

## ADA4051-1/ADA4051-2

### FEATURES

- Very low supply current: 13  $\mu$ A typical
- Low offset voltage: 15  $\mu$ V maximum
- Offset voltage drift: 20 nV/ $^{\circ}$ C
- Single-supply operation: 1.8 V to 5.5 V
- High PSRR: 110 dB minimum
- High CMRR: 110 dB minimum
- Rail-to-rail input/output
- Unity-gain stable
- Extended industrial temperature range

### APPLICATIONS

- Pressure and position sensors
- Temperature measurements
- Electronic scales
- Medical instrumentation
- Battery-powered equipment
- Handheld test equipment

### PIN CONFIGURATION

Figure 1. 5-Lead SOT-23 (RJ-5)

Figure 2. 5-Lead SC-70 (KS-5)

Figure 3. 8-Lead MSOP (RM-8)

NOTES  
1. IT IS RECOMMENDED THAT THE EXPOSED PAD BE CONNECTED TO V-.

Figure 4. 8-Lead LFCSP (CP-8-2)

### GENERAL DESCRIPTION

The ADA4051-1/ADA4051-2 are CMOS, micropower, zero-drift operational amplifiers utilizing an innovative chopping technique. These amplifiers feature rail-to-rail input/output swing and extremely low offset voltage while operating from a 1.8 V to 5.5 V power supply. In addition, these amplifiers offer high power supply rejection ratio (PSRR) and common-mode rejection ratio (CMRR) while operating with a typical supply current of 13  $\mu$ A per amplifier. This combination of features makes the ADA4051-1/ADA4051-2 amplifiers ideal choices for battery-powered applications where high precision and low power consumption are important.

The ADA4051-1/ADA4051-2 are specified for the extended industrial temperature range of  $-40^{\circ}$ C to  $+125^{\circ}$ C. The ADA4051-1 amplifier is available in 5-lead SOT-23 and 5-lead SC-70 packages. The ADA4051-2 amplifier is available in 8-lead MSOP and 8-lead LFCSP packages.

The ADA4051-1/ADA4051-2 are members of a growing series of zero-drift op amps offered by Analog Devices, Inc. Refer to Table 1 for a list of these devices.

Table 1. Op Amps

Supply	Low Power, 5V	5V	16V
Single	AD8538	AD8628	AD8638
Dual	AD8539	AD8629	AD8639
Quad		AD8630

## ABSOLUTE MAXIMUM RATINGS

Table 4.

Parameter	Rating
Supply Voltage	6 V
Input Voltage	$\pm V_{SY} \pm 0.3 \text{ V}$
Input Current <sup>1</sup>	$\pm 10 \text{ mA}$
Differential Input Voltage <sup>2</sup>	$\pm V_{SY}$
Output Short-Circuit Duration to GND	Indefinite
Storage Temperature Range	-65°C to +150°C
Operating Temperature Range	-40°C to +125°C
Junction Temperature Range	-65°C to +150°C
Lead Temperature (Soldering, 60 sec)	300°C

<sup>1</sup> The input pins have clamp diodes to the power supply pins. Limit the input current to 10 mA or less whenever input signals exceed the power supply rail by 0.3 V.

<sup>2</sup> Inputs are protected against high differential voltages by internal series 1.33 kΩ resistors and back-to-back diode-connected N-MOSFETs (with a typical  $V_T$  of 0.7 V for  $V_{CM}$  of 0 V).

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{JA}$  is specified for the worst-case conditions, that is, a device soldered on a circuit board for surface-mount packages with its exposed paddle soldered to a pad, if applicable. Table 5 shows simulated thermal values for a 4-layer (2S2P) JEDEC standard thermal test board, unless otherwise specified.

Table 5. Thermal Resistance

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
5-Lead SOT-23 (RJ-5)	190	92	°C/W
5-Lead SC-70 (KS-5)	534	173	°C/W
8-Lead MSOP (RM-8)	142	45	°C/W
8-Lead LFCSP (CP-8-2)	77	14	°C/W

## POWER SEQUENCING

The op amp supplies must be established simultaneously with or before any input signals are applied. If this is not possible, the input current must be limited to 10 mA.

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## THEORY OF OPERATION

The ADA4051-1/ADA4051-2 micropower chopper operational amplifiers feature a novel, patent-pending technique that suppresses offset-related ripple in a chopper amplifier. Instead of filtering the ripple in the ac domain, this technique nulls the amplifier's initial offset in the dc domain, thus preventing ripple at the overall output.

Auto-zeroing and chopping are two techniques widely used in high precision CMOS amplifiers to achieve low offset, low offset drift, and no 1/f noise. Each of these techniques has pros and cons. Auto-zeroing results in more in-band noise due to aliasing introduced by sampling. On the other hand, chopping produces offset-related ripple because it modulates the initial offset associated with the amplifier up to its chopping frequency.

To accomplish the best noise vs. power trade-off, the chopping technique is the better approach when designing a low offset amplifier because there is no increased in-band noise. It is preferable to suppress the offset-related ripple inside a chopper amplifier because the offset-related ripple would otherwise need to be eliminated by an extra off-chip postfilter.

Figure 59 shows the block diagram design of the ADA4051-1/ADA4051-2 chopper amplifiers employing a local feedback loop called autocorrection feedback (ACFB). The main signal path contains an input chopping switch network (CHOP1), a first transconductance amplifier (Gm1), an output chopping switch network (CHOP2), a second transconductance amplifier (Gm2), and a third transconductance amplifier (Gm3). CHOP1 and CHOP2 operate at 40 kHz of chopping frequency to modulate the initial offset and 1/f noise from Gm1 up to the chopping frequency. A fourth transconductance amplifier (Gm4) in the ACFB senses the modulated ripple at the output of CHOP2, caused by the initial offset voltage of Gm1. Then, the ripple is demodulated down to a dc domain through a third chopping switch network (CHOP3), operating with the same chopping clock as CHOP1 and CHOP2. Finally, a null transconductance amplifier (Gm5) tries to null any dc component at the output of Gm1 that would otherwise appear in the overall output as ripple.

A switched-capacitor notch filter (NF) functions to selectively suppress the undesired offset-related ripple without disturbing the desired input signal from the overall input. The desired input dc signal appears as a dc signal at the output of CHOP2. Then, the initial offset is modulated up to the chopping frequency by CHOP3 and filtered out by the NF. Therefore, initial offset does not create any feedback and does not disturb the desired input signal. The NF is synchronized with the chopping clock to filter out the modulated component. In the same manner, the offset of Gm5 is filtered out by the combination of CHOP3 and the NF, enabling accurate ripple sensing at the output of CHOP2.

In parallel with the high dc gain path, a feedforward transconductance amplifier (Gm6) is added to bypass the phase shift introduced by the ACFB at the chopping frequency. Gm6 is designed to have the same transconductance as Gm1 to avoid

pole-zero doublets. This design prevents any instability introduced by the ACFB in the overall feedback loop.

Figure 59. ADA4051-1/ADA4051-2 Chopper Amplifiers Block Diagram

The voltage noise density, which is equal to the thermal noise floor dominated by the Gm1, is essentially flat from dc to the chopping frequency because CHOP1 and CHOP2 eliminate the 1/f noise generated in Gm1 and the ACFB does not contribute any additional noise. Although the ACFB suppresses the ripple related to the chopping, there is a remaining voltage ripple. To further suppress the remaining ripple down to a desired level, it is recommended to have a postfilter at the output of the amplifier.

The remaining voltage ripple originates from two sources. The first type of ripple is due to the residual ripple associated with the initial offset of the Gm1. It is proportional to the magnitude of the initial offset and creates a spectrum at the chopping frequency ( $f_{CHOP}$ ). When the amplifier is configured as a unity-gain buffer, this ripple has a typical value of 4.9  $\mu\text{V rms}$  and a maximum of 34.7  $\mu\text{V rms}$ . The second type of ripple is due to the intermodulation between the high frequency input signal and the chopping frequency. This ripple depends on the input frequency ( $f_{IN}$ ) and creates a spectrum at frequencies equal to the difference between the chopping frequency and the input frequency ( $f_{CHOP} - f_{IN}$ ), as well as at frequencies equal to the summation of the chopping frequency and the input frequency ( $f_{CHOP} + f_{IN}$ ). The magnitude of the ripple for different input frequencies is shown in Figure 60.

Figure 60. ADA4051-1/ADA4051-2 Modulated Output Ripple vs. Input Frequency

## ADA4051-1/ADA4051-2

The design architecture of the ADA4051-1/ADA4051-2 specifically targets precision signal conditioning applications requiring accurate and stable performance from dc to 10 Hz bandwidth. In summary, the main features of the ADA4051-1/ADA4051-2 chopper amplifiers are

- Considerable suppression of the offset-related ripple
- No affect on the desired input signal as long as its frequency is much lower than the chopping frequency shown in Figure 60
- Achievement of low offset similar to a conventional chopper amplifier
- No introduction of excess noise

The ADA4051-1/ADA4051-2 chopper amplifiers provide a rail-to-rail input range with a 1.8 V to 5.5 V supply voltage range and 20  $\mu$ A supply current consumption over the  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  extended industrial temperature range. The gain bandwidth is 125 kHz as a unity-gain stable amplifier up to 100 pF load capacitance.

### INPUT VOLTAGE RANGE

The ADA4051-1/ADA4051-2 have internal ESD protection diodes. These diodes are connected between the inputs and each supply rail to protect the input MOSFETs from an electrical discharge event and are reversed-biased during normal operation. This protection scheme allows voltages as high as approximately 0.3 V beyond the supplies ( $\pm V_{\text{SY}} \pm 0.3 \text{ V}$ ) to be applied at the input of either terminal without causing permanent damage.

If either input exceeds one of the supply rails by more than 0.3 V, these ESD diodes become forward-biased and large amounts of current begin to flow through them. Without current limiting, this excessive current would cause permanent damage to the device. If the inputs are expected to be subject to overvoltage conditions, install a resistor in series with each input to limit the input current to 10 mA maximum.

The ADA4051-1/ADA4051-2 also have internal circuitry that protects the input stage from high differential voltages. This circuitry is composed of internal 1.33 k $\Omega$  resistors in series with each input and back-to-back diode-connected N-MOSFET (with a typical  $V_{\text{T}}$  of 0.7 V for a  $V_{\text{CM}}$  of 0 V) after these series resistors. With normal negative feedback operating conditions, the ADA4051-1/ADA4051-2 amplifiers correct their output to ensure that the two inputs are at the same voltage. However, if the device is configured as a comparator or there are unusual operating conditions, the input voltages can be forced to different potentials, which may cause excessive current to flow through the internal diode-connected N-MOSFETs.

Although the ADA4051-1/ADA4051-2 are rail-to-rail input amplifiers, take care to ensure that the potential difference between the inputs does not exceed  $\pm V_{\text{SY}}$  to avert permanent damage to the device.

### OUTPUT PHASE REVERSAL

Although output phase reversal can occur with other amplifiers when the input common-mode voltage range is exceeded, the ADA4051-1/ADA4051-2 amplifiers are designed to prevent any output phase reversal, provided both inputs are maintained approximately within 0.3 V above and below the supply voltages ( $\pm V_{\text{SY}} \pm 0.3 \text{ V}$ ).

With other amplifiers, the outputs may jump in the opposite direction to the supply rail when a common-mode voltage moves outside the common-mode range. This usually occurs when one of the internal stages of the amplifier no longer has sufficient bias voltage across it and subsequently turns off.

However, with the ADA4051-1/ADA4051-2 amplifiers, if one or both inputs exceed the input voltage range but remain within the  $\pm V_{\text{SY}} \pm 0.3 \text{ V}$  range, an internal loop opens and the output remains in saturation mode, without phase reversal, until the input voltage is brought back to within the input voltage range limits as shown in Figure 55 and Figure 58.

# OUTLINE DIMENSIONS

<sup>1</sup> Z = RoHS Compliant Part.

**NOTES**

**NOTES**

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
