

### FEATURES

Two 12-Bit DACs in One Package  
 DAC Ladder Resistance Matching: 0.5%  
 Space Saving Skinny DIP and Surface Mount Packages  
 4-Quadrant Multiplication  
 Low Gain Error (1 LSB max Over Temperature)  
 Byte Loading Structure  
 Fast Interface Timing

### APPLICATIONS

Automatic Test Equipment  
 Programmable Filters  
 Audio Applications  
 Synchro Applications  
 Process Control

### GENERAL DESCRIPTION

The AD7537 contains two 12-bit current output DACs on one monolithic chip. A separate reference input is provided for each DAC. The dual DAC saves valuable board space, and the monolithic construction ensures excellent thermal tracking. Both DACs are guaranteed 12-bit monotonic over the full temperature range.

The AD7537 has a 2-byte (8 LSBs, 4 MSBs) loading structure. It is designed for right-justified data format. The control signals for register loading are A0, A1,  $\overline{CS}$ ,  $\overline{WR}$  and  $\overline{UPD}$ . Data is loaded to the input registers when  $\overline{CS}$  and  $\overline{WR}$  are low. To transfer this data to the DAC registers,  $\overline{UPD}$  must be taken low with  $\overline{WR}$ .

Added features on the AD7537 include an asynchronous  $\overline{CLR}$  line which is very useful in calibration routines. When this is taken low, all registers are cleared. The double buffering of the data inputs allows simultaneous update of both DACs. Also, each DAC has a separate AGND line. This increases the device versatility; for instance one DAC may be operated with AGND biased while the other is connected in the standard configuration.

The AD7537 is manufactured using the Linear Compatible CMOS (LC<sup>2</sup>MOS) process. It is speed compatible with most microprocessors and accepts TTL, 74HC and 5 V CMOS logic level inputs.

### FUNCTIONAL BLOCK DIAGRAM

### PRODUCT HIGHLIGHTS

- 1. DAC to DAC Matching:**  
 Since both DACs are fabricated on the same chip, precise matching and tracking is inherent. Many applications which are not practical using two discrete DACs are now possible. Typical matching: 0.5%.
- 2. Small Package Size:**  
 The AD7537 is packaged in small 24-pin 0.3" DIPs and in 28-terminal surface mount packages.
- 3. Wide Power Supply Tolerance:**  
 The device operates on a +12 V to +15 V  $V_{DD}$ , with  $\pm 10\%$  tolerance on this nominal figure. All specifications are guaranteed over this range.

\*Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as  $4000\text{ V}$  readily accumulate on the human body and test equipment and can discharge without detection. Although the AD7537 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

PLCC

CIRCUIT INFORMATION - D/A SECTION

The AD7537 contains two identical 12-bit multiplying D/A converters. Each DAC consists of a highly stable R-2R ladder and 12 N-channel current steering switches. Figure 2 shows a simplified D/A circuit for DAC A. In the R-2R ladder, binary weighted currents are steered between I<sub>OUTA</sub> and AGNDA. The

current flowing in each ladder leg is constant, irrespective of switch state. The feedback resistor R<sub>FBA</sub> is used with an op amp (see Figures 4 and 5) to convert the current flowing in I<sub>OUTA</sub> to a voltage output.

Figure 2. Simplified Circuit Diagram for DAC A

EQUIVALENT CIRCUIT ANALYSIS

Figure 3 shows the equivalent circuit for one of the D/A converters (DAC A) in the AD7537. A similar equivalent circuit can be drawn for DAC B.

C<sub>OUT</sub> is the output capacitance due to the N-channel switches and varies from about 50 pF to 150 pF with digital input code. The current source I<sub>LKG</sub> is composed of surface and junction leakages and approximately doubles every 10°C. R<sub>0</sub> is the equivalent output resistance of the device which varies with input code.

DIGITAL CIRCUIT INFORMATION

The digital inputs are designed to be both TTL and 5 V CMOS compatible. All logic inputs are static protected MOS gates with typical input currents of less than 1 nA.

Table I. AD7537 Truth Table

CLR	UPD	CS	WR	A1	A0	FUNCTION
1	1	1	X	X	X	No Data Transfer

Figure 3. Equivalent Analog Circuit for DAC A

## UNIPOLAR BINARY OPERATION (2-QUADRANT MULTIPLICATION)

Figure 4 shows the circuit diagram for unipolar binary operation. With an ac input, the circuit performs 2-quadrant multiplication. The code table for Figure 4 is given in Table II.

Operational amplifiers A1 and A2 can be in a single package (AD644, AD712) or separate packages (AD544, AD711, AD OP27). Capacitors C1 and C2 provide phase compensation to help prevent overshoot and ringing when high-speed op amps are used.

For zero offset adjustment, the appropriate DAC register is loaded with all 0s and amplifier offset adjusted so that  $V_{OUTA}$  or  $V_{OUTB}$  is 0 V. Full-scale trimming is accomplished by loading the DAC register with all 1s and adjusting R1 (R3) so that  $V_{OUTA}$  ( $V_{OUTB}$ ) =  $-V_{IN}$  (4095/4096). For high temperature operation, resistors and potentiometers should have a low Temperature Coefficient. In many applications, because of the excellent Gain T.C. and Gain Error specifications of the AD7537, Gain Error trimming is not necessary. In fixed reference applications, full scale can also be adjusted by omitting R1, R2, R3, R4 and trimming the reference voltage magnitude.

Figure 4. AD7537 Unipolar Binary Operation

Table II. Unipolar Binary Code Table for Circuit of Figure 4

Binary Number in DAC Register MSB      LSB	Analog Output, $V_{OUTA}$ or $V_{OUTB}$
1111 1111 1111	$-V_{IN} \left( \frac{4095}{4096} \right)$
1000 0000 0000	$-V_{IN} \left( \frac{2048}{4096} \right) = -\frac{1}{2} V_{IN}$
0000 0000 0001	$-V_{IN} \left( \frac{1}{4096} \right)$
0000 0000 0000	0 V

## BIPOLAR OPERATION (4-QUADRANT MULTIPLICATION)

The recommended circuit diagram for bipolar operation is shown in Figure 5. Offset binary coding is used.

With the appropriate DAC register loaded to 1000 0000 0000, adjust R1 (R3) so that  $V_{OUTA}$  ( $V_{OUTB}$ ) = 0 V. Alternatively, R1, R2 (R3, R4) may be omitted and the ratios of R6, R7 (R9, R10) varied for  $V_{OUTA}$  ( $V_{OUTB}$ ) = 0 V. Full-scale trimming can be accomplished by adjusting the amplitude of  $V_{IN}$  or by varying the value of R5 (R8).

If R1, R2 (R3, R4) are not used, then resistors R5, R6, R7 (R8, R9, R10) should be ratio matched to 0.01% to ensure gain error performance to the data sheet specification. When operating over a wide temperature range, it is important that the resistors be of the same type so that their temperature coefficients match.

The code table for Figure 5 is given in Table III.

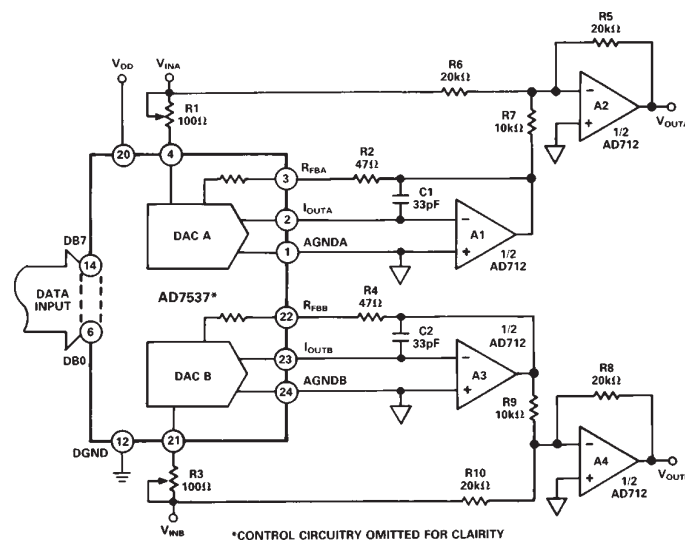

Figure 5. Bipolar Operation (Offset Binary Coding)

Table III. Bipolar Code Table for Offset Binary Circuit of Figure 5

Binary Number in DAC Register MSB      LSB	Analog Output, $V_{OUTA}$ or $V_{OUTB}$
1111 1111 1111	$+V_{IN} \left( \frac{2047}{2048} \right)$

1000 0000 0000	0 V
0111 1111 1111	$-V_{IN} \left( \frac{1}{2048} \right)$
0000 0000 0000	$-V_{IN} \left( \frac{2048}{2048} \right) = -V_{IN}$

# AD7537

## SEPARATE AGND PINS

The DACs in the AD7537 have separate AGND lines taken to pins AGNDA and AGNDB on the package. This increases the applications versatility of the part. Figure 6 is an example of this. DAC A is connected in standard fashion as a programmable attenuator. AGNDA is at ground potential. DAC B is operating with AGND B biased to +5 V by the AD584. This gives an output range of +5 V to +10 V.

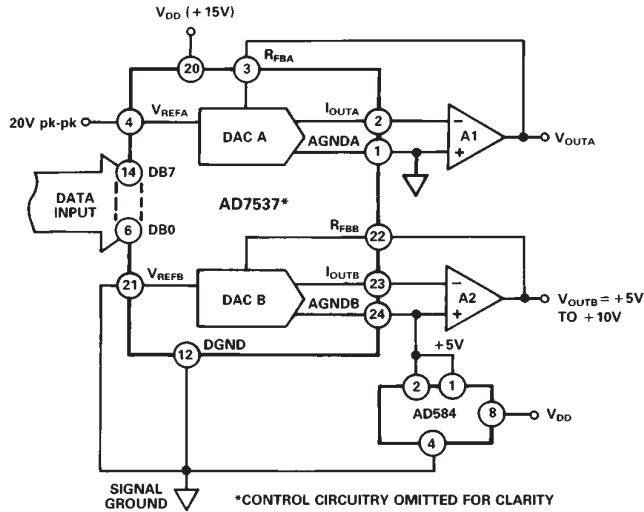

Figure 6. AD7537 DACs Used in Different Modes

## PROGRAMMABLE OSCILLATOR

Figure 7 shows a conventional state variable oscillator in which

the AD7537 controls the programmable integrators. The frequency of oscillation is given by:

$$f = \frac{1}{2\pi} \sqrt{\frac{R6}{R5} \times \frac{1}{C1 \times C2 \times R_{EQ1} \times R_{EQ2}}}$$

where  $R_{EQ1}$  and  $R_{EQ2}$  are the equivalent resistances of the DACs. The same digital code is loaded into both DACs. If  $C1 = C2$  and  $R5 = R6$ , the expression reduces to

$$f = \frac{1}{2\pi} \times \frac{1}{C} \sqrt{\frac{1}{R_{EQ1} \times R_{EQ2}}}$$

Since  $R_{EQ} = \frac{2^n \times R_{LAD}}{N}$ , ( $R_{LAD}$  = DAC ladder resistance).

$$\begin{aligned} f &= \frac{1}{2\pi} \times \frac{1}{C} \sqrt{\frac{(N/2^n)^2}{R_{LAD1} \times R_{LAD2}}} \\ &= \frac{1}{2\pi} \times \frac{D}{C} \frac{1}{\sqrt{R_{LAD1} \times R_{LAD2}}} \quad D = \left(\frac{N}{2^n}\right) \\ &= \frac{1}{2\pi} \times \frac{D}{C \times R_{LAD} \sqrt{m}} \end{aligned}$$

where  $m$  is the DAC ladder resistance mismatch ratio, typically 1.005.

With the values shown in Figure 7, the output frequency varies from 0 Hz to 1.38 kHz. The amplitude of the output signal at the A3 output is 10 V peak-to-peak and is constant over the entire frequency span.

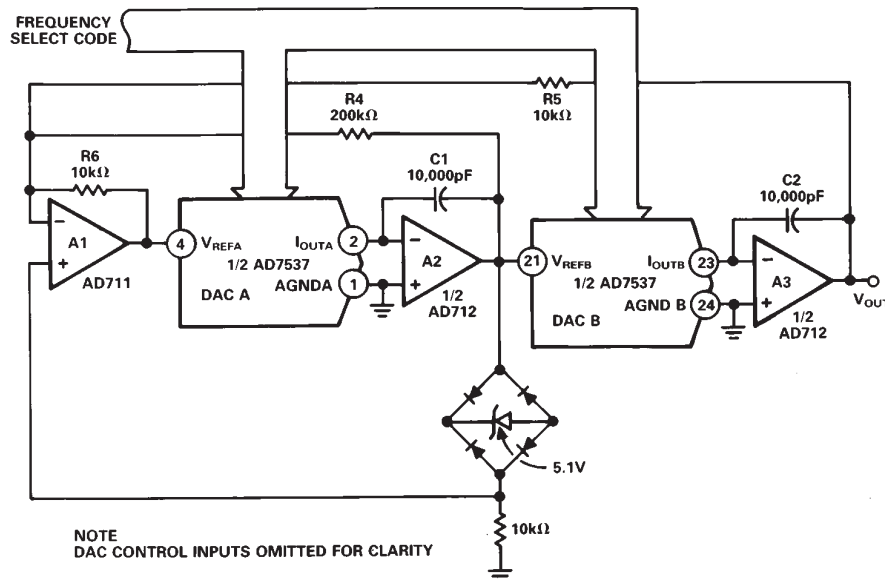

Figure 7. Programmable State Variable Oscillator

## APPLICATION HINTS

**Output Offset:** CMOS D/A converters in circuits such as Figures 4 and 5 exhibit a code dependent output resistance which in turn can cause a code dependent error voltage at the output of the amplifier. The maximum amplitude of this error, which adds to the D/A converter nonlinearity, depends on  $V_{OS}$ , where  $V_{OS}$  is the amplifier input offset voltage. To maintain specified operation, it is recommended that  $V_{OS}$  be no greater than  $(25 \times 10^{-6}) (V_{REF})$  over the temperature range of operation. Suitable op amps are the AD711C and its dual version, the AD712C. These op amps have a wide bandwidth and high slew rate and are recommended for wide bandwidth ac applications. AD711/AD712 settling time to 0.01% is typically 3  $\mu$ s.

**Temperature Coefficients:** The gain temperature coefficient of the AD7537 has a maximum value of 5 ppm/ $^{\circ}$ C and typical value of 1 ppm/ $^{\circ}$ C. This corresponds to worst case gain shifts of 2 LSBs and 0.4 LSBs respectively over a 100 $^{\circ}$ C temperature range. When trim resistors R1 (R3) and R2 (R4) are used to adjust full scale range as in Figure 4, the temperature coefficient of R1 (R3) and R2 (R4) should also be taken into account. For further information see "Gain Error and Gain Temperature Coefficient of CMOS Multiplying DACs", Application Note, Publication Number E630c-5-3/86 available from Analog Devices.

**High Frequency Considerations:** AD7537 output capacitance works in conjunction with the amplifier feedback resistance to add a pole to the open loop response. This can cause ringing or oscillation. Stability can be restored by adding a phase compensation capacitor in parallel with the feedback resistor. This is shown as C1 and C2 in Figures 4 and 5.

**Feedthrough:** The dynamic performance of the AD7537 depends upon the gain and phase stability of the output amplifier, together with the optimum choice of PC board layout and decoupling components. A suggested printed circuit layout for Figure 4 is shown in Figure 8 which minimizes feedthrough from  $V_{REFA}$ ,  $V_{REFB}$  to the output in multiplying applications.

Figure 8. Suggested Layout for AD7537

## MICROPROCESSOR INTERFACING

The byte loading structure of the AD7537 makes it very easy to interface the device to any 8-bit microprocessor system. Figures 9 and 10 show two interfaces: one for the MC6809 and the

other for the MC68008. Figure 11 shows how an AD7537 system can be easily expanded by tying all the  $\overline{UPD}$  lines together and using a single decoder output to control these. This expanded system is shown using a Z80 microprocessor but it is just as easily configured using any other 8-bit microprocessor system. Note how the system shown in Figure 11 produces 4 analog outputs with a minimum amount of hardware.

<sup>1</sup> Z = RoHS Compliant Part.

<sup>2</sup> Analog Devices reserves the right to ship side-brazed CERP packages (D-24-1) in lieu of CERP packages (Q-24-1).

<sup>3</sup> To order MIL-STD-883, Class B processed parts, add/883B to part number. Contact your local sales office for military data sheet.

# AD7537

## REVISION HISTORY

**6/12—Rev. 0 to Rev. A**

Added SOIC Package ..... Universal  
Removed LCCC Pin Configuration.....4  
Updated Outline Dimensions.....8  
Changes to Ordering Guide.....9

**10/87—Revision 0: Initial Version**

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
