

## FEATURES

- ESD Protection Over  $\pm 10\text{kV}$
- 3V Logic Interface
- Uses Small Capacitors:  $0.1\mu\text{F}$ ,  $0.2\mu\text{F}$
- $1\mu\text{A}$  Supply Current in Shutdown
- Low Power Driver Disable Operating Mode
- Pin Compatible with LT1137A
- **120kBaud Operation for  $R_L = 3\text{k}$ ,  $C_L = 2500\text{pF}$**
- **250kBaud Operation for  $R_L = 3\text{k}$ ,  $C_L = 1000\text{pF}$**
- CMOS Comparable Low Power:  $60\text{mW}$
- Operates from a 5V Supply and 3V Logic Supply
- Easy PC Layout: Flowthrough Architecture
- Rugged Bipolar Design
- Outputs Assume a High Impedance State When Off or Powered Down
- Absolutely No Latchup

## APPLICATIONS

- Notebook Computers
- Palmtop Computers

## DESCRIPTION

The LT<sup>®</sup>1342 is an advanced low power three-driver, five-receiver RS232 transceiver. The LT1342 operates from a 5V supply and a 3V logic supply. Receiver outputs can interface directly to 3V logic circuits. Included on the chip is a shutdown pin for reducing supply current to near zero. All receivers and drivers assume high impedance states during shutdown.

The driver disable function provides additional control of operating mode. When driver disable is high the charge pump and drivers turn off. Receivers continue to operate during driver disable.

New ESD structures on the chip allow the LT1342 to survive multiple  $\pm 10\text{kV}$  strikes, eliminating the need for costly TransZorbs<sup>®</sup> on the RS232 line pins.

The LT1342 is fully compliant with all EIA RS232 specifications and operates in excess of 120kbaud even driving heavy capacitive loads.

LT, LTC and LT are registered trademarks of Linear Technology Corporation. TransZorb is a registered trademark of General Instruments, GSI.

## TYPICAL APPLICATION

The ● denotes specifications which apply over the full operating temperature range ( $0^\circ C \leq T_A \leq 70^\circ C$  for commercial grade).

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

**Note 2:** Testing done at  $V_{CC} = 5V, V_L = 3.3V$  and  $V_{ON/OFF} = 3V$ .

**Note 3:** Supply current is measured with external capacitors  $C^+ = C^- = 0.1\mu F, C1 = C2 = 0.2\mu F$ . All outputs are open with all driver inputs tied high.

**Note 4:**  $V_L$  supply current is measured with all receiver outputs high.

**Note 5:** Supply current and leakage measurements in shutdown are performed with  $V_{ON/OFF} \leq 0.1V$ . Supply current measurements using driver disable are performed with  $V_{DRIVER\ DISABLE} \geq 3V$ .

**Note 6:** For driver delay measurements,  $R_L = 3k$  and  $C_L = 51pF$ . Trigger points are set between the driver's input logic threshold and the output transition to the zero crossing ( $t_{HL} = 1.4V$  to  $0V$  and  $t_{LH} = 1.4V$  to  $0V$ ).

**Note 7:** For receiver delay measurements,  $C_L = 51pF$ . Trigger points are set between the receiver's input logic threshold and the output transition to standard TTL/CMOS logic threshold ( $t_{HL} = 1.3V$  to  $2.4V$  and  $t_{LH} = 1.7V$  to  $0.8V$ ).

**Note 8:** Data rate operation guaranteed by slew rate, short-circuit current and propagation delay tests.

## PIN FUNCTIONS

**V<sub>CC</sub>**: 5V Input Supply Pin. This pin should be decoupled with a 0.1μF ceramic capacitor close to the package pin. Insufficient supply bypassing can result in low output drive levels and erratic charge pump operation.

**V<sub>L</sub>**: 3V Logic Supply Pin. Provides power to the receiver outputs. Decouple with a 0.1μF ceramic capacitor.

**GND**: Ground Pin.

**ON/OFF**: A TTL/CMOS Compatible Operating Mode Control. A logic low puts the device in the low power shutdown mode. Drivers and receivers assume a high impedance state in shutdown. The transceiver consumes almost no supply current while in shutdown. A logic high fully enables the transceiver. An ON/OFF logic low signal supersedes the state of the DRIVER DISABLE pin.

**DRIVER DISABLE**: This pin provides an alternate control for the charge pump and RS232 drivers. A logic high on this pin shuts down the charge pump and places all drivers in a high impedance state. All five receivers remain active under these conditions. Floating the DRIVER DISABLE pin or driving it to a logic low level fully enables the transceiver. A logic low on the ON/OFF pin supersedes the state of the DRIVER DISABLE pin. Supply current drops to 3mA when in driver disable mode.

**V<sup>+</sup>**: Positive Supply Output (RS232 Drivers). V<sup>+</sup> ≈ 2V<sub>CC</sub> – 1.5V. This pin requires an external charge storage capacitor C ≥ 0.1μF, tied to ground or V<sub>CC</sub>. With multiple transceivers, the V<sup>+</sup> and V<sup>-</sup> pins may be paralleled into common charge storage capacitors. Larger value capacitors may be used to reduce supply ripple.

## PIN FUNCTIONS

**V<sup>-</sup>:** Negative Supply Output (RS232 Drivers).  $V^- \approx -(2V_{CC} - 2.5V)$ . This pin requires an external charge storage capacitor  $C \geq 0.1\mu F$ . To reduce supply ripple, increase the size of the storage capacitor.

**C1<sup>+</sup>, C1<sup>-</sup>, C2<sup>+</sup>, C2<sup>-</sup>:** Commutating Capacitor Inputs. These pins require two external capacitors  $C \geq 0.2\mu F$ : one from C1<sup>+</sup> to C1<sup>-</sup>, and another from C2<sup>+</sup> to C2<sup>-</sup>. The capacitor's effective series resistance should be less than  $2\Omega$ . For  $C \geq 1\mu F$ , low ESR tantalum capacitors work well in this application, although small value ceramic capacitors may be used with a minimal reduction in charge pump compliance. For operation with an external 12V supply, omit C1 and connect the 12V supply to pin C1<sup>+</sup>. Pin V<sup>+</sup> may also be shorted to C1<sup>+</sup> when a separate supply is used. The 12V supply must be bypassed with a 0.1F capacitor.

**DRIVER IN:** RS232 Driver Input Pins. These inputs are compatible with TTL or CMOS logic. Tie unused inputs to  $V_{CC}$  or  $V_L$ .

**DRIVER OUT:** Driver Outputs at RS232 Voltage Levels. Driver output swing meets RS232 levels for loads up to 3k. Slew rates are controlled for lightly loaded lines. Output current capability is sufficient for load conditions up to 2500pF. Outputs are in a high impedance

state when in shutdown mode,  $V_{CC} = 0V$ , or when the DRIVER DISABLE pin is active. Outputs are fully short-circuit protected from  $V^- + 30V$  to  $V^+ - 30V$ . Applying higher voltages will not damage the device if the overdrive is moderately current limited. Short circuits on one output can load the power supply generator and may disrupt the signal levels of the other outputs. The driver outputs are protected against ESD to  $\pm 10V$  for human body model discharges.

**RX IN:** Receiver Inputs. These pins accept RS232 level signals ( $\pm 30V$ ) into a protected 5k terminating resistor. The receiver inputs are protected against ESD to  $\pm 10kV$  for human body model discharges. Each receiver provides 0.4V of hysteresis for noise immunity. Open receiver inputs assume a logic low state.

**RX OUT:** Receiver Outputs with 3.3V Logic Compatible Voltage Levels. Outputs are in a high impedance state when in shutdown mode to allow data line sharing. Outputs are fully short-circuit protected to ground or  $V_{CC}$  or  $V_L$  with the power on, off, or in shutdown mode. Receiver output level is determined by  $V_L$  supply voltage. Use  $V_L = 3.3V$  for interfacing with 3.3V logic,  $V_L = 5V$  for interfacing with 5V logic.

## ESD PROTECTION

The RS232 line inputs of the LT1342 have on-chip protection from ESD transients up to  $\pm 10kV$ . The protection structures act to divert the static discharge safely to system ground. In order for the ESD protection to function effectively, the power supply and ground pins of the LT1342 must be connected to ground through low impedances. The power supply decoupling capacitors and charge pump storage capacitors provide this low impedance in normal application of the circuit. The only constraint is that low ESR capacitors must be used for bypassing and charge storage. ESD testing must be done with pins  $V_{CC}$ ,  $V^+$ ,  $V^-$  and GND shorted to ground or connected with low ESR capacitors.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
