

High-side current sense amplifier plus signal conditioning amplifier

Datasheet - production data

- Output amplifier for tailor-made signal conditioning
- -40 °C to 125 °C operating temperature range
- 4 kV ESD protection

Applications

- Battery chargers
- Automotive current monitoring
- Notebook computers
- DC motor control
- Photo-voltaic systems
- Precision current sources
- Uninterruptible power supplies
- High-end power supplies

Description

The TSC102 measures a small differential voltage on a high-side shunt resistor and translates it into a ground-referenced output voltage.

The device's wide input common-mode voltage range, low quiescent current and tiny TSSOP8 packaging enable use in a wide variety of applications (also available in SO8 package).

The input common-mode and power supply voltages are independent. The common-mode voltage can range from 2.8 to 30 V in operating conditions.

The TSC102 is rugged against abnormal conditions on the input pins: Vp and Vm can withstand up to 60 V in case of voltage spikes, as little as -16 V in case of reversed battery, and up to 4 kV in case of electrostatic discharge.

In addition to the current sensing amplifier, the TSC102 offers a fully accessible amplifier for output signal conditioning. The device's overall current consumption is lower than 420 μ A.

Features

- Independent supply and input common-mode voltages
- Wide common-mode operating range: 2.8 to 30 V
- Wide common-mode surviving range: -16 to 60 V (reversed battery and load-dump conditions)
- Low current consumption: I_{CC} max = 420 μ A

1 Application schematic and pin description

The TSC102 high-side current sense amplifier features a 2.8 V to 30 V input common-mode range that is independent of the supply voltage. The main advantage of this feature is that it allows high-side current sensing at voltages much greater than the supply voltage (V_{CC}).

Figure 1. Application schematics

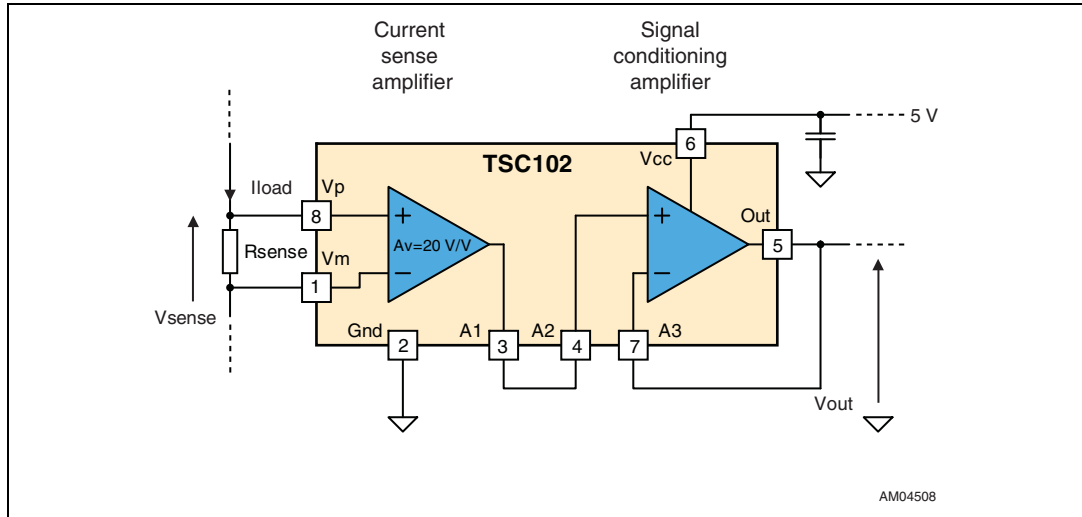

Table 1 describes the function of each pin. Their position is shown in the illustration on the cover page and in Figure 1 above.

Table 1. Pin description

Symbol	Type	Function
Out	Analog output	Out voltage is proportional to the magnitude of the sense voltage $V_p - V_m$
Gnd	Power supply	Ground line
V_{CC}		Positive power supply line
V_p	Analog input	Connection for the external sense resistor. The measured current enters the shunt on the V_p side
V_m		Connection for the external sense resistor. The measured current exits the shunt on the V_m side
A1		Connection to current sensing amplifier output
A2		Connection to signal conditioning amplifier non-inverting input
A3		Connection to signal conditioning amplifier inverting input

2 Absolute maximum ratings and operating conditions

Table 2. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{id}	Input pins differential voltage ($V_p - V_m$)	± 20	V
V_i	Current sensing input pin voltages (V_p and V_m) ⁽¹⁾	-16 to 60	
V_1	Voltage for pins A1, A2, A3, Out, V_{cc} ⁽¹⁾	-0.3 to 7	
T_{stg}	Storage temperature	-55 to 150	°C
T_j	Maximum junction temperature	150	
R_{thja}	TSSOP8 thermal resistance junction to ambient	120	°C/W
	SO8 thermal resistance junction to ambient	125	
ESD	HBM: human body model for V_m and V_p pins ⁽²⁾	4	kV
	HBM: human body model ⁽³⁾	2.5	
	MM: machine model ⁽⁴⁾	200	V
	CDM: charged device model ⁽⁵⁾	1.5	kV

1. These voltage values are measured with respect to the GND pin.
2. Human body model for V_m and V_p : a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between the V_p or V_m pin and Gnd while the other pins are floating.
3. Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
4. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.
5. Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to ground.

Table 3. Operating conditions

Symbol	Parameter	Value	Unit
V_{CC}	DC supply voltage from T_{min} to T_{max}	3.5 to 5.5	V
T_{oper}	Operational temperature range (T_{min} to T_{max})	-40 to 125	°C
V_{icm}	Common-mode voltage range (V_m pin voltage)	2.8 to 30	V

3 Electrical characteristics

Unless otherwise specified, the electrical characteristics given in the following tables have been measured under the following test conditions.

- $T_{amb} = 25\text{ °C}$, $V_{CC} = 5\text{ V}$, $V_{sense} = V_p - V_m = 50\text{ mV}$, $V_m = 12\text{ V}$.
- No load on Out pin.
- Signal conditioning amplifier used as a buffer (pin A3 connected to pin Out and pin A1 connected to pin A2).

Table 4. Supply

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
I_{CC}	Total supply current	$V_{sense} = 0\text{ V}$, pin A1 open, pin A2 shorted to Gnd $T_{min} < T_{amb} < T_{max}$	-	240	420	μA
I_{CC1}		$V_{sense} = 50\text{ mV}$, pin A1 connected to pin A2 $T_{min} < T_{amb} < T_{max}$		420	700	

Table 5. Current sensing amplifier input stage

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
DC CMR1	DC common-mode rejection Variation of V_{a1} versus V_{icm} referred to input ⁽¹⁾	$2.8\text{ V} < V_m < 30\text{ V}$ $-40\text{ °C} < T_{amb} < 150\text{ °C}$	90	100		dB
AC CMR1	AC common-mode rejection Variation of V_{a1} versus V_{icm} referred to input (peak-to-peak voltage variation)	$2.8\text{ V} < V_m < 30\text{ V}$ 1 kHz sine wave		75		
		$2.8\text{ V} < V_m < 30\text{ V}$ 10 kHz sine wave		60		
SVR1	Supply voltage rejection Variation of V_{a1} versus V_{CC} ⁽²⁾	$3.5\text{ V} < V_{CC} < 5.5\text{ V}$ $-40\text{ °C} < T_{amb} < 125\text{ °C}$	85	90		
V_{os}	Input offset voltage ⁽³⁾	$T_{amb} = 25\text{ °C}$ $-40\text{ °C} < T_{amb} < 125\text{ °C}$			± 1.5 ± 2.3	mV
dV_{os}/dT	Input offset drift versus T	$-40\text{ °C} < T_{amb} < 125\text{ °C}$		± 3	± 8	$\mu\text{V}/\text{°C}$
I_{lk}	Input leakage current	$V_{CC} = 0\text{ V}$ $T_{min} < T_{amb} < T_{max}$			1	μA
I_{ib}	Input bias current	$V_{sense} = 0\text{ V}$ $T_{min} < T_{amb} < T_{max}$		5	7	

1. See [Section 6: Parameter definitions](#) for the definition of CMR

2. See [Section 6](#) for the definition of SVR

3. See [Section 6](#) for the definition of V_{os}

Table 6. Current sensing amplifier output stage

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
A_v	Gain (variation of V_{a1} versus V_{sense})			20		V/V
V_{oh1}	A1 node high-level saturation voltage $V_{oh1} = V_{CC} - V_{a1}$	$V_{sense} = 1\text{ V}$ $I_{a1} = 1\text{ mA}$ $-40\text{ °C} < T_{amb} < 125\text{ °C}$		85	185	mV
V_{ol1}	A1 node low-level saturation voltage	$V_{sense} = -1\text{ V}$ $I_{a1} = 1\text{ mA}$ $-40\text{ °C} < T_{amb} < 125\text{ °C}$		75	165	
I_{sc1}	Short-circuit current	A1 connected to V_{CC} or Gnd	10	30		mA
$\Delta V_{a1}/\Delta T$	Output voltage drift versus T ⁽¹⁾	$T_{min} < T_{amb} < T_{max}$			± 400	ppm/°C
$\Delta V_{a1}/\Delta I_{a1}$	Output stage load regulation	$-5\text{ mA} < I_{a1} < +5\text{ mA}$ I_{a1} sink or source current		0.4	± 2	mV/mA
ΔV_{a1}	Total output voltage accuracy ⁽²⁾	$V_{sense} = 50\text{ mV}$ $T_{amb} = 25\text{ °C}$ $T_{min} < T_{amb} < T_{max}$			± 2.5 ± 4	%
ΔV_{a1}	Total output voltage accuracy ⁽²⁾	$V_{sense} = 100\text{ mV}$ $T_{amb} = 25\text{ °C}$ $T_{min} < T_{amb} < T_{max}$			± 2.5 ± 4	
ΔV_{a1}	Total output voltage accuracy ⁽²⁾	$V_{sense} = 20\text{ mV}$ $T_{amb} = 25\text{ °C}$ $T_{min} < T_{amb} < T_{max}$			± 8 ± 10	
ΔV_{a1}	Total output voltage accuracy ⁽²⁾	$V_{sense} = 10\text{ mV}$ $T_{amb} = 25\text{ °C}$ $T_{min} < T_{amb} < T_{max}$			± 13 ± 16	

1. See [Section 6: Parameter definitions](#) for the definition of output voltage drift versus temperature.
2. Output voltage accuracy is the difference with the expected theoretical output voltage $V_{a1-th} = A_v * V_{sense}$. See [Section 6](#) for a more detailed definition.

Table 7. Current sensing amplifier frequency response

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
t_s	V_{a1} settling to 1% final value	$V_{sense} = 10\text{ mV to }100\text{ mV}$, $C_{load} = 47\text{ pF}$	-	7	-	μs
SR	Slew rate	$V_{sense} = 10\text{ mV to }100\text{ mV}$	0.2	0.4	-	V/ μs

4 Electrical characteristics curves: current sense amplifier

Unless otherwise specified, the test conditions for the following curves are:

- $T_{amb} = 25\text{ }^{\circ}\text{C}$, $V_{CC} = 5\text{ V}$, $V_{sense} = V_p - V_m = 50\text{ mV}$, $V_m = 12\text{ V}$.
- no load on Out pin.
- signal conditioning amplifier used as a buffer (pin A3 connected to pin Out and pin A1 connected to pin A2).

6 Parameter definitions

6.1 Common-mode rejection ratio (CMR)

The common-mode rejection ratio (CMR) measures the ability of the current sensing amplifier to reject any DC voltage applied on both inputs V_p and V_m . The CMR is referred back to the input so that its effect can be compared with the applied differential signal. The CMR is defined by the formula:

$$\text{CMR} = -20 \cdot \log \frac{\Delta V_{a1}}{\Delta V_{icm} \cdot A_v}$$

6.2 Supply voltage rejection ratio (SVR)

The supply voltage rejection ratio (SVR) measures the ability of the current sensing amplifier to reject any variation of the supply voltage V_{CC} . The SVR is referred back to the input so that its effect can be compared with the applied differential signal. The SVR is defined by the formula:

$$\text{SVR} = -20 \cdot \log \frac{\Delta V_{a1}}{\Delta V_{cc} \cdot A_v}$$

6.3 Gain (A_v) and input offset voltage (V_{os})

The input offset voltage is defined as the intersection between the linear regression of the V_{a1} versus V_{sense} curve with the X-axis (see [Figure 18](#)). If V_{a11} is the output voltage with $V_{sense} = V_{sense1} = 50$ mV and V_{a12} is the output voltage with $V_{sense} = V_{sense2} = 5$ mV, then V_{os} can be calculated with the formula:

$$V_{os} = V_{sense1} - \left(\frac{V_{sense1} - V_{sense2}}{V_{a11} - V_{a12}} \cdot V_{out1} \right)$$

The amplification gain A_v is defined as the ratio between the output voltage and the input differential voltage.

$$A_v = \frac{V_{out}}{V_{sense}}$$

Figure 18. V_{a1} versus V_{sense} characteristics: detail for low V_{sense} values

6.4 Output voltage drift versus temperature

The output voltage drift versus temperature is defined as the maximum variation of V_{a1} with respect to its value at 25 °C, over the temperature range. It is calculated as follows:

$$\frac{\Delta V_{a1}}{\Delta T} = \max \frac{V_{a1}(T_{amb}) - V_{a1}(25^\circ \text{C})}{T_{amb} - 25^\circ \text{C}}$$

with $T_{min} < T_{amb} < T_{max}$.

[Figure 19](#) provides a graphical definition of the output voltage drift versus temperature. On this chart, V_{a1} is always within the area defined by the maximum and minimum variation of V_{a1} versus T , and $T = 25^\circ \text{C}$ is considered to be the reference.

Figure 19. Output voltage drift versus temperature

6.5 Output voltage accuracy

The output voltage accuracy is the difference between the actual output voltage and the theoretical output voltage. Ideally, the current sensing output voltage should be equal to the input differential voltage multiplied by the theoretical gain, as in the following formula.

$$V_{a1-th} = Av \cdot V_{sense}$$

The actual value is very slightly different, mainly due to the effects of the input offset voltage V_{OS} and the non-linearity.

Figure 20. V_{a1} vs. V_{sense} theoretical and actual characteristics

The output voltage accuracy, expressed as a percentage, can be calculated with the following formula:

$$\Delta V_{a1} = \frac{\text{abs}(V_{a1} - (Av \cdot V_{sense}))}{Av \cdot V_{sense}}$$

with $Av = 20 \text{ V/V}$.

7 Application information

The TSC102 can be used to measure current and feed back the information to a microcontroller, as shown in [Figure 21](#).

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.

Как с нами связаться
