 0.4P) which helps to save space on the board.

Features

- NOCAP Output Eliminates DC-Blocking Capacitors:
 - ◆ Saves Board Area
 - ◆ Saves Component Cost
 - ◆ No Low-Frequency Response Attenuation
- LongPlay Architecture: Increase the Battery Life
- High PSRR (-100 dB): Direct Connection to the Battery
- High SNR Performance (100 dB)
- “Pop and Click” Noise Protection Circuitry
- Internal Gain (-1.5 V/V) or External Adjustable Gain
- Ultra Low Current Shutdown Mode
- High Impedance Mode
- 1.6 V – 5.5 V Operation
- Thermal Overload Protection Circuitry
- CSP 1.62 x 1.22, 0.4P
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications

- Headset Audio Amplifier for
 - ◆ Cellular Phones
 - ◆ MP3 player
 - ◆ Personal Digital Assistant and Portable Media Player
 - ◆ Portable devices

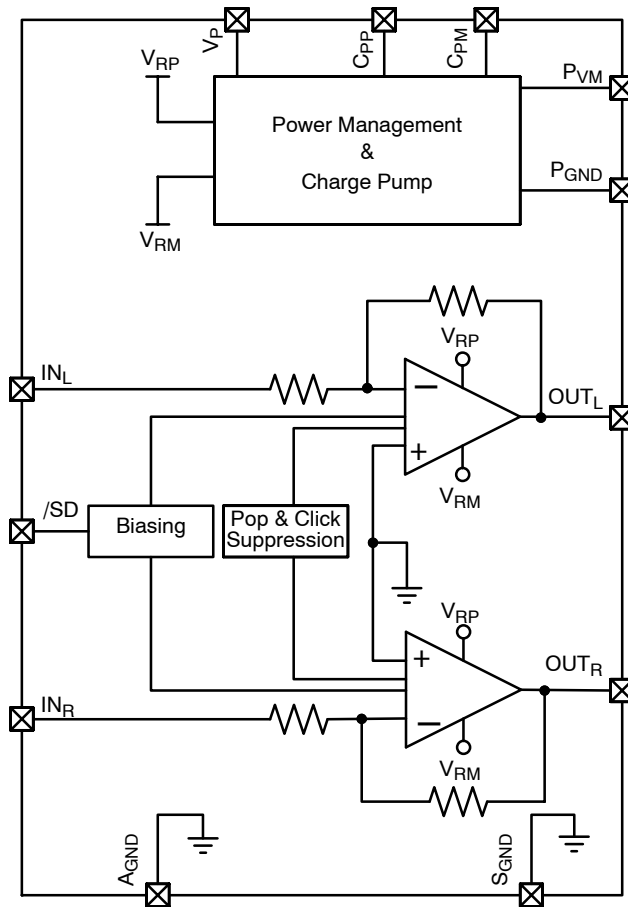

Figure 1. Block Diagram

PIN FUNCTION DESCRIPTION

| Pin | Pin Name | Type | Description |
|-----|------------------|----------------|--|
| A1 | C _{PM} | Input / Output | Charge pump flying capacitor negative terminal. A 1 μ F ceramic capacitor to C _{PP} is required |
| A2 | P _{VM} | Output | Charge pump output. A 1 μ F ceramic capacitor to ground is needed |
| A3 | IN _L | Input | Left input of the audio source |
| A4 | IN _R | Input | Right input of the audio source |
| B1 | P _{GND} | Ground | Power ground. This pin should be connected directly to the ground plane. |
| B2 | /SD | Input | Enable activation. |
| B4 | S _{GND} | Ground | Sense Ground. Connect to shield terminal of headphone jack or ground plane. |
| C1 | C _{PP} | Input / Output | Charge pump flying capacitor positive terminal. A 1 μ F ceramic capacitor to C _{PM} is required |
| C2 | V _P | Power | Positive supply voltage. Connected to single secondary cell Lithium-Ion battery or any other kind of power supply |
| C3 | OUT _L | Output | Left audio channel output signal |
| C4 | OUT _R | Output | Right audio channel output signal |
| B3 | A _{GND} | Ground | Analog ground. This pin should be connected directly to the GND plane. Careful layout and no direct connection to other ground pins are required to ensure good noise immunity |

MAXIMUM RATINGS

| Rating | Symbol | Value | Unit |
|---|-------------------|------------------------------|------|
| V _P Pin: Power Supply Voltage (Note 1) | V _P | −0.3 to + 6.0 | V |
| /SD Pin: Input | V _{mr1} | −0.3 to V _P + 0.3 | V |
| Human Body Model (HBM) ESD Rating are (Notes 2 and 3) | ESD HBM | 2000 | V |
| Machine Model (MM) ESD Rating are (Note 2 and 3) | ESD MM | 200 | V |
| CSP 1.62 x 1.22, 0.4P package (Note 6 and 7) Thermal Resistance Junction to Case | R _{θJC} | (Note 7) | °C/W |
| Operating Ambient Temperature Range | T _A | −40 to + 85 | °C |
| Operating Junction Temperature Range | T _J | −40 to + 125 | °C |
| Maximum Junction Temperature (Note 6) | T _{JMAX} | + 150 | °C |
| Storage Temperature Range | T _{STG} | −65 to + 150 | °C |
| Moisture Sensitivity (Note 5) | MSL | Level 1 | |

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- Maximum electrical ratings are defined as those values beyond which damage to the device may occur at T_A = 25°C.
- According to JEDEC standard JESD22–A108B.
- This device series contains ESD protection and passes the following tests:
Human Body Model (HBM) ±2.0 kV per JEDEC standard: JESD22–A114 for all pins.
Machine Model (MM) ±200 V per JEDEC standard: JESD22–A115 for all pins.
- Latch up Current Maximum Rating: ±100 mA per JEDEC standard: JESD78 class II.
- Moisture Sensitivity Level (MSL): 1 per IPC/JEDEC standard: J–STD–020A.
- The thermal shutdown set to 150 °C (typical) avoids irreversible damage on the device due to power dissipation.
- The R_{θCA} is dependent on the PCB heat dissipation. The maximum power dissipation (P_D) is dependent on the min input voltage, the max output current and external components selected.

$$R_{\theta CA} = \frac{125 - T_A}{P_D} - R_{\theta JC}$$

ELECTRICAL CHARACTERISTICS Min & Max Limits apply for T_A between −40°C to +85°C and T_J up to + 125°C for V_P = 3.6 V (Unless otherwise noted). Typical values are referenced to T_A = + 25°C and V_P = 3.6 V.

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|----------------------|---------------------------------|--|------|----------|------|-------------------|
| V _{BATTERY} | Supply voltage range | | 1.6 | | 5.5 | V |
| I _{SD} | Shutdown current | | | | 1 | μA |
| I _Q | Quiescent current | V _P = 1.8 V | | 2.3 | 3.0 | mA |
| R _{IN} | Input resistance | | 7.5 | 10 | 12.5 | kΩ |
| R _{SD} | /SD pull-down resistor | | | 300 | | kΩ |
| | Maximum input signal swing | | | 2.8 | | V _{PP} |
| V _{IH} | High-level input voltage SD pin | | 1.2 | | | V |
| V _{IL} | Low-level input voltage SD pin | | | | 0.4 | V |
| UVLO | UVLO threshold | Falling edge | | 1.4 | | V |
| UVLO _{HYS} | UVLO hysteresis | | | 100 | | mV |
| T _{SD} | Thermal shutdown temperature | | | 160 | | °C |
| V _{OS} | Output offset voltage | Input AC grounded | | ± 0.5 | | mV |
| T _{WU} | Turning On time | | | 1 | | ms |
| V _{LP} | Max Output Swing (peak value) | V _P = 1.8 V, Headset = 32 Ω | 1.13 | | | V _{peak} |
| P _O | Max Output Power (Note 8) | V _P = 1.8 V, THD+N = 1% Headset = 16 Ω Headset = 32 Ω | 20 | 41 27 | | mW |

- Guaranteed by design and characterized.

DETAIL OPERATING DESCRIPTION

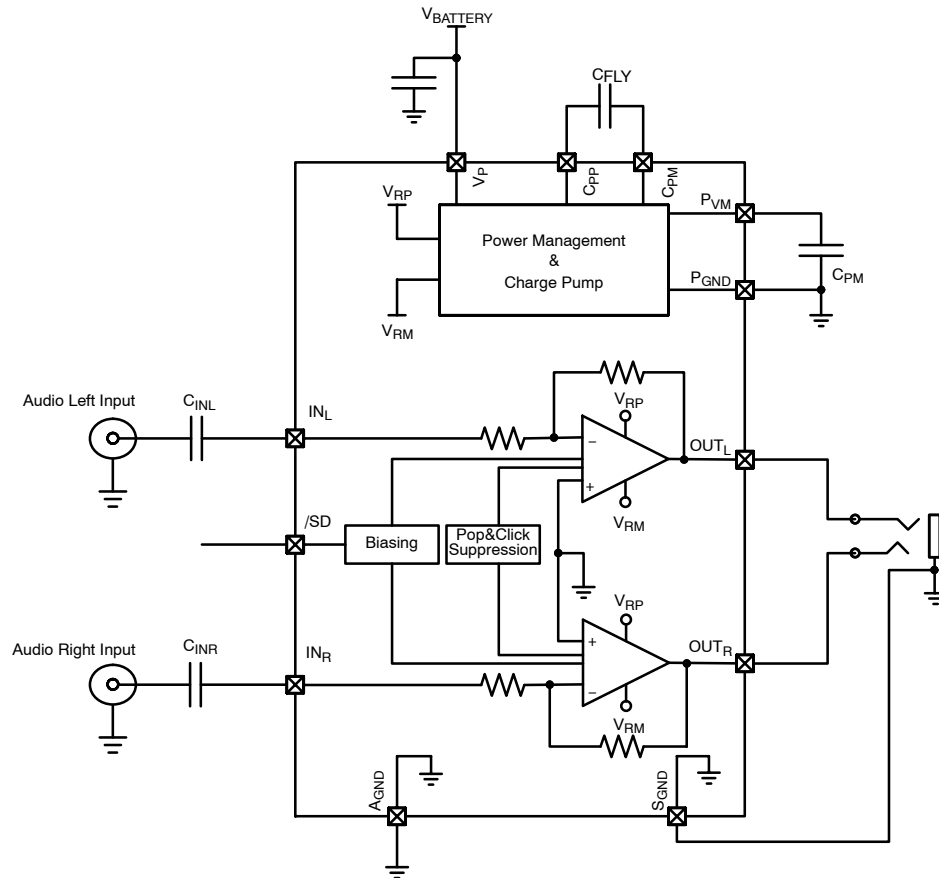

Figure 12. Typical Application Circuit

Detailed Descriptions

The NCP2817 stereo headphone amplifier features the ON Semiconductor NOCAP architecture that eliminates the large output DC-blocking capacitors required by conventional headphone amplifier.

An integrated power supply block generates low noise positive (V_{RP}) and negative (V_{RM}) voltages from the positive supply voltage (V_P). The stereo headphone amplifiers operate from these symmetrical supplies. Amplifiers output are referenced to ground (GND), instead of DC voltage (typically $V_P/2$) for conventional headphone amplifiers.

The NCP2817 integrates two true ground amplifiers, an Under Voltage Lock Out (UVLO), a short circuit protection and a thermal shutdown circuitry. In addition, a special circuit is embedded to eliminate pop and click noise that occurs during turn on and turn off time.

NCP2817 has an embedded gain setting network set to 1.5 V/V.

NOCAP™

NOCAP is a patented architecture which requires only two small ceramic capacitors. From single positive only rail,

it generates the symmetrical positive and negative rails that supplies amplifiers output stage. This feature allows the output of the amplifiers to be biased around the ground level and eliminates need of huge DC voltage blocking capacitors.

LongPlay Architecture

The “LongPlay” feature, based on unique ultra low current consumption architecture saves more battery life by reducing the quiescent current depending on the load.

Current Limit Protection Circuit

The NCP2817 output power stage features a protection circuitry against short to ground. The current is limited to 300 mA typical when an output is shorted to GND and a signal is applied to the input.

Thermal Overload Protection

Internal amplifiers are switched off when the temperature exceed 160°C , and will be switched back on when the temperature decreases below 140°C .

Under Voltage Lockout

When the battery voltage decreases below 1.4 V, the amplifiers are turned off. The hysteresis to turn back on the device is 100 mV.

Pop and Click Suppression Circuitry

The NCP2817 includes a special circuitry to eliminate any pop and click noise during turn on and turn off time.

During uncontrolled turn on and turn off sequences, normal amplifiers would create an output offset. This offset drives the loudspeaker and generates a parasitic noise called “pop and click noise”.

The NCP2817 carefully controls the amplifier output stages during turn on and off sequences to eliminate this problem.

Input capacitor selection

The input coupling capacitor blocks the DC voltage at the amplifier input terminal. This capacitor creates a high-pass filter with the R_{IN} input resistor (10 k Ω for NCP2817).

The size of the capacitor must be large enough to cut off low frequencies without severe attenuation in the audio bandwidth (20 Hz – 20 kHz).

The cut off frequency for the input high-pass filter is:

$$F_c = \frac{1}{2\pi R_{in} C_{in}}$$

With $R_{IN} = 10 \text{ k}\Omega$

A $F_c < 20 \text{ Hz}$ is recommended.

Charge Pump Capacitor Selection

Use ceramic capacitor with low ESR for better performances. X5R / X7R capacitor is recommended.

The C_{FLY} flying capacitor serves to transfer charge during the generation of the negative voltage and directly affects load regulation and charge pump output impedance. A too low value results in poor current performance while higher value increases charge pump regulation and lowers output impedance (until internal switches $R_{DS(on)}$ becomes predominant). We recommend 1 μF , but lower values can be uses in systems with lower audio power requirements.

The C_{PVM} capacitor must be equal at least to the C_{FLY} capacitor to allow maximum transfer charge. In addition, the ESR of C_{PVM} capacitor directly affects ripple on P_{VM} as well as charge pump output impedance. We recommend 1 μF , but lower values can be uses in systems with lower audio power requirements.

Table 1. SUGGEST TYPICAL VALUE AND MANUFACTURER

| Value | Reference | Package | Manufacturer |
|-----------------|------------------|---------|--------------|
| 1 μF | C1005X5R0J105K | 0402 | TDK |
| 1 μF | GRM155R60J105K19 | 0402 | Murata |

Power Supply Decoupling Capacitor (C1)

The NCP2817 is a NOCAP amplifier and proper power supply bypassing is critical to reduce noise, high THD+N and PSRR performances. It is recommended to use a 1 μF X5R / X7R ceramic capacitor and place it as close as possible to the V_P pin.

Shutdown Function

The device enters in shutdown mode when shutdown signal is low. During the shutdown mode, the DC quiescent current of the circuit does not exceed 1 μA . In this configuration, the output impedance is 20 k Ω on each output.

Layout Recommendation

Minimize trace impedance of the power, the ground and all output traces. The voltage drop between NCP2817 and the headset load results in decrease of output power and efficiency. We strongly recommend using wide traces for power supply inputs to optimize the power supplies efficiency and regulation performances. Good ground connection improves the amplifier immunity to external switching noise, improves crosstalk between channels as well as general audio performances. We also recommend wide PCB traces for the power outputs routing. If possible, we recommend to use local Ground and power planes.

The power supply decoupling capacitor C_{BYP} will help to minimize the input voltage ripple during fast load transients. It is important to minimize traces impedances from C_{BYP} to GND plane and from C_{BYP} to V_P pin as close as possible of the V_P pin. C_{BYP} should be placed as close as possible to the V_P pin.

The charge pump creates the V_{PM} negative voltage that supplies the amplifiers. C_{FLY} and C_{PVM} capacitors location and access impedances are also critical. Connect C_{FLY} and C_{PVM} as close as possible of the NCP2817 and route their terminal to the associated pin with wide traces to minimize impedance and optimize the charge pump ripple and efficiency performances. In addition, the C_{FLY} and C_{PVM} capacitors as well as the traces connecting capacitors to the device should be kept away from the audio input and output traces to avoid any switching noise coupling with the audio signal.

A_{GND} is the ground reference for all internal analog features so, particular attention should govern the A_{GND} pin connection to the Ground reference plane. A_{GND} pin should be directly connected to the board Ground reference plane and keep it separated from other ground connections. The A_{GND} to GND ground reference plane trace should not be shared with the trace between S_{GND} or P_{GND} and the Ground plane.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
