## 74HC/HCT163

### FEATURES

- Two count enable inputs for n-bit cascading
- Positive-edge triggered clock
- Synchronous reset
- Output capability: standard
- I<sub>CC</sub> category: MSI

### GENERAL DESCRIPTION

The 74HC/HCT163 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT163 are synchronous presettable binary counters which feature an internal look-ahead carry and can be used for high-speed counting. Synchronous operation is provided by having all flip-flops clocked simultaneously on the positive-going edge of the clock (CP).

The outputs (Q<sub>0</sub> to Q<sub>3</sub>) of the counters may be preset to a HIGH or LOW level. A LOW level at the parallel enable input ( $\overline{PE}$ ) disables the counting action and causes the data at the data inputs (D<sub>0</sub> to D<sub>3</sub>) to be loaded into the counter on the positive-going edge of the clock (providing that the set-up and hold time requirements for  $\overline{PE}$  are met).

Preset takes place regardless of the levels at count enable inputs (CEP and CET).

For the "163" the clear function is synchronous.

A LOW level at the master reset input ( $\overline{MR}$ ) sets all four outputs of the flip-flops (Q<sub>0</sub> to Q<sub>3</sub>) to LOW level after the next positive-going transition on the clock (CP) input (provided that the set-up and hold time requirements for  $\overline{MR}$  are met). This action occurs regardless of the levels at  $\overline{PE}$ , CET and CEP inputs.

This synchronous reset feature enables the designer to modify the maximum count with only one external NAND gate.

The look-ahead carry simplifies serial cascading of the counters. Both count enable inputs (CEP and CET) must be HIGH to count. The CET input is fed forward to enable the terminal count output (TC). The TC output thus enabled will produce a HIGH output pulse of a duration approximately equal to a HIGH level output of Q<sub>0</sub>. This pulse can be used to enable the next cascaded stage.

The maximum clock frequency for the cascaded counters is determined by the CP to TC propagation delay and CEP to CP set-up time, according to the following formula:

$$f_{\max} = \frac{1}{t_{P(\max)}(\text{CP to TC}) + t_{\text{SU}}(\text{CEP to CP})}$$

### QUICK REFERENCE DATA

GND = 0 V; T<sub>amb</sub> = 25 °C; t<sub>r</sub> = t<sub>f</sub> = 6 ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t <sub>PHL</sub> / t <sub>PLH</sub>	propagation delay CP to Q <sub>n</sub> CP to TC CET to TC	C <sub>L</sub> = 15 pF; V <sub>CC</sub> = 5 V	17	20	ns
			21	25	ns
			11	14	ns
f <sub>max</sub>	maximum clock frequency		51	50	MHz
C <sub>I</sub>	input capacitance		3.5	3.5	pF
C <sub>PD</sub>	power dissipation capacitance per package	notes 1 and 2	33	35	pF

### Notes

1. C<sub>PD</sub> is used to determine the dynamic power dissipation (P<sub>D</sub> in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o)$$

where:

f<sub>i</sub> = input frequency in MHz  
 f<sub>o</sub> = output frequency in MHz  
 ∑ (C<sub>L</sub> × V<sub>CC</sub><sup>2</sup> × f<sub>o</sub>) = sum of outputs

C<sub>L</sub> = output load capacitance in pF

V<sub>CC</sub> = supply voltage in V

2. For HC the condition is  
 V<sub>I</sub> = GND to V<sub>CC</sub>  
 For HCT the condition is  
 V<sub>I</sub> = GND to V<sub>CC</sub> – 1.5 V
