

LIN Transceiver with Voltage Regulator and Reset Pin

ON Semiconductor®

<http://onsemi.com>

General Description

The NCV7425 is a fully featured local interconnect network (LIN) transceiver designed to interface between a LIN protocol controller and the physical bus.

The NCV7425 LIN device is a member of the in-vehicle networking (IVN) transceiver family of ON Semiconductor that integrates a LIN v2.1 physical transceiver and a low-drop voltage regulator. It is designed to work in harsh automotive environment and is submitted to the TS16949 qualification flow.

The LIN bus is designed to communicate low rate data from control devices such as door locks, mirrors, car seats, and sunroofs at the lowest possible cost. The bus is designed to eliminate as much wiring as possible and is implemented using a single wire in each node. Each node has a slave MCU-state machine that recognizes and translates the instructions specific to that function. The main attraction of the LIN bus is that all the functions are not time critical and usually relate to passenger comfort.

Features

- LIN-Bus Transceiver
 - ♦ LIN compliant to specification revision 2.1 (backward compatible to versions 2.0 and 1.3) and J2602
 - ♦ Bus Voltage ± 45 V
 - ♦ Transmission Rate up to 20 kBaud
 - ♦ Integrated Slope Control for Improved EMI Compatibility
- Package
 - ♦ SOIC-16 Wide Body Green Package with Exposed Pad
- Protection
 - ♦ Thermal Shutdown
 - ♦ Indefinite Short-Circuit Protection on Pins LIN and WAKE Towards Supply and Ground
 - ♦ Load Dump Protection (45 V)
 - ♦ Bus Pins Protected Against Transients in an Automotive Environment
 - ♦ ESD Protection Level for LIN, INH, WAKE and V_{BB} up to ± 10 kV
- Voltage Regulator
 - ♦ Two Device Versions: Output Voltage 3.3 V or 5 V For Loads up to 150 mA
- Under-Voltage Detector with a Reset Output to the Supplied Microcontroller
- INH Output for Auxiliary Purposes (switching of an external pull-up or resistive divider towards battery, control of an external voltage regulator etc.)
- Modes
 - ♦ Normal Mode: LIN Communication in Either Low (up to 10 kBaud) or Normal Slope
 - ♦ Sleep Mode: V_{CC} is Switched “off” and No Communication on LIN Bus
 - ♦ Stand-by Mode: V_{CC} is Switched “on” but There is No Communication on LIN Bus
 - ♦ Wake-up Bringing the Component From Sleep Mode Into Standby Mode is Possible Either by LIN Command or Digital Input Signal on WAKE Pin
 - ♦ Wake-up from LIN Bus can also be Detected and Flagged When the Chip is Already in Standby Mode
- These are Pb-Free Devices

Typical Applications

- Automotive
- Industrial Networks

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 19 of this data sheet.

Table 1. KEY TECHNICAL CHARACTERISTICS

Symbol	Parameter	Min	Typ	Max	Unit
3.3 V VERSION					
V _{BB}	Nominal battery operating voltage	5	12	28	V
V _{BB}	Load dump protection (Note 1)			45	V

5 V VERSION

V _{BB}	Nominal battery operating voltage	6	12	28	V
V _{BB}	Load dump protection (Note 1)			45	V
I _{BB_SLP}	Supply current in sleep mode			20	μA
V _{CC_OUT} (Note 2)	Regulated V _{CC} output in normal mode, V _{CC} load 0–100 mA	4.90	5	5.10	V
	Regulated V _{CC} output in normal mode, 100 mA < V _{CC} load < 150 mA	4.85	5	5.15	V
I _{OUT_LIM}	V _{CC} regulator current limitation	150	225	300	mA
V _{WAKE}	Operating DC voltage on WAKE pin	0		V _{BB}	V
	Maximum rating voltage on WAKE pin	–45		45	
V _{INH}	Operating DC voltage on INH pin	0		V _{BB}	V
T _{J_TSD}	Junction thermal shutdown temperature	165		195	°C
T _J	Operating junction temperature	–40		+150	°C

- The applied transients shall be in accordance with ISO 7637 part 1, test pulse 5. The device complies with functional class C;. The LIN communication itself complies with functional class B. On regulator class A can be reached depending on the application and external components
- V_{CC} voltage must be properly stabilized by external capacitors: capacitor of min. 80 nF with ESR < 10 mΩ in parallel with a capacitor of min. 8 μF, ESR < 1 Ω.

Table 2. THERMAL CHARACTERISTICS

Symbol	Parameter	Conditions	Value	Unit

NCV7425

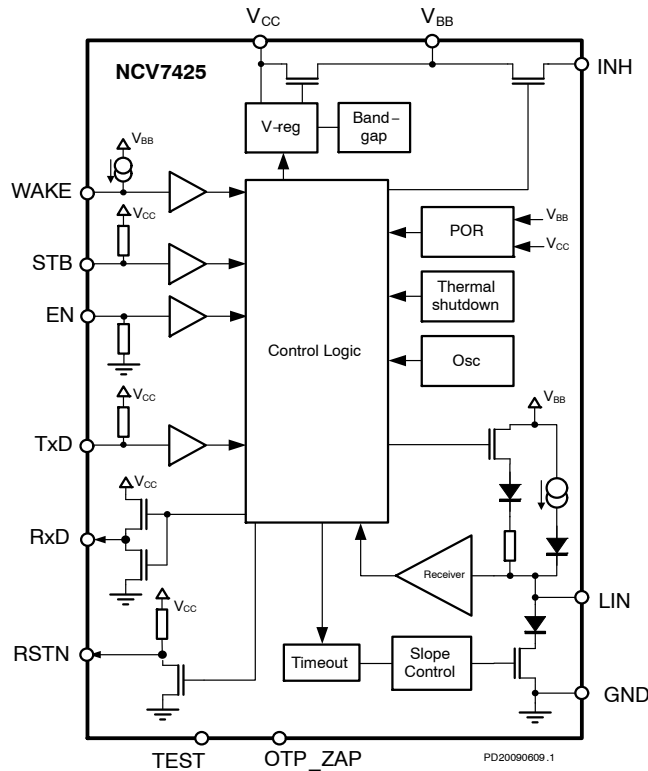

Figure 1. Block Diagram

TYPICAL APPLICATION

Application Information

The EMC immunity of the Master-mode device can be further enhanced by adding a capacitor between the LIN output and ground. The optimum value of this capacitor is determined by the length and capacitance of the LIN bus, the number and capacitance of Slave devices, the pull-up resistance of all devices (Master and Slave), and the required time constant of the system, respectively.

V_{CC} voltage must be properly stabilized by external capacitors: capacitor of min. 80 nF (ESR < 10 m Ω) in parallel with a capacitor of min. 8 μ F (ESR < 1 Ω).

The 10 μ F capacitor on the battery is optional and serves as reservoir capacitor to deal with battery supply micro-cuts.

Figure 3. Pin Assignment

Table 3. PIN FUNCTION DESCRIPTION

Pin Number	Pin Name	Description
1	V _{BB}	Battery supply input
2	LIN	LIN bus output/input
3	GND	Ground
4	GND	Ground
5	WAKE	High voltage digital input pin to switch the part from sleep- to standby mode
6	INH	Inhibit output
7	OTP_SUP	Supply for programming of trimming bits at factory testing, needs to be grounded in the application
8	n.c.	not connected
9	n.c.	not connected
10	TEST	Digital input for factory testing, needs to be grounded in the application
11	EN	Enable input for mode control
12	STB	Standby mode control input
13	RSTN	Reset output; open-drain output with an on-chip pull-up resistor
14	TxD	Transmit data input, low in dominant state
15	RxD	Receive data output; low in dominant state; push-pull output
16	V _{CC}	Voltage regulator output

FUNCTIONAL DESCRIPTION

Overall Functional Description

LIN is a serial communication protocol that efficiently supports the control of mechatronic nodes in distributed automotive applications. The domain is class-A multiplex buses with a single master node and a set of slave nodes.

NCV7425 is designed as a master or slave node for the LIN communication interface with an integrated 3.3 V or 5 V voltage regulator having a current capability up to 150 mA for supplying any external components (microcontroller, CAN node, etc.).

NCV7425 contains the LIN transmitter, LIN receiver, voltage regulator, power-on-reset (POR) circuits and thermal shutdown (TSD). The LIN transmitter is optimized for the maximum specified transmission speed of 20 kBaud

with EMC performance due to reduced slew rate of the LIN output.

The junction temperature is monitored via a thermal shutdown circuit that switches the LIN transmitter and voltage regulator off when temperature exceeds the TSD trigger level.

NCV7425 has four operating states (normal mode, low slope mode, stand-by mode, and sleep mode) that are determined by the input signals EN, WAKE, STB, and TxD.

Operating States

NCV7425 provides four operating states, two modes for normal operation with communication, one stand-by without communication and one low power mode with very low current consumption – see Figure 4 and Table 4.

Table 4. MODE SELECTION

Mode	V _{CC}	RxD	INH	LIN Transceiver	30 kΩ on LIN	RSTN
Normal – Slope (Note 3)	ON	Low = Dominant State High = Recessive State	High if STB = High during state transition; Floating otherwise	Normal Slope	ON	High
Normal – Low Slope (Note 4)	ON	Low = Dominant State High = Recessive State	High if STB = High during state transition; Floating otherwise	Low Slope	ON	High
Stand-by (Note 5)	ON	Low after LIN wake-up, high otherwise (Note 6)	Floating	OFF	OFF	Controlled by V _{CC} under-voltage monitor
Sleep	OFF	Clamped to V _{CC} (Note 6)	Floating	OFF	OFF	Low

3. The normal slope mode is entered when pin EN goes HIGH while TxD is in HIGH state during EN transition.
4. The low slope mode is entered when pin EN goes HIGH while TxD is in LOW state during EN transition. LIN transmitter gets on only after TxD returns to high after the state transition.
5. The stand-by mode is entered automatically after power-up.
6. In Stand-by and Sleep mode, the High state is achieved by internal pull-up resistor to V_{CC}.

PD20090610.01

Figure 4. State Diagram

Normal Slope Mode

In normal slope mode the transceiver can transmit and receive data via LIN bus with speed up to 20 kBaud. The transmit data stream of the LIN protocol is present on the TxD pin and converted by the transmitter into a LIN bus signal with controlled slew rate to minimize EMC emission. The receiver consists of the comparator that has a threshold with hysteresis in respect to the supply voltage and an input filter to remove bus noise. The LIN output is pulled HIGH via an internal 30 kΩ pull-up resistor. For master applications it is needed to put an external 1 kΩ resistor with a serial diode between LIN and V_{BB} (or INH) – see Figure 2.

The mode selection is done by EN=HIGH when TxD pin is HIGH. If STB pin is high during the standby-to-normal slope mode transition, INH pin is pulled high. Otherwise, it stays floating.

Low Slope Mode

In low slope mode the slew rate of the signal on the LIN bus is reduced (rising and falling edges of the LIN bus signal are longer). This further reduces the EMC emission. As a consequence the maximum speed on the LIN bus is reduced up to 10 kBaud. This mode is suited for applications where the communication speed is not critical. The mode selection

is done by EN=HIGH when TxD pin is LOW. In order not to transmit immediately a dominant state on the bus (because TxD = LOW), the LIN transmitter is enabled only after TxD returns to HIGH. If STB pin is high during the standby-to-low slope mode transition, INH pin is pulled high. Otherwise, it stays floating.

Stand-by Mode

The stand-by mode is always entered after power-up of the NCV7425. It can also be entered from normal mode when the EN pin is low and the stand-by pin is high. From sleep mode it can be entered after a local wake-up or LIN wakeup. In stand-by mode the V_{CC} voltage regulator for supplying external components (e.g. a microcontroller) stays active. Also the LIN receiver stays active to be able to detect a remote wake-up via bus. The LIN transmitter is disabled and the slave internal termination resistor of 30 k Ω between LIN and V_{BB} is disconnected in order to minimize current consumption. Only a pull-up current source between V_{BB} and LIN is active.

Sleep Mode

The Sleep Mode provides extremely low current consumption. This mode is entered when both EN and STB pins are LOW coming from normal mode. The internal termination resistor of 30 k Ω between LIN and V_{BB} is disconnected and also the V_{CC} regulator is switched off to minimize current consumption.

Wake-up

NCV7425 has two possibilities to wake-up from sleep or stand-by mode (see Figure 4):

Local wake-up: enables the transition from sleep mode to stand-by mode

Remote wake-up via LIN: enables the transition from sleep- to stand-by mode and can be also detected when already in standby mode.

A local wake-up is **only** detected in sleep mode if a transition from LOW to HIGH or from HIGH to LOW is seen on the wake pin.

Figure 5. Local Wake-Up Signal

PC20060427.3

A remote wake-up is **only** detected if a combination of (1) a falling edge at the LIN pin (transition from recessive to dominant) is followed by (2) a dominant level maintained

for a time period $> t_{WAKE}$ and (3) again a rising edge at pin LIN (transition from dominant to recessive) happens.

Figure 6. Remote Wake-Up Behavior

PC20060427.2

The wake-up source is distinguished by pin RxD in the stand-by mode:

RxD remains HIGH after power-up or local wake-up.

RxD is kept LOW until normal mode is entered after a remote wake-up (LIN)

V_{CC} Under-voltage Detection and RSTN Pin

In standby, normal and low-slope modes, the V_{CC} regulator is monitored. Whenever the regulator output falls below $V_{CC_UV_THR}$ level (typically 90% of the nominal voltage) for longer than $V_{CC_UV_deb}$ (typically 5 μ s), an

under-voltage is detected. Output pin RSTN is pulled to Low level to indicate the under-voltage condition to the external load (a microcontroller). At the same time, the device enters automatically the standby mode. As soon as the regulator output returns above the under-voltage level, the RSTN Low level is extended by typically 6ms and only then released to High level in order to ensure microcontroller initialization under correct supply conditions.

In the sleep mode, RSTN pin is kept Low regardless the V_{CC} level – it means that RSTN becomes Low immediately at sleep mode entry even if the V_{CC} capacitor is still charged.

In all situations where RSTN pin is kept Low, the digital inputs to NCV7425 are discarded by the internal control logic and have no effect on its behavior.

The RSTN pin function is illustrated in Figure 7.

Figure 7. RSTN Pin Behavior

ELECTRICAL CHARACTERISTICS

Definitions

All voltages are referenced to GND. Positive currents flow into the IC.

Table 5. ABSOLUTE MAXIMUM RATINGS – 3.3 V and 5 V VERSIONS

Symbol	Parameter	Min.	Max.	Unit
V_{BB}	Battery voltage on pin V_{BB} (Note 7)	-0.3	+45	V
V_{CC}	DC voltage on pin V_{CC}	0	+6	V
I_{VCC}	Current delivered by the V_{CC} regulator	150		mA
V_{LIN}	LIN bus voltage (Note 8)	-45	+45	V
V_{INH}	DC voltage on inhibit pin	-0.3	$V_{BB} + 0.3$	V
V_{WAKE}	Voltage on WAKE pin	-45	45	V
V_{Dig_IO}	DC voltage on pins TxD, RxD, EN, STB, RSTN	-0.3	$V_{CC} + 0.3$	V
T_J	Maximum junction temperature	-40	+165	°C
V_{esd}	Electrostatic discharge voltage (INH, WAKE and V_{BB}) system Human Body Model (HBM) (Note 9)	-10	+10	kV
	Electrostatic discharge voltage (LIN pin, no external capacitor) HBM (Note 9)	-10	+10	
	Electrostatic discharge voltage (LIN pin, 220 pF) System HBM (Note 9)	-15	+15	
	Electrostatic discharge voltage (pins LIN, INH, WAKE and V_{BB}) HBM (Note 10)	-8	+8	
	Electrostatic discharge voltage (other pins) HBM (Note 10)	-4	+4	
	Electrostatic discharge voltage; charge device model (Note 11)	-250	+250	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

7. The applied transients shall be in accordance with ISO 7637 part 1, test pulses 1, 2, 3a, 3b, and 5. The device complies with functional class C; class A can be reached depending on the application and external components.
8. The applied transients shall be in accordance with ISO 7637 part 1, test pulses 1, 2, 3a, and 3b. The device complies with functional class C; class A can be reached depending on the application and external components.
9. Equivalent to discharging a 150 pF capacitor through a 330 Ω resistor conform to IEC Standard 61000-4-2. The specified values are verified by external test house.
10. Equivalent to discharging a 100 pF capacitor through a 1.5 k Ω resistor conform to MIL STD 883 method 3015.7.
11. Conform to EOS/ESD-DS5.3 (socket mode).

V _{rec_cnt}	Receiver center voltage	(V _{BUS_dom} + V _{BUS_rec}) / 2	0.475		0.525	V _{BB}
V _{rec_hys}	Receiver hysteresis		0.05		0.175	V _{BB}

15. Measured at output voltage V_{CC_OUT} = (V_{CC_OUT} @ V_{BB} = 6 V) – 2%.16. The voltage drop in Normal mode between LIN and V_{BB} pin is the sum of the diode drop and the drop at serial pull up resistor. The drop at the switch is negligible. See Figure 2.

17. Guaranteed by design. Not tested

Table 7. DC CHARACTERISTICS – 5 V VERSIONV_{BB} = 6 V to 28 V; T_J = -40°C to +150°C; unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
--------	-----------	------------	-----	-----	-----	------

DC CHARACTERISTICS – DIGITAL I/O PINS**PIN WAKE**

V _{WAKE_TH}	Threshold voltage		0.35		0.65	V _{BB}
I _{leak}	Input leakage current	V _{WAKE} = 0 V; V _{BB} = 18 V	-1	-0.5	1	μA
T _{WAKE_MIN}	Debounce time	Sleep mode; rising and falling edge	8		54	μs

PINS TxD AND STB

V _{il}	Low level input voltage				0.8	V
V _{ih}	High level input voltage		2.0			V
R _{pu}	Pull-up resistance to V _{CC}		50		200	kΩ

PIN INH

Delta_VH	High level voltage drop	I _{INH} = 15 mA		0.35	0.75	V
I _{leak}	Leakage current	Sleep mode; V _{INH} = 0 V	-1		1	μA

PIN EN

V _{il}	Low level input voltage				0.8	V
V _{ih}	High level input voltage		2.0			V
R _{pd}	Pull-down resistance to ground		50		200	kΩ

PIN RxD

V _{ol}	Low level output voltage	I _{sink} = 2 mA			0.65	V
V _{oh}	High level output voltage (In Normal mode)	Normal mode, I _{source} = -2 mA	V _{CC} - 0.65			V
R _{pu}	Pull-up resistance to V _{CC} (In Standby and Sleep mode)	Standby mode, Sleep mode		10		kΩ

PIN RSTN

V _{ol}	Low level output voltage	I _{sink} = 2 mA			0.65	V
R _{pu}	Pull-up resistance to V _{CC}		50		200	kΩ

DC CHARACTERISTICS**POWER-ON RESET**

POR _{H_VBB}	V _{BB} POR high level detection threshold				4.5	V
POR _{L_VBB}	V _{BB} POR low level detection threshold		1.7		3.8	V
POR _{_VBB_sl}	Maximum slope on V _{BB} to guarantee POR				2	V/μs

THERMAL SHUTDOWN

T _{J_tsd}	Junction temperature	For shutdown	165		195	°C
T _{J_hyst}	Thermal shutdown hysteresis		9		18	°C

15. Measured at output voltage V_{CC_OUT} = (V_{CC_OUT} @ V_{BB} = 6 V) - 2%.16. The voltage drop in Normal mode between LIN and V_{BB} pin is the sum of the diode drop and the drop at serial pull up resistor. The drop at the switch is negligible. See Figure 2.

17. Guaranteed by design. Not tested

Table 8. AC CHARACTERISTICS – 3.3 V AND 5 V VERSIONSV_{BB} = 7 V to 18 V; T_J = -40°C to +150°C; unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
AC CHARACTERISTICS LIN TRANSMITTER						
D1	Duty Cycle 1 = $t_{BUS_rec(min)} / (2 \times T_{Bit})$ see Figure 24	normal slope mode TH _{rec(max)} = 0.744 x V _{BB} TH _{dom(max)} = 0.581 x V _{BB} T _{Bit} = 50 μs V _{BB} = 7 V to 18 V	0.396		0.5	
D2	Duty Cycle 2 = $t_{BUS_rec(max)} / (2 \times T_{Bit})$ see Figure 24	normal slope mode TH _{rec(min)} = 0.422 x V _{BB} TH _{dom(min)} = 0.284 x V _{BB} T _{Bit} = 50 μs V _{BB} = 7.6 V to 18 V	0.5		0.581	
D3	Duty Cycle 3 = $t_{BUS_rec(min)} / (2 \times T_{bit})$ see Figure 24	normal slope mode TH _{rec(max)} = 0.778 x V _{BB} TH _{dom(max)} = 0.616 x V _{BB} T _{Bit} = 96 μs V _{BB} = 7 V to 18 V	0.417		0.5	
D4	Duty Cycle 4 = $t_{BUS_rec(max)} / (2 \times T_{bit})$ see Figure 24	normal slope mode TH _{rec(min)} = 0.389 x V _{BB} TH _{dom(min)} = 0.251 x V _{BB} T _{Bit} = 96 μs V _{BB} = 7.6 V to 18 V	0.5		0.590	
T _{fall_norm}	LIN falling edge	Normal slope mode; V _{BB} = 12 V; L1, L2 (Note 18)			22.5	μs
T _{rise_norm}	LIN rising edge	Normal slope mode; V _{BB} = 12 V; L1, L2 (Note 18)			22.5	μs
T _{sym_norm}	LIN slope symmetry	Normal slope mode; V _{BB} = 12 V; L1, L2 (Note 18)	-4		4	μs
T _{fall_norm}	LIN falling edge	Normal slope mode; V _{BB} = 12 V; L3 (Note 18)			27	μs
T _{rise_norm}	LIN rising edge	Normal slope mode; V _{BB} = 12 V; L3 (Note 18)			27	μs
T _{sym_norm}	LIN slope symmetry	Normal slope mode; V _{BB} = 12 V; L3 (Note 18)	-5		5	μs
T _{fall_low}	LIN falling edge	Low slope mode (Note 19); V _{BB} = 12 V; L3 (Note 18)			62	μs
T _{rise_low}	LIN rising edge	Low slope mode (Note 19); V _{BB} = 12 V; L3 (Note 18)			62	μs
T _{WAKE}	Dominant time-out for wake-up via LIN bus		30		150	μs
T _{dom}	TxD dominant time-out	TxD = low	6		20	ms
V _{CC_UV_deb}	V _{CC} under-voltage detection debounce time		1.5	5	10	μs
R _{STN_ext}	Extension time of RSTN Low pulse beyond V _{CC} under-voltage		3	6	10	ms

AC CHARACTERISTICS LIN RECEIVER

T _{rec_prop_down}	Propagation delay of receiver falling edge		0.1		6	μs
T _{rec_prop_up}	Propagation delay of receiver rising edge		0.1		6	μs
T _{rec_sym}	Propagation delay symmetry	T _{rec_prop_down} - T _{rec_prop_up}	-2		2	μs

18. The AC parameters are specified for following RC loads on the LIN bus: L1 = 1 kΩ / 1 nF; L2 = 660 Ω / 6.8 nF; L3 = 500 Ω / 10 nF.

19. Low slope mode is not compliant to the LIN 1.3 or LIN 2.0/2.1 standard.

SOLDERING FOOTPRINT*

DIMENSIONS: INCHES

NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSION A AND B DO NOT INCLUDE MOLD PROTRUSION.
4. MAXIMUM MOLD PROTRUSION 0.15 (0.006) PER SIDE.
5. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE PROTRUSION SHALL BE 0.13 (0.005) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION.
6. 751R-01 OBSOLETE, NEW STANDARD 751R-02.

DIM	MILLIMETERS		INCHES	
	MIN	MAX	MIN	MAX
A	10.15	10.45	0.400	0.411

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
