

NCV7754

Octal Low-Side Relay Driver

The NCV7754 is an automotive eight channel low-side driver providing drive capability up to 500 mA per channel. Output control is via a SPI port and offers convenient reporting of faults for open load (or short to ground), over load, and over temperature conditions. Additionally, parallel control of the outputs is addressable (in pairs) via the INx pins.

A dedicated limp-home mode pin (LHI) enables OUT1-OUT4 while disabling OUT5-OUT8.

Each output driver is protected for over load current and includes an output clamp for inductive loads.

The NCV7754 is available in a SSOP-24 fused lead package.

Features

- 8 Channels
- 500 mA Low-Side Drivers
 - ♦ $R_{DS(on)}$ 0.8 Ω (Typ), 1.6 Ω (Max)
- 16-bit SPI Control
 - ♦ Frame Error Detection (8-bit)
 - ♦ Daisy Chain Capable
- Parallel Input Pins for PWM operation
- Power Up Without Open Circuit Detection Active (for LED applications)
- Low Quiescent Current in Sleep and Standby Modes
- Limp Home Functionality
- 3.3 V and 5 V compatible Digital Input Supply Range
- Fault Reporting
 - ♦ Open Load Detection (selectable)
 - ♦ Over Load
 - ♦ Over Temperature
- Power-on Reset (VDD, VDDA)
- SSOP-24 Package (internally fused leads)
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These are Pb-Free Devices

Applications

- Automotive Body Control Unit
- Automotive Engine Control Unit
- Relay Driver
- LED Driver
- Stepper Motor Driver

PACKAGE PIN DESCRIPTION

SSOP-24	Symbol	Description
1	GND	Ground. (fused)
2	GND	Ground. (fused)
3	OUT1	Channel 1 low-side drive output. Requires an external pull-up device for operation.
4	OUT2	Channel 2 low-side drive output. Requires an external pull-up device for operation.
5	OUT3	Channel 3 low-side drive output. Requires an external pull-up device for operation.
6	OUT4	Channel 4 low-side drive output. Requires an external pull-up device for operation.
7	OUT5	Channel 5 low-side drive output. Requires an external pull-up device for operation.
8	OUT6	Channel 6 low-side drive output. Requires an external pull-up device for operation.
9	OUT7	Channel 7 low-side drive output. Requires an external pull-up device for operation.
10	OUT8	Channel 8 low-side drive output. Requires an external pull-up device for operation.
11	GND	Ground. (fused)
12	GND	Ground. (fused)
13	VDD	Digital Power Supply for SO output (3.3 V or 5 V).
14	IN4	Parallel control of OUT4 and OUT8 Ground if not used for best EMI performance. Alternatively keep open and internal pull-down will hold the input low. (120 k Ω pull down resistor).
15	IN3	Parallel control of OUT3 and OUT7 Ground if not used for best EMI performance. Alternatively keep open and internal pull-down will hold the input low. (120 k Ω pull down resistor).
16	IN2	Parallel control of OUT2 and OUT6. Ground if not used for best EMI performance. Alternatively keep open and internal pull-down will hold the input low. (120 k Ω pull down resistor).
17	IN1	Parallel control of OUT1 and OUT5. Ground if not used for best EMI performance. Alternatively keep open and internal pull-down will hold the input low. (120 k Ω pull down resistor).
18	LHI	Limp Home Input. Active High. A high on this pin powers up the device and activates the respective output drive INx designator while disabling outputs OUT5–OUT8. Input SPI commands are ignored, but the output register reports faults. (Read capability only. No write capability.) All registers are reset coming out of LHI mode. Ground if not used for best EMI performance. Alternatively keep open and internal pull-down resistor (120 k Ω) will hold the input low.
19	SO	SPI serial data output. Output high voltage level referenced to pin VDD.
20	SCLK	SPI clock (120 k Ω pull down resistor).
21	EN	Global Enable (active high). (120 k Ω pull down resistor).
22	SI	SPI serial data input (120 k Ω pull down resistor).
23	CSB	SPI Chip Select "Bar" (120 k Ω pull up resistor to VDD).
24	VDDA	Analog Power Supply Input voltage (5 V).

DETAILED OPERATING DESCRIPTION

Power Outputs

The NCV7754 provides eight independent 500 mA power transistors with their source connection referenced to the ground pin and with their drain connection brought out to individual pins resulting in 8 independent low-side drivers. Output driver location on one side of the IC layout provides for optimum pcb layout to the loads.

Internal clamping structures are provided to limit transient voltages when switching inductive loads. Each output has an over load detection current of 0.5 A (min) where the drivers turn-off and stay latched off. An Over Load Current Shut-Down Delay Time of 15 μ s (typ) is designed into the IC as a filter allowing for spikes in current which may occur during normal operation and allowing for protection from overload conditions. Over Load detection is active in situations where the output is turned on with a pre-existing short, and when a short occurs after a device is on.

Faults can be cleared with the SPI input register (**command 00**) or via a power-on-reset. Fault detection is provided in real time. (See Page 17, Clearing the Fault Registers)

The NCV7754 is available in a SSOP-24 fused package.

Output Control (SPI)

Each output driver is controlled via a digital SPI port after the device has powered up (out of POR) and enabled via the EN pin. The NCV7754 device will go through a power up reset each time the EN pin is toggled high resulting in a device setup of default values as described in the Register Specifics section. Standby Mode, Input Mode, ON Mode, and OFF Mode are all selectable via the SPI for each channel independently.

Power up, Power-On Reset (UVLO mode)

Both VDD and VDDA supply an independent power-on-reset function to the IC. Coming out of power-on-reset all input bits are set to a 1 (OFF Mode) and all output bits are set to a 0 except for the TER bit which is set to a 1. The device cannot operate without both supplies above their respective power-on reset thresholds with the exception of LHI mode. During LHI mode, VDD POR is ignored and the device is only affected by VDDA POR.

The NCV7754 powers up into the Global OFF Mode without the open circuit diagnostic current enabled. This allows the device to be turned on via EN = 0 to EN = 1 without any illumination of LED loads (reference Figure 21 State Diagram). All other paths to Global OFF Mode enable open circuit diagnostic current.

Table 1. MODES OF OPERATION

Modes of Operation	Conditions	Description
UVLO Mode	VDD or VDDA below their respective POR thresholds	All outputs off in this mode. Coming out of this mode with EN = 1 sets all channels in the OFF mode without open circuit diagnostic current enabled. With LHI = 1 and EN = x, the part enters limp home mode.
OFF Mode	SPI Control (Command 11)	Output off. Open circuit diagnostic current is disabled (powerup mode). Open circuit diagnostic current is enabled (normal mode).
Global OFF Mode	SPI Control All Channels (Command 11)	Output off. Open circuit diagnostic current is disabled (powerup mode). Open circuit diagnostic current is enabled (normal mode).
ON Mode	SPI Control (Command 10)	Output on.
Limp Home Mode (LHI)	LHI = high, EN = x	Dedicated output turn on control of OUT1-OUT4 using IN1-IN4. OUT5-OUT8 are in OFF Mode.
Low Iq Mode	EN = LHI = low	Provides a state with the lowest quiescent current for VDD and VDDA.
Standby Mode	SPI Control (Command 00)	Provides an OFF state with Open circuit diagnostic current disabled.
Global Standby Mode	SPI Control All Channels (Command 00)	Provides a reduced quiescent current mode. Provides an OFF state with Open circuit diagnostic current disabled.
Input Mode	SPI Control (Command 01)	Directs output channel to be driven from INx input pins.

Figure 19. Basic State Diagram

Figure 20. Normal Operation State Diagram

Figure 21. Detailed State Diagram

Limp Home and PWM operation (INx control)

Pulse Width Modulation techniques are allowed utilizing the parallel inputs (INx).

Output pins (OUTx) are programmed for use in conjunction with the INx pins using the SPI command (**command 01**).

The LHI pin controls the operation of the INx pins.

LHI = Low and EN = High

With LHI=low, default pairs of outputs are controlled by the INx pins (via SPI programming).

IN1 controls channels OUT1 and OUT5.

IN2 controls channels OUT2 and OUT6.

IN3 controls channels OUT3 and OUT7.

IN4 controls channels OUT4 and OUT8.

Alternatively, any of the eight channels can be commanded off (e.g. if OUT5 is commanded off via a SPI command, only OUT1 will be controlled via IN1).

Output pins (OUTx) are programmed for use in conjunction with the INx pins using the SPI command (**command 01**).

It is important to note faults occurring during PWM operation (LHI = low) must be cleared via the SPI port.

LHI = High

To go into limp home mode, bring LHI=high, the corresponding outputs of IN1–IN4 will turn on or off, and OUT5–OUT8 will be forced off.

During Limp Home Mode, over load and over temperature sensing are functional, and are reported via the SPI port. But, since input SPI commands are ignored with LHI = high, driver turn-off (overload or over temperature) occurring when LHI=high can only be re-initiated by toggling LHI or through a POR of VDDA.

All registers are reset coming out of LHI mode. The device enters OFF mode (EN = 1) or Low Iq Mode (EN = 0) depending on the state of the EN pin. Open Load diagnostics are disabled in both cases.

A transmission error bit (TER) is set ("1") when exiting the Limp Home Mode into Global Off Mode. See Frame Detection Transmission Error Section for operation details.

UVLO (Under Voltage Lockout with LHI = High)

A breach of VDDA Power-On Reset thresholds will cause the outputs to turn off and enter the UVLO mode. In LHI mode (LHI = 1), VDD POR is ignored. If VDD is below the operation of SO drive capability, fault information is preserved and can be retrieved when SO drive capability is restored.

Enable Input (EN)

The EN input pin is a logic controlled input with a voltage threshold between 0.8 V and 2.0 V. The device powers up when EN goes from low to high, and exits Low Iq Mode (with LHI = 0 V) into global Off Mode. Device power up is also controlled via the Limp Home Input (LHI) as an OR'd condition. The EN input is a don't care when the LHI pin is driven from low to high. In this situation, the device enters Limp Home Mode.

Output Drive Clamping

Internal zener diodes (Z1 & Z2, Figure 22) help to protect the output drive transistors from the expected fly back energy generated from an inductive load turning off. Z1 provides the voltage setting of the clamp (along with V_{gs} of the output transistor and Z2) while Z2 isolates Z1 from normal turn-on activity.

The output clamp voltage is specified between 36 V and 44 V. This includes clamping operation during unpowered input supplies (VDD and VDDA). Device protection will be provided when the load is driven from an alternative driver source. This is an important feature when considering protecting for load dump with an un-powered IC.

NCV7754

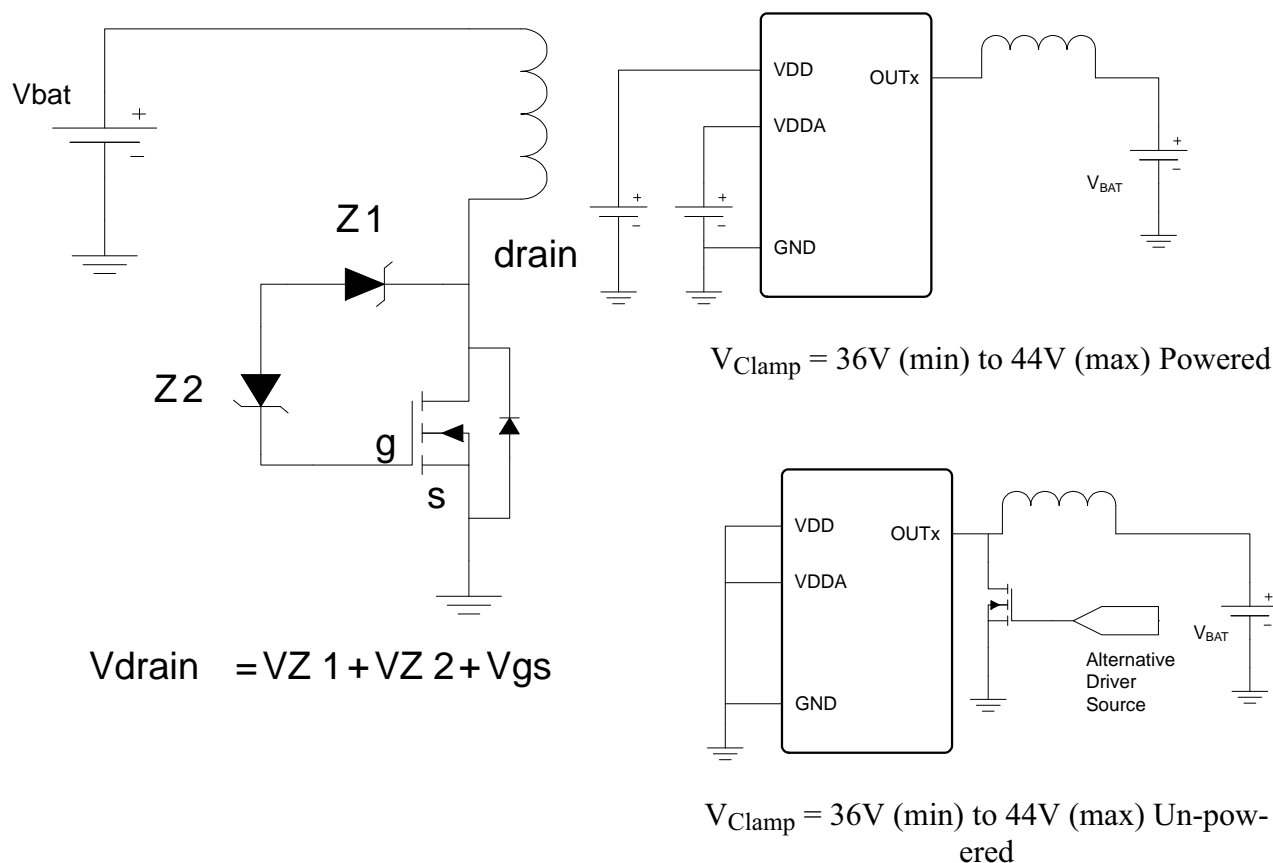

Figure 22. Output Clamp

Over Temperature / Thermal Shutdown

The NCV7754 incorporates eight individual thermal sensors located in proximity to each output driver. A channel is latched off upon the detection of an Over Temperature event. This allows operation of unaffected channels before, during, and after a channel detection of over temperature. The thermal shutdown detection threshold is typically 175°C with 25°C of hysteresis.

Open Load Detection

Open Load Detection is achieved for each output with the Open Load Detection Threshold Voltage reference voltage (V_{OL}) and its corresponding Open Load Diagnostic Sink Current (I_{OL}) (when the output driver (OUTx) is off). The output driver maintains its functionality with and without the open bit set (i.e. it can turn on and off).

During normal operation, the open circuit impedance (R_{oc}) is 0 Ω . This sets the voltage on OUTx to V_{BAT} volts. As long as V_{BAT} is above V_{OL} no open circuit fault will be recognized. The voltage appearing on OUTx is a result of V_{BAT} and the voltage drop across R_{oc} realized by the current flow created by I_{OL} .

The NCV7754 voltage level trip points are referenced to ground. The threshold range is between 1.0 V and 2.5 V.

With a nominal battery voltage (V_{BAT}) of 14 V, the resultant worst case thresholds of detection are as follows.

$$\frac{(V_{BAT} - \text{OpenLoadDetectionThresholdVoltage})}{\text{OpenLoadDiagnosticSinkCurrent}} = \text{OpenLoad Impedance}$$

$$\frac{(14\text{ V} - 2.5\text{ V})}{100\text{ }\mu\text{A}} = 115\text{ k}\Omega$$

$$\frac{(14\text{ V} - 1.0\text{ V})}{20\text{ }\mu\text{A}} = 650\text{ k}\Omega$$

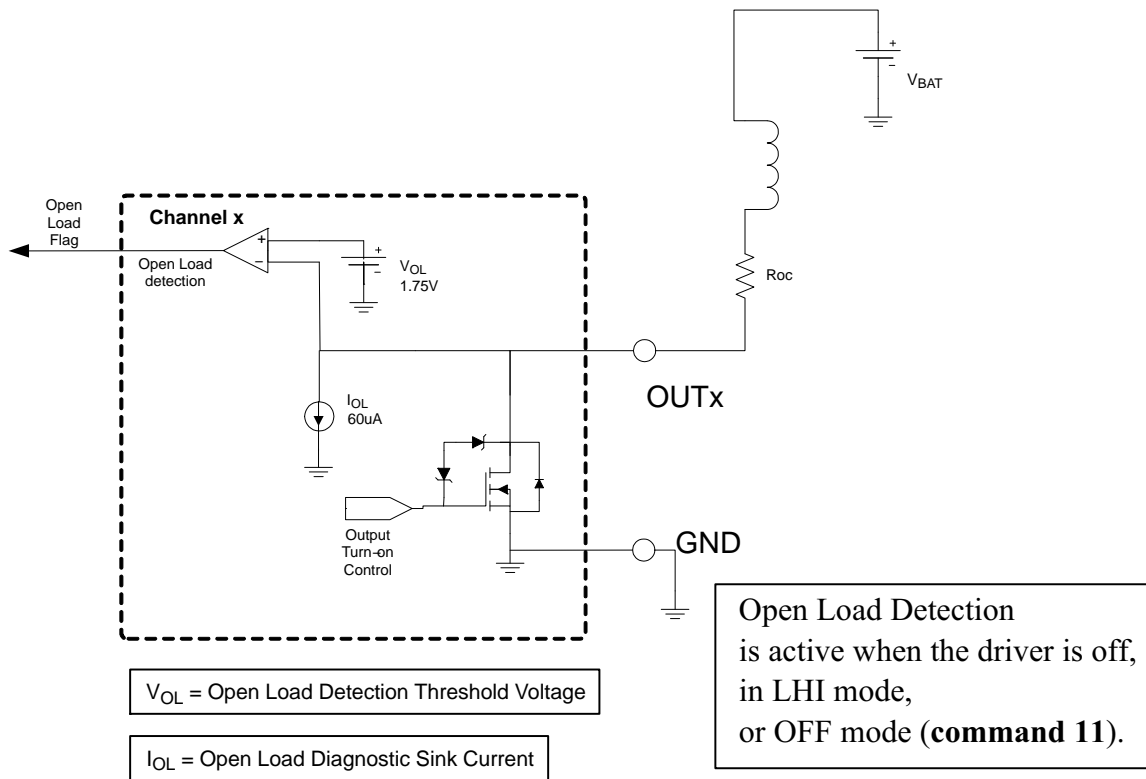

Figure 23. Open Load Detection

NOTE: Detection of an open load condition is limited by the Parallel Control Output turn-off time and the Open Load Detection Time specifications. The maximum allowable frequency of operation for PWM (pulse width modulation) using the INx inputs is calculated from the maximum limits of these specifications. INx must be low for longer than the sum of these maximum specifications (50 μ sec and 200 μ sec). Assuming a 50% duty cycle yields a maximum frequency of operation of $[1/(2*(50\mu + 200\mu))]=2$ kHz.

LED Loads

The NCV7754 features a power up feature for the Global OFF Mode enabling the part to power up in a mode without the open load diagnostic current enabled. This averts any unintended illumination of LED loads during power up.

Programming Features

The NCV7754 provides two registers.

1. Input Register. Input for IC mode state and output driver state control.
2. Output Register. Provides diagnostic information on the output driver condition.

Clearing the Fault Registers

Registers are reset with the following conditions.

1. Channel in Standby Mode. (clears only the output addressed)
2. Power-on reset of VDD. (all channels)
3. Power-on reset of VDDA. (all channels)
4. EN low. (all channels)
5. Coming out of Limp Home Mode(LHI). (all channels)

SPI-Interface

The device provides a 16 bit SPI-interface for output drive control and fault reporting. Data is imported into the NCV7754 through the SI (serial input) pin. Data is exported out of the NCV7754 through the SO (serial output) pin.

The input-frame (SI) (2 bits / channel) is used to command the output stages.

The response frame (SO) provides channel-specific (2 bits / channel) status information fault reporting.

Words should be composed of 16 bits MSB (most significant bit) transmitted first.

Frame Detection Transmission Error (TER)

The NCV7754 detects the number of bits transmitted after CSB goes low. Bit counts not a multiple of 8 (16 bit minimum) are reported as a fault on the TER bit. The transmission error information (TER) is available on SO after CSB goes low until the first rising SCLK edge. Reference the Serial Peripheral Interface diagram (Figure 27).

In addition to unqualified bit counts setting $TER = 1$, the bit will also be set by

1. Coming out of UVLO.
2. Transitioning from Limp Home Mode to Global Off Mode.
3. Transitioning from Low Iq Mode to Global Off Mode.

The TER bit is cleared by sending a valid SPI command.

The TER bit is multiplexed with the SPI SO data and OR'd with the SI input (Figure 24) to allow for reporting in a serial daisy chain configuration. A TER error bit as a "1" automatically propagates through the serial daisy chain circuitry from the SO output of one device to the SI input of the next. This is shown in Figures 25 and 26 first as the daisy chained devices connected with no Transmission Error (Figure 25) and subsequently with a Transmission Error in device 1 propagating through to device 2 (Figure 26).

Figure 24. TER SPI Link

Figure 25. TER (no error)

Figure 26. TER Error Propagation

NOTE: TER is valid from CSB going low until the 1st low-to-high transition of SCLK to allow for propagation of the SI signal. Reference Figure 27.
For proper TER status retrieval, SI should be in a low state.

TER Information Retrieval

TER information retrieval is as simple as bringing CSB high-to-low. No clock signals are required.

Figure 27. Serial Peripheral Interface

The timing diagram highlighted in Figure 27 shows the SPI interface communication.

Note:

1. The MSB (most significant bit) is the first transmitted bit.
2. Data is sampled from SI on the falling edge of SCLK
3. Data is shifted out from SO on the rising edge of SCLK
4. SCLK should be in a low state when CSB makes a transition.

Frame Detection

Input word integrity (SI) is evaluated by the use of a frame consistency check. The word frame length is compared to an $n * 8$ bit (where n is an integer) acceptable word length (16-bit minimum) before the data is latched into the input register. This guarantees the proper word length has been imported and allows for daisy chain operation applications with 8-bit SPI devices.

The frame length detector is enabled with the CSB falling edge and the SCLK rising edge.

Reference the valid SPI frame shown below. (Figure 27)

Figure 28. Frame Detection

DAISY CHAIN SETUP

Serial Connection

Daisy chain setups are possible with the NCV7754. The serial setup shown in Figure 29 highlights the NCV7754 along with any 16 bit device using a similar SPI protocol. Particular attention should be focused on the fact that the first 16 bits which are clocked out of the SO pin when the CSB pin transitions from a high to a low will be the Diagnostic Output Data from the Fault Output Register. These are the bits representing the status of the IC. Additional programming bits should be clocked in which follow the Diagnostic Output bits. The timing diagram shows a typical transfer of data from the microprocessor to the SPI connected IC's.

Table 2 refers to the transition of data over time of the Serial Daisy Chain setup of Figure 29 as word bits are shifted through the system. 64 bits are needed for complete transport of data in the example system. Each column of the table displays the status after transmittal of each word (in 16 bit increments) and the location of each word packet along the way.

8-bit Devices

The NCV7754 is also compatible with 8 bit devices due to the features of the frame detection circuitry. The internal bit counter of the NCV7754 starts counting clock pulses when CSB goes low. The 1st valid word consists of 16 bits and each subsequent word must be comprised of just 8-bits (reference the Frame Detection Section).

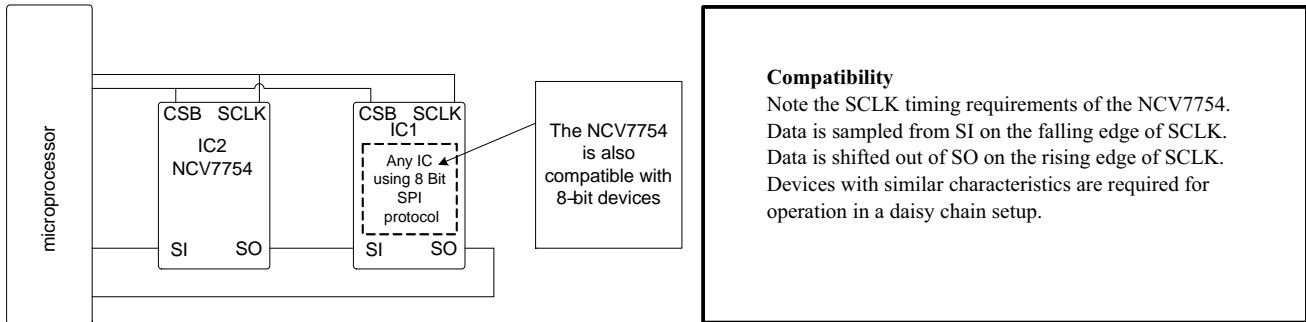

Figure 31. Serial Daisy Chain with 8-bit Devices

Parallel Connection

A more efficient way (time focused) to control multiple SPI compatible devices is to connect them in a parallel fashion and allow each device to be controlled in a multiplex mode. Figure 32 shows a typical connection between the microprocessor or microcontroller and multiple SPI compatible devices. In a serial daisy chain configuration, the programming information for the last device in the serial string must first pass through all the previous devices. The parallel control setup eliminates that requirement, but at the cost of additional control pins from the microprocessor for each individual CSB (chip select bar) pin for each controllable device. Serial data is only recognized by the device that is activated through its respective CSB pin.

Figure 33 shows the waveforms for typical operation when addressing IC1.

Figure 32. Parallel Connection

Figure 33. Parallel Connection Timing Diagram

Stepper Motor Operation

The NCV7754 device is capable of driving stepper motors. Each stepper motor requires 4 low-side drive outputs. Consequently, each NCV7754 device is capable of driving two stepper motors. Figure 34 below illustrates a Unipolar stepper motor setup. For proper operation, the code listed in Table 3 should be used (and repeated) for one way operation (clockwise). For reverse direction, simply reverse the code and repeat (counterclockwise). Outputs 1–4 are utilized for one stepper usage. For a 2nd stepper motor, repeat the code used for outputs 1–4 to outputs 5–8. During operation waveforms similar to Figure 35 can be expected on the OUTx pins.

(Unipolar Portescap 35L048L32U)

Table 3. NCV7754 STEPPER MOTOR CODE

OUT 4	OUT 3	OUT 2	OUT 1
OFF	ON	OFF	ON
ON	OFF	OFF	ON
ON	OFF	ON	OFF
OFF	ON	ON	OFF

{Repeat}

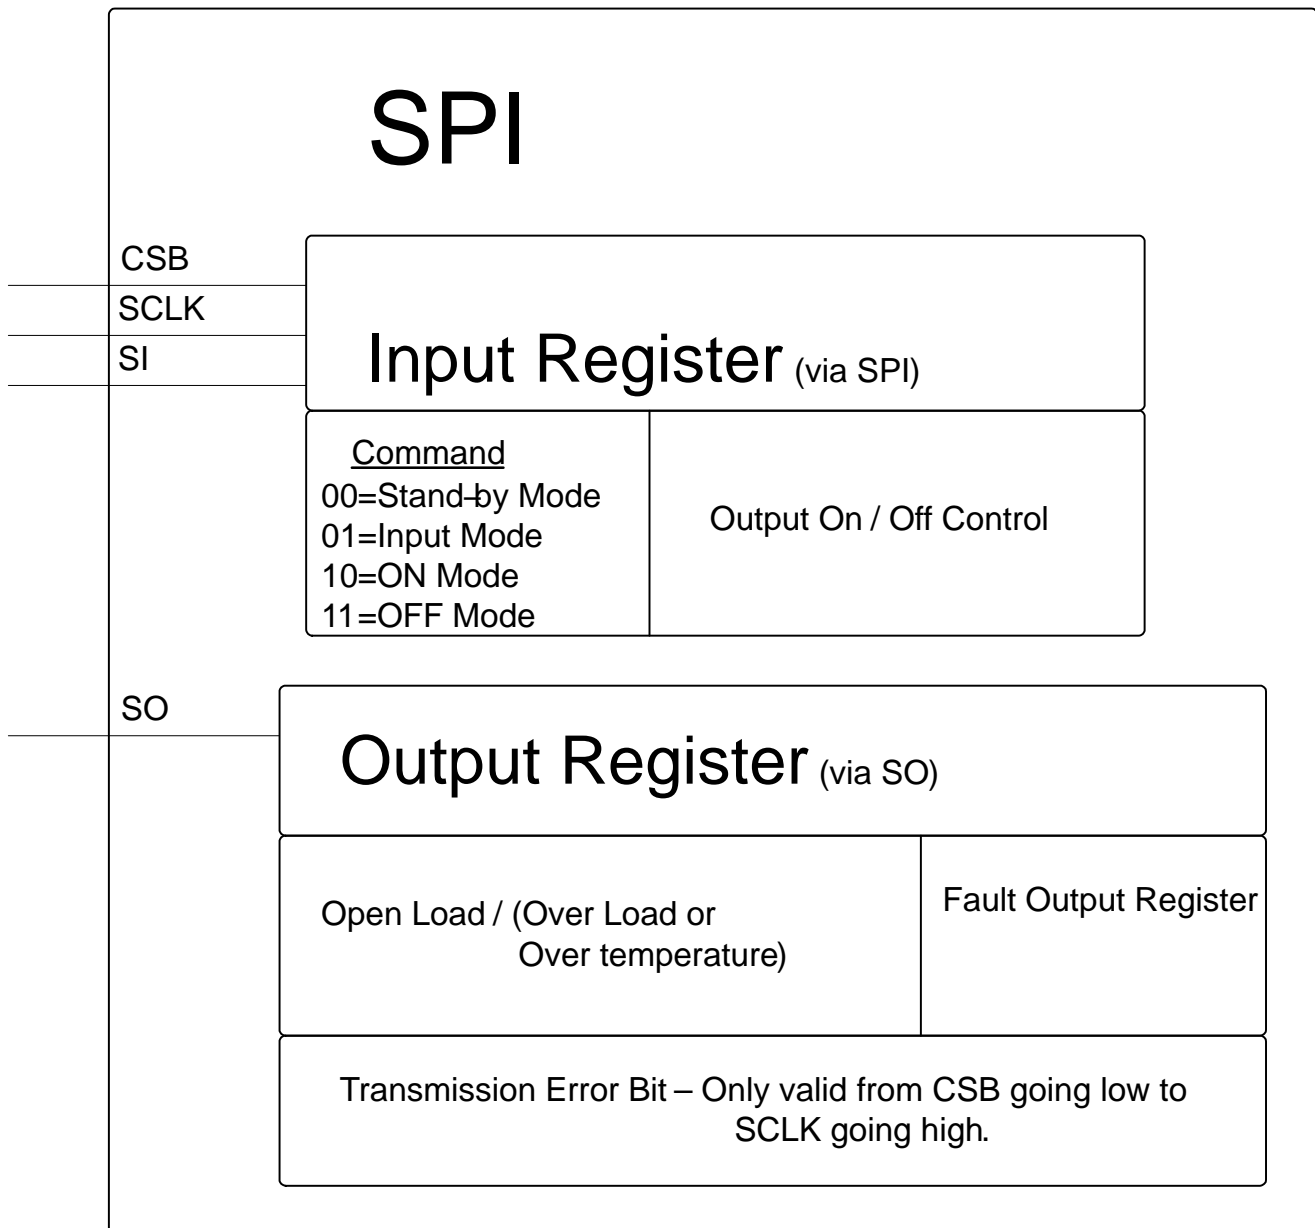

Figure 36. SPI Register Overview

Figure 36 displays the functions controlled and reported via the SPI port. The input register controls the input source (parallel or SPI) and the SPI input data. The output register transmits the output fault bits and the frame detection integrity.

SI SPI Input Data (16-bit serial structure of input word)

The 16-bit data received (SI) is decoded into instructions for each channel per the table below.
After a power-on reset, all register bits are set to a 1.

Table 4. SPI INPUT DATA

Channel 8		Channel 7		Channel 6		Channel 5		Channel 4		Channel 3		Channel 2		Channel 1	
MSB														LSB	
B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0

INPUT DATA REGISTER

Field	Bits	Description	
channel x (x = 1–8)	15, 14	Command	
	13, 12	00	Channel Stand-by Mode Fast channel turn off Corresponding Channel Fault Register reset
	11, 10		
	9, 8		
	7, 6	Diagnostic Current	Disabled
	5, 4		
	3, 2	01	Input Mode Channel Input directed to INx. (reference PWM operation section).
	1, 0		
		Diagnostic Current	Enabled in OFF State.
		10	ON Mode Channel turned on.
		Diagnostic Current	Disabled
		11	OFF Mode Channel turned off.
		Diagnostic Current	Enabled (Disabled after POR)*

*For proper LED load operation.

SO (fault diagnostic retrieval)

Output fault diagnostics from the output fault diagnostic register are shifted out on any 16 bit word clocked into Serial Input (SI).

Output fault diagnostics and frame detection errors are available through the serial output (SO).

Table 5. SPI OUTPUT DATA

TER	OL8	D8	OL7	D7	OL6	D6	OL5	D5	OL4	D4	OL3	D3	OL2	D2	OL1	D1
-----	-----	----	-----	----	-----	----	-----	----	-----	----	-----	----	-----	----	-----	----

FAULT DIAGNOSTIC REGISTER

Field	Bits	Description
TER	CSB high-to-low prior to 1st SCLK low-to-high	Transmission Error. 0 Successful transmission in previous communication. 1 Frame detection error in previous transmission or exiting Limp Home Mode, exiting UVLO Mode, or exiting Low Iq mode to Global Off Mode
OIn (n = 1 – 8)	1, 3, 5, 7, 9, 11, 13, 15	Open Load 0 Normal Operation 1 Fault detected
Dn (n = 1 – 8)	0, 2, 4, 6, 8, 10, 12, 14	Over Load or Over Temperature 0 Normal Operation 1 Fault detected

Table 6. FAULT CONDITIONS

Output Fault Condition	Fault Memory	Miscellaneous
Open Load	Latched	Detected in Driver Off State (1.75 V [Typ] threshold) when detection is enabled. Reported in Output Fault Diagnostics Register until cleared via the SPI port. Output will maintain turn-on capability.
Short to Ground	Latched	Detected as part of the Open Load circuitry described above.
Short to V_{bat}	N/A	Protected via Over Load and Over Temperature functions.
Over Load	Latched	Detected in Driver On State 0.5 A [min], 0.95 A [max]. A latched off condition must be cleared via the SPI port before it can be turned on.
Over Temperature	Latched	Detected in IC On State ($T_J = 175^{\circ}\text{C}$ [Typ]) A latched off condition must be cleared via the SPI port before it can be turned on.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
