Mode of Operation

Example 1 (Types C .0.)

OFF-time period first

The time period starts when power supply is applied.

At the end of the first set time period, the relay operates. At the end of the second set time period (equal to the first), the relay releases.

This sequence is repeated until power supply is interrupted. If power supply is disconnected, the time is reset and a recovery period of 250 ms should be allowed before the recycler is ready for reactivation.

Example 2 (Types C .1.)

ON-time period first

The relay operates and the time period starts immediately when power supply is applied.

At the end of the first set time period, the relay releases. At the end of the second set time period (equal to the first), the relay operates again.

This sequence is repeated with equal intervals until power supply is interrupted. If power supply is interrupted, the time is reset and a recovery period of 250 ms should be allowed before the recycler is ready for reactivation.
