MPC5744P Data Sheet

32-bit MCU suitable for ISO26262 ASIL-D chassis and safety applications

Features

- The MPC5744P microcontroller is based on the Power Architecture® developed by NXP. It targets chassis and safety applications and other applications requiring a high Automotive Safety Integrity Level (ASIL). The MPC5744P is a SafeAssure solution.
- This document provides electrical specifications, pin assignments, and package diagram information for the MPC5744P series of microcontroller units (MCUs). For functional characteristics and the programming model, see the MPC5744P Reference Manual.
- Junction temperature: The upper limit is 150°C or 165°C depending on the device marking.

1 Introduction

1.1 Features

The following table summarizes the features of the MPC5744P.

Table 1. MPC5744P feature summary

| Feature | Details |
|---|---|
| CPU | |
| Power Architecture | 2 x e200z4 in delayed lock step |
| Architecture | Harvard |
| Execution speed | 0 MHz to 200 MHz (+2% FM) |
| Embedded FPU | Yes |
| Core MPU | 24 regions |
| Instruction Set PPC | No |
| Instruction Set VLE | Yes |
| Instruction cache | 8 KB, EDC |
| Data cache | 4 KB, EDC |
| Data local memory | 64 KB, ECC |
| System MPU | Yes (16 regions) |
| Buses | |
| Core bus | AHB, 32-bit address, 64-bit data, e2e ECC |
| Internal periphery bus | 32-bit address, 32-bit data |
| Crossbar | |
| Master x slave ports | 4 x 5 |
| Memory —see Table 2 for additional details | |
| Code/data flash memory | 2.5 MB , ECC, RWW |
| Data flash memory | Supported with RWW |
| SRAM | 384 KB , ECC |
| Overlay access to SRAM from Flash Memory Controller | Yes |
| Modules | |
| Interrupt controller | 32 interrupt priority levels, 16 SW programmable interrupts |
| PIT | 1 module with 4 channels |
| System Timer Module (STM) | 1 module with 4 channels |
| Software Watchdog Timer (SWT) | Yes |
| eDMA | 32 channels, in delayed lock step |
| FlexRay | 1 module with 64 message buffer, dual channel |
| FlexCAN | 3 modules with 64 message buffer |
| LINFlexD (UART and LIN with DMA support) | 2 modules |

| Feature | Details |
|---|--|
| Clockout | Yes |
| Fault Control and Collection Unit (FCCU) | Yes |
| Cross Triggering Unit (CTU) | 2 modules |
| eTimer | 3 modules with 6 channels |
| FlexPWM | 2 modules with 4 x (2+1) channels |
| Analog-to-digital converter (ADC) | 4 modules with 12-bit ADC, each with 16 channels (25 external channels including shared channels plus internal channels) |
| Sine-wave generator (SGEN) | 32 point |
| SPI | 4 modules As many as 8 chip selects |
| CRC Unit | Yes |
| SENT | 2 modules with 2 channels |
| Interprocessor serial link interface (SIPI) | Yes |
| Junction temperature sensor | Yes (replicated module) |
| Digital I/Os | ≥ 16 |
| Peripheral register protection | Yes |
| Ethernet | Yes |
| Error Injection Module (EIM) | Yes |
| Supply | |
| Device Power Supply | 3.3 V with external ballast transistor 3.3 V with external 1.25 V low drop-out (LDO) regulator |
| ADC Analog Reference voltage | 3.15 V to 5.5 V |
| Clocking | |
| Phase Lock Loop (PLL) | 1 x PLL and 1 coupled FMPLL |
| Internal RC Oscillator | 16 MHz |
| External Crystal Oscillator | 8 MHz to 40 MHz |
| Low power modes | |
| HALT and STOP | Yes |
| Debug | |
| Nexus | Level 3+, MDO and Aurora interface |
| Package | |
| LQFP | 144 pins, 0.5 mm pitch, 20 mm x 20 mm outline |
| MAPBGA | 257 MAPBGA, 0.8 mm pitch, 14 mm x 14 mm outline |
| Temperature | |
| Temperature range (junction) | -40°C to +150°C, option for 165°C |
| Ambient temperature range (LQFP) | -40°C to +125°C, 135°C option (with 165°C junction option) |
| Ambient temperature range (BGA) | -40°C to +125°C, 135°C option (with 165°C junction option) |

2.2 Pin/ball descriptions

The following sections provide signal descriptions and related information about the functionality and configuration of the device. Note that this section is under development.

2.2.1 Pin/ball startup and reset states

The following table provides startup state and reset state information for device pins/balls.

The startup state and subsequent states of the following pins/balls cannot be configured by the user:

- JCOMP
- TMS
- TCK
- XTAL/EXTAL
- FCCU_F[0] and FCCU_F[1]
- EXT_POR_B
- RESET_B

The user can configure the state after reset of the following pins/balls by programming the applicable MSCRs/IMCRs:

- GPIOs
- Analog inputs
- TDI
- TDO
- NMI_B
- FAB
- ABS[0]
- ABS[2]

1. Startup state is exited when the core and high-voltage supplies reach minimum levels.
2. Pads marked "high impedance" for POR will be in either high-impedance or weak low drive state when VDD_LV_CORE is off and HV_VDD_IO is below 1.5 V.
3. See [Generic pins/balls](#).
4. Not all non-supply or reference pins on the device are explicitly defined in this table.
5. See [System pins/balls](#).
6. This pin/ball is dedicated to and directly connected to a peripheral module pin.

1. VPP_TEST must be connected to ground.
2. Do not connect on the board.

2.2.4 LVDS pins/balls

The following tables contain information on LVDS pin functions for the devices.

Table 6. SIPI LFAST LVDS pin descriptions

| Functional block | Port pin | Signal | Signal description | Direction | 257MAPBGA |
|---------------------------|--------------------|---------------|--|-----------|-----------|
| SIPI LFAST ^{1,2} | I[5] | LFAST_TX N | SIPI/ LFAST, LVDS Transmit Negative Terminal | O | N15 |
| | C[12] ³ | LFAST_TX P | SIPI/ LFAST, LVDS Transmit Positive Terminal | O | M14 |
| | I[6] | LFAST_RX N | SIPI/ LFAST, LVDS Receive Negative Terminal | I | M15 |
| | G[7] ³ | LFAST_RX P | SIPI/ LFAST, LVDS Receive Positive Terminal | I | M16 |

1. DRCLK and TCK/DRCLK usage for SIPI LFAST are described in the reference manual's SIPI LFAST chapters.
2. For the MSCR SSS value of the port pin, see [Table 1](#).
3. The 144LQFP package has G[7] and C[12] but no SIPI LFAST functionality.

CAUTION

SIPI LFAST pins are muxed with GPIOs. Do not use GPIO and SIPI LFAST functionality in parallel.

Table 7. Aurora LVDS pin descriptions

| Functional block | Pad | Signal | Signal description | Direction | 257MAPBGA ¹ |
|-------------------------------|-------|--------|--|-----------|------------------------|
| Nexus Aurora High Speed Trace | G[12] | TX0P | Nexus Aurora High Speed Trace Lane 0, LVDS Positive Terminal | O | H14 |

| | G[15] | TX1N | Nexus Aurora High Speed Trace Lane 1, LVDS Negative Terminal | O | K14 |
| | H[0] | CLKP | Nexus Aurora High Speed Trace Clock, LVDS Positive Terminal | I | K15 |
| | H[1] | CLKN | Nexus Aurora High Speed Trace Clock, LVDS Negative Terminal | I | J15 |

1. Nexus Aurora High Speed Trace is available only on the 257MAPBGA.

2.2.5 Generic pins/balls

The I/O signal descriptions for the device are in the following table. It contains the port definition, multiplexing, direction, pad type, and package pin/ball numbers for each I/O pin on the device.

MSCR registers are used for alternative (ALT) mode selection and programming of pad control options.

IMCR registers are used to configure input muxing by peripheral. See [Peripheral input muxing](#) for details.

For the pins which have Nexus functionality muxed with GPIO or other functions, the Nexus functionality of such pins is automatically set when the Nexus tool is connected to the device. The value in MSCR register may have value that does not correspond to Nexus functionality.

1. Selecting an alternative function with a "Reserved" source function causes the pin to enter a null state (input buffer and output buffer enables are both 0).

2. **(Default) = ALT mode configuration after reset.**
3. Changing the B[5] configuration during debug might affect the availability of TDI.
4. ADC analog input: Program corresponding MSCR APC bit and enable ADC to switch on the analog input path.
5. When the LFAST interface is selected the other functionality of the MSCR register is not available.
6. Shared with SIPI LFAST transmit pad SIPI_TXP. Alternative modes and GPIO must be disabled (OBE=0, IBE=0) if port is used for SIPI LFAST.
7. To operate D[7] as GPIO, disable the Sine Wave Generator (SGEN) and the peripheral bus clock of the SGEN: Program the MC_ME_PCTL239 register to select an MC_ME_RUN_PCn (or MC_ME_LP_PCn) configuration where the field for the desired mode is 0.
8. SGEN output if SGEN is enabled.
9. Shared with SIPI LFAST receive pad SIPI_RXP. Alternative modes and GPIO must be disabled (OBE=0, IBE=0) if port is used for SIPI LFAST.
10. Shared with SIPI LFAST receive pad SIPI_TXN. Alternative modes and GPIO must be disabled (OBE=0, IBE=0) if port is used for SIPI LFAST.
11. Shared with SIPI LFAST receive pad SIPI_RXN. Alternative modes and GPIO must be disabled (OBE=0, IBE=0) if port is used for SIPI LFAST.

The following table list ports that are not implemented. The corresponding control and data registers are not implemented.

Table 9. Ports - Not Implemented

| Port Name | Port Index |
|-----------|-------------|
| C | 3,8,9 |
| D | 13,15 |
| E | 1,3,8 |
| F | 1,2 |
| G | 0,1,[12:15] |
| H | [0:3] |
| J | [10:15] |

Any attempt to access unimplemented MSCRs generates a bus error. The read value from unimplemented ports must be masked in case of parallel port accesses.

2.2.6 Peripheral input muxing

1. (Default) = configuration after reset
2. Selecting an alternate function with a 'Reserved' source function causes the pin to enter a null state (Input buffer and Output buffer enables both at 0).

3 Electrical characteristics

3.1 Introduction

This section contains detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications for this device.

This device is designed to operate at 200 MHz.

3.2 165°C junction temperature option

For orderable parts whose device marking shows they support this extended temperature option:

- Operation at $150^{\circ}\text{C} < T_J < 165^{\circ}\text{C}$ is allowed for a maximum cumulative time of 200 hours over the device lifetime.
- Production parameters at 165°C reflect testing over an ambient temperature range of -40°C to 150°C with appropriate guardbanding to guarantee operation at 165°C .

3.3 Absolute maximum ratings

NOTE

Functional operating conditions appear in the DC electrical characteristics. Absolute maximum ratings are stress ratings only, and functional operation at the maximum values is not guaranteed.

CAUTION

Stress beyond the listed maximum values may affect device reliability or cause permanent damage to the device.

Table 12. Absolute maximum ratings

| Symbol | Parameter | Conditions | Min | Max | Unit |

1. 1.45 V to 1.5 V allowed for 60 seconds cumulative time at maximum T_J=165°C; remaining time as defined in note -1 and note -1.
2. 1.375 V to 1.45 V allowed for 10 hours cumulative time at maximum T_J=165°C; remaining time as defined in note -1.
3. 1.32 V to 1.375 V range allowed periodically for supply with sinusoidal shape and average supply value below 1.275 V at maximum T_J=165°C.
4. 5.3 V for 10 hours cumulative over lifetime of device; 3.3 V +10% for time remaining.
5. Voltage overshoots during a high-to-low or low-to-high transition must not exceed 10 seconds per instance.
6. V_{DD_HV_ADRE0} and V_{DD_HV_ADRE1} cannot be operated at different voltages and must be supplied by the same voltage source.
7. Only when V_{DD_HV_IO} < 3.63 V.
8. The following conditions apply:
 - Absolute maximum supply: V_{DD_HV_ADREX} = 6.0 V (60 seconds lifetime, no restrictions—part can switch)

- Absolute maximum supply: $V_{DD_HV_ADREx} = 6.0\text{ V}$ (10 hours, device in reset—no switching)
- Absolute maximum supply: $V_{DD_HV_ADREx} = 5.5\text{ V}$ (always)
- Absolute maximum ADC input pin voltage = 7.0 V (60 seconds lifetime), when V_{DD_HV} is connected to the 5 V
- Absolute maximum ADC input pin voltage = 6.5 V (always while respecting 5 mA maximum injection), when V_{DD_HV} is connected to the 5 V

3.4 Recommended operating conditions

NOTE

Full functionality cannot be guaranteed when voltage drops below 3.0 V. In particular, ADC electrical characteristics and DC electrical specifications for I/Os might not be guaranteed.

- The chip functions down to the point where LVD_PMC resets the chip. When the voltage drops below LVD_PMC, the chip resets.
- The chip functions down to the point where LVD_IO resets the chip. When the voltage drops below LVD_IO, the chip resets.
- The chip functions down to the point where LVD_FLASH resets the chip. When the voltage drops below LVD_FLASH, the chip resets.
- The chip functions down to the point where LVD_OSC resets the chip. When the voltage drops below LVD_OSC, the chip resets.
- $V_{DD_HV_ADRE0}$ and $V_{DD_HV_ADRE1}$ cannot be operated at different voltages and need to be supplied by the same voltage source.
- The chip functions down to the point where LVD_ADC resets the chip. When the voltage drops below LVD_ADC, the chip resets.
- The chip functions down to the point where LVD_CORE or up to the point where HVD_CORE resets the chip by default.
- I/O and analog input specifications are valid only if the injection current on adjacent pins is within these limits. See the absolute maximum ratings table for maximum input current for reliability requirements.
- Full device lifetime without performance degradation.
- The I/O pins on the device are clamped to the I/O supply rails for ESD protection. When the voltage of the input pin is above the supply rail, current will be injected through the clamp diode to the supply rail. For external RC network calculation, assume typical 0.3 V drop across the active diode. The diode voltage drop varies with temperature.
- For a maximum T_J of 150°C, the corresponding maximum T_A is 125°C.
- Some orderable parts have a maximum T_J value of 150°C. See the device marking for the applicable temperature range.
- For devices supporting the 165°C junction temperature option: Operation at 150°C < T_J < 165°C is allowed for a maximum cumulative time of 200 hours over the device lifetime.

3.5 Thermal characteristics

Table 14. Thermal characteristics for 144LQFP and 257MAPBGA packages

| Symbol | Parameter | Conditions | 144LQFP | 257MAPBGA | Unit |

| $R_{\theta JC}$ | Thermal resistance junction-to-case ⁶ | — | 8 | 8 | °C/W |
| Ψ_{JT} | Junction-to-package-top natural convection ⁷ | — | 2 | 2 | °C/W |

- Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
- Junction-to-Ambient thermal resistance determined per JEDEC JESD51-3 and JESD51-6. Thermal test board meets JEDEC specification for this package.
- Per JEDEC JESD51-2 with the single layer board horizontal. Board meets JESD51-9 specification.
- Per JEDEC JESD51-6 with the board horizontal.

5. Junction-to-Board thermal resistance determined per JEDEC JESD51-8. Thermal test board meets JEDEC specification for the specified package. Board temperature is measured on the top surface of the board near the package.
6. Junction-to-Case at the top of the package determined using MIL-STD 883 Method 1012.1. The cold plate temperature is used for the case temperature. Reported value includes the thermal resistance of the interface layer.
7. Thermal characterization parameter indicating the temperature difference between the package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

3.5.1 General notes for specifications at maximum junction temperature

An estimation of the chip junction temperature, T_J , can be obtained from this equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

- T_A = ambient temperature for the package ($^{\circ}\text{C}$)
- $R_{\theta JA}$ = junction to ambient thermal resistance ($^{\circ}\text{C}/\text{W}$)
- P_D = power dissipation in the package (W)

The junction to ambient thermal resistance is an industry standard value that provides a quick and easy estimation of thermal performance. Unfortunately, there are two values in common usage: the value determined on a single layer board and the value obtained on a board with two planes. For packages such as the PBGA, these values can be different by a factor of two. Which value is closer to the application depends on the power dissipated by other components on the board. The value obtained on a single layer board is appropriate for the tightly packed printed circuit board. The value obtained on the board with the internal planes is usually appropriate if the board has low power dissipation and the components are well separated.

When a heat sink is used, the thermal resistance is expressed in the following equation as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

- $R_{\theta JA}$ = junction to ambient thermal resistance ($^{\circ}\text{C}/\text{W}$)
- $R_{\theta JC}$ = junction to case thermal resistance ($^{\circ}\text{C}/\text{W}$)
- $R_{\theta CA}$ = case to ambient thermal resistance ($^{\circ}\text{C}/\text{W}$)

$R_{\theta JC}$ is device related and cannot be influenced by the user. The user controls the thermal environment to change the case to ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the size of the heat sink, the air flow around the device, the interface material, the mounting arrangement on printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device.

To determine the junction temperature of the device in the application when heat sinks are not used, the Thermal Characterization Parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using this equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

- T_T = thermocouple temperature on top of the package ($^{\circ}\text{C}$)
- Ψ_{JT} = thermal characterization parameter ($^{\circ}\text{C}/\text{W}$)
- P_D = power dissipation in the package (W)

The thermal characterization parameter is measured per JESD51-2 specification using a 40 gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over about 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.

1. All tests ran with core and bus frequency at 200 MHz. Test #2 had "weak" FM modulation and Test #3 had "strong" FM modulation.
2. I = Class 1 (36 dB μ V), L = Class 2 (24 dB μ V), N = Class 3 (12 dB μ V)
3. LINFlex0/1 running at 19.2 kbd, SPI0 running at 2.5 MHz, SPI1 running at 7.5 MHz, SPI2 running at 4.5 MHz, CAN0/1 running at 500 kbd
4. Test #4 values were slightly above class I level.
5. PG1 = port group 1: pins F[3:15]
6. PG2 = port group 2: pins A[2:4], C[11:14], D14, F12, G6, J8

Each of the tests ran once across each of the following frequency bands.

|--------------------|-----------|-----------|---------------------|---------------|--------------|
| 150 kHz to 30 MHz | 9 | 30 | 5 | ON (-20 dB) | Peak-Average |
| 30 MHz to 1000 MHz | 120 | 300 | | | |

3.7 Electrostatic discharge (ESD) characteristics

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device ($3 \text{ parts} \times (n + 1) \text{ supply pin}$). This test conforms to the AEC-Q100-002/-003/-011 standard.

NOTE

A device will be defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements.

1. All ESD testing is in conformity with CDF-AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits.

3.8 Voltage regulator electrical characteristics

The voltage regulator is composed of the following blocks:

- High power regulator (external NPN to support core current)
- Low voltage detector (LVD_IO) for 3.3 V supply to IO ($V_{DD_HV_IO}$)
- Low voltage detector (LVD_PMC) for 3.3 V supply ($V_{DD_HV_PMU}$)
- Low voltage detector (LVD_FLASH) for 3.3 V flash memory supply ($V_{DD_HV_FLA}$)
- Low voltage detector (LVD_ADC) for 3.3 V ADC supply ($V_{DD_HV_ADV}$)
- Low voltage detector (LVD_OSC) for 3.3 V OSC supply ($V_{DD_HV_OSC}$)
- Low voltage detector (LVD_CORE) for 1.25 V digital core supply (V_{DD_LV})
- Low voltage detector (LVD_CORE_BK) for the self-test of LVD_CORE
- High voltage detector (HVD_CORE) for 1.25 V digital core supply (V_{DD_LV})

- High voltage detector (HVD_CORE_BK) for the self-test of HVD_CORE
- Power on Reset (POR)

NOTE

When the external regulator mode is used either the EXT_POR_B signal needs to be driven by external circuitry until all power supplies are in recommended ranges or the internal LVDs keep the device in POR until all power supply are in recommended range. There needs to be used the external over voltage detectors for all power supplies in both regulator modes for safety operation.

The following bipolar transistor is supported:

- ON Semiconductor™ NJD2873 (requires a heat sink to operate up to 165 °C): See [Table 16](#).

3.12 Main oscillator electrical characteristics

This device provides a driver for the oscillator in pierce configuration with amplitude control. Controlling the amplitude allows a more sinusoidal oscillation, reducing EMI and power consumption. This Loop Controlled Pierce (LCP mode) requires good practices to reduce the stray capacitance of traces between the crystal and the MCU.

An operation in Full Swing Pierce (FSP mode), implemented by an inverter, is also available in cases of parasitic capacitances that cannot be reduced or of using a crystal with high equivalent series resistance. This mode requires special care regarding the serial resistance used to avoid the crystal overdrive.

Two other provided modes are External (EXT Wave) and disable (OFF mode). For EXT Wave, the drive is disabled and an external clock source within the CMOS level based in the analog oscillator supply can be used. When OFF, the EXTAL is pulled down by a 240-kohm resistor and the feedback resistor remains active, connecting XTAL through EXTAL by a 1M resistor.

The following figure describes a simple model of the internal oscillator driver and provides an example of connections for an oscillator.

NOTE

When selecting C1 and C2 in your oscillator circuit, contact the crystal manufacturer for their recommended values. Capacitor loading of the oscillator must be fully characterized at the system level to ensure proper operation.

Figure 5. Oscillator connection scheme

NOTE

XTAL/EXTAL must not be directly used to drive external circuits.

- $V_{DD_HV_IO} = 3.3\text{ V}$ -5%,+10%, $T_J = -40$ to $+165\text{ °C}$, unless otherwise specified, and analog input voltage from V_{AGND} to V_{AREF}
- AD_CK clock is always half of the ADC module input clock defined via the auxiliary clock divider for the ADC.
- During the sample time the input capacitance C_S can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_{sample} . After the end of the sample time t_{sample} , changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_{sample} depend on programming.
- This parameter does not include the sample time t_{sample} , but only the time for determining the digital result and the time to load the result register with the conversion result.
- See [Figure 2](#).
- For the 144-pin package.
- Test conditions have an influence on the achieved performance. Please contact FSL personnel to share the conditions for these results.

NOTE

The ADC performance specifications are not guaranteed if two ADCs simultaneously sample the same shared channel.

1. Array Integrity times need to be calculated and is dependent on system frequency and number of clocks per read. The equation presented require T_{period} (which is the unit accurate period, thus for 200 MHz, T_{period} would equal $5e-9$) and N_{read} (which is the number of clocks required for read, including pipeline contribution. Thus for a read setup that requires 6 clocks to read with no pipeline, N_{read} would equal 6. For a read setup that requires 6 clocks to read, and has the address pipeline set to 2, N_{read} would equal 4 (or $6 - 2$.)
2. The units for Array Integrity are determined by the period of the system clock. If unit accurate period is used in the equation, the results of the equation are also unit accurate.

1. Program times are actual hardware programming times and do not include software overhead. Block program times assume quad-page programming.
2. Typical program and erase times represent the median performance and assume nominal supply values and operation at 25 °C. Typical program and erase times may be used for throughput calculations.
3. Conditions: ≤ 150 cycles, nominal voltage.
4. Plant Programming times provide guidance for timeout limits used in the factory.
5. Typical End of Life program and erase times represent the median performance and assume nominal supply values. Typical End of Life program and erase values may be used for throughput calculations.
6. Conditions: -40°C ≤ T_J ≤ 165°C; full spec voltage. 16 KB, 32 KB and 64 KB blocks are allowed to be programmed or erased up to T_J = 165°C with restrictions.
7. 256 KB blocks may be programmed or erased at T_J = 150°C maximum. Times listed on this row are T_J = 150°C times.

3.16.3 Flash memory read wait-state and address-pipeline control settings

The following table describes the recommended settings of the Flash Memory Controller's PFCR1[RWSC] and PFCR1[APC] fields at various operating frequencies, based on specified intrinsic flash memory access times of the C55FMC array at 150°C.

NOTE

If the user does not follow these recommended settings, the user must run the flash memory's array integrity (AI) check with breakpoints disabled: Set the Array Integrity Break Point Enable bit in the C55FMC's UTest 0 register (C55FMC_UT0[AIBPE]) to 0.

1. Peak to Peak value is measured with no R or I load.
2. It is range of the typical values for room temperature.
3. Peak to Peak excludes noise, SINAD must be considered.
4. Common mode value is measured with no R or I load.
5. SINAD is measured at Max Peak-to-Peak voltage.
6. Internal device routing resistance. ESD pad resistance is in series and must be considered for max Peak-to-Peak voltages, depending on application Iload and/or Rload.

3.18 RESET sequence duration

This following table shows the duration of different reset sequences. See the chip's Reference Manual for details about the reset sequences.

1. JTAG specifications in this table apply when used for debug functionality. All Nexus timing relative to MCKO is measured from 50% of MCKO and 50% of the respective signal.
2. For all Nexus modes except DDR mode, MDO, \overline{MSEO} , and \overline{EVTO} data is held valid until next MCKO low cycle.
3. The system clock frequency needs to be four times faster than the TCK frequency.

1. Slave Receive Only Mode can operate at a maximum frequency of 60 MHz. In this mode, the SPI can receive data on SIN, but no valid data is transmitted on SOUT.
2. P is the number of clock cycles added to delay the SPI input sample point and is software programmable.
3. t_{SYS} is the period of the DSPI_CLKn clock, the input clock to the SPI module. Maximum frequency is 50 MHz (min t_{SYS} = 20 ns).
