

Multi Power Supply IC with Amplifier for LCD

NO.EA-301-160107

OUTLINE

The R1293K is a multi power supply IC dedicated for mid-size TFT LCD panels. The R1293K consists of a PWM control step-up DC/DC converter, an LDO regulator, a VCOM amplifier and six GAMMA amplifiers. The output noise can be reduced by SEL pin. (SEL pin "H": normal mode, SEL pin "L": low noise mode.) The MOSFET for step-up DC/DC converter is built-in and, low power operation is realized by standby mode. The package is 4mm square QFN(PLP)0404-32.

FEATURES

Step-up DC/DC converter part

- Input Voltage Range 2.2V to 5.5V (V_{IN_DC} pin)
- Adjustable Output Voltage Range with external resistors up to 16V
- Feedback Voltage 1.0V
- Feedback Voltage Accuracy $\pm 1.5\%$
- Adjustable Oscillator Frequency with external resistors for RT pin 300kHz to 1MHz
- Adjustable Phase compensation with external components
- Internal Soft Start Time TYP. 10ms
- Adjustable Soft Start Time with external capacitors for DTC pin
- Oscillator Maximum Duty Cycle Set with external resistors for

DTC pin (Limit TYP. 90%)

- UVLO detector threshold TYP. 1.9V
- Internal 2A /16V capability Nch MOSFET Driver TYP. 0.2 Ω
- Built-in Peak Current Limit Circuit
- Short Protection with timer latch function (Adjustable delay time with external capacitors for D_{DELAY} pin)

LDO part

- Input Voltage Range 2.2V to 5.5V (V_{IN_LDO} pin)
- Output Voltage Range 1.8V to 2.5V (Selectable / 0.1V Step)
- Output Voltage Accuracy $\pm 1.0\%$
- Maximum Output Current Min. 350mA guaranteed
- Ripple Rejection TYP. 65db (Frequency = 1kHz)
- Built-in Fold-back Protection Circuit TYP. 70mA (Current at short mode)

Buffer Amplifier part

- Input Voltage Range for Amplifiers 5V to 16V (V_{BUFF} pin)
- Output Current Range for VCOM Amplifier -100mA to 100mA
- Output Current Range for GAMMA Amplifier -10mA to 10mA

Others

- Built-in Thermal Shutdown Circuit
- Stand-by function by ENB pin
- Package QFN(PLP)0404-32

APPLICATIONS

- Power sources of the medium and small sized TFT LCD panels

R1293K Block Diagram

SELECTION GUIDE

The output voltage (V_{OUT}) for the ICs is a user-selectable option.

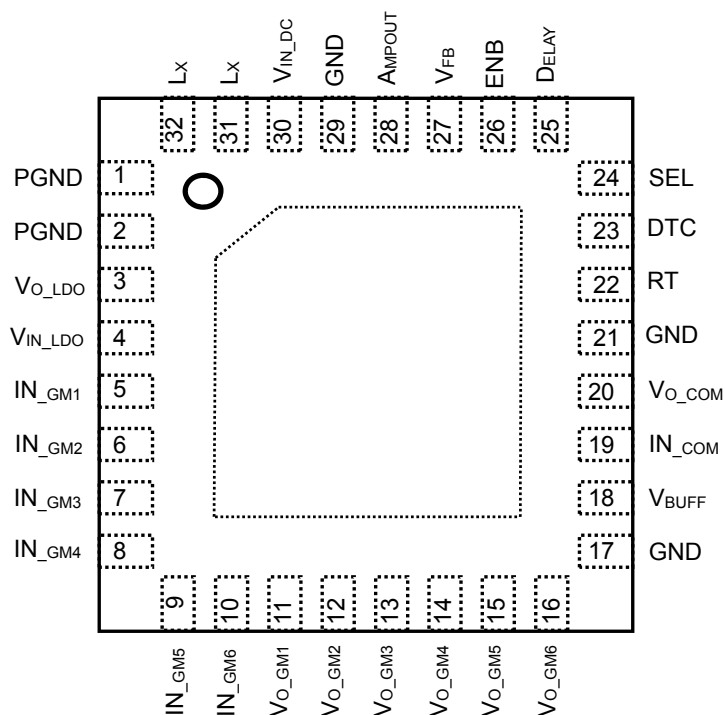

Selection Guide

Product Name	Package	Quantity per Reel	Pb Free	Halogen Free
R1293Kxx1A-E2	QFN(PLP)0404-32	2,000 pcs	Yes	Yes

xx: Designation of the LDO output voltage (V_{OUT})

V_{OUT} can be set within the range of 1.8 V to 2.5 V in 0.1 V steps.

PIN CONFIGURATION

QFN(PLP)0404-32 Pin Configuration

R1293K

NO.EA-301-160107

PIN DESCRIPTIONS**R1293K Pin Description**

Pin No	Symbol	Description	Notes
1	PGND	Power GND Pin	Make the PGND pin a short-circuit with the GND pin.
2	PGND	Power GND Pin	Make the PGND pin a short-circuit with the GND pin.
3	V _{O_LDO}	LDO Output Pin	
4	V _{IN_LDO}	LDO Power Input Pin	Input 2.2V to 5.5V to V _{IN_LDO} . Make V _{IN_LDO} a short-circuit with the V _{IN_DC} pin.
5	IN _{GM1} *1	GAMMA1 Input Pin	
6	IN _{GM2} *1	GAMMA2 Input Pin	
7	IN _{GM3} *1	GAMMA3 Input Pin	
8	IN _{GM4} *1	GAMMA4 Input Pin	
9	IN _{GM5} *1	GAMMA5 Input Pin	
10	IN _{GM6} *1	GAMMA6 Input Pin	
11	V _{O_GM1}	GAMMA1 Output Pin	
12	V _{O_GM2}	GAMMA2 Output Pin	
13	V _{O_GM3}	GAMMA3 Output Pin	
14	V _{O_GM4}	GAMMA4 Output Pin	
15	V _{O_GM5}	GAMMA5 Output Pin	
16	V _{O_GM6}	GAMMA6 Output Pin	
17	GND	GND Pin	
18	V _{BUFF}	Buffer Amplifier Power Source Pin	Connect the V _{BUFF} pin to Boost Output.
19	IN _{COM} *1	VCOM Input Pin	
20	V _{O_COM}	VCOM Output Pin	
21	GND	GND Pin	
22	RT	Oscillator Frequency Setting Pin	Connect a resistor to the RT pin to set the operation frequency.
23	DTC	Maxduty/ Soft-start Time Setting Pin	By adding a resistor, the Maxduty limit can be set; otherwise the Maxduty limit will be the preset value set inside the ICs. By adding a capacitor, Maxduty can start from 0 which means startup-time can be set longer.
24	SEL*1	Noise Reduction Level Selection Pin	“L” Input: Low Noise Mode “H” Input: Normal Mode

Pin No	Symbol	Description	Notes
25	DELAY	Short-circuit Protection Delay Time Setting Pin	By adding a capacitor, the DELAY pin can set a protection delay time.
26	ENB ^{*1}	Chip Enable Pin (DC/DC or Buffer Amplifier)	“L” Input: Active
27	V _{FB}	DC/ DC Feedback Pin	
28	AMPOUT	DC/ DC Phase Compensation Pin	
29	GND	GND Pin	
30	V _{IN_DC}	DC/ DC Power Source Pin	Input voltage should be 2.2V to 5.5V. Make the V _{IN_DC} pin a short-circuit with the V _{IN_LDO} pin.
31	L _X	DC/ DC Switching Pin	
32	L _X	DC/ DC Switching Pin	

The exposed tab on the bottom of the package enhances thermal performance and is electrically connected to GND(substrate level). It is recommended that the exposed tab be connected to the ground plane on the board otherwise be left open.

^{*1} Do not leave the IN_{GM1} to IN_{GM6}, IN_{COM}, SEL and ENB pins open.

V _{O_BUFF}	Buffer Amplifier Output Voltage	-0.3 to V _{BUFF} +0.3	V
P _o	Power Dissipation (Standard Land Pattern)* ¹	1500	mW
T _a	Operating Temperature Range	-40 to +85	°C
T _{stg}	Storage Temperature Range	-55 to +125	°C
T _j	Junction Temperature	-40 to +125	°C

*¹ For more information about the Power Dissipation, please refer to PACKAGE INFORMATION.

ABSOLUTE MAXIMUM RATINGS

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the life time and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

ELECTRICAL CHARACTERISTICS

$V_{IN_DC} = 3.6\text{ V}$, $T_a = 25^\circ\text{C}$ unless otherwise noted.

TECHNICAL NOTES

Output Voltage Setting (DC/ DC)

V_{OUT} controls the V_{FB} pin voltage to maintain $V_{FB}=1.0V$. V_{OUT} can be set using R1 and R2 in the following equation. V_{OUT} voltage should be set between 5V to 16V. Also, the sum of R1 and R2 should be equal or less than 500k Ω .

$$V_{OUT} = V_{FB} \times (R1 + R2) / R2$$

Phase Compensation Setting (DC/ DC)

A 180 degree phase shift may be caused by the inductor (L1) and the capacitor (C_{01}). The phase shift reduces phase margin and stability of the system. Thus, it is necessary to keep a leading phase margin. In the following equation, the pole is made by L1 and C_{01} .

$$F_{pole} \sim 1 / \{2 \times \pi \times \sqrt{L1 \times C_{01}}\}$$

The phase compensation and the system gain can be set by using R4, C3 and C2. Please refer to *Typical Application* (P.10,11) for positioning and setting value examples. In the following equation, the zero is made by R4 and C3.

$$F_{zero} \sim 1 / (2 \times \pi \times R4 \times C3)$$

When selecting the values for R4 and C3, please consider that the cutoff frequency of zero should be approximately equal to the cutoff frequency of pole.

For example, if $L1=10\mu H$ and $C_{01}=10\mu F$, the cutoff frequency of pole is approximately 16kHz.

The gain can be set by the resistance ratio of R4 and R_T which is the combined resistance of R1 and R2 ($R_T=R1 \times R2 / (R1+R2)$). If R4 is larger than R_T , the gain becomes high. The high gain improves the response characteristic; however, the extremely high gain decreases stability of the operation. It is important to select an appropriate value for R4. In the following equation, zero is made by R1 and C2.

$$F_{zero} \sim 1 / (2 \times \pi \times R1 \times C2)$$

Set the cutoff frequency of zero lower than the cutoff frequency of pole.

Reduction of Feedback Voltage Noise (DC/ DC)

If the system noise is large, it may wrap around the V_{FB} pin and causes unstable operation. In this case, set R1 and R2 resistance values lower to reduce the noise entering the V_{FB} pin. Or, place R3 with 1k Ω to 5k Ω to reduce the noise entering the V_{FB} pin as shown in *Typical Application* (P.10,11).

Input Voltage Setting (DC/ DC and LDO)

The input voltage ranges of the V_{IN_DC} and V_{IN_LDO} pins are from 2.2V to 5.5V. Place a bypass capacitor between V_{IN} and GND. Use Boost Output as the input voltage for the V_{BUFF} pin.

R1293K

NO.EA-301-160107

Oscillator Frequency Setting (DC/ DC)

By connecting R6 to the the RT pin, f_{osc} can be set in the range of 300kHz to 1MHz. R6 can be calculated by inserting a desired oscillator frequency value into f_{osc} in the following equation.

$$R6 = 19.128 \times 10^9 / F_{osc} - 3443$$

Example: Oscillator Frequency 700kHz

$$R6 = 19.128 \times 10^9 / (700 \times 10^3) - 3443 = 23883 \approx 24k\Omega$$

Maxduty and Maxduty Soft-start Adjustment (DC/ DC)

Maxduty is preset to 90% (Typ.); however, it can be set lower by adding R5 to the DTC pin. Maxduty is determined by R6 and R5 as shown in the equation below. The preset Maxduty is compared with the Maxduty set by the DTC pin, and the lower Maxduty will be selected.

$$\text{Maxduty (DC)} = \frac{0.3267 \times R5 - 0.6285 \times R6 + 2367}{R6 + 3550}$$

Example: R6=24kΩ, R5=110kΩ

$$\begin{aligned} \text{Maxduty} &= (0.3267 \times 110000 - 0.6285 \times 24000 + 2367) / (24000 + 3550) \\ &\approx 0.843 \rightarrow 84.3\% \end{aligned}$$

By adding C_{DTC} to the DTC pin, Maxduty can increase gradually and the inrush current can be controlled. (Maxduty Soft-start). After start-up, Maxduty after t-time (Maxduty (t)) can be calculated by the following equation.

$$\text{Maxduty (t)} = \frac{0.3267 \times R5 \times [1 - \text{EXP}(-t / C_{DTC} \times R5)] - 0.6285 \times R6 + 2367}{R6 + 3550}$$

Example: R6=24kΩ, R5=110kΩ, C_{DTC} =0.047μF to 0.47μF

Typical Application with RT Pin/ DTC Pin

When using Maxduty soft-start, it is recommended that latch protection delay time (t_{DLY}) be set $t_{DLY} > 6 \times (R5 \times C_{DTC})$. t_{DLY} should be longer than the soft-start time.

Overcurrent Protection (DC/ DC)

The overcurrent protection circuit monitors the Nch-switch current and immediately turns off if the Nch-switch current reaches the current limit. Nch-switch turns on every internal reference clock cycle and turns off if the Nch-switch current reaches the current limit again.

Short Current Protection/ Protection Delay Time Setting (DC/ DC)

If Boost Output drops and causes the VFB voltage drop to 85% of the preset value, the IC recognizes a short-circuit and starts to charge C1. If the short-circuit condition persists for a certain period of time and the DELAY pin voltage reaches V_{DLY} , the latch-type protection circuit shuts down Boost Output. t_{DLY} can be set by C1 shown in the following equations.

$$t_{DLY} = C \times V_{DLY} / I_{DLY}$$

To release latch state, make $V_{IN,DC}$ voltage below the UVLO detector threshold and then restart, or set ENB "H" once and then set it back to "L".

Undervoltage Lock Out (DC/ DC)

If the $V_{IN,DC}$ pin voltage becomes equal or lower than UVLO detector threshold, the UVLO circuit immediately disables the switching output.

Thermal Shutdown (LDO and Buffer AMP)

Thermal shutdown circuit detects overheating of the IC and turns off VCOM Output, GAMMA Output, and LDO Outputs to reset the IC if the junction temperature becomes more than the detector threshold. If the causes of overheating are removed and the junction temperature decreases to the release temperature, the IC restarts.

Standby Mode (DC/ DC and Buffer AMP)

By setting the ENB pin "H", DC/ DC and Buffer AMP go into Standby mode and the output shuts down. LDO is always-on and outputs voltage.

SEL Pin Mode Switching (DC/ DC)

By setting the SEL pin voltage "L", the switching speed of a built-in MOSFET shifts to moderate mode to reduce the influences of noise to external parts. The SEL pin voltage operates in normal mode when "H".

Diode, Inductor and Capacitor Selections (DC/ DC, LDO and Buffer AMP)

Efficiency and stability of system can be affected by the following conditions. Spike voltage may be generated by the influence of an inductor when Nch MOSFET turns off. Therefore, diodes, inductors and capacitors should not exceed the voltage tolerance of the capacitor connected to V_{OUT} or their respected rated values (voltage, current and power). Please refer to *Operation of DC/ DC Converter and Output Current* (P.15). Choose the diode with low forward voltage (schottky diode), small reverse current and fast switching speed.

Operation of DC/ DC Converter and Output Current

Figure 1. Basic Circuit

Figure 2. The inductor current (IL) flowing through the inductor (L)

Discontinuous Mode

Continuous Mode

There are two operation modes in the PWM step-up DC/ DC converter: continuous mode and discontinuous mode. When a transistor is in the On-state, the voltage to be applied to L is described as V_{IN} . An increase in the inductor current ($i1$) can be written as follows:

$$\Delta i1 = V_{IN} \times t_{on} / L \dots\dots\dots \text{Formula 1}$$

In the step-up circuit, the energy accumulated during the On-state is transferred into the capacitor even in the Off-state. A decrease in the inductor current ($i2$) can be written as follows:

$$\Delta i2 = (V_{OUT} - V_{IN}) \times t_{open} / L \dots\dots\dots \text{Formula 2}$$

In the PWM switching control, i_1 and i_2 become continuous when $t_{open}=t_{off}$, which is called continuous mode.

When the IC is in the continuous mode and operates in steady-state conditions, the variations of i_1 and i_2 are same:

$$V_{IN} \times t_{on} / L = (V_{OUT} - V_{IN}) \times t_{off} / L \dots\dots\dots \text{Formula 3}$$

Therefore, the duty cycle in the continuous mode is:

$$\text{Duty} = t_{on} / (t_{on} + t_{off}) = (V_{OUT} - V_{IN}) / V_{OUT} \dots\dots\dots \text{Formula 4}$$

When $t_{open}=t_{off}$, the average of I_L is:

$$I_L (\text{Ave.}) = V_{IN} \times t_{on} / (2 \times L) \dots\dots\dots \text{Formula 5}$$

If the input voltage (V_{IN}) is equal to V_{OUT} , the output current (I_{OUT}) is:

$$I_{OUT} = V_{IN}^2 \times t_{on} / (2 \times L \times V_{OUT}) \dots\dots\dots \text{Formula 6}$$

If I_{OUT} is larger than Formula 6, the IC switches to the continuous mode.

I_{Lmax} flowing through L is:

$$I_{Lmax} = I_{OUT} \times V_{OUT} / V_{IN} + V_{IN} \times t_{on} / (2 \times L) \dots\dots\dots \text{Formula 7}$$

$$I_{Lmax} = I_{OUT} \times V_{OUT} / V_{IN} + V_{IN} \times T \times (V_{OUT} - V_{IN}) / (2 \times L \times V_{OUT}) \dots\dots\dots \text{Formula 8}$$

As a result, I_{Lmax} becomes larger compared to I_{OUT} .

When considering the input and output conditions or selecting the external parts, please pay attention to I_{Lmax} .

The above calculations are based on the ideal operation of the ICs in the continuous mode. They do not include the losses caused by the external parts or L_x switch. The actual maximum output current will be 50% to 80% of the above calculation results. Especially, if I_L is large or V_{IN} is low, it may cause the switching losses. As for V_{OUT} , please consider V_F of the diode (approximately 0.8V).

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment.

Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
