

Features

- Logic & Mixed Signal Circuits
- Highly Versatile Macro Cells
- Read Back Protection (Read Lock)
- 1.8 V ($\pm 5\%$) to 5 V ($\pm 10\%$) VDD
- 1.8 V ($\pm 5\%$) to 5 V ($\pm 10\%$) VDD2 ($VDD2 \leq VDD$)
- Operating Temperature Range: -40°C to 85°C
- RoHS Compliant / Halogen-Free
- 20-pin STQFN: $2 \times 3 \times 0.55 \text{ mm}$, 0.4 mm pitch or
- 22-pin MSTQFN $2 \times 2.2 \times 0.55 \text{ mm}$, 0.4 mm pitch

Applications

- Personal Computers and Servers
- PC Peripherals
- Consumer Electronics
- Data Communications Equipment
- Handheld and Portable Electronics

1.0 Overview

The SLG46538 provides a small, low power component for commonly used mixed-signal functions. The user creates their circuit design by programming the one time Non-Volatile Memory (NVM) to configure the interconnect logic, the I/O Pins and the macro cells of the SLG46538. This highly versatile device allows a wide variety of mixed-signal functions to be designed within a very small, low power single integrated circuit.

The additional power supply (VDD2) on the SLG46538 provides the ability to interface two independent voltage domains within the same design. Users can configure pins, dedicated to each power supply, as inputs, outputs, or both (controlled dynamically by internal logic) to both VDD and VDD2 voltage domains. Using the available macro-cells designers can implement mixed-signal functions bridging both domains or simply pass through level-translation in both High to Low and Low to High directions.

The macro cells in the device include the following:

- Four Analog Comparators (ACMP)
- Two Voltage References (Vref)
- Seventeen Combination Function Macrocells
 - Three Selectable DFF/Latch or 2-bit LUTs
 - One Selectable Continuous DFF/Latch or 3-bit LUT
 - Four Selectable DFF/Latch or 3-bit LUTs
 - One Selectable Pipe Delay or 3-bit LUT
 - One Selectable Programmable Function Generator or 2-bit LUT
 - Five 8-bit delays/counters or 3-bit LUTs
 - Two 16-bit delays/counters or 4-bit LUTs
- State Machine
 - Eight States
 - Flexible input logic from state transitions
- Serial Communications
 - I²C Protocol compliant
- Pipe Delay – 16 stage/3 output (Part of Combination Function Macrocell)
- Programmable Delay
- Additional Logic Functions
 - Two Deglitch Filters with Edge Detectors
 - One Inverter
- Two Oscillators (OSC)
 - Configurable 25 kHz/2 MHz
 - 25MHz RC Oscillator
- Crystal Oscillator
- Power-On-Reset (POR)
- Eight Byte RAM + OTP User Memory
 - RAM Memory space that is readable and writeable via I²C
 - User defined initial values transferred from OTP

2.0 Pin Description

2.1 Functional Pin Description

| STQFN 20L Pin # | MSTQFN 22L Pin# | Pin Name | Signal Name | Function | Input Options | Output Options |

3.0 User Programmability

Non-volatile memory (NVM) is used to configure the SLG46538's connection matrix routing and macro-cells. The NVM is One-Time-Programmable (OTP). However, Silego's GreenPAK development tools can be used to configure the connection matrix and macro-cells, without programming the NVM, to allow on-chip emulation. This configuration will remain active on the device as long as it remains powered and can be re-written as needed to facilitate rapid design changes.

When a design is ready for in-circuit testing, the same GreenPAK development tools can be used to program the NVM and create samples for small quantity builds. Once the NVM is programmed, the device will retain this configuration for the duration of its lifetime.

Once the design is finalized, the design file can be forwarded to Silego to integrate into the production process.

Figure 1. Steps to create a custom Silego GreenPAK device

4.0 Ordering Information

| Part Number | Type |
|-------------|------------------------------------------|
| SLG46538V | 20-pin STQFN |
| SLG46538VTR | 20-pin STQFN - Tape and Reel (3k units) |
| SLG46538M | 22-pin MSTQFN |
| SLG46538MTR | 22-pin MSTQFN - Tape and Reel (3k units) |

5.0 Electrical Specifications

5.1 Absolute Maximum Conditions

| Parameter | | Min. | Max. | Unit |
|----------------------------------------|-------------------------------|-----------|------------|------|
| Supply voltage on VDD relative to GND | | -0.5 | 7 | V |
| Supply voltage on VDD2 relative to GND | | -0.5 | VDD + 0.5 | V |
| DC Input voltage | IOs 0, 1, 2, 3, 4, 5, 6, 7, 8 | GND - 0.5 | VDD + 0.5 | V |
| | IOs 9, 10, 12, 13, 14, 15, 17 | | VDD2 + 0.5 | |
| Current at Input Pin | | -1.0 | 1.0 | mA |
| Storage Temperature Range | | -65 | 150 | °C |
| Junction Temperature | | -- | 150 | °C |
| ESD Protection (Human Body Model) | | 2000 | -- | V |
| ESD Protection (Charged Device Model) | | 500 | -- | V |

5.8 I²C Specifications

| Symbol | Parameter | Condition/Note | Min. | Typ. | Max. | Unit |
|---------------------|----------------------------------------------|----------------------------------|------|------|------|------|
| F _{SCL} | Clock Frequency, SCL | V _{DD} = (1.71...5.5) V | -- | -- | 400 | kHz |
| t _{LOW} | Clock Pulse Width Low | V _{DD} = (1.71...5.5) V | 1300 | -- | -- | ns |
| t _{HIGH} | Clock Pulse Width High | V _{DD} = (1.71...5.5) V | 600 | -- | -- | ns |
| t _I | Input Filter Spike Suppression (SCL, SDA) | V _{DD} = 1.8 V ± 5 % | -- | -- | 168 | ns |
| | | V _{DD} = 3.3 V ± 10% | -- | -- | 157 | |
| | | V _{DD} = 5.0 V ± 10 % | -- | -- | 156 | |
| t _{AA} | Clock Low to Data Out Valid | V _{DD} = (1.71...5.5) V | -- | -- | 900 | ns |
| t _{BUF} | Bus Free Time between Stop and Start | V _{DD} = (1.71...5.5) V | 1300 | -- | -- | ns |
| t _{HD_STA} | Start Hold Time | V _{DD} = (1.71...5.5) V | 600 | -- | -- | ns |
| t _{SU_STA} | Start Set-up Time | V _{DD} = (1.71...5.5) V | 600 | -- | -- | ns |
| t _{HD_DAT} | Data Hold Time | V _{DD} = (1.71...5.5) V | 0 | -- | -- | ns |
| t _{SU_DAT} | Data Set-up Time | V _{DD} = (1.71...5.5) V | 100 | -- | -- | ns |
| t _R | Inputs Rise Time | V _{DD} = (1.71...5.5) V | -- | -- | 300 | ns |
| t _F | Inputs Fall Time | V _{DD} = (1.71...5.5) V | -- | -- | 300 | ns |
| t _{SU_STD} | Stop Set-up Time | V _{DD} = (1.71...5.5) V | 600 | -- | -- | ns |
| t _{DH} | Data Out Hold Time | V _{DD} = (1.71...5.5) V | 50 | -- | -- | ns |

5.9 Asynchronous State Machine (ASM) Specifications

| Symbol | Parameter | Condition/Note | Min. | Typ. | Max. | Unit |
|---------------------------|-----------------------------------------------------------|--------------------------------|------|------|------|------|
| t _{st_out_delay} | Asynchronous State Machine Output Delay Time | V _{DD} = 1.8 V ± 5 % | 225 | -- | 275 | ns |
| | | V _{DD} = 3.3 V ± 10% | 95 | -- | 118 | |
| | | V _{DD} = 5.0 V ± 10 % | 67 | -- | 77 | |
| t _{st_out} | Asynchronous State Machine Output Transition Time | V _{DD} = 1.8 V ± 5 % | -- | -- | 165 | ns |
| | | V _{DD} = 3.3 V ± 10% | -- | -- | 70 | |
| | | V _{DD} = 5.0 V ± 10 % | -- | -- | 46 | |
| t _{st_pulse} | Asynchronous State Machine Input Pulse Acceptance Time | V _{DD} = 1.8 V ± 5 % | 29 | -- | -- | ns |
| | | V _{DD} = 3.3 V ± 10% | 14 | -- | -- | |
| | | V _{DD} = 5.0 V ± 10 % | 9.2 | -- | -- | |

| Symbol | Parameter | Condition/Note | Min. | Typ. | Max. | Unit |
|----------------------|------------------------------------------------|--------------------------------|------|------|------|------|
| t _{st_comp} | Asynchronous State Machine Input Complete Time | V _{DD} = 1.8 V ± 5 % | -- | -- | 29 | ns |
| | | V _{DD} = 3.3 V ± 10% | -- | -- | 14 | |
| | | V _{DD} = 5.0 V ± 10 % | -- | -- | 10 | |

5.10 IDD Estimator

Table 1. Typical Current estimated for each block

| Symbol | Parameter | Note | V _{DD} /V _{DD2} = 1.8 V | V _{DD} /V _{DD2} = 3.3V | V _{DD} /V _{DD2} = 5.0V | Unit |
|--------|-----------|-------------------------------------|-------------------------------------------|------------------------------------------|------------------------------------------|------|
| I | Current | Chip Quiescent, IDD1 | 0.45 | 0.75 | 1.12 | μA |

5.12 Typical Counter/Delay Offset Measurements

Table 3. Typical Counter/Delay Offset Measurements

| Parameter | RC OSC Freq | RC OSC Power | $V_{DD} = 1.8\text{ V}$ | $V_{DD} = 3.3\text{ V}$ | $V_{DD} = 5.0\text{ V}$ | Unit |
|-------------------------------------|-------------|--------------|-------------------------|-------------------------|-------------------------|---------------|
| Offset (Power On Delay) | 25 kHz | auto | 1.6 | 1.6 | 1.6 | μs |
| Offset (Power On Delay), fast start | 25 kHz | auto | 2.1 | 2.1 | 2.1 | μs |
| Offset (Power On Delay) | 2 MHz | auto | 0.4 | 0.2 | 0.2 | μs |
| Offset (Power On Delay), fast start | 2 MHz | auto | 0.7 | 0.5 | 0.4 | μs |
| Offset (Power On Delay) | 25 MHz | auto | 0.01 | 0.05 | 0.04 | μs |
| Frequency settling time | 25 kHz | auto | 19 | 14 | 12 | μs |
| Frequency settling time | 2 MHz | auto | 14 | 14 | 14 | μs |
| Variable (CLK period) | 25 kHz | forced | 0-40 | 0-40 | 0-40 | μs |

**Table 3. Typical Counter/Delay Offset Measurements**

| Parameter | RC OSC Freq | RC OSC Power | V _{DD} = 1.8 V | V _{DD} = 3.3V | V _{DD} = 5.0V | Unit |
|------------------------------------|------------------|--------------|-------------------------|------------------------|------------------------|------|
| Variable (CLK period) | 2 MHz | forced | 0-0.5 | 0-0.5 | 0-0.5 | μs |
| Variable (CLK period) | 25 MHz | | 0-0.04 | 0-0.04 | 0-0.04 | μs |
| T _{pd} (non-delayed edge) | 25 kHz/ 2 MHz | either | 35 | 14 | 10 | ns |

5.13 Expected Delays and Widths

Table 4. Expected Delays and Widths (typical)

| Symbol | Parameter | Note | V _{DD} = 1.8 V | V _{DD} = 3.3V | V _{DD} = 5.0V | Unit |
|--------|---------------------|-------------------------------------------|-------------------------|------------------------|------------------------|------|
| tw | Pulse Width, 1 cell | mode:(any)edge detect, edge detect output | 296 | 135 | 101 | ns |
| tw | Pulse Width, 2 cell | mode:(any)edge detect, edge detect output | 597 | 272 | 203 | ns |
| tw | Pulse Width, 3 cell | mode:(any)edge detect, edge detect output | 898 | 410 | 305 | ns |
| tw | Pulse Width, 4 cell | mode:(any)edge detect, edge detect output | 1195 | 546 | 407 | ns |
| time1 | Delay, 1 cell | mode:(any)edge detect, edge detect output | 55 | 24 | 18 | ns |
| time1 | Delay, 2 cell | mode:(any)edge detect, edge detect output | 55 | 24 | 18 | ns |
| time1 | Delay, 3 cell | mode:(any)edge detect, edge detect output | 55 | 24 | 18 | ns |
| time1 | Delay, 4 cell | mode:(any)edge detect, edge detect output | 55 | 24 | 18 | ns |
| time2 | Delay, 1 cell | mode: both edge delay, edge detect output | 367 | 165 | 106 | ns |
| time2 | Delay, 2 cell | mode: both edge delay, edge detect output | 667 | 300 | 193 | ns |
| time2 | Delay, 3 cell | mode: both edge delay, edge detect output | 968 | 440 | 279 | ns |
| time2 | Delay, 4 cell | mode: both edge delay, edge detect output | 1265 | 575 | 365 | ns |

5.14 Typical Pulse Width Performance

Table 5. Typical Pulse Width Performance at T = 25°C

| Parameter | V _{DD} = 1.8 V | V _{DD} = 3.3V | V _{DD} = 5.0V | Unit |
|-----------------------------------|-------------------------|------------------------|------------------------|------|
| Filtered Pulse Width for Filter 0 | < 114 | < 47 | < 30 | ns |
| Filtered Pulse Width for Filter 1 | <75 | <30 | <19 | ns |

5.15 OSC Specifications

Table 6. 25 kHz RC OSC0 frequency limits

| Power Supply Range (VDD) V | Temperature Range | | | | | |
|----------------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|
| | +25 °C | | 0 °C ... +85 °C | | -40 °C ... +85 °C | |
| | Minimum Value, kHz | Maximum Value, kHz | Minimum Value, kHz | Maximum Value, kHz | Minimum Value, kHz | Maximum Value, kHz |
| 1.8 V ±5% | 24.240 | 25.781 | 21.963 | 27.188 | 21.963 | 27.562 |
| 3.3 V ±10% | 24.447 | 25.556 | 21.905 | 27.221 | 21.905 | 27.263 |
| 5 V ±10% | 24.315 | 25.911 | 22.045 | 27.099 | 22.045 | 27.422 |
| 2.5 V ... 4.5 V | 24.398 | 25.576 | 21.897 | 27.221 | 21.897 | 27.277 |

6.0 Summary of Macro Cell Function

6.1 I/O Pins

- Digital Input (low voltage or normal voltage, with or without Schmitt Trigger)
- Open Drain Outputs (NMOS and PMOS)
- Push Pull Outputs (1X and 2X)
- Analog I/O
- 10 k Ω /100 k Ω /1 M Ω pull-up/pull-down resistors
- 40 mA Open Drain 4X Drive output

6.2 Connection Matrix

- Digital matrix for circuit connections based on user design

6.3 Analog Comparators (4 total)

- Selectable hysteresis 0 mV / 25 mV / 50 mV / 200 mV
- Wake and Sleep Control (Part of Combination Function Macrocell)

6.4 Voltage Reference

- Used for references on Analog Comparators
- Can also be driven to external pins

6.5 Combination Function Macrocells (17 total)

- Three Selectable DFF/Latch or 2-bit LUTs
- Five Selectable DFF/Latch or 3-bit LUTs
- One Selectable Pipe Delay or 3-bit LUT
- One Selectable Programmable Function Generator or 2-bit LUT
- Five Selectable 8-bit CNT/DLY or 3-bit LUT
- Two Selectable 16-bit CNT/DLY or 4-bit LUT
- Wake and Sleep Controller

6.6 State Machine

- Eight States
- Flexible input logic from state transitions

6.7 Serial Communications

- I²C Protocol compliant macrocell

6.8 Pipe Delay (Part of Combination Function Macrocell)

- 16 stage / 3 output
- One single stage fixed output
- Two 1 to 16 stage selectable outputs

6.9 Programmable Delay

- 125 ns/250 ns/375 ns/500 ns @ VDD = 3.3 V
- Includes Edge Detection function

6.10 Additional Logic Functions (2 total)

- Two Deglitch filter macro cells
- Includes Edge Detection function

6.11 RC Oscillator

- 25 kHz and 2 MHz selectable frequency
- 25 MHz RC Oscillator
- First stage divider (4): OSC/1, OSC/2, OSC/4, and OSC/8
- Second stage divider for 25 kHz and 2 MHz (5): Output to Matrix: OSC/1, OSC/2, OSC/3, OSC/4, OSC/8, OSC/12, OSC/24, OSC/64

6.12 Crystal Oscillator

6.13 Eight byte RAM + OTP User Memory

- RAM Memory space that is readable and writable via I²C
- User defined initial values transferred from OTP

6.14 Analog Temperature Sensor

7.0 I/O Pins

The SLG46538 has a total of 17 multi-function I/O pins which can function as either a user defined Input or Output, as well as serving as a special function (such as voltage reference output), or serving as a signal for programming of the on-chip Non Volatile Memory (NVM).

Refer to Section 2.0 *Pin Description* for normal and programming mode pin definitions.

Normal Mode pin definitions are as follows:

- VDD: V_{DD} power supply
- IO0: general purpose input
- IO1: general purpose input or output with OE
- IO2: general purpose input or output
- IO3: general purpose input or output with OE
- IO4: general purpose input or output or analog comparator 0(+)
- IO5: general purpose input or output with OE or analog comparator 0(-)
- IO6: general purpose input or OD output I²C SCL
- IO7: general purpose input or OD output I²C SDA
- IO8: general purpose input or output with OE or analog comparator 1(+)
- GND: ground
- IO9: general purpose input or output or analog comparator 1(-)
- IO10: general purpose input or output with OE or analog comparator 2(+)
- VDD2: V_{DD2} power supply
- IO12: general purpose input or output or analog comparator 3(+)
- IO13: general purpose input or output with OE
- IO14: general purpose input or output
- IO15: general purpose input or output with OE and Vref output (VREF2)
- IO16: general purpose input or output with OE and Vref output (VREF1)
- IO17: general purpose input or output or external clock input

Programming Mode pin definitions are as follows:

- VDD: V_{DD} power supply
- IO0: V_{PP} programming voltage
- IO6: Programming SCL
- IO7: Programming SDA
- GND: ground

Of the 17 user defined I/O pins on the SLG46538, all but one of the pins (IO0) can serve as both digital input and digital output. IO0 can only serve as a digital input pin.

7.1 Input Modes

Each I/O pin can be configured as a digital input pin with/without buffered Schmitt Trigger, or can also be configured as a low voltage digital input. IOs 4, 5, 8, 9, 10, and 12 can also be configured to serve as analog inputs to the on-chip comparators. IOs 15 and 16 can also be configured as analog reference voltage inputs.

7.2 Output Modes

IOs 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, and 17 can all be configured as digital output pins.

7.3 Pull Up/Down Resistors

All I/O pins have the option for user selectable resistors connected to the input structure. The selectable values on these resistors are 10 k Ω , 100 k Ω and 1 M Ω . In the case of IO0, the resistors are fixed to a pull-down configuration. In the case of all other I/O pins, the internal resistors can be configured as either pull-up or pull-downs.

7.4 I/O Register Settings
7.4.1 IO0 Register Settings
Table 21. IO0 Register Settings

| Signal Function | Register Bit Address | Register Definition |
|----------------------------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| IO0 Pull Down Resistor Value Selection | <1029:1028> | 00: Floating 01: 10 kΩ Resistor 10: 100 kΩ Resistor 11: 1 MΩ Resistor |

8.0 Connection Matrix

The Connection Matrix in the SLG46538 is used to create the internal routing for internal functional macrocells of the device once it is programmed. The registers are programmed from the one-time NVM cell during Test Mode Operation. The output of each functional macrocell within the SLG46538 has a specific digital bit code assigned to it that is either set to active "High" or inactive "Low" based on the design that is created. Once the 2048 register bits within the SLG46538 are programmed a fully custom circuit will be created.

The Connection Matrix has 64 inputs and 110 outputs. Each of the 64 inputs to the Connection Matrix is hard-wired to the digital output of a particular source macrocell, including I/O pins, LUTs, analog comparators, other digital resources and VDD and GND. The input to a digital macrocell uses a 6-bit register to select one of these 64 input lines.

For a complete list of the SLG46538's register table, see Section 22.0 Appendix A - SLG46538 Register Definition.

| Matrix Input Signal Functions | N | | | | | | | | | | |
|-------------------------------|----|------------------|----------------------------|----------------------------|----------------------------|---|-----------------------------------------------|--|--|--|--|

8.1 Matrix Input Table

Table 38. Matrix Input Table

| Matrix Input Number | Matrix Input Signal Function | Matrix Decode | | | | | |
|---------------------|-------------------------------------------------------------------------------------------------------|---------------|---|---|---|---|---|
| | | 5 | 4 | 3 | 2 | 1 | 0 |
| 0 | GND | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | IO0 Digital Input | 0 | 0 | 0 | 0 | 0 | 1 |
| 2 | IO1 Digital Input | 0 | 0 | 0 | 0 | 1 | 0 |
| 3 | IO2 Digital Input | 0 | 0 | 0 | 0 | 1 | 1 |
| 4 | IO3 Digital Input | 0 | 0 | 0 | 1 | 0 | 0 |
| 5 | IO4 Digital Input | 0 | 0 | 0 | 1 | 0 | 1 |
| 6 | IO5 Digital Input | 0 | 0 | 0 | 1 | 1 | 0 |
| 7 | IO8 Digital Input | 0 | 0 | 0 | 1 | 1 | 1 |
| 8 | LUT2_0 / DFF0 Output | 0 | 0 | 1 | 0 | 0 | 0 |
| 9 | LUT2_1 / DFF1 Output | 0 | 0 | 1 | 0 | 0 | 1 |
| 10 | LUT2_2 / DFF2 Output | 0 | 0 | 1 | 0 | 1 | 0 |
| 11 | LUT2_3 / PGEN Output | 0 | 0 | 1 | 0 | 1 | 1 |
| 12 | LUT3_0 / DFF3 Output | 0 | 0 | 1 | 1 | 0 | 0 |
| 13 | LUT3_1 / DFF4 Output | 0 | 0 | 1 | 1 | 0 | 1 |
| 14 | LUT3_2 / DFF5 Output | 0 | 0 | 1 | 1 | 1 | 0 |
| 15 | LUT3_3 / DFF6 Output | 0 | 0 | 1 | 1 | 1 | 1 |
| 16 | LUT3_4 / DFF7 Output | 0 | 1 | 0 | 0 | 0 | 0 |
| 17 | LUT3_5 / CNT_DLY2(8bit) Output | 0 | 1 | 0 | 0 | 0 | 1 |
| 18 | LUT3_6 / CNT_DLY3(8bit) Output | 0 | 1 | 0 | 0 | 1 | 0 |
| 19 | LUT3_7 / CNT_DLY4(8bit) Output | 0 | 1 | 0 | 0 | 1 | 1 |
| 20 | LUT3_8 / CNT_DLY5(8bit) Output | 0 | 1 | 0 | 1 | 0 | 0 |
| 21 | LUT3_9 / CNT_DLY6(8bit) Output | 0 | 1 | 0 | 1 | 0 | 1 |
| 22 | LUT4_0 / CNT_DLY0(16bit) Output | 0 | 1 | 0 | 1 | 1 | 0 |
| 23 | LUT4_1 / CNT_DLY1(16bit) Output | 0 | 1 | 0 | 1 | 1 | 1 |
| 24 | LUT3_10 / Pipe Delay (1st stage) Output | 0 | 1 | 1 | 0 | 0 | 0 |
| 25 | Pipe Delay Output0 | 0 | 1 | 1 | 0 | 0 | 1 |
| 26 | Pipe Delay Output1 | 0 | 1 | 1 | 0 | 1 | 0 |
| 27 | Internal OSC Pre-Divided by 1/2/4/8 Output and Post-Divided by 1/2/3/4/8/12/24/64 Output (25KHz/2MHz) | 0 | 1 | 1 | 0 | 1 | 1 |
| 28 | Internal OSC Pre-Divided by 1/2/4/8 Output and Post-Divided by 1/2/3/4/8/12/24/64 Output (25KHz/2MHz) | 0 | 1 | 1 | 1 | 0 | 0 |
| 29 | Internal OSC Pre-Divided by 1/2/4/8 Output (25MHz) | 0 | 1 | 1 | 1 | 0 | 1 |
| 30 | Filter0 / Edge Detect0 Output | 0 | 1 | 1 | 1 | 1 | 0 |
| 31 | Filter1 / Edge Detect1 Output | 0 | 1 | 1 | 1 | 1 | 1 |
| 32 | IO6 Digital or I2C_virtual_0 Input | 1 | 0 | 0 | 0 | 0 | 0 |
| 33 | IO7 Digital or I2C_virtual_1 Input | 1 | 0 | 0 | 0 | 0 | 1 |
| 34 | I2C_virtual_2 Input | 1 | 0 | 0 | 0 | 1 | 0 |
| 35 | I2C_virtual_3 Input | 1 | 0 | 0 | 0 | 1 | 1 |

Table 38. Matrix Input Table

| Matrix Input Number | Matrix Input Signal Function | Matrix Decode | | | | | |
|---------------------|----------------------------------------------|---------------|---|---|---|---|---|

| reg <863:856> | Matrix OUT: IN2 of LUT4_1 or UP Input of FSM1 | 107 |
| reg <871:864> | Matrix OUT: IN3 of LUT4_1 or KEEP Input of FSM1 | 108 |
| reg <879:872> | Matrix OUT: PD of either Temp-output with BG AND/OR crystal oscillator by reg<1268> | 109 |

8.3 Connection Matrix Virtual Inputs

As mentioned previously, the Connection Matrix inputs come from the outputs of various digital macrocells on the device. Eight of the Connection Matrix inputs have the special characteristic that the state of these signal lines comes from a corresponding data bit written as a register value via I²C. This gives the user the ability to write data via the serial channel, and have this information translated into signals that can be driven into the Connection Matrix and from the Connection Matrix to the digital inputs of other macrocells on the device. The I²C address for reading and writing these register values is at byte 0244.

Six of the eight Connection Matrix Virtual Inputs are dedicated to this virtual input function. An I²C write command to these register bits will set the signal values going into the Connection Matrix to the desired state. A read command to these register bits will read either the original data values coming from the NVM memory bits (that were loaded during the initial device startup), or the values from a previous write command (if that has happened).

Two of the eight Connection Matrix Virtual Inputs are shared with Pin digital inputs,(IO6 Digital or I2C_virtual_0 Input) and (IO7 Digital or I2C_virtual_1 Input). If the virtual input mode is selected, an I²C write command to these register bits will set the signal values going into the Connection Matrix to the desired state. Two register bits select whether the Connection Matrix input comes from the pin input or from the virtual register:

- reg <1074> Select SCL & Virtual Input 0 or IO6
- reg <1082> Select SDA & Virtual Input 1 or IO7

See table below for Connection Matrix Virtual Inputs.

| Matrix Input Number | Matrix Input Signal Function | Register Bit Addresses (d) |
|---------------------|------------------------------|----------------------------|
| 32 | I2C_virtual_0 Input | reg<1952> |
| 33 | I2C_virtual_1 Input | reg<1953> |
| 34 | I2C_virtual_2 Input | reg<1954> |
| 35 | I2C_virtual_3 Input | reg<1955> |
| 36 | I2C_virtual_4 Input | reg<1956> |
| 37 | I2C_virtual_5 Input | reg<1957> |
| 38 | I2C_virtual_6 Input | reg<1958> |
| 39 | I2C_virtual_7 Input | reg<1959> |

8.4 Connection Matrix Virtual Outputs

The digital outputs of the various macrocells are routed to the Connection Matrix to enable interconnections to the inputs of other macrocells in the device. At the same time, it is possible to read the state of each of the macrocell outputs as a register value via I²C. This option, called Connection Matrix Virtual Outputs, allows the user to remotely read the values of each macrocell output. The I²C addresses for reading these register values are at bytes 0240 to 0247. Write commands to these same register values will be ignored (with the exception of the Virtual Input register bits at byte 0244).

9.0 Combination Function Macro Cells

The SLG46538 has seventeen combination function macrocells that can serve more than one logic or timing function. In each case, they can serve as a Look Up Table (LUT), or as another logic or timing function. See the list below for the functions that can be implemented in these macrocells;

- Three macrocells that can serve as either 2-bit LUTs or as D Flip Flops;
- Five macrocells that can serve as either 3-bit LUTs or as D Flip Flops with Set/Reset Input;
- One macrocell that can serve as either 3-bit LUT or as Pipe Delay;
- One macrocell that can serve as either 2-bit LUT or as Programmable Pattern Generator (PGEN);
- Five macrocells that can serve as either 3-bit LUTs or as 8-Bit Counter / Delays;
- Two macrocells that can serve as either 4-bit LUTs or as 16-Bit Counter / Delays.

Inputs/Outputs for the 17 combination function macrocells are configured from the connection matrix with specific logic functions being defined by the state of NVM bits.

When used as a LUT to implement combinatorial logic functions, the outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR).

9.1 2-Bit LUT or D Flip Flop Macrocells

There are three macrocells that can serve as either 2-bit LUTs or as D Flip Flops. When used to implement LUT functions, the 2-bit LUTs each take in two input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement D Flip Flop function, the two input signals from the connection matrix go to the data (D) and clock (clk) inputs for the Flip Flop, with the output going back to the connection matrix.

The operation of the D Flip-Flop and Latch will follow the functional descriptions below:

- DFF: CLK is rising edge triggered, then Q = D; otherwise Q will not change
- Latch: when CLK is Low, then Q = D; otherwise Q remains its previous value (input D has no effect on the output, when CLK is High).

Figure 12. 2-bit LUT0 or DFF0

9.1.1 2-Bit LUT or D Flip Flop Macrocells Used as 2-Bit LUTs

Table 40. 2-bit LUT0 Truth Table

| IN1 | IN0 | OUT | |
|-----|-----|------------|-----|
| 0 | 0 | reg <1204> | LSB |
| 0 | 1 | reg <1205> | |
| 1 | 0 | reg <1206> | |
| 1 | 1 | reg <1207> | MSB |

Table 42. 2-bit LUT2 Truth Table

| IN1 | IN0 | OUT | |
|-----|-----|------------|-----|
| 0 | 0 | reg <1212> | LSB |
| 0 | 1 | reg <1213> | |
| 1 | 0 | reg <1214> | |
| 1 | 1 | reg <1215> | MSB |

Table 41. 2-bit LUT1 Truth Table

| IN1 | IN0 | OUT | |
|-----|-----|------------|-----|
| 0 | 0 | reg <1200> | LSB |
| 0 | 1 | reg <1201> | |
| 1 | 0 | reg <1202> | |
| 1 | 1 | reg <1203> | MSB |

Each Macrocell, when programmed for a LUT function, uses a 4-bit register to define their output function:

2-Bit LUT0 is defined by reg<1207:1204>

2-Bit LUT1 is defined by reg<1203:1200>

2-Bit LUT2 is defined by reg<1215:1212>

The table below shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the two 2-bit LUT logic cells.

Table 43. 2-bit LUT Standard Digital Functions

| Function | MSB | | | LSB |
|----------|-----|---|---|-----|
| AND-2 | 1 | 0 | 0 | 0 |
| NAND-2 | 0 | 1 | 1 | 1 |
| OR-2 | 1 | 1 | 1 | 0 |
| NOR-2 | 0 | 0 | 0 | 1 |
| XOR-2 | 0 | 1 | 1 | 0 |
| XNOR-2 | 1 | 0 | 0 | 1 |

9.1.2 2-Bit LUT or D Flip Flop Macrocells Used as D Flip Flop Register Settings
Table 44. DFF0 Register Settings

| Signal Function | Register Bit Address | Register Definition |
|------------------------------|----------------------|--------------------------------------|
| LUT2_0 or DFF0 Select | 1191 | 0: LUT2_0 1: DFF0 |

9.3 3-Bit LUT or D Flip Flop with Set/Reset Macrocells

There are five macrocells that can serve as either 3-bit LUTs or as D Flip Flops with Set/Reset inputs. When used to implement LUT functions, the 3-bit LUTs each take in three input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement D Flip Flop function, the three input signals from the connection matrix go to the data (D) and clock (clk) and Set/Reset (rRST/nSET) inputs for the Flip Flop, with the output going back to the connection matrix.

DFF3 has a user selectable option to allow the macrocell output to either come from the Q/nQ output of one D Flip Flop, or two D Flip Flops in series, with the first D Flip Flop triggering on the rising clock edge, and the second D Flip Flop triggering on the falling clock edge.

Each Macrocell, when programmed for a LUT function, uses a 8-bit register to define their output function:

3-Bit LUT0 is defined by reg<1223:1216>

3-Bit LUT1 is defined by reg<1231:1224>

3-Bit LUT2 is defined by reg<1239:1232>

3-Bit LUT3 is defined by reg<1247:1240>

3-Bit LUT4 is defined by reg<1255:1248>

3-Bit LUT11 is defined by reg<1375:1368>

3-Bit LUT12 is defined by reg<1383:1376>

3-Bit LUT13 is defined by reg<1391:1384>

3-Bit LUT14 is defined by reg<1399:1392>

3-Bit LUT15 is defined by reg<1407:1400>

3-Bit LUT16 is defined by reg<1415:1408>

3-Bit LUT17 is defined by reg<1423:1416>

The table below shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the six 3-bit LUT logic cells.

Table 59. 3-bit LUT Standard Digital Functions

| Function | MSB | | | | | | | LSB |
|----------|-----|---|---|---|---|---|---|-----|
| AND-3 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| NAND-3 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

9.4 Initial Polarity Operations

Figure 28. DFF Polarity Operations

9.5 3-Bit LUT or Pipe Delay Macrocell

There is one macrocell that can serve as either a 3-bit LUT or as a Pipe Delay.

When used to implement LUT functions, the 3-bit LUT take in three input signals from the connection matrix and produces a single output, which goes back into the connection matrix.

When used as a pipe delay, there are three inputs signals from the matrix: Input (IN), Clock (CLK) and Reset (nRST). The pipe delay cell is built from 16 D Flip-Flop logic cells that provide the three delay options, two of which are user selectable. The DFF cells are tied in series where the output (Q) of each delay cell goes to the next DFF cell. The first delay option (OUT2) is fixed at the output of the first flip-flop stage. The other two outputs (OUT0 and OUT1) provide user selectable options for 1 to 16 stages of delay. There are delay output points for each set of the OUT0 and OUT1 outputs to a 16-input mux that is controlled by reg <1259:1256> for OUT0 and reg <1263:1260> for OUT1. The 16-input mux is used to select the amount of delay.

The overall time of the delay is based on the clock used in the SLG46538 design. Each DFF cell has a time delay of the inverse of the clock time (either external clock or the RC Oscillator within the SLG46538). The sum of the number of DFF cells used will be the total time delay of the Pipe Delay logic cell.

Note: CLK is rising edge triggered.

Figure 29. 3-bit LUT10 or Pipe Delay

9.5.1 3-Bit LUT or Pipe Delay Macrocells Used as 3-Bit LUTs

Table 65. 3-bit LUT10 Truth Table

| OUT1 select | reg<1263:1260> | |
| Pipe delay OUT1 Polarity Select Bit | reg<1271> | 0: Non-inverted 1: Inverted |

9.6 3-Bit LUT or 8-Bit Counter / Delay Macrocells

There are five macrocells that can serve as either 3-bit LUTs or as Counter / Delays. When used to implement LUT function, the 3-bit LUT takes in three input signals from the connection matrix and produces a single output, which goes back into the connection matrix. When used to implement 8-Bit Counter / Delay function, two of the three input signals from the connection matrix go to the external clock (ext_clk) and reset (DLY_in/CNT_Reset) for the counter/delay, with the output going back to the connection matrix.

These macrocells can also operate in a one-shot mode, which will generate an output pulse of user-defined width.

These macrocells can also operate in a frequency detection or edge detection mode.

For timing diagrams refer to section 9.8 CNT/DLY/FSM Timing Diagrams

Two of the five macrocells can have their active count value read via I²C (CNT4 and CNT6). See Section 19.4.6.4 Reading Counter Data via I2C for further details.

Each Macrocell, when programmed for a LUT function, uses a 8-bit register to define their output function:

3-Bit LUT0 is defined by reg<1223:1216>

3-Bit LUT1 is defined by reg<1231:1324>

3-Bit LUT2 is defined by reg<1239:1232>

3-Bit LUT3 is defined by reg<1247:1240>

3-Bit LUT4 is defined by reg<1255:1248>

The table below shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the six 3-bit LUT logic cells.

Table 79. 3-bit LUT Standard Digital Functions

| Function | MSB | | | | | | | LSB |
|----------|-----|---|---|---|---|---|---|-----|
| AND-3 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| NAND-3 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

9.7 4-Bit LUT or 16-Bit Counter / Delay Macrocells

There are two macrocells that can serve as either 4-bit LUTs or as 16-bit Counter / Delays. When used to implement LUT function, the 4-bit LUT takes in four input signals from the Connection Matrix and produces a single output, which goes back into the Connection Matrix. When used to implement 16-Bit Counter / Delay function, four input signals from the connection matrix go to the external clock (`ext_clk`) and reset (`DLY_in/CNT_Reset`), Keep and Up for the counter/delay, with the output going back to the connection matrix.

These two macrocells have an optional Finite State Machine (FSM) function. There are two matrix inputs for Up and Keep to support FSM functionality. Any counter within Green PAK is counting down by default. In FSM mode (`CNT/DLY0` and `CNT/DLY1`) it is possible to reverse counting by applying High level to Up input. Also, there is a possibility to pause counting by applying High level to Keep input, after the level goes Low, the counter will proceed counting. These macrocells can also operate in a one-shot mode, which will generate an output pulse of user-defined width.

These macrocells can also operate in a frequency detection or edge detection mode.

Delay time and Output Period can be calculated using the following formulas:

- Delay time: $[(\text{Counter data} + 2) / \text{CLK input frequency} - \text{Offset}^*]$;
- Output Period: $[(\text{Counter data} + 1) / \text{CLK input frequency} - \text{Offset}^*]$.

One Shot pulse width can be calculated using formula:

- Pulse width = $[(\text{Counter Data} + 2) / \text{CLK input frequency} - \text{Offset}^*]$;

*Offset is the asynchronous time offset between the input signal and the first clock pulse.

For timing diagrams refer to section *9.8 CNT/DLY/FSM Timing Diagrams*.

Both of these macrocells can have their active count value read via I²C. See Section *19.4.6.4 Reading Counter Data via I2C* for further details.

9.8 CNT/DLY/FSM Timing Diagrams

9.8.1 Delay mode (edge select: both, counter data: 3) CNT/DLY2...CNT/DLY6

Figure 37. Delay Mode Timing Diagram

9.8.2 Count mode (count data: 3), Counter reset (rising edge detect) CNT/DLY2...CNT/DLY6

Figure 38. Counter Mode Timing Diagram

9.8.3 One-shot mode CNT/DLY0...CNT/DLY6

This macrocell will generate a pulse whenever a selected edge is detected on its input. Register bits set the edge selection. The pulse width determines by counter data and clock selection properties. The output pulse polarity (non-inverted or inverted) is selected by register bit. Any incoming edges will be ignored during the pulse width generation. The following diagram shows one-shot function for non-inverted output.

Figure 39. One-Shot Function Timing Diagram

This macrocell generates a high level pulse with a set width (defined by counter data) when detecting the respective edge. It does not restart while pulse is high.

9.8.4 Frequency Detection Mode CNT/DLY0...CNT/DLY6

Rising Edge: The output goes high if the time between two successive edges is less than the delay. The output goes low if the second rising edge has not come after the last rising edge in specified time.

Falling Edge: The output goes high if the time between two falling edges is less than the set time. The output goes low if the second falling edge has not come after the last falling edge in specified time.

Both Edge: The output goes high if the time between the rising and falling edges is less than the set time, which is equivalent to the length of the pulse. The output goes low if after the last rising/falling edge and specified time, the second edge has not come.

Figure 40. Frequency Detection Mode Timing Diagram

9.8.5 Edge Detection Mode CNT/DLY2...CNT/DLY6

The macrocell generates high level short pulse when detecting the respective edge. See *Table 4. Expected Delays and Widths (typical)*.

Figure 41. Edge Detection Mode Timing Diagram

9.8.6 Delay Mode CNT/DLY0...CNT/DLY6

The macrocell shifts the respective edge to a set time and restarts by appropriate edge. It works as a filter if the input signal is shorter than the delay time.

Figure 46. CNT/FSM Timing Diagram (set rising edge mode, oscillator is forced on, UP=1) for counter data = 3

9.8.8 Difference in Counter Value for Counter, Delay, One-Shot and Frequency Detect Modes

There is a difference in counter value for Counter and Delay/One-Shot/Frequency Detect modes. The counter value is shifted for two rising edges of the clock signal in Delay/One-Shot/Frequency Detect modes compared to Counter mode. See *Figure 47*.

Figure 47. Counter Value, Counter Data = 3

9.9 2-bit LUT or Programmable Pattern Generator

The SLG46538 has one combination function macrocell that can serve as a logic or timing function. This macrocell can serve as a Look Up Table (LUT), or Programmable Pattern Generator (PGEN).

When used to implement LUT functions, the 2-bit LUT takes in four input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used as a LUT to implement combinatorial logic functions, the outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR). The user can also define the combinatorial relationship between inputs and outputs to be any selectable function.

When operating as a Programmable Pattern Generator, the output of the block with clock out a sequence of two to sixteen bits that are user selectable in their bit values, and user selectable in the number of bits (up to sixteen) that are output before the pattern repeats. See figure Figure 49.

Figure 48. 2-bit LUT3 or PGEN

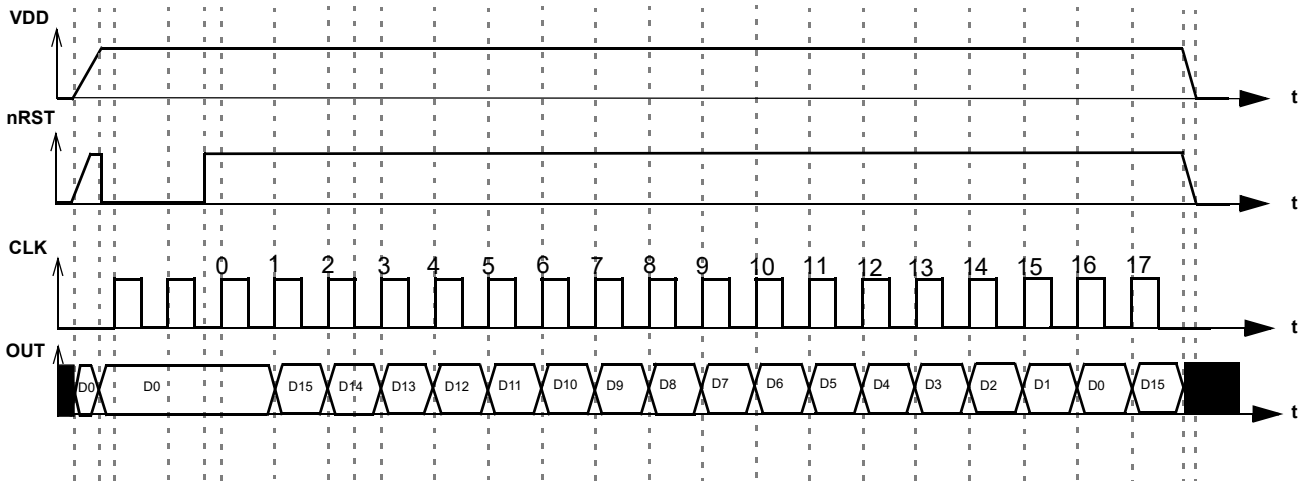

Figure 49. PGEN Timing Diagram

9.10 Wake and Sleep controller (WS)

The SLG46538 has a Wake and Sleep function for all ACMPs. The macrocell CNT/DLY0 can be reconfigured for this purpose reg<1319:1318>=11 and reg<1495>=1. The WS serves for power saving, it allows to switch on and off selected ACMPs on selected bit of 16-bit counter.

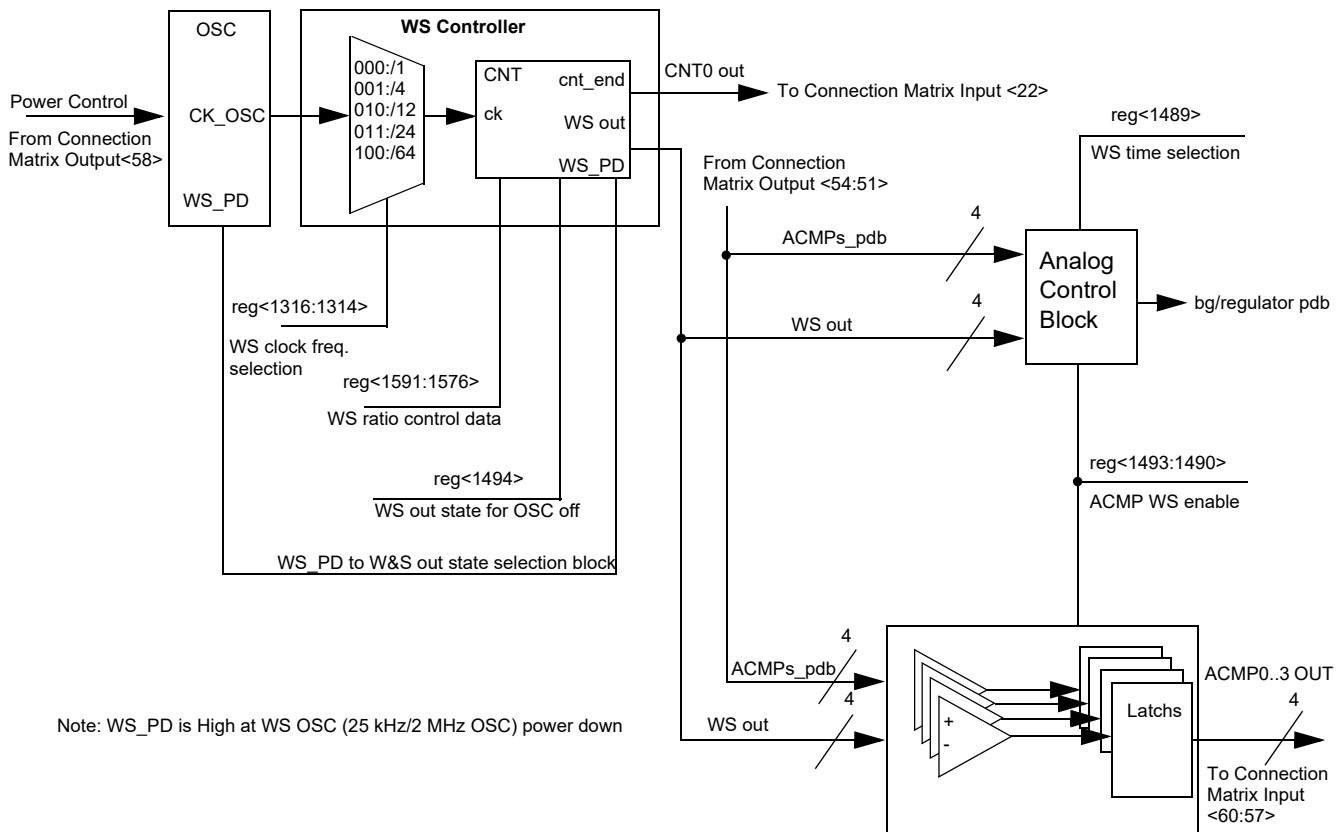

Figure 50. WS controller

To use any ACMP under WS controller the following settings must be done:

- ACMP Power Up Input from matrix = 1 (for each ACMP separately);
- CNT/DLY0 must be set to Wake and Sleep Controller function (for all ACMPs);
- Register WS => enable (for each ACMP separately);
- CNT/DLY0 set/reset input = 0 (for all ACMPs).

As the OSC any oscillator with any pre divider can be used. The user can select a period of time while the ACMPs are sleeping in a range of 0 - 65535 clock cycles. Before they are sent to sleep their outputs are latched so the ACMPs remain their state (High or Low) while sleeping.

WS controller has the following settings:

- Wake and Sleep Output State (High/Low)
If OSC is powered off (Power Down option is selected; power down input = 1) and Wake and Sleep Output State = High, the ACMP is continuously on.

If OSC is powered off (Power Down option is selected; power down input = 1) and Wake and Sleep Output State = Low, the ACMP is continuously off.
Both cases WS function is turned off.

- Counter Data (Range: 0 - 65535)
User can select wake and sleep ratio of the ACMP; counter data = sleep time, one clock = wake time.
- Q mode - defines the state of WS counter data when Set/Reset signal appears
Reset - when active signal appears, the WS counter will reset to zero and High level signal on its output will turn the ACMPs on. When Reset signal goes out, the WS counter will go Low and turn the ACMPs off until the counter counts up to the end
Set - when active signal appears, the WS counter will stop and Low level signal on its output will turn the ACMPs off. When Set signal goes out, the WS counter will go on counting and High level signal will turn the ACMPs on while counter is counting up to the end.
- Edge Select defines the edge for Q mode
High level Set/Reset - switches mode Set/Reset when level is High
Note: Q mode operates only in case of High Level Set/Reset.
- Wake time selection - time required for wake signal to turn the ACMPs on
Normal Wake Time - when WS signal is High, it takes a BG time (100/550 μ s) to turn the ACMPs on They will stay on until WS signal is Low again. Wake time is one clock period. It should be longer than BG turn on time and minimal required comparing time of the ACMP.
Short Wake Time - when WS signal is High, it takes a BG time (100/550 μ s) to turn the ACMPs on. They will stay on for 1 μ s and turn off regardless of WS signal. The WS signal width does not matter.
- Keep - pauses counting while Keep = 1
- Up - reverses counting
If Up = 1, CNT is counting up from user selected value to 65535.
If Up = 0, CNT is counting down from user selected value to 0.

9.10.1 WS Register Settings
Table 89. WS Register Settings

| Signal Function | Register Bit Address | Register Definition |
|---------------------------------------------------------------------------------------------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|

10.0 Analog Comparators (ACMP)

There are four Analog Comparator (ACMP) macro cells in the SLG46538. In order for the ACMP cells to be used in a GreenPAK design, the power up signals (ACMPx_pdb) need to be active. By connecting to signals coming from the Connection Matrix, it is possible to have each ACMP be always on, always off, or power cycled based on a digital signal coming from the Connection Matrix. Also, all ACMPs have Wake and Sleep function (WS), see section 9.10 *Wake and Sleep controller (WS)*. When ACMP is powered down, output is low.

PWR UP = 1 => ACMP is powered up.
PWR UP = 0 => ACMP is powered down.

During ACMP power up, its output will remain low, and then becomes valid 1.03 ms (max) after ACMP power up signal goes high, see *Figure 52*. If VDD is greater or equal to 2.7 V, it is possible to decrease turn-on time by setting the BG ok delay to 100 μ s, see *Figure 53*. The ACMP cells have an input "Low bandwidth" signal selection, which can be used to save power and reduce noise impact when lower bandwidth signals are being compared. To ensure proper chip startup operation, it is recommended to enable the ACMPs with the POR signal, and not the VDD signal.

Note: Regulator and Charge Pump set to automatic ON/OFF.

Figure 51. Maximum Power On Delay vs. VDD, BG = Auto-delay.

Figure 52. Maximum Power On Delay vs. VDD, BG = 550 μs.

Figure 53. Maximum Power On Delay vs. VDD, BG = 100 μs.

Each of the ACMP cells has a positive input signal that can be provided by a variety of external sources. There is also a selectable gain stage (1X, 0.5X, 0.33X, 0.25X) before connection to the analog comparator. The Gain divider is unbuffered and consists of 250 KΩ (typ.) resistors, see *Table 90*. For gain divider accuracy refer to *Table 91*. IN- voltage range: 0 - 1.2 V. Can use Vref selection VDD/4 and VDD/3 to maintain this input range.

Input bias current < 1 nA (typ).

**Table 90. Gain Divider Input Resistance**

| | | | | |
|------------------|--------|------|---------|-------|
| Gain | x1 | x0.5 | x0.33 | x0.25 |
| Input Resistance | 100 MΩ | 1 MΩ | 0.75 MΩ | 1 MΩ |

Table 91. Gain Divider Accuracy

| | | | |
|----------|--------|--------|--------|
| Gain | x0.5 | x0.33 | x0.25 |
| Accuracy | ±0.51% | ±0.34% | ±0.25% |

Each cell also has a hysteresis selection, to offer hysteresis of 0 mV, 25 mV, 50 mV or 200 mV. The 50 mV and 200 mV hysteresis options can be used with internal voltage reference only, while 25 mV hysteresis option can be used with both internal and external voltage reference. The 50 mV and 200 mV hysteresis options are one way hysteresis. It means that the actual thresholds will be V_{ref} (high threshold) and $V_{ref} - \text{hysteresis}$ (low threshold). The ACMP output will retain its previous value, if the input voltage is within threshold window (between V_{ref} and $V_{ref} - \text{hysteresis}$). Please note: for the 25 mV hysteresis option threshold levels will be $V_{ref} + \text{hysteresis}/2$ (high threshold) and $V_{ref} - \text{hysteresis}/2$ (low threshold).

Note: Any ACMP powered on enables the BandGap internal circuit as well. An analog voltage will appear on V_{ref} even when the Force BandGap option is set as Disabled.

For high input impedance when using the gain divider (x0.25, x0.33, x0.5), it is possible to use the input buffer. However, this will add some offset, see *Figure 54* to *Figure 55*. It is not recommended to use ACMP buffer when $V_{DD} < 2.5$ V.

Figure 54. Typical Buffer Input Voltage Offset vs. Voltage Reference at $T = (-40.... +85)^{\circ}\text{C}$, Buffer Bandwidth = 1 kHz, $V_{\text{hys}} = 0$ mV, Gain = 1.

Figure 55. Typical Input Threshold Variation (including Vref variation, ACMP offset) vs. Voltage Reference at T = (-40.... +85)°C, LMB Mode - Disable, V_{hys} = 0 mV.

Note: when VDD < 1.8V voltage reference should not exceed 1100 mV.

Table 92. Built-in Hysteresis Tolerance at T = 25°C

| V _{hys} (mV) | VDD=(1.7-1.8) V | | | | | | VDD=(1.89-5.5) V | | | | | |

11.0 Pipe Delay (PD)

The SLG46538 has a pipe delay logic cell that is shared with the LUT3_10 in one of the Combination Function macrocells. The user can select one of these functions to use in a design, but not both. Please see Section 9.5 *3-Bit LUT or Pipe Delay Macrocell* for the description of this Combination Function macrocell.

12.0 Programmable Delay / Edge Detector

The SLG46538 has a programmable time delay logic cell available that can generate a delay that is selectable from one of four timings configured in the GreenPAK Designer. The programmable time delay cell can generate one of four different delay patterns, rising edge detection, falling edge detection, both edge detection and both edge delay. See the timing diagrams below for further information.

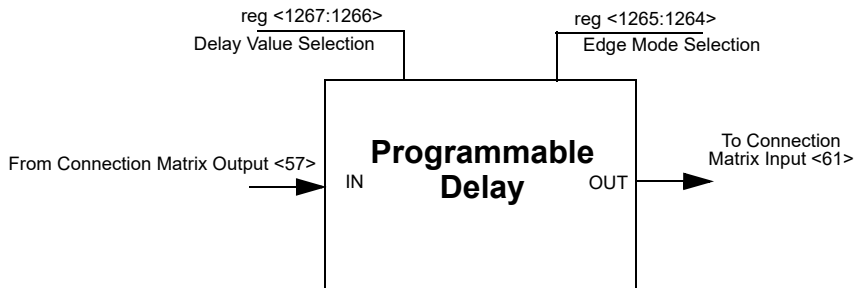

Figure 60. Programmable Delay

12.1 Programmable Delay Timing Diagram - Edge Detector Output

Figure 61. Edge Detector Output

Please refer to Table 4. *Expected Delays and Widths (typical)*

12.2 Programmable Delay Register Settings

13.0 Additional Logic Functions

The SLG46538 has three additional logic functions that are connected directly to the Connection Matrix inputs and outputs. There are two deglitch filters, each with edge detector functions. See section 5.14 *Typical Pulse Width Performance*. Deglitch Filter / Edge Detector

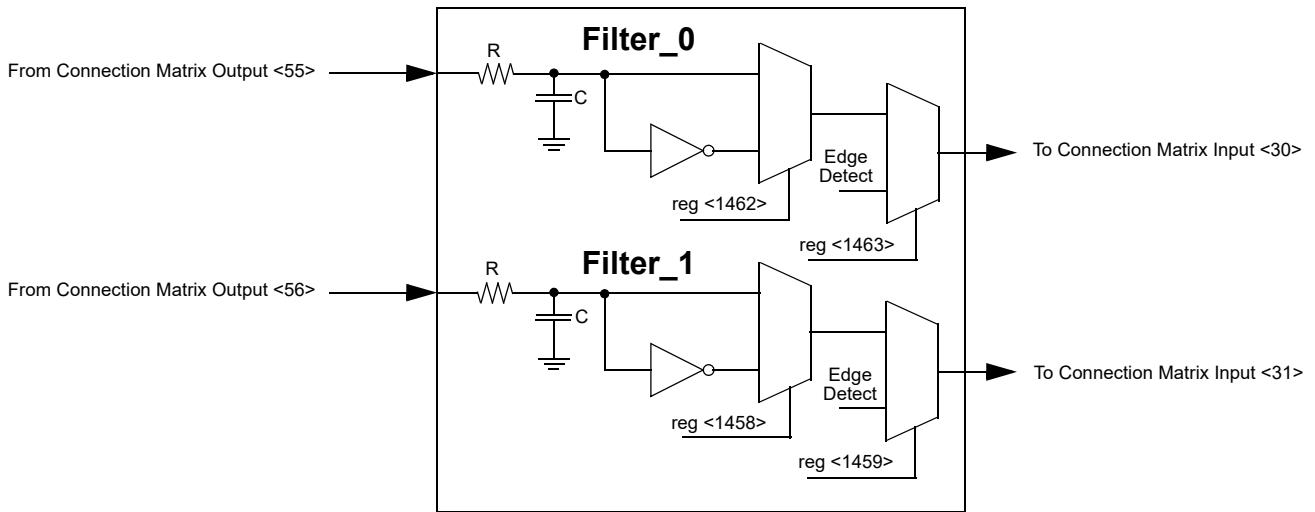

Figure 62. Deglitch Filter / Edge Detector

13.2 INV Gate

Figure 63. INV Gate

14.0 Voltage Reference (VREF)

14.1 Voltage Reference Overview

The SLG46538 has a Voltage Reference Macrocell to provide references to the four analog comparators. This macrocell can supply a user selection of fixed voltage references, $1/3$ and $1/4$ reference off of the V_{DD} power supply to the device, and externally supplied voltage references from IOs 5 and 9. The macrocell also has the option to output reference voltages on IOs 15 and 16. See table below for the available selections for each analog comparator. Also see *Figure 64* below, which shows the reference output structure.

14.2 VREF Selection Table

Table 99. VREF Selection Table

| 1.7 V - 2.0V | 50 mV ~ 1.0 V | Do not operate above 1.0 V |

14.3 VREF Block Diagram

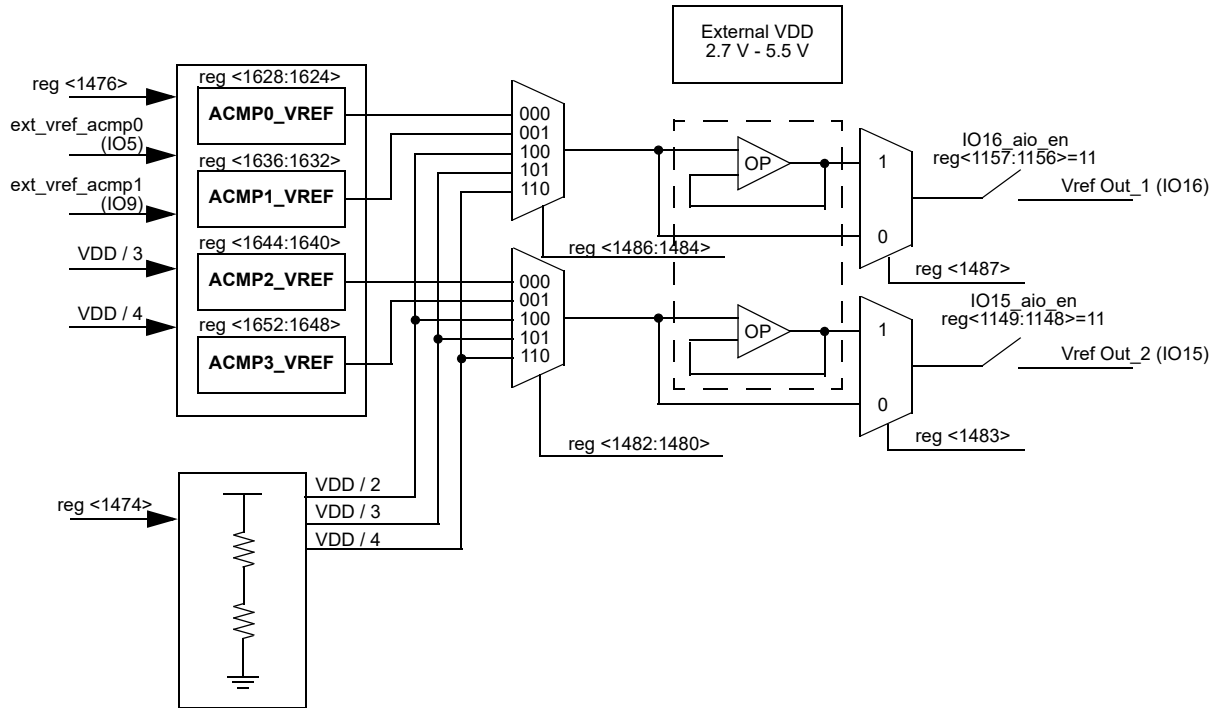

Figure 64. Voltage Reference Block Diagram

14.4 VREF Load Regulation

Note 1: It is not recommended to use VREF connected to external pin without buffer.

Note 2: VREF buffer performance is not guaranteed at VDD < 2.7 V.

Figure 65. Typical Load Regulation, VREF = 600 mV, T = (-40...+85)°C, Buffer - Enable

Figure 66. Typical Load Regulation, VREF = 1000 mV, T = (-40...+85)°C, Buffer - Enable

Figure 67. Typical Load Regulation, VREF = 1200 mV, T = (-40...+85)°C, Buffer - Enable

15.0 RC Oscillator (RC Osc)

The SLG46538 has three internal oscillators. RC Oscillator that runs at 25 kHz / 2 MHz (OSC0), Oscillator that runs at 25 MHz (OSC1) and Crystal Oscillator. It is possible to use all three oscillators simultaneously. The fundamental frequency can also come from clock input (IO15 or IO17 for 25 kHz / 2 MHz and IO14 for 25 MHz or Crystal OSC), see section 21.0 External Clocking.

15.1 25 kHz/2 MHz and 25 MHz RC Oscillators

There are two divider stages that allow the user flexibility for introducing clock signals on various Connection Matrix Input lines. The predivider allows the selection of /1, /2, /4 or /8 divide down frequency from the fundamental. The second stage divider (only for 25 kHz / 2 MHz Oscillator) has an input of frequency from the predivider, and outputs one of seven different frequencies on Connection Matrix Input lines <27> (OUT0) and <28> (OUT1). See *Figure 68* and *Figure 69* below for details.

There are two modes of the POWER CONTROL pin, (reg<1658> for 25 kHz / 2 MHz OSC and reg<1657> for 25 MHz OSC):

- **POWER DOWN <0>**. If PWR CONTROL input of oscillator is LOW, the oscillator will be turned on. If PWR CONTROL input of oscillator is HIGH the oscillator will be turned off.
- **FORCE ON <1>**. If PWR CONTROL input of oscillator is HIGH, the oscillator will be turned on. If PWR CONTROL input of oscillator is LOW the oscillator will be turned off.

The PWR CONTROL signal has the highest priority.

The SLG46538 has a 25 kHz / 2 MHz OSC FAST START-UP function reg<1338> (1 – on, 0 – off). It allows the OSC to run immediately after power-up this decreases the settling time. Note that when OSC FAST START-UP is on, the current consumption will rise.

The user can select two OSC POWER MODEs (reg<1343 for 25 kHz / 2 MHz OSC and reg<1341> for 25 MHz OSC):

- If **AUTO POWER ON <0>** is selected, the OSC will run when any block that uses OSC is powered on.
- If **FORCE POWER ON <1>** is selected, the OSC will run when the SLG46538 is powered on.

OSC can be turned on by:

- Register control (force power on)
- Delay mode, when delay requires OSC
- PWM
- CNT/FSM

The Power Down Mode is paired with temperature sensor, Section 20.0 Analog Temperature Sensor. If it is enabled for Crystal OSC, it is not available for Temp Sensor and vice versa. However, it is possible to enable Power Down Mode for Crystal OSC and Temp Sensor simultaneously.

Note 1: For more information see section 5.15 OSC Specifications.

Note 2: 25 MHz RC OSC1 performance is not guaranteed at VDD < 2.5 V.

16.0 Crystal Oscillator

The Crystal OSC provides high precision and stability of the output frequency. IO14 and IO13 are input and output, respectively, of an inverting amplifier which is configured for use as an On-chip Oscillator, as shown in *Figure 78*. Either a quartz crystal or a ceramic resonator may be used. C1 and C2 should always be equal for both crystals and resonators. The optimal value of the capacitors depends on the crystal or resonator in use, the amount of stray capacitance, and the electromagnetic noise of the environment. Refer to *Table 100*. For the ceramic resonators, the capacitor values given by the manufacturer should be used. It is possible to use an external clock source, it must be connected to IO14. In this case no external components are required.

The Power Down Mode is paired with temperature sensor. If it is enabled for Crystal OSC, it is not available for Temp Sensor and vice versa. However, it is possible to enable Power Down Mode for Crystal OSC and Temp Sensor simultaneously

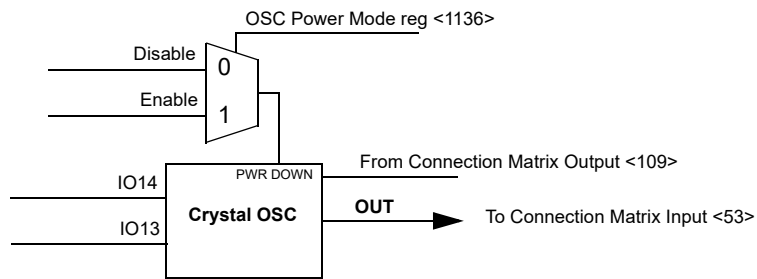

Figure 77. Crystal OSC Block Diagram

Table 100. External Components Selection Table

| f | C1 | C2 | R1 | R2 |
|------------|-------|--------|-------|-------|
| 32.768 kHz | 10 pF | 330 pF | 20 MΩ | 20 kΩ |
| 4 - 40 MHz | 12 pF | 12 pF | 1 MΩ | 0 Ω |

17.0 Power On Reset (POR)

The SLG46538 has a power-on reset (POR) macrocell to ensure correct device initialization and operation of all macrocells in the device. The purpose of the POR circuit is to have consistent behavior and predictable results when the VDD power is first ramping to the device, and also while the VDD is falling during power-down. To accomplish this goal, the POR drives a defined sequence of internal events that trigger changes to the states of different macrocells inside the device, and finally to the state of the I/O pins.

17.1 General Operation

To start the POR sequence in the SLG46538, the voltage applied on the VDD should be higher than the Power_ON threshold (see Note 1). The full operational VDD range for the SLG46538 is 1.71 V to 5.5 V (1.8 V $\pm 5\%$ to 5 V $\pm 10\%$). This means that the VDD voltage must ramp up to the operational voltage value, but the POR sequence will start earlier, as soon as the VDD voltage rises to the Power_ON threshold. After the POR sequence has started, the SLG46538 will have a typical period of time to go through all the steps in the sequence (noted in the datasheet for that device), and will be ready and completely operational after the POR sequence is complete.

The SLG46538 is guaranteed to be powered down and nonoperational when the VDD voltage (voltage on VDD) is less than 0.6V, but not less than -0.6 V. Another essential condition for the chip to be powered down is that no voltage higher (see Note 2) than the VDD voltage is applied to any other PIN. For example, if VDD voltage is 0.3 V, applying a voltage higher than 0.3 V to any other PIN is incorrect, and can lead to incorrect or unexpected device behavior.

Note 1: The Power_ON threshold can vary by PVT, but typically it is 1.6 V.

Note 2: There is a 0.6V margin due to forward drop voltage of the ESD protection diodes.

To power down the chip the VDD voltage should be lower than the operational and to guarantee that chip is powered down it should be less than 0.6 V.

All PINs are in high impedance state when the chip is powered down and while the POR sequence is taking place. The last step in the POR sequence releases the I/O structures from the high impedance state, at which time the device is operational. The pin configuration at this point in time is defined by the design programmed into the chip. Also as it was mentioned before the voltage on PINs can't be bigger than the VDD, this rule also applies to the case when the chip is powered on.

Note that VDD2 has no influence on POR sequence, all internal blocks are powered from VDD. It means, VDD2 can be switched on/off while VDD is on. If voltage on VDD2 appears after the POR sequence, IOs 9, 10, 12, 13, 14, 15, 16, 17 become available when VDD2 reaches 0.6 V.

For proper power up sequence, make sure VDD2 will not exceed VDD at any point during startup.

For normal operation VDD should not be switched off while VDD2 is on, due to $VDD2 \leq VDD$, see section 5.0 Electrical Specifications.

17.2 POR Sequence

The POR system generates a sequence of signals that enable certain macrocells. The sequence is shown in *Figure 79*.

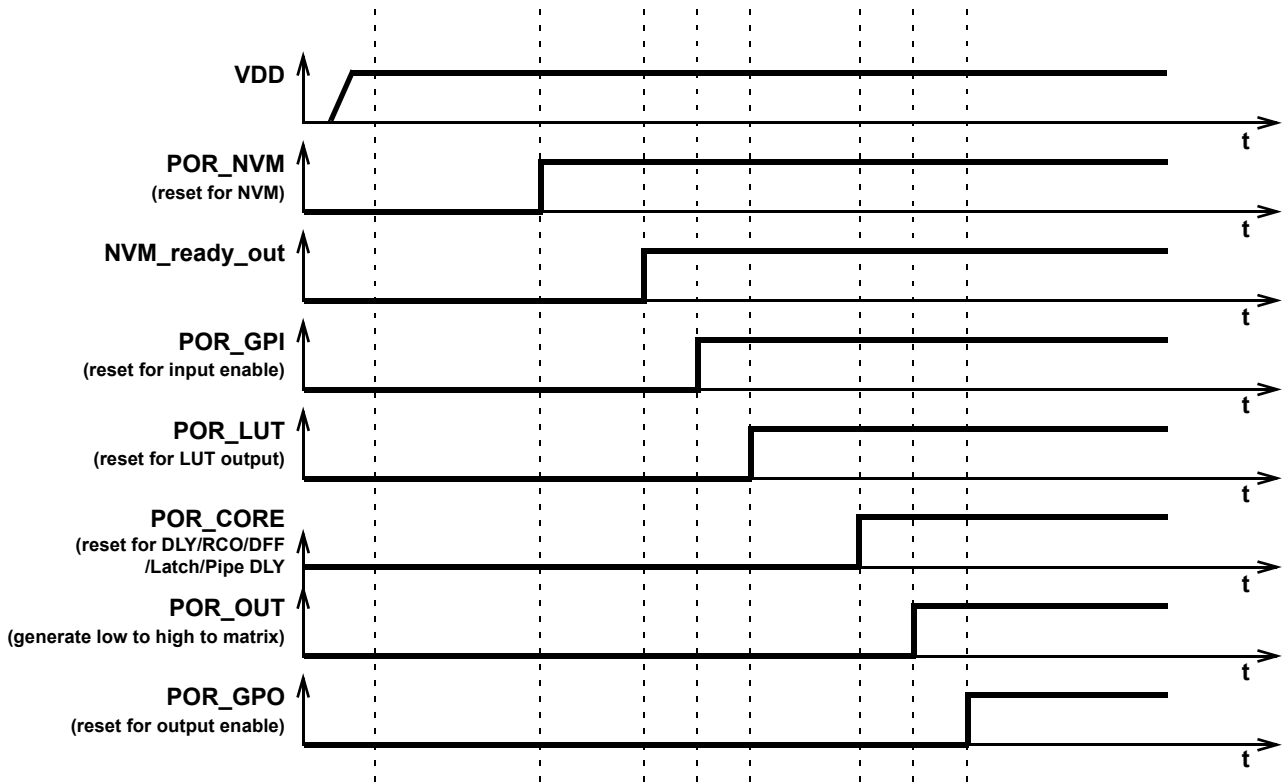

Figure 79. POR sequence

As can be seen from *Figure 79* after the VDD has start ramping up and crosses the Power_ON threshold, first, the on-chip NVM memory is reset. Next the chip reads the data from NVM, and transfers this information to SRAM registers that serve to configure each macrocell, and the Connection Matrix which routes signals between macrocells. The third stage causes the reset of the input pins, and then to enable them. After that, the LUTs are reset and become active. After LUTs the Delay cells, RC OSC, DFFs, Latches and Pipe Delay are initialized. Only after all macrocells are initialized internal POR signal (POR macrocell output) goes from LOW to HIGH. The last portion of the device to be initialized are the output PINs, which transition from high impedance to active at this point.

The typical time that takes to complete the POR sequence varies by device type in the GreenPAK family. It also depends on many environmental factors, such as: slew rate, VDD value, temperature and even will vary from chip to chip (process influence).

17.3 Blocks Output States During POR Sequence

To have a full picture of SLG46538 operation during powering and POR sequence, review the overview the macrocell output states during the POR sequence (Figure 80 describes the output signals states).

First, before the NVM has been reset, all macrocells have their output set to logic LOW (except the output PINs which are in high impedance state). Before the NVM is ready, all macrocell outputs are unpredictable (except the output PINs). On the next step, some of the macrocells start initialization: input pins output state becomes LOW; LUTs also output LOW. Only P DLY macrocell configured as edge detector becomes active at this time. After that input PINs are enabled. Next, only LUTs are configured. Next, all other macrocells are initialized. After macrocells are initialized, internal POR matrix signal switches from LOW to HIGH. The last are output PINs that become active and determined by the input signals.

Figure 80. Internal Block States during POR sequence

17.3.1 Initialization

All internal blocks by default have initial LOW level. Starting from indicated powerup time of 1.15 V - 1.6 V, blocks in GPAK are powered on while forced to the reset state. All outputs are in Hi-Z and chip starts loading data from NVM. Then the reset signal is released for internal blocks and they start to initialize according to the following sequence:

1. I²C;
2. Input PINs, ACMP, pull up/down;
3. LUTs;
4. DFFs, Delays/Counters, Pipe Delay;
5. POR output to matrix;
6. Output PIN corresponds to the internal logic.

The VREF output pin driving signal can precede POR output signal going high by 3 μ s - 5 μ s. The POR signal going high indicates the mentioned power-up sequence is complete.

Note: The maximum voltage applied to any PIN should not be higher than the VDD level. There are ESD Diodes between PIN – > VDD and PIN –> GND on each PIN. So if the input signal applied to PIN is higher than VDD, then current will sink through the diode to VDD. Exceeding VDD results in leakage current on the input PIN, and VDD will be pulled up, following the voltage on the input PIN. There is no effect from input pin when input voltage is applied at the same time as VDD.

17.3.2 Power Down

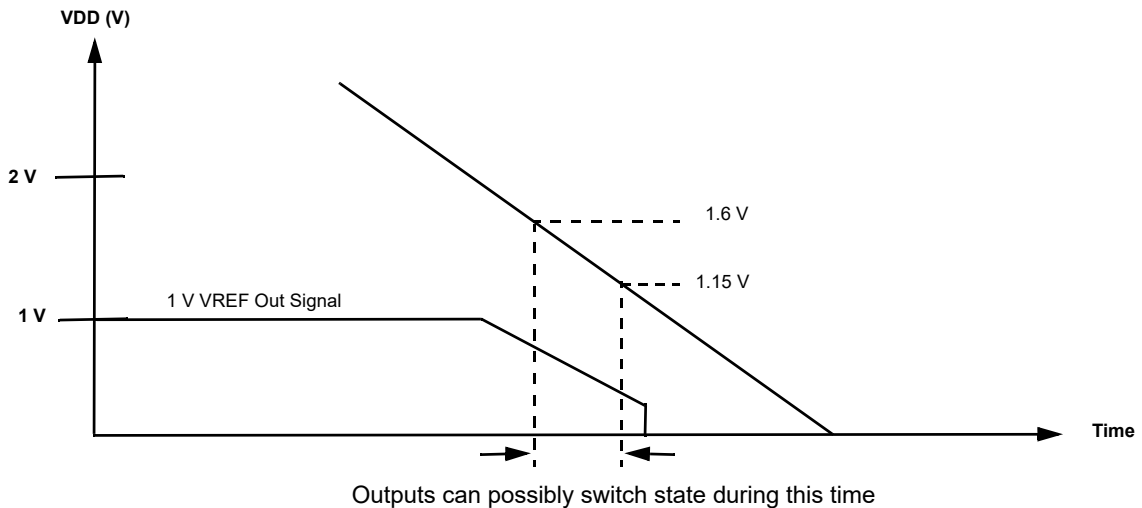

Figure 81. Power Down

During powerdown, blocks in SLG46538 are powered off and logic blocks may switch states after falling below 1.4 V. The I/O buffers are disabled when POR goes low at VDD~1 V. Please note that during a slow rampdown, outputs can possibly switch state during this time.

18.0 Asynchronous State Machine (ASM) Macrocell

18.1 ASM Macrocell Overview

The Asynchronous State Machine (ASM) macrocell is designed to allow the user to create state machines with between 2 to 8 states. The user has flexibility to define the available states, the available state transitions, and the input signals (a, b, c ...) that will cause transitions from one state to another state, as shown in *Figure 82*.

This macrocell has a total of 25 inputs, as shown in *Figure 83*, which come from the Connection Matrix outputs. Of these 25 inputs, 24 are user selectable for driving general state transitions, and 1 is for driving a state transition to an Initial / Reset state. Each of the 24 inputs is level sensitive and active high, meaning that a high level input will drive the user selected transition from one state to another. The fact that there are 24 inputs puts the upper bound of 24 possible state transitions total in the user defined state machine design. There is an nReset input which will drive an immediate state transition to the user-defined Initial / Reset state when active, shown in red, in the *Figure 82*. For more details refer to section *18.2 ASM Inputs*.

There are a total of 8 outputs, which go to the Connections Matrix inputs, and from there can be routed to other internal macrocells or pins. The 8 outputs are user defined for each of the possible 8 states. This information is held in the Connection Matrix Output RAM. For more details refer to section *18.3 ASM Outputs*.

In using this macrocell, the user must take into consideration the critical timing required on all input and output signals. The timing waveforms and timing specifications for this macrocell are all measured relative to the input signals (which come into the macrocell on the Connection Matrix outputs) and on the outputs from the macrocell (which are direct connections to Connection Matrix inputs). The user must consider any delays from other logic and internal chip connections, including I/O delays, to insure that signals are properly processed, and state transitions are deterministic.

The GPAK Designer development tools support user designs for the ASM macrocell at both the physical level and logic level. *Figure 82* is a representation of the user design at the logical level, and *Figure 83* shows the physical resources inside the macrocell. To best utilize this macrocell, the user must develop a logical representation of their desired state machine, as well as a physical mapping of the input and outputs required for the desired functionality.

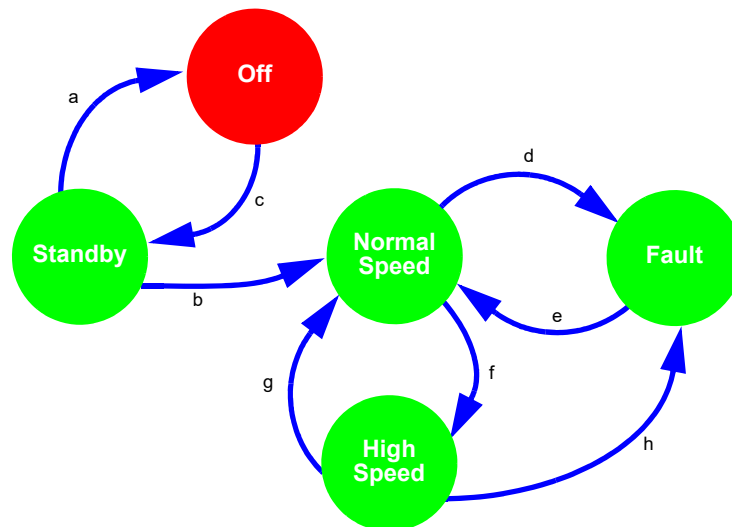

Figure 82. Asynchronous State Machine State Transitions

Figure 83. Asynchronous State Machine

18.2 ASM Inputs

The ASM macrocell has a total of 25 inputs which come from the Connection Matrix outputs. Of these 25 inputs, 24 are user selectable for driving general state transitions, and 1 is for driving a state transition to an Initial / Reset state.

There are a total of 24 inputs to the ASM macrocell for general state transitions, highlighted in red in *Figure 84*. Each of these inputs is level sensitive, and active high. A high level input will trigger a state transition.

These inputs are grouped so that each set of 3 inputs can drive a state transition **going into** a particular state. As an example, there are three inputs that can drive a state transition to State 1. This sets an upper bound on the number of transitions that the user can select going into a particular state to be 3, shown in *Figure 85*.

There is no limitation on the number of transitions that can be supported coming out of a particular state, the user can select to have transitions going from a state to all other states, shown in *Figure 86*.

The ASM macrocell also has a nReset input highlighted in blue in *Figure 84*. This input is level sensitive and active low. An active signal on this input will drive an immediate state transition to the user-defined Initial / Reset state. The user can choose which state within the ASM Editor inside GPAK Designer is the initial state.

Figure 84. Asynchronous State Machine Inputs

Figure 85. Maximum 3 State Transitions into Given State

Figure 86. Maximum 7 State Transitions out of a Given State

18.3 ASM Outputs

There are a total of 8 outputs from the ASM macrocell, which go to the Connections Matrix inputs, and from there can be routed to other internal macrocells or pins. The 8 outputs are user defined for each of the possible 8 states, this information is held in the Connection Matrix Output RAM, shown in *Figure 87*. The Connection Matrix Output RAM has a total of 64 bits, arranged as 8 bits per state. The values loaded in each of the 8 bits define the signal level on each of the 8 ASM macrocell outputs.

The ASM Editor inside the GPAK Designer software allows the user to make their selections for the value of each bit in the Connection Matrix Output RAM, which selects the level of the macrocell outputs based on the current state of the ASM block, as shown in *Figure 86*.

Figure 87. Connection Matrix Output RAM

Table 101. ASM Editor - Connection Matrix Output RAM

| RAM | | | | | | | | |
|------------|------------------------------|------|------|------|------|------|------|------|
| State name | Connection Matrix Output RAM | | | | | | | |
| | OUT7 | OUT6 | OUT5 | OUT4 | OUT3 | OUT2 | OUT1 | OUT0 |
| State 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| State 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| State 2 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| State 3 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| State 4 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| State 5 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| State 6 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| State 7 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

There is a possibility to configure ASM (it's settings and transitions) via I²C. Registers (reg<197:0>) correspond for ASM inputs, registers (reg<1727:1664>) correspond for ASM outputs configuration. Using I²C commands (see section 19.4 I2C Serial Communications Commands) it is possible to read ASM settings and connections, as well as change them. Additionally, user can change Connection Matrix Output RAM bit configuration (bytes 0xD0...0xD7)

Note: After Connection Matrix Output RAM was updated via I²C, ASM outputs to Connection Matrix can be changed only after ASM changes its state or after reset event. To change ASM outputs to Connection Matrix instantly after I²C write command, ASM must be in reset all the time.

18.4 Basic ASM Timing

The basic state transition timing from input on Matrix Connection output to output on Matrix Connection input is shown in *Figure 88* and *Figure 89*. The time from a valid input signal to the time that there is a valid change of state and valid signals being available on the state outputs is State Machine Output Delay Time ($T_{st_out_delay}$). The minimum and maximum values of $T_{st_out_delay}$ define the differential timing between the shortest state transition (input on matrix output and output on matrix input) and the longest state transition (input on matrix output and output on matrix input).

Figure 88. State Transition

Figure 89. State Transition Timing

18.5 Asynchronous State Machines vs. Synchronous State Machines

It is important to note that this macrocell is designed for asynchronous operation, which means the following:

1. No clock source is needed, it reacts only to input signals.
2. The input signals do not have to be synchronized to each other, the macrocell will react to the earliest valid signal for state transition.
3. This block does not have traditional set-up and hold time specifications which are related to incoming clock, as this macrocell has no clock source.
4. The macrocell only consumes power while in state transition.

18.6 ASM Power Considerations

A benefit of the asynchronous nature of this macrocell is that it will consume power only during state transitions. Shown in *Figure 88* and *Figure 90* below, the current consumption of the macrocell will be a fraction of a μA between state transitions, and will rise only during state transitions. See Section 5.10 *IDD Estimator* to find average current during state transitions.

Figure 90. State Transition

Figure 91. State Transition Timing and Power Consumption

18.7 ASM Logical vs. Physical Design

A successful design with the ASM macrocell must include both the logic level design as well as the physical level design. The GPAK Designer development software support user designs for the ASM macrocell at both the logic level and physical level. The logic level design of the user defined state machine takes place inside the ASM Editor. In the ASM Editor, the user can select and name states, define and name allowed state transitions, define the Initial / Reset state and define the output values for the 8 outputs in the Output RAM Matrix. The physical level design takes place in the general GPAK Designer window, and here the user makes connections for the sources for ASM input signals, as well as making connections for destinations for ASM output signals.

18.8 ASM Special Case Timing Considerations

18.8.1 State Transition Pulse Input Timing

All inputs to the ASM macrocell are level sensitive. If the input to the state machine block for a state transition is a pulse, there is a minimum pulse width on the input to the state machine block (as measured at the matrix input to the block) which is guaranteed to result in a state transition shown in *Figure 92* and *Figure 93*. This pulse width is defined by the State Machine Input Pulse Acceptance Time (Tst_pulse). If a pulse width that is shorter than Tst_pulse is input to the state machine block, it is indeterminate whether the state transition will happen or not. If a pulse that is rejected (invalid due to the pulse width being narrower than the guaranteed minimum of Tst_pulse), this will not stop a valid pulse on another state transition input that does meet minimum pulse width.

Figure 92. State Transition

Figure 93. State Transition Pulse Input Timing

18.8.2 State Transition Competing Input Timing

There will be situations where two input signals can be valid inputs that will drive two different state transitions from a given state. In that sense, the two signals are “competing” (signals a and b in *Figure 94*), and the signal that arrives sooner should drive the state transition that will “win”, or drive the state transition. If one signal arrives T_{st_comp} before the other one, it is guaranteed to win, and the state transition that it codes for will be taken, as shown in *Figure 95*. If the two signals arrive within T_{st_comp} of each other, it will be indeterminate which state transition will win, but one of the transitions will take place as long as the winning signal satisfies the pulse width criteria described in the paragraph above, as shown in *Figure 96*.

Figure 94. State Transition - Competing Inputs

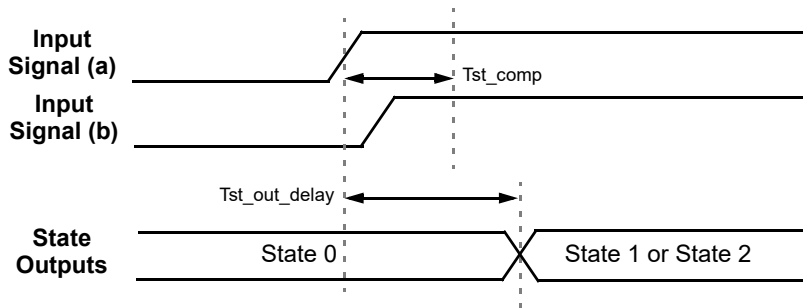

Figure 95. State Transition Timing - Competing Inputs Indeterminate

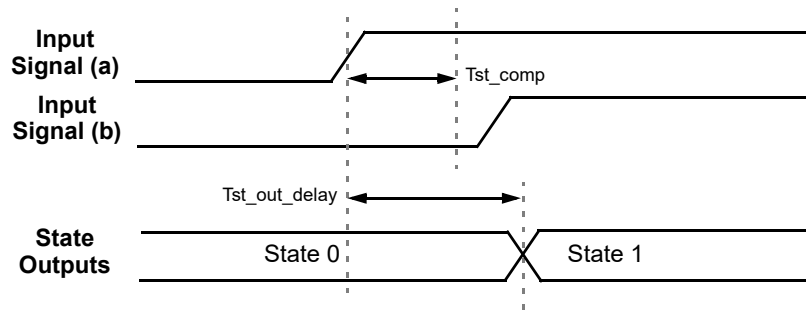

Figure 96. State Transition Timing - Competing Inputs Determinable

18.8.3 ASM State Transition Sequential Timing

It is possible to have a valid input signal for a transition out from a particular state be active before the state is active. If this is the case, the block will only stay in that particular state for *Tst_out_delay* time before making the transition to the next state. An example of this sequential behavior is shown in *Figure 97* and the associated timing is shown in *Figure 98*.

Figure 97. State Transition - Sequential

Figure 98. State Transition - Sequential Timing

18.8.4 State Transition Closed Cycling

It is possible to have a closed cycle of state transitions that will run continuously if there are valid inputs that are active at the same time. The rate at which the state transitions will take place is determined by *Tst_out_delay*. The example shown here

in Figure 99 involves cycling between two states, but any number of two – eight states can be included in state transition closed cycling of this nature. Figure 100 shows the associated timing for closed cycling.

Figure 99. State Transition - Closed Cycling

Figure 100. State Transition - Closed Cycling Timing

19.0 I²C Serial Communications Block

19.1 I²C Serial Communications Block Overview

In the standard use case for the GreenPAK devices, the configuration choices made by the user are stored as bit settings in the Non-Volatile Memory (NVM), and this information is transferred at startup time to volatile RAM registers that enable the configuration of the macrocells. Other RAM registers in the device are responsible for setting the connections in the Connection Matrix to route signals in the manner most appropriate for the user’s application.

The I²C Serial Communications Macrocell in this device allows an I²C bus Master to read and write this information via a serial channel directly to the RAM registers, allowing the remote re-configuration of macrocells, and remote changes to signal chains within the device.

An I²C bus Master is also able read and write other I²C register bits that are not associated with NVM memory. As an example, the input lines to the Connection Matrix can be read as digital register bits. These are the signal outputs of each of the macrocells in the device, giving an I²C bus Master the capability to remotely read the current value of any macrocell.

The user has the flexibility to control read access and write access via registers bits reg<1832>, reg<1870>, and reg<1871>. See section 19.4.6.2 I2C Serial Command Register Protection for more details on I²C read/write memory protection.

Note: GreenPAK I²C is fully compatible with standard I²C protocol.

19.2 I²C Serial Communications Device Addressing

Each command to the I²C Serial Communications block begins with a Control Byte. The bits inside this Control Byte are shown in Figure 101. After the Start bit, the first four bits are a control code, which can be set by the user in reg<1867:1864>. This gives the user flexibility on the chip level addressing of this device and other devices on the same I²C bus. The Block Address is the next three bits (A10,A9, A8), which will define the most significant bits in the addressing of the data to be read or written by the command. The last bit in the Control Byte is the R/W bit, which selects whether a read command or write command is requested, with a “1” selecting for a Read command, and a “0” selecting for a Write command. This Control Byte will be followed by an Acknowledge bit (ACK), which is sent by this device to indicate successful communication of the Control Byte data.

In the I²C-bus specification and user manual, there are two groups of eight addresses (0000 xxx and 1111 xxx) that are reserved for the special functions, such as a system General Call address. If the user of this device choses to set the Control Code to either “1111” or “0000” in a system with other slave device, please consult the I²C-bus specification and user manual to understand the addressing and implementation of these special functions, to insure reliable operation.

In the read and write command address structure, there are a total of 11 bits of addressing, each pointing to a unique byte of information, resulting in a total address space of 2K bytes. Of this 2K byte address space, the valid addresses accessible to the I²C Macrocell on the SLG46538 are in the range from 0 (0x00) to 255 (0xFF). The MSB address bits (A10, A9 and A8) will be “0” for all commands to the SLG46538.

With the exception of the Current Address Read command, all commands will have the Control Byte followed by the Word Address. Figure 101 shows this basic command structure.

Figure 101. Basic Command Structure

19.3 I²C Serial General Timing

Shown in Figure 102 is the general timing characteristics for the I²C Serial Communications block. Timing specifications can be found in the AC Characteristics section.

Figure 102. I²C General Timing Characteristics

19.4 I²C Serial Communications Commands

19.4.1 Byte Write Command

Following the Start condition from the Master, the Control Code [4 bits], the Block Address [3 bits] and the R/W bit (set to “0”), are placed onto the I²C bus by the Master. After the SLG46538 sends an Acknowledge bit (ACK), the next byte transmitted by the Master is the Word Address. The Block Address (A10, A9, A8), combined with the Word Address (A7 through A0), together set the internal address pointer in the SLG46538 where the data byte is to be written. After the SLG46538 sends another Acknowledge bit, the Master will transmit the data byte to be written into the addressed memory location. The SLG46538 again provides an Acknowledge bit and then the Master generates a Stop condition. The internal write cycle for the data will take place at the time that the SLG46538 generates the Acknowledge bit.

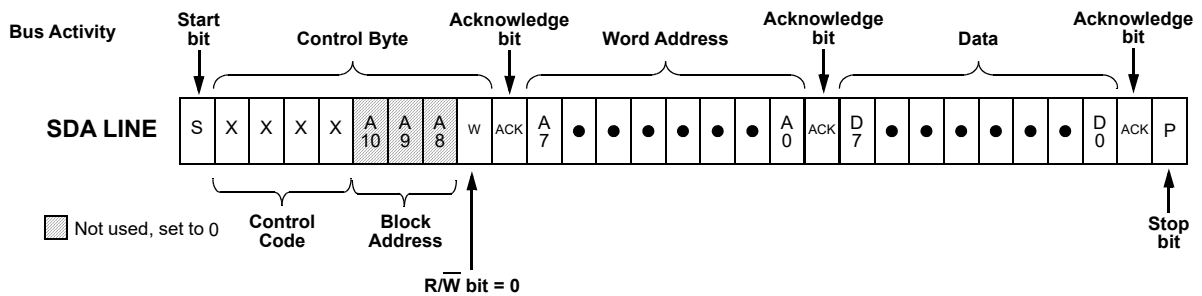

Figure 103. Byte Write Command, R/W = 0

19.4.2 Sequential Write Command

The write Control Byte, Word Address and the first data byte are transmitted to the SLG46538 in the same way as in a Byte Write command. However, instead of generating a Stop condition, the Master continues to transmit data bytes to the SLG46538. Each subsequent data byte will increment the internal address counter, and will be written into the next higher byte in the command addressing. As in the case of the Byte Write command, the internal write cycle will take place at the time that the SLG46538 generates the Acknowledge bit.

Figure 104. Sequential Write Command, $\overline{R/W} = 0$

19.4.3 Current Address Read Command

The Current Address Read Command reads from the current pointer address location. The address pointer is incremented at the first STOP bit following any write control byte. For example, if a Write or Random Read (which contains a write control byte) writes or reads data up to address n, the address pointer would get incremented to n+1 upon the STOP of that command. Subsequently, a Current Address Read that follows would start reading data at n+1. The Current Address Read Command contains the Control Byte sent by the Master, with the $\overline{R/W}$ bit = "1". The SLG46538 will issue an Acknowledge bit, and then transmit eight data bits for the requested byte. The Master will not issue an Acknowledge bit, and follow immediately with a Stop condition.

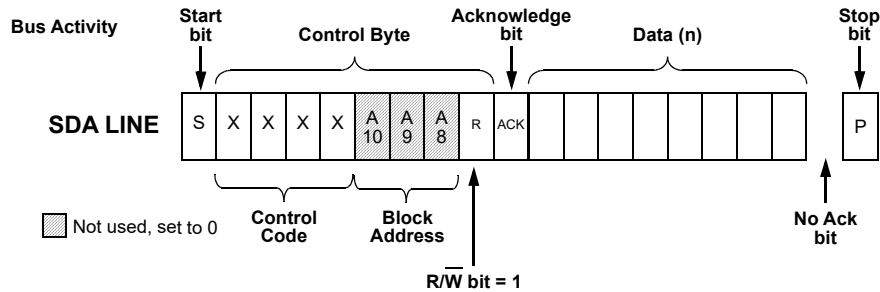

Figure 105. Current Address Read Command, $\overline{R/W} = 1$

19.4.4 Random Read Command

The Random Read command starts with a Control Byte (with R/W bit set to "0", indicating a write command) and Word Address to set the internal byte address, followed by a Start bit, and then the Control Byte for the read (exactly the same as the Byte Write command). The Start bit in the middle of the command will halt the decoding of a Write command, but will set the internal address counter in preparation for the second half of the command. After the Start bit, the Master issues a second control byte with the R/W bit set to "1", after which the SLG46538 issues an Acknowledge bit, followed by the requested eight data bits.

Figure 106. Random Read Command

19.4.5 Sequential Read Command

The Sequential Read command is initiated in the same way as a Current Address Read or Random Read command, except that once the SLG46538 transmits the first data byte, the Master issues an Acknowledge bit as opposed to a Stop condition in a random read. The Master can continue reading sequential bytes of data, and will terminate the command with a Stop condition.

Figure 107. Sequential Read Command

19.4.6 I²C Serial Command Address Space

In the read and write command address structure, there are a total of 11 bits of addressing, each pointing to a unique byte of information, resulting in a total address space of 2K bytes. Of this 2K byte address space, the valid addresses accessible to the I²C Macrocell on the SLG46538 are in the range from 0 (0x00) to 255 (0xFF). The MSB address bits (A10, A9 and A8) will be “0” for all commands to the SLG46538.

19.4.6.1 I²C Serial Command Register Map

These register addresses are broken down into four Banks to give the user greater control on access to reading and writing information in each bank. Each of the four banks is 512 bits (64 bytes) in length. Writing information to register bits in these Banks will change the configuration of the device, resulting in either a change in the interconnection options provided by the Connection Matrix, or by changing the configuration of individual macrocells. During device use, all register bits can be read or written via I²C, unless protection bits are set to prevent this.

See Section 22.0 Appendix A - SLG46538 Register Definition for detailed information on all register bits

Figure 108. Register Bank Map

19.4.6.2 I²C Serial Command Register Protection

The memory space is divided into four banks, each of which has 512bits (64bytes). There are three bits that allow the user to define rules for reading and writing bits in each of these banks via I²C:

- reg<1832> Bank 0/1/2 I²C read protection bit. If the system provides any read commands to the addresses in these three banks, the device will respond with 'FFH' in data field.
- reg<1871> Bank 0/1/2 I²C write protection bit. If the system provides any write commands to the addresses in these three banks, the device will acknowledge these commands, but will not do internal writes to the register space.
- reg<1870> Bank 0/1/2/3 I²C write protection bit. If the system provides any write commands to the addresses in these four banks, the device will acknowledge these commands, but will not do internal writes to the register space.

Note 1. reg<1870> is higher priority than reg<1871>, and if reg<1870> is set, then reg<1871> does not have any effect.

Note 2. If the user sets IOs 6 and 7 function to a selection other than SDA and SCL, all access via I²C will be disabled.

If reg <1870> is not set, register bits in Bank 3 are open to read and write commands via I²C with the following exceptions:

- reg<1663> IO Latching Enable During I²C Write Interface is always protected from I²C write, see Note 3.
- reg<1871> Bank 0/1/2 I²C-write protection bit is always protected from I²C write
- reg<1867:1864> I²C Control Code Bit [3:0] is always protected from I²C write

Note 3. If reg<1663> = 1, all outputs are latched while inputs and internal blocks retain their status during I²C write

Note 4. Any write commands that come to the device via I²C that are not blocked, based on the protection bits, will change the contents of the RAM register bits that mirror the NVM bits. These write commands will not change the NVM bits themselves, and a POR event will restore the register bits to original programmed contents of the NVM.

See Section 22.0 Appendix A - SLG46538 Register Definition for detailed information on all registers.

19.4.6.3 I²C Serial Reset Command

If I²C serial communication is established with the device, it is possible to reset the device to initial power up conditions, including configuration of all macrocells, and all connections provided by the Connection Matrix. This is implemented by setting reg<1662> I²C reset bit to "1", which causes the device to re-enable the Power On Reset (POR) sequence, including the reload of all register data from NVM. During the POR sequence, the outputs of the device will be in tri-state. After the reset has taken place, the contents of reg<1662> will be set to "0" automatically. The timing diagram shown below illustrates the sequence of events for this reset function.

- 1) I²C write with reg<1662>=1 (I²C reset bit with reloading NVM into Data register)
- 2) POR go to LOW and reloading NVM into Data register start after “STOP” of I²C
- 3) POR go to HIGH after reloading NVM into Data register

Figure 109. Reset Command Timing

19.4.6.4 Reading Counter Data via I²C

The current count value in four counters in the device can be read via I²C. The counters that have this additional functionality are 16-bit CNT0 and CNT1, and 8-bit counters CNT4 and CNT6.

19.4.6.5 User RAM and OTP Memory Array

There are eight bytes of RAM memory that can be read and written remotely by I²C commands. The initial contents of this memory space can be selected by the user, and this information will be transferred from OTP memory to the RAM memory space during the power-up sequence. The lowest order byte in this array (User Configurable RAM/OTP Byte 0) is located at I²C address 0xD8, and the highest order byte in this array is located at I²C address 0xDF.

Table 102. RAM Array Table

| I ² C Address (hex) | Highest Bit Address | Lowest Bit Address | Memory Byte |
|--------------------------------|---------------------|--------------------|----------------------------------|
| D8 | 1735 | 1728 | User Configurable RAM/OTP Byte 0 |
| D9 | 1743 | 1736 | User Configurable RAM/OTP Byte 1 |
| DA | 1751 | 1744 | User Configurable RAM/OTP Byte 2 |
| DB | 1759 | 1752 | User Configurable RAM/OTP Byte 3 |
| DC | 1767 | 1760 | User Configurable RAM/OTP Byte 4 |
| DD | 1775 | 1768 | User Configurable RAM/OTP Byte 5 |
| DE | 1783 | 1776 | User Configurable RAM/OTP Byte 6 |
| DF | 1791 | 1784 | User Configurable RAM/OTP Byte 7 |

20.0 Analog Temperature Sensor

The SLG46538 has an Analog Temperature sensor (TS) with an output voltage linearly-proportional to the Centigrade temperature. The TS cell shares buffer with VREF0, so it is impossible to use both cells simultaneously, its output can be connected directly to the IO16. Using buffer causes low-output impedance, linear output and makes interfacing to readout or control circuitry especially easy. The TS is rated to operate over a -40°C to 180°C temperature range. The error in the whole temperature range does not exceed $\pm 10.3\%$ ($\pm 5.7\%$ in a range from -40°C to 100°C). TS output voltage variation over VDD at constant temperature is less than $\pm 10.3\%$ ($\pm 6.3\%$ without buffer). For more detail refer to section 5.14 *Analog Temperature Sensor (TS) Specifications*

Figure 110. Analog Temperature Sensor Structure Diagram

Figure 111. TS Output vs. Temperature, VDD = (1.71...5.5) V

Table 103. TS Register Settings

| Signal Function | Register Bit Address | Register Definition |
|--------------------------------------------------------------------------------------------------------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable temp. sensor (Separately, needs to turn on IO16 VREF buffer) | reg<1464> | 0: Disable 1: Enable |
| CP function selection & Power divider (VDD/3, VDD/4) ON/OFF (must be set to Auto ON/OFF when using TS) | reg<1474:1472> | 100: CP Auto ON/OFF (Use for 1.71V<VDD<5.5V), X10: CP always OFF (Use for 2.7V<VDD), XX1: CP always ON (Use for VDD<2.7V) 0XX: Power divider off (if there is no use of VDD/3, VDD/4 @ ACMP negative in) |
| Force Bandgap ON (must be enabled when using TS) | reg<1476> | 0: Auto-Mode 1: Enable (if chip is Power Down, the Bandgap will Power Down even if it is Set to 1) |
| Temp output range control | reg<1478> | 0: 0.62V ~ 0.99V (TYP) 1: 0.75V ~ 1.2V (TYP) |
| VREF1 and TS Output Active Buffer Control | reg<1487> | 0: Disabled (Bypass Active Buffer) 1: Enabled |

21.0 External Clocking

The SLG46538 supports several ways to use an external, higher accuracy clock as a reference source for internal operations.

21.1 Crystal Mode

When reg<1136> is set to 1, an external crystal can be connected to IOs 13 and 14 for supplying an accurate clock source. See section 16.0 *Crystal Oscillator*. An external clocking signal on IO14 can be used in place of the crystal. The high and low limits for crystal frequency that can be selected are 32.768 kHz and 40 MHz.

21.2 IO17 or IO15 Source for 25 KHz / 2 MHz Clock

When reg<1358> is set to 1, an external clocking signal on IOs 15 or 17 will be routed in place of the internal RC oscillator derived 25 kHz/2 MHz clock source. When reg<1355> is set to 0, IO17 is in use, when 1 – IO15 is in use. See *Figure 68*. The high and low limits for external frequency that can be selected are 0 MHz and 77 MHz.

21.3 IO14 Source for 25 MHz Clock

When reg<1357> is set to 1, an external clocking signal on IO14 will be routed in place of the internal RC oscillator derived 25 MHz clock source. See *Figure 69*. The high and low limits for external frequency that can be selected are 0 MHz and 84 MHz.

22.0 Appendix A - SLG46538 Register Definition

| Address | | Signal Function | Register Bit Definition | I ² C Interface | |

23.0 Package Top Marking System Definition

23.1 STQFN 20L 2x3mm 0.4P COL Package

- XXXXXX – Part ID Field: identifies the specific device configuration
- DD – Date Code Field: Coded date of manufacture
- LLL – Lot Code: Designates Lot #
- C – Assembly Site/COO: Specifies Assembly Site/Country of Origin
- RR – Revision Code: Device Revision

23.2 MSTQFN 22L 2x2.2 mm 0.4P Package

Silego Website & Support

Silego Technology Website

Silego Technology provides online support via our website at <http://www.silego.com/>. This website is used as a means to make files and information easily available to customers.

For more information regarding Silego Green products, please visit our website.

Our Green product lines feature:

GreenPAK: Programmable Mixed Signal Matrix products

GreenFET1 / GreenFET3: MOSFET Drivers and ultra-small, low RDSon Load Switches

GreenCLK1 / GreenCLK2 / GreenCLK3: Crystal replacement technology

Products are also available for purchase directly from Silego at the Silego Online Store at <http://www.silego.com/buy/>.

Silego Technical Support

Datasheets and errata, application notes and example designs, user guides, and hardware support documents and the latest software releases are available at the Silego website or can be requested directly at info@silego.com.

For specific GreenPAK design or applications questions and support please send e-mail requests to GreenPAK@silego.com

Users of Silego products can receive assistance through several channels:

Contact Your Local Sales Representative

Customers can contact their local sales representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. More information regarding your local representative is available at the Silego website or send a request to info@silego.com

Contact Silego Directly

Silego can be contacted directly via e-mail at info@silego.com or user submission form, located at the following URL:

<http://support.silego.com/>

Other Information

The latest Silego Technology press releases, listing of seminars and events, listings of world wide Silego Technology offices and representatives are all available at <http://www.silego.com/>

THIS PRODUCT HAS BEEN DESIGNED AND QUALIFIED FOR THE CONSUMER MARKET. APPLICATIONS OR USES AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS ARE NOT AUTHORIZED. SILEGO TECHNOLOGY DOES NOT ASSUME ANY LIABILITY ARISING OUT OF SUCH APPLICATIONS OR USES OF ITS PRODUCTS. SILEGO TECHNOLOGY RESERVES THE RIGHT TO IMPROVE PRODUCT DESIGN, FUNCTIONS AND RELIABILITY WITHOUT NOTICE.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
