

1.8V Low-Power Wide-Range Frequency Clock Driver

Recommended Application:

- DDR2 Memory Modules / Zero Delay Board Fan Out
- Provides complete DDR DIMM logic solution with ICSSTU32864/SSTUF32864/SSTUF32866/SSTUA32864/SSTUA32866/SSTUA32S868/SSTUA32S865/SSTUA32S869

Product Description/Features:

- Low skew, low jitter PLL clock driver
- 1 to 10 differential clock distribution (SSTL_18)
- Feedback pins for input to output synchronization
- Spread Spectrum tolerant inputs
- Auto PD when input signal is at a certain logic state

Switching Characteristics:

- Period jitter: 40ps (DDR2-400/533)
30ps (DDR2-667/800)
- Half-period jitter: 60ps (DDR2-400/533)
50ps (DDR2-667/800)
- OUTPUT - OUTPUT skew: 40ps (DDR2-400/533)
30ps (DDR2-667/800)
- CYCLE - CYCLE jitter 40ps

The PLL clock buffer, **ICS97ULP877B**, is designed for a V_{DDQ} of 1.8 V, a AV_{DD} of 1.8 V and differential data input and output levels. Package options include a plastic 52-ball VF BGA and a 40-pin MLF.

ICS97ULP877B is a zero delay buffer that distributes a differential clock input pair (CLK_INT, CLK_INC) to ten differential pair of clock outputs (CLKT[0:9], CLKC[0:9]) and one differential pair feedback clock outputs (FB_OUTT, FBOUTC). The clock outputs are controlled by the input clocks (CLK_INT, CLK_INC), the feedback clocks (FB_INT, FB_INC), the LVC MOS program pins (OE, OS) and the Analog Power input (AVDD). When OE is low, the outputs (except FB_OUTT/FB_OUTC) are disabled while the internal PLL continues to maintain its locked-in frequency. OS (Output Select) is a program pin that must be tied to GND or V_{DDQ}. When OS is high, OE will function as described above. When OS is low, OE has no effect on CLKT7/CLKC7 (they are free running in addition to FB_OUTT/FB_OUTC). When AV_{DD} is grounded, the PLL is turned off and bypassed for test purposes.

When both clock signals (CLK_INT, CLK_INC) are logic low, the device will enter a low power mode. An input logic detection circuit on the differential inputs, independent from the input buffers, will detect the logic low level and perform a low power state where all outputs, the feedback and the PLL are OFF. When the inputs transition from both being logic low to being differential signals, the PLL will be turned back on, the inputs and outputs will be enabled and the PLL will obtain phase lock between the feedback clock pair (FB_INT, FB_INC) and the input clock pair (CLK_INT, CLK_INC) within the specified stabilization time t_{STAB}.

The PLL in **ICS97ULP877B** clock driver uses the input clocks (CLK_INT, CLK_INC) and the feedback clocks (FB_INT, FB_INC) to provide high-performance, low-skew, low-jitter output differential clocks (CLKT[0:9], CLKC[0:9]). **ICS97ULP877B** is also able to track Spread Spectrum Clocking (SSC) for reduced EMI.

ICS97ULP877B is characterized for operation from 0°C to 70°C.

Absolute Maximum Ratings

| | |
|-------------------------------|---------------------------------------|
| Supply Voltage (VDDQ & AVDD) | -0.5V to 2.5V |
| Logic Inputs | GND - 0.5V to V _{DDQ} + 0.5V |
| Ambient Operating Temperature | 0°C to +70°C |
| Storage Temperature | -65°C to +150°C |

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Notes:

1. Unused inputs must be held high or low to prevent them from floating.
2. DC input signal voltage specifies the allowable DC execution of differential input.
3. Differential inputs signal voltages specifies the differential voltage [VTR-VCP] required for switching, where VTR is the true input level and VCP is the complementary input level.
4. Differential cross-point voltage is expected to track variations of V_{DDQ} and is the voltage at which the differential signal must be crossing.

Timing Requirements

$T_A = 0 - 70^\circ\text{C}$ Supply Voltage AVDD, VDDQ = 1.8 V +/- 0.1V (unless otherwise stated)

| PARAMETER | SYMBOL | CONDITIONS | MIN | MAX | UNITS |
|-----------------------------|---------------------|------------------|-----|-----|-------|
| Max clock frequency | freq _{op} | 1.8V±0.1V @ 25°C | 95 | 410 | MHz |
| Application Frequency Range | freq _{App} | 1.8V±0.1V @ 25°C | 160 | 410 | MHz |
| Input clock duty cycle | d _{tin} | | 40 | 60 | % |
| CLK stabilization | T _{STAB} | | | 15 | µs |

NOTE: The PLL must be able to handle spread spectrum induced skew.

NOTE: Operating clock frequency indicates a range over which the PLL must be able to lock, but in which it is not required to meet the other timing parameters. (Used for low speed system debug.)

NOTE: Application clock frequency indicates a range over which the PLL must meet all timing parameters.

NOTE: Stabilization time is the time required for the integrated PLL circuit to obtain phase lock of its feedback signal to its reference signal, within the value specified by the Static Phase Offset (t_{AE}), after power-up. During normal operation, the stabilization time is also the time required for the integrated PLL circuit to obtain phase lock of its feedback signal to its reference signal when CK and CK go to a logic low state, enter the power-down mode and later return to active operation. CK and CK may be left floating after they have been driven low for one complete clock cycle.

- Place the 2200pF capacitor close to the PLL.
- Use a wide trace for the PLL analog power & ground. Connect PLL & caps to AGND trace & connect trace to one GND via (farthest from PLL).
- Recommended bead: Fair-Rite P/N 2506036017Y0 or equivalent (0.8 Ohm DC max, 600 Ohms @ 100 MHz).

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
