## Operational Amplifiers, High Slew Rate, Low Voltage, Rail-to-Rail Output

The NCS2003 family of op amps features high slew rate, low voltage operation with rail-to-rail output drive capability. The 1.8 V operation allows high performance operation in low voltage, low power applications. The fast slew rate and wide unity-gain bandwidth (5 MHz at 1.8 V) make these op amps suited for high speed applications. The low input offset voltage (4 mV max) allows the op amp to be used for current shunt monitoring. Additional features include no output phase reversal with overdriven inputs and ultra low input bias current of 1 pA.

The NCS2003 family is the ideal solution for a wide range of applications and products. The single channel NCS2003, dual channel NCS20032, and quad channel NCS20034 are available in a variety of compact and space-saving packages. The NCV prefix denotes that the device is AEC-Q100 Qualified and PPAP Capable.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Neither input should exceed the range of  $V_{SS} - 300$  mV to 7.0 V. This device contains internal protection diodes between the input pins and  $V_{DD}$ . When  $V_{IN}$  exceeds  $V_{DD}$ , the input current should be limited to the specified value.
- Indefinite duration; however, maximum package power dissipation limits must be observed to ensure that the maximum junction temperature is not exceeded.
- This device series incorporates ESD protection and is tested by the following methods:  
ESD Human Body Model tested per AEC-Q100-002 and JESD22-A114  
ESD Machine Model tested per AEC-Q100-003 and JESD22-A115
