## FEATURES

56 MSPS correlated double sampler (CDS) with 6 dB gain On-chip horizontal and RG timing driver
Single-supply operation ( 2.7 V min)
Precision Timing ${ }^{\text {m }}$ core with 0.37 ns resolution at 56 MSPS
Low power CMOS: 105 mW at 2.7 V ( 115 mW at 3.0 V )
48-lead LQFP and 48-lead LFCSP packages

## APPLICATIONS

Professional HDTV camcorders
Professional/high end digital cameras
Broadcast cameras
Industrial high speed cameras
High speed data-acquisition systems

## GENERAL DESCRIPTION

The AD9940 is a high speed, correlated double sampler for high speed digital imaging applications. Integrated with a programmable timing driver using the Precision Timing core, the AD9940 features a 56 MHz CDS amplifier with 6 dB of fixed gain, an internal voltage reference supply, and timing control for all the high speed clocks necessary for CCD imaging systems. The Precision Timing core allows adjustment of high speed clocks with a resolution of 0.37 ns . Output buffers are also included, providing drive strength for PCB traces and direct connection to an image signal processor such as the AD9941.

The AD9940 is ideal for applications that need to place the CDS and VGA/ADC circuits on separate PC boards. The fully differential outputs of the AD9940 provide good signal integrity when interfaced with the differential input AD9941. The AD9940 operates from a single 2.7 V power supply, typically dissipates 105 mW (excluding the H/RG drive current), and is packaged in 48-lead LQFP and 48-lead LFCSP packages.

## ABSOLUTE MAXIMUM RATINGS

Table 5.

| Parameter | Rating |
| :--- | :--- |
| AVDD and TCVDD to AVSS | -0.3 V to +3.9 V |
| HVDD and RGVDD to HVSS and | -0.3 V to +3.9 V |
| RGVSS | -0.3 V to +3.9 V |
| DVDD and OVDD to DVSS and OVSS | -0.3 V to +0.3 V |
| Any VSS to Any VSS | -0.3 V to DVDD +0.3 V |
| CLPOB/HBLK to DVSS | -0.3 V to DVDD +0.3 V |
| SCK, SL, and SDI to DVSS | -0.3 V to RGVDD +0.3 V |
| RG to RGVSS | -0.3 V to HVDD +0.3 V |
| H1-H4 to HVSS | -0.3 V to AVDD +0.3 V |
| REFT, REFB, and CCDIN to AVSS | $150^{\circ} \mathrm{C}$ |
| Junction Temperature | $350^{\circ} \mathrm{C}$ |
| Lead Temperature $(10$ sec) |  |

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## THERMAL CHARACTERISTICS

$\theta_{\text {JA }}$ is measured using a 4-layer PCB with the exposed paddle soldered to the board.

Thermal resistance for 48-lead LQFP package:

$$
\theta_{\mathrm{JA}}=92^{\circ} \mathrm{C} / \mathrm{W}
$$

Thermal resistance for 48-lead LFCSP package:

$$
\theta_{\mathrm{JA}}=24^{\circ} \mathrm{C} / \mathrm{W}^{1}
$$

${ }^{1} \theta_{\mathrm{AA}}$ is measured using a 4-layer PCB with the exposed paddle soldered to the board.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance
 degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

1. NC = NO CONNECT.
2. THE LFCSP PACKAGE HAS AN EXPOSED PAD. CONNECT THE EPAD TO GND.

Figure 4. Pin Configuration

Table 6. Pin Function Descriptions

| Pin No. | Mnemonic | Type ${ }^{1}$ | Description |
| :--- | :--- | :--- | :--- |
| 1 | NC | NC | No Connect. Connect to GND. |
| 2 | AVSS | P | Analog Ground. |
| 3 | AVDD | P | Analog Supply. |
| 4 | DIFFN | AO | CDS Output, Data (Negative). |
| 5 | DIFFP | AO | CDS Output, Data (Positive). |
| 6 | OVSS | P | Analog Output Buffer Ground. |
| 7 | OVDD | P | Analog Output Buffer Supply. |
| 8 | TCVDD | P | Analog Supply for Timing Core. |
| 9 | CLI | DI | Reference Clock Input. |
| 10 | TCVSS | P | Analog Ground for Timing Core. |
| 11 | DVSS | P | Digital Ground. |

## SERIAL INTERFACE TIMING

All the internal registers of the AD9940 are accessed through a 3-wire serial interface. Each register consists of an 8-bit data byte starting with the LSB bit. As shown in Figure 5, the data bits are clocked in on the rising edge of SCK after SL is asserted low and the entire 8 -bit word is latched in on the rising edge of SL after the last MSB bit. Consecutive serial writes are performed starting with Address 0 and ending with an address MSB bit prior to asserting SL high.

The AD9940 contains two banks of registers, which are programmed independently. Bank 1 consists of the registers located at Address 0 to Address 13, and Bank 2 consists of Address 14 to Address 26. The WRITEMODE register located at Address 0 is used to select which register bank is written to.

Every write operation must begin with a write to Address 0 to specify Part select bit and Bank location, then followed with any number of consecutive data words. Address 0 is always followed by Address 01 or Address 14 depending on the value specified for WRITEMODE (used for Bank selection).

A hard reset is recommended after power-up to reset the AD9940 prior to performing a serial interface write. A hard reset is performed by asserting the RST pin low for a minimum of $10 \mu \mathrm{~s}$. The serial interface pins SCK, SL, and SDI must be in a know state after the RST has been applied.

## SYSTEM OVERVIEW

Figure 6 shows the typical system block diagram for the AD9940. The CCD output is processed by the AD9940's AFE circuitry, which consists of a correlated double sampler (CDS) and output buffer. The differential output of the AD9940 provides good signal integrity when interfaced with the AD9941.

To operate the AD9940, all CCD and AFE timing parameters are programmed into the AD9940 from the system microprocessor through the 3-wire serial interface. From the system master clock, CLI, provided by the image processor or external crystal, the AD9940 generates the CCD's horizontal and reset gate clocks and all internal AFE clocks.

The H-drivers for H 1 to H4, HL and RG, are included in the AD9940, allowing these clocks to be directly connected to the CCD. An H-drive voltage of up to 3.6 V is supported.

## ANALOG FRONT END OPERATION

The AD9940 signal-processing chain is shown in Figure 7, consisting of a dc restore circuit, CDS, and output buffer.

## DC Restore

To reduce the large dc offset of the CCD output signal, a dc restore circuit is used with an external $0.1 \mu \mathrm{~F}$ series coupling capacitor. This restores the dc level of the CCD signal to approximately 1.5 V to be compatible with the 3 V analog supply of the AD9940.

## Correlated Double Sampler

The CDS circuit samples each CCD pixel twice to extract the video information and reject low frequency noise. The timing diagram in Figure 10 illustrates how the two internally generated CDS clocks, SHP and SHD, are used to sample the reference level and the data level, respectively, of the CCD signal. The placement of the SHP and SHD sampling edges is determined by the setting of the SHPLOC (Address 22) and SHDLOC (Address 23) control registers. Placement of these two clock edges is critical to achieve the best performance from the CCD.

Figure 6. Typical System Block Diagram

Figure 7. AD9940 Signal-Processing Chain

## PRECISION TIMING, HIGH SPEED TIMING GENERATION

The AD9940 generates flexible, high speed timing signals using the Precision Timing core. This core is the foundation for generating the timing used for both the CCD and the AFE: the reset gate RG, horizontal drivers H 1 to H 4 , and the SHP/SHD sample clocks. A unique architecture makes it routine for the system designer to optimize image quality by providing precise control over the horizontal CCD readout and the AFE correlated double sampling.

## TIMING RESOLUTION

The Precision Timing core uses a $1 \times$ master clock input (CLI) as a reference. This clock should be the same as the CCD pixel clock frequency. Figure 8 illustrates how the internal timing core divides the master clock period into 48 steps or edge positions. Therefore, the edge resolution of the Precision Timing core is ( $\mathrm{t}_{\mathrm{cL}} / 48$ ).

## HIGH SPEED CLOCK PROGRAMMABILITY

Figure 9 shows how the high speed clocks, RG, HL, H1-H4, SHP, and SHD are generated. The RG pulse has programmable rising and falling edges, and can be inverted using the polarity control. The horizontal clocks H1/H3 have programmable rising and falling edges, and polarity control. The $\mathrm{H} 2 / \mathrm{H} 4$ clocks are always inverses of the $\mathrm{H} 1 / \mathrm{H} 3 \mathrm{H}$-driver outputs.

Table 8 summarizes the high speed timing registers and their parameters. Each edge location setting is 6 bits wide, but only 48 valid edge locations are available. Therefore, the register values are mapped into four quadrants, with each quadrant containing 12 edge locations. Table 9 shows the correct register values for the corresponding edge locations.

Figure 8. High Speed Clock Resolution from CLI Master Clock Input

Figure 9. High Speed Clock Programmable Locations

Figure 10. SHP, SHD, and Data Output Timing

## H-DRIVER AND RG OUTPUTS

In addition to the programmable timing positions, the AD9940 features on-chip output drivers for the RG and H 1 to H 4 outputs. These drivers are powerful enough to directly drive the CCD inputs. The H-driver and RG driver current can be adjusted for optimum rise/fall time into a particular load using the H1/H3DRV, H2/H4DRV, RGDRV, and HLDRV registers The horizontal output drive strength register is divided into fifteen different 4-bit values, each one adjustable in 4.3 mA increments. The minimum setting of 0 is off or three-state, and the maximum setting of 15 is 64.5 mA .

The RG and HL output drive strength registers are divided into seven 3-bit values, each adjustable in 2.2 mA increments. The minimum setting of 0 is equal to off or three-state, and the maximum setting of 7 is 15.4 mA .

As shown in Figure 11, the $\mathrm{H} 2 / \mathrm{H} 4$ outputs are inverses of H1/H3. The internal propagation delay resulting from the signal inversion is less than 1 ns , which is significantly less than the typical rise time driving the CCD load. This results in an $\mathrm{H} 1 / \mathrm{H} 2$ crossover voltage at approximately $50 \%$ of the output swing. The crossover voltage is not programmable.

Table 8. Timing Core Register Parameters for H1, H3, RG1, RG2, and SHP/SHD

| Parameter | Length (Bits) | Range | Description |
| :---: | :---: | :---: | :---: |
| Polarity | 1 | High/low | Polarity control for H1/H3, RG1, and RG2: $\begin{aligned} & 0=\text { no inversion. } \\ & 1=\text { inversion. } \end{aligned}$ |
| Positive Edge | 6 | 0 to 47 edge location | Positive edge location for $\mathrm{H} 1 / \mathrm{H} 3, \mathrm{RG} 1$, and RG2. |
| Negative Edge | 6 | 0 to 47 edge location | Negative edge location for H1/H3, RG1, and RG2. |
| Sample Location | 6 | 0 to 47 sample location | Sampling location for SHP and SHD. |
| H-Drive Control | 4 | 0 to 15 current steps | Drive current for H 1 to $\mathrm{H} 4,0$ to 15 steps of 4.3 mA each. |
| RG-Drive Control | 3 | 0 to 7 current steps | Drive current for RG, 0 to 7 steps of 2.2 mA each. |
| HL-Drive Control | 3 | 0 to 7 current steps | Drive current for $\mathrm{HL}, 0$ to 7 steps of 2.2 mA each. |

Figure 11. H-Clock Inverse Phase Relationship

Table 9. Precision Timing Edge Locations

| Quadrant | Edge Location (Decimal) | Register Value (Decimal) | Register Value (Binary) |
| :--- | :--- | :--- | :--- |
| I | 0 to 11 | 0 to 11 | 000000 to 001011 |
| II | 12 to 23 | 16 to 27 | 010000 to 011011 |
| III | 24 to 35 | 32 to 43 | 100000 to 101011 |
| IV | 36 to 47 | 48 to 59 | 110000 to 111011 |

## HBLK SEQUENCES

The HBLK programmable timing shown in Figure 12 is programmed using the HBLKTOG registers．Only the toggle positions are used to designate the start and the stop posi－ tions of the blanking period．Additionally，a polarity control， HBLKMASKPOL，designates the polarity of the horizontal clock signals H 1 to H 4 during the blanking period．Setting HBLKMASKPOL high sets $\mathrm{H} 1=\mathrm{H} 3=$ high and $\mathrm{H} 2=\mathrm{H} 4=$ low during the blanking．

## Individual HBLK Sequences

Up to three individual HBLK sequences are available in each line．This allows special H－blanking as shown in Figure 14．The HBLK sequences are sequential starting with Sequence 0．To ensure proper HBLK operation，the following sequence is required for values programmed in the HBLKTOG registers：

HBLKTOG1＿0＜HBLKTOG2＿0＜HBLKTOG1＿1＜ HBLKTOG2＿1＜HBLKTOG1＿2＜HBLKTOG2＿2

PROGRAMMABLE SETTINGS：
1HBLKTOG1＿n（ $\mathbf{n}=\mathbf{0}, \mathbf{1}, \mathbf{2}$ ）
${ }^{2}$ HBLKMASKPOL
${ }^{3}$ HBLKTOG2＿n（ $\mathbf{n}=0,1,2$ ）

Figure 12．Horizontal Blanking Example Showing HBLKTOG1＿0＝0，HBLKMASKPOL $=0$ ，and HBLKTOG2＿0＝ 3

NOTE
1．THE POLARITY OF H1 DURING THE BLANKING REGION IS PROGRAMMABLE（H2 HAS THE OPPOSITE POLARITY OF H1）．

Figure 14. Generating Special HBLK Patterns

## APPLICATIONS INFORMATION

All signals should be carefully routed on the PCB to maintain low noise performance. The CCD output signal should be connected to the CCDIN pin through a $0.1 \mu \mathrm{~F}$ capacitor. The CCD timing signals H1A/B to H2A/B and RG1 to RG2 should be routed directly to the CCD with minimum trace lengths. The clock inputs are located on the other side of the package, where the analog pins are located, and should be connected to the digital ASIC away from the analog and CCD clock signals.

A single ground plane is recommended for the AD9940. This ground plane should be as continuous as possible, particularly where analog pins are concentrated, to ensure that all analog decoupling capacitors provide the lowest possible impedance path between the power and bypass pins and their respective ground pins.

All decoupling capacitors should be located as close as possible to the package pins. Careful use of a split ground plane can be effective to avoid the return current of horizontal driver flows into analog ground, thereby reducing coupling noise.

Power-supply decoupling is very important for achieving low noise performance. Figure 15 shows the local high frequency decoupling capacitors, but additional capacitance is recommended for lower frequencies. Additional capacitors and ferrite beads can further reduce noise.

When using the LFCSP package, it is recommended that the exposed paddle on the bottom of the package be soldered to a large pad, with multiple vias connecting the pad to the ground plane.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
