MAX6730–MAX6735

Single-/Dual-/Triple-Voltage µP Supervisory Circuits with Independent Watchdog Output

General Description

The MAX6730–MAX6735 single-/dual-/triple-voltage microprocessor (µP) supervisors feature a watchdog timer and manual reset capability. The MAX6730–MAX6735 offer factory-set reset thresholds for monitoring voltages from +0.9V to +5V and an adjustable reset input for monitoring voltages down to +0.63V. The combination of these features significantly improves system reliability and accuracy when compared to separate ICs or discrete components.

The active-low reset output asserts and remains asserted for the reset timeout period after all the monitored voltages exceed their respective thresholds. Multiple factory-set reset threshold combinations reduce the number of external components required. The MAX6730/MAX6731 monitor a single fixed voltage, the MAX6732/MAX6733 monitor two fixed voltages, and the MAX6734/MAX6735 monitor two fixed voltages and one adjustable voltage. All devices are offered with six minimum reset timeout periods ranging from 1.1ms to 1120ms.

The MAX6730–MAX6735 feature a watchdog timer with an independent watchdog output. The watchdog timer prevents system lockup during code execution errors. A watchdog startup delay of 54s after reset asserts allows system initialization during power-up. The watchdog operates in normal mode with a 1.68s delay after initialization. The MAX6730/MAX6732/MAX6734 provide an active-low, open-drain watchdog output. The MAX6731/MAX6733/MAX6735 provide an active-low, push-pull watchdog output.

Other features include a manual reset input (MAX6730/MAX6731/MAX6734/MAX6735) and push-pull reset output (MAX6731/MAX6733/MAX6735) or open-drain reset output (MAX6730/MAX6732/MAX6734). The MAX6730–MAX6733 are offered in a tiny SOT23-6 package. The MAX6734/MAX6735 are offered in a space-saving SOT23-8 package. All devices are fully specified over the extended -40°C to +85°C temperature range.

Applications

- Multivoltage Systems
- Telecom/Networking Equipment
- Computers/Servers
- Portable/Battery-Operated Equipment
- Industrial Equipment
- Printer/Fax
- Set-Top Boxes

Typical Operating Circuit and Pin Configurations appear at end of data sheet.

Features

- ◆ Vcc1 (Primary Supply) Reset Threshold Voltages from +1.575V to +4.63V
- ◆ Vcc2 (Secondary Supply) Reset Threshold Voltages from +0.79V to +3.08V
- ◆ Adjustable RSTIN Threshold for Monitoring Voltages Down to +0.63V (MAX6734/MAX6735 Only)
- ◆ Six Reset Timeout Options
- ◆ Watchdog Timer with Independent Watchdog Output 35s (min) Initial Watchdog Startup Period 1.12s (min) Normal Watchdog Timeout Period
- ◆ Manual Reset Input (MAX6730/MAX6731/MAX6734/MAX6735)
- ◆ Guaranteed Reset Valid down to Vcc1 or Vcc2 = +0.8V
- ◆ Push-Pull RESET or Open-Drain RESET Output
- ◆ Immune to Short Vcc Transients
- ◆ Low Supply Current: 14µA (typ) at +3.6V
- ◆ Small 6-Pin and 8-Pin SOT23 Packages

Ordering Information

PART*	TEMP RANGE	PIN-PACKAGE
MAX6730UT_D_-T	-40°C to +85°C	6 SOT23
MAX6731UT_D_-T	-40°C to +85°C	6 SOT23
MAX6732UT_D_-T	-40°C to +85°C	6 SOT23
MAX6733UT_D_-T	-40°C to +85°C	6 SOT23
MAX6734KA_D_-T	-40°C to +85°C	8 SOT23
MAX6734KA_D_N-T	-40°C to +85°C	8 SOT23
MAX6735KA_D_-T	-40°C to +85°C	8 SOT23

*Insert the threshold level suffixes for Vcc1 and Vcc2 (Table 1) after "UT" or "KA." For the MAX6730/MAX6731, insert only the Vcc1 threshold suffix after the "UT." Insert the reset timeout delay (Table 2) after "D" to complete the part number. For example, the MAX6732UTLD3-T provides a Vcc1 threshold of +4.625V, a Vcc2 threshold of +3.075V, and a 210ms reset timeout period. Sample stock is generally held on standard versions only (see the Standard Versions table). Standard versions have an order increment requirement of 2500 pieces. Nonstandard versions have an order increment requirement of 10,000 pieces. Contact factory for availability.

Devices are available in both leaded and lead(Pb)-free/RoHS-compliant packaging.

Specify lead-free by replacing "-T" with "+T" when ordering. /V denotes an automotive qualified part.

For pricing, delivery, and ordering information, please contact Maxim Direct at 1-888-629-4642, or visit Maxim's website at www.maximintegrated.com.

MAX6730–MAX6735

Single-/Dual-/Triple-Voltage µP Supervisory Circuits with Independent Watchdog Output

ABSOLUTE MAXIMUM RATINGS

V _{CC1} , V _{CC2} , RSTIN, MR, WDI to GND	-0.3V to +6V

Storage Temperature Range	-65°C to +150°C
Junction Temperature	+150°C
Lead Temperature (soldering, 10s)	+300°C
Soldering Temperature (reflow)	

Lead (Pb)-free packages+260°C

Package containing lead (Pb)+240°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PACKAGE THERMAL CHARACTERISTICS (Note 1)

6 SOT23

Junction-to-Ambient Thermal Resistance (θ_{JA}).....230°C/W

Junction-to-Case Thermal Resistance (θ_{JC}).....76°C/W

8 SOT23

Junction-to-Ambient Thermal Resistance (θ_{JA}).....180°C/W

Junction-to-Case Thermal Resistance (θ_{JC}).....60°C/W

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

ELECTRICAL CHARACTERISTICS

MAX6730–MAX6735

Single-/Dual-/Triple-Voltage µP Supervisory Circuits with Independent Watchdog Output

Pin Description

PIN			NAME	FUNCTION
MAX6730 MAX6731	MAX6732 MAX6733	MAX6734 MAX6735		
1	1	1	RST	Active-Low Reset Output. The MAX6730/MAX6732/MAX6734 provide an open-drain output. The MAX6731/MAX6733/MAX6735 provide a push-pull output. RST asserts low when any of the following conditions occur: Vcc1 or Vcc2 drops below its preset threshold, RSTIN drops below its reset threshold, or MR is driven low. Open-drain versions require an external pullup resistor.
2	2	2	GND	Ground
3	3	4	WDO	Active-Low Watchdog Output. The MAX6730/MAX6732/MAX6734 provide an open-drain WDO output. The MAX6731/MAX6733/MAX6735 provide a push-pull WDO output. WDO asserts low when no low-to-high or high-to-low transition occurs on WDI within the watchdog timeout period (t_{WD}) or if an undervoltage lockout condition exists for Vcc1, Vcc2, or RSTIN. WDO deasserts without a timeout period when Vcc1, Vcc2, and RSTIN exceed their reset thresholds, or when the manual reset input is asserted. Open-drain versions require an external pullup resistor.
4	—	5	MR	Active-Low Manual Reset Input. Drive MR low to force a reset. RST remains asserted as long as MR is low and for the reset timeout period after MR releases high. MR has a 50kΩ pullup resistor to Vcc1; leave MR open or connect to Vcc1 if unused.
5	5	3	WDI	Watchdog Input. If WDI remains high or low for longer than the watchdog timeout period, the internal watchdog timer expires and the watchdog output asserts low. The internal watchdog timer clears whenever RST asserts or a rising or falling edge on WDI is detected. The watchdog has an initial watchdog timeout period (35s min) after each reset event and a short timeout period (1.12s min) after the first valid WDI transition. Leaving WDI unconnected does not disable the watchdog timer function.
6	6	8	Vcc1	Primary Supply-Voltage Input. Vcc1 provides power to the device when it is greater than Vcc2. Vcc1 is the input to the primary reset threshold monitor.
—	4	6	Vcc2	Secondary Supply-Voltage Input. Vcc2 provides power to the device when it is greater than Vcc1. Vcc2 is the input to the secondary reset threshold monitor.
—	—	7	RSTIN	Undervoltage Reset Comparator Input. RSTIN provides a high-impedance comparator input for the adjustable reset monitor. RST asserts low if the voltage at RSTIN drops below the 626mV internal reference voltage. Connect a resistive voltage-divider to RSTIN to monitor voltages higher than 626mV. Connect RSTIN to Vcc1 or Vcc2 if unused.

D5	280	560
D6	560	1120
D4	1120	2240

Detailed Description

Supply Voltages

The MAX6730–MAX6735 microprocessor (µP) supervisors maintain system integrity by alerting the µP to fault conditions. The MAX6730–MAX6735 monitor one to three supply voltages in µP-based systems and assert an active-low reset output when any monitored supply voltage drops below its preset threshold. The output state remains valid for V_{CC1} or V_{CC2} greater than +0.8V.

Threshold Levels

The two-letter code in the Reset Voltage Threshold Suffix Guide (Table 1) indicates the threshold level combinations for V_{CC1} and V_{CC2}.

Reset Output

The MAX6730–MAX6735 feature an active-low reset output (RST). RST asserts when the voltage at either V_{CC1} or V_{CC2} falls below the voltage threshold level, VRSTIN drops below its threshold, or MR is driven low (Figure 1). RST remains low for the reset timeout period (Table 2) after V_{CC1}, V_{CC2}, and RSTIN increase above their respective thresholds and after MR releases high. Whenever V_{CC1}, V_{CC2}, or RSTIN go below the reset threshold before the end of the reset timeout period, the internal timer restarts. The MAX6730/MAX6732/ MAX6734 provide an open-drain RST output, and the MAX6731/ MAX6733/MAX6735 provide a push-pull RST output.

MAX6730–MAX6735

Single-/Dual-/Triple-Voltage µP Supervisory Circuits with Independent Watchdog Output

Manual Reset Input

Many µP-based products require manual reset capability, allowing the operator, a test technician, or external logic circuitry to initiate a reset. A logic low on MR asserts the reset output, clears the watchdog timer, and deasserts the watchdog output. Reset remains asserted while MR is low and for the reset timeout period (t_{RP}) after MR returns high. An internal 50kΩ pullup resistor allows MR to be left open if unused. Drive MR with TTL or CMOS-logic levels or with open-drain/collector outputs. Connect a normally open momentary switch from MR to GND to create a manual reset function; external debounce circuitry is not required. Connect a 0.1µF capacitor from MR to GND to provide additional noise immunity when driving MR over long cables or if the device is used in a noisy environment.

Adjustable Input Voltage (RSTIN)

The MAX6734/MAX6735 provide an additional high-impedance comparator input with a 626mV threshold to monitor a third supply voltage. To monitor a voltage higher than 626mV, connect a resistive-divider to the circuit as shown in Figure 2 to establish an externally controlled threshold voltage, V_{EXT_TH} .

$$V_{EXT_TH} = 626\text{mV} \times \frac{(R_1 + R_2)}{R_2}$$

Figure 2. Monitoring a Third Voltage

Figure 1. RST, WDO, and MR Timing Diagram

MAX6730–MAX6735

Single-/Dual-/Triple-Voltage μ P Supervisory Circuits with Independent Watchdog Output

The RSTIN comparator derives power from Vcc1, and the input voltage must remain less than or equal to Vcc1. Low leakage current at RSTIN allows the use of large-valued resistors, resulting in reduced power consumption of the system.

Watchdog

The watchdog feature monitors μ P activity through the watchdog input (WDI). A rising or falling edge on WDI within the watchdog timeout period (twd) indicates normal μ P operation. WDO asserts low if WDI remains high or low for longer than the watchdog timeout period. Leaving WDI unconnected does not disable the watchdog timer.

The MAX6730–MAX6735 include a dual-mode watchdog timer to monitor μ P activity. The flexible timeout architecture provides a long-period initial watchdog mode, allowing complicated systems to complete lengthy boots, and a short-period normal watchdog mode, allowing the supervisor to provide quick alerts when processor activity fails. After each reset event (Vcc power-up, brownout, or manual reset), there is a long initial watchdog period of 35s (min). The long watchdog period mode provides an extended time for the system to power up and fully initialize all μ P and system components before assuming responsibility for routine watchdog updates.

The usual watchdog timeout period (1.12s min) begins after the initial watchdog timeout period (twd-L) expires or after the first transition on WDI (Figure 3). During normal operating mode, the supervisor asserts the WDO output if the μ P does not update the WDI with a valid transition (high to low or low to high) within the standard timeout period (twd-S) (1.12s min).

Connect \overline{MR} to \overline{WDO} to force a system reset in the event that no rising or falling edge is detected at WDI within the watchdog timeout period. WDO asserts low when no edge is detected by WDI, the RST output asserts low, the watchdog counter immediately clears, and WDO returns high. The watchdog counter restarts, using the long watchdog period, when the reset timeout period ends (Figure 4).

Ensuring a Valid RESET Output Down to $V_{CC} = 0V$

The MAX6730–MAX6735 guarantee proper operation down to $V_{CC} = +0.8V$. In applications that require valid reset levels down to $V_{CC} = 0V$, use a $100\text{k}\Omega$ pulldown resistor from RST to GND. The resistor value used is not critical, but it must be large enough not to load the reset output when V_{CC} is above the reset threshold. For most applications, $100\text{k}\Omega$ is adequate. Note that this configuration does not work for the open-drain outputs of MAX6730/MAX6732/MAX6734.

Figure 4. Watchdog Input/Output Timing Diagram (\overline{MR} and $\overline{WD}\overline{O}$ Connected)

Applications Information

Interfacing to µPs with Bidirectional Reset Pins

Microprocessors with bidirectional reset pins can interface directly with the open-drain \overline{RST} output options. However, conditions might occur in which the push-pull output versions experience logic contention with the bidirectional reset pin of the µP. Connect a $10k\Omega$ resistor between \overline{RST} and the µP's reset I/O port to prevent logic contention (Figure 5).

Falling Vcc Transients

The MAX6730–MAX6735 µP supervisors are relatively immune to short-duration falling $V_{CC_}$ transients (glitches). Small glitches on $V_{CC_}$ are ignored by the MAX6730–MAX6735, preventing undesirable reset pulses to the µP. The *Typical Operating Characteristics* show Maximum Transient Duration vs. Reset Threshold

Figure 5. Interfacing to µPs with Bidirectional Reset I/O

MAX6730–MAX6735

Single-/Dual-/Triple-Voltage μ P Supervisory Circuits with Independent Watchdog Output

Overdrive, for which reset pulses are not generated. The graph was produced using falling VCC_– pulses, starting above V_{TH} and ending below the reset threshold by the magnitude indicated (reset threshold overdrive). The graph shows the maximum pulse width that a falling VCC transient typically might have without causing a reset pulse to be issued. As the amplitude of the transient increases (i.e., goes further below the reset threshold), the maximum allowable pulse width decreases. A 0.1 μ F bypass capacitor mounted close to VCC_– provides additional transient immunity.

Watchdog Software Considerations

Setting and resetting the watchdog input at different points in the program rather than “pulsing” the watchdog input high-low-high or low-high-low helps the watchdog timer closely monitor software execution. This technique avoids a “stuck” loop, in which the watchdog timer continues to be reset within the loop, preventing the watchdog from timing out. Figure 6 shows an example flow diagram in which the I/O driving the watchdog input is set high at the beginning of the program, set low at the beginning of every subroutine or loop, and then set high again when the program returns to the beginning. If the program “hangs” in any subroutine, the I/O continually asserts low (or high), and the watchdog timer expires, issuing a reset or interrupt.

Note: Sample stock is generally held on standard versions only. Standard versions have an order increment requirement of 2500 pieces. Nonstandard versions have an order increment requirement of 10,000 pieces. Contact factory for availability of nonstandard versions.

MAX6730–MAX6735

Single-/Dual-/Triple-Voltage µP Supervisory Circuits with Independent Watchdog Output

Pin Configurations

Typical Operating Circuit

Chip Information

PROCESS: BiCMOS

Package Information

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

PACKAGE TYPE	PACKAGE CODE	OUTLINE NO.	LAND PATTERN NO.
6 SOT23	U6-1	21-0058	90-0175
8 SOT23	K8SN-1	21-0078	90-0176

MAX6735	3	Push-Pull	✓	✓	Push-Pull

MAX6730–MAX6735

Single-/Dual-/Triple-Voltage µP Supervisory Circuits with Independent Watchdog Output

Revision History

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
0	10/02	Initial release.	—
1	12/02	Released MAX6730/MAX6731.	1
2	1/03	Released MAX6733.	1
3	3/04	Updated <i>Typical Operating Circuit</i> .	14
4	12/05	Added lead-free notation to <i>Ordering Information</i> .	1
5	3/09	Updated <i>Pin Description</i> and added <i>Package Table</i> .	7, 14
6	11/11	Added automotive-qualified part information	1
7	4/13	Added <i>Package Thermal Characteristics</i> and corrected power dissipation errors and package code for 8 SOT23	2–4, 14

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the Electrical Characteristics table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.

Maxim Integrated 160 Rio Robles, San Jose, CA 95134 USA 1-408-601-1000

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помошь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помошь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
