Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Output Adjustment

The MAX675 trim terminal can be used to adjust the output voltage over a $5V \pm 150mV$ range. This feature allows system errors to be trimmed by setting the reference to a voltage other than 5V such as 5.120V for binary applications (see *Typical Operating Circuit*). The trim terminal may, of course, be left open if no adjustment is needed.

Adjustment of the output does not significantly affect the temperature performance of the device. The temperature coefficient change is approximately $0.7ppm/^{\circ}C$ for each 100mV of output adjustment from its initial value.

Temperature Voltage Output

The MAX675 provides a temperature-dependent output voltage on the TEMP pin. This voltage is proportional to the absolute temperature, and has a scale factor of approximately $2.1mV/^{\circ}C$ (Figure 2).

$$\text{Output Voltage} = 2.1(T + 273)mV$$

where T = Temperature in $^{\circ}C$
