

Description

The F2270 is a 75Ω, low insertion loss voltage variable RF attenuator (VVA) designed for a multitude of wireless and other RF applications. This device covers a broad frequency range from 5MHz to 3000MHz. In addition to providing low insertion loss, the F2270 provides excellent linearity performance over its entire attenuation range.

The F2270 uses a positive supply voltage of 3.3V or 5V. Other features include a V_{MODE} pin allowing either a positive or negative voltage control slope versus attenuation and multi-directional operation where the RF input can be applied to either the RF1 or RF2 pins. The attenuation control voltage range is from 0V to 5V using either a 3.3V or 5V power supply.

Competitive Advantage

The F2270 provides extremely low insertion loss and superb IP3, IP2, return loss performance, and slope linearity across the control range. Compared to the previous state-of-the-art for silicon VVAs, this device provides superior performance:

- Operation down to 5MHz
- Insertion loss at 300MHz of 1.1dB
- Typical attenuation slope: 10dB/Volt
- Minimum OIP3 (maximum attenuation): +35dBm
- Minimum IIP2 (maximum attenuation, > 35MHz): +85dBm

Typical Applications

- CATV/Broadband Applications
 - Headend
 - Fiber/HFC Distribution Nodes
- CATV Test Equipment

Features

- Frequency range: 5MHz to 3000MHz
- Low insertion loss: 1.1dB at 300MHz
- Typical/Minimum IIP3 \geq 50MHz: 62dBm / 46dBm
- Typical/Minimum IIP2 \geq 50MHz: 98dBm / 77dBm
- Up to 35dB attenuation range
- Attenuation slope versus V_{CTRL} : 10dB/Volt
- Bi-directional RF ports
- +36dBm input P1dB
- V_{MODE} pin allows either positive or negative attenuation control response
- Linear-in-dB attenuation characteristic
- Nominal supply voltage: 3.3V or 5V
- V_{CTRL} range: 0V to 5V using 3.3V or 5V supply
- -40°C to +105°C operating temperature range
- 3mm x 3mm, 16-pin QFN package

Pin Descriptions

Table 1. Pin Descriptions

Number	Name	Description
1, 5 – 8, 12, 13	GND	Internally grounded. This pin must be grounded as close to the device as possible.
2, 4, 9, 11	NC	No internal connection. These pins can be left unconnected, have a voltage applied, or be connected to ground (recommended).
3	RF1	RF Port 1. Matched to 75Ω. Since the RF pin internally has DC present, an external AC coupling capacitor must be used. For low-frequency operation, increase the capacitor value to result in a low reactance at the frequency of interest. An external series inductor of 2.4nH can also be used to improve the high frequency match. This inductor, if used, should be placed as close to the device as possible.
10	RF2	RF Port 2. Matched to 75Ω. Since the RF pin internally has DC present, an external AC coupling capacitor must be used. For low-frequency operation, increase the capacitor value to result in a low reactance at the frequency of interest. An external series inductor of 2.8nH can also be used to improve the high frequency match. This inductor, if used, should be placed as close to the device as possible.
14	V _{CTRL}	Attenuator control voltage. Apply a voltage in the range specified in under “Recommended Operating Conditions.” See the “Application Information” section for details about V _{CTRL} . This pin is connected to an internal 100kΩ series resistor that drives a biased voltage divider network.
15	V _{DD}	Power supply input. Bypass to ground (GND) with capacitors as close as possible to the pin.
16	V _{MODE}	Attenuator slope control. Set to logic LOW to enable negative attenuation slope (maximum attenuation at maximum V _{CTRL}). Set to logic HIGH to enable positive attenuation slope (maximum attenuation at minimum V _{CTRL}). This pin is internally connected to a 170kΩ pull-down resistor to ground.
	– EPAD	Exposed paddle. Internally connected to ground. Solder this exposed paddle to a printed circuit board (PCB) pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple ground vias are also required to achieve the specified RF performance.

Absolute Maximum Ratings

Stresses above those listed below may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 2. Absolute Maximum Ratings

Parameter	Symbol	Minimum	Maximum	Units
V_{DD} to GND	V_{DD}	-0.3	6.0	V
V_{MODE} to GND	V_{MODE}	-0.3	Lower of (V_{DD} , 3.9)	V
V_{CTRL} to GND	V_{CTRL}	-0.3	Lower of ($V_{DD} + 3.0$, 5.3)	V
RF1, RF2 to GND	V_{RF}	-0.3	0.3	V
RF1 or RF2 Input Power Applied for 24 Hours Maximum (V_{DD} applied at 1GHz and T_{EP} [Exposed Paddle] = +85°C, $Z_S = Z_L = 75\Omega$)	P_{MAX24}		+28	dBm
Junction Temperature	T_{JMAX}		+150	°C
Storage Temperature Range	T_{STOR}	-65	+150	°C
Lead Temperature (soldering, 10s)	T_{LEAD}		+260	°C
Electrostatic Discharge – HBM (JEDEC/ESDA JS-001-2012)	V_{ESDHMB}		2000 (Class 2)	V
Electrostatic Discharge – CDM (JEDEC 22-C101F)	$V_{ESDHCDM}$		500 (Class C2)	V

Recommended Operating Conditions

Table 3. Recommended Operating Conditions

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Power Supply Voltage	V_{DD}		3.15		5.5	V
Mode Voltage ^[a]	V_{MODE}		0		Lower of (V_{DD} , 3.6)	V
Control Voltage ^[a]	V_{CTRL}		0		Lower of ($V_{DD} + 3.0$, 5.0)	V
Operating Temperature Range	T_{EP}	Exposed Paddle	-40		+105	°C
RF Frequency Range	f_{RF}		5		3000	MHz
Maximum Input RF Power	P_{MAX}	Power can be applied to RF1 or RF2			See Figure 3	dBm
RF1 Port Impedance	Z_{RF1}			75		Ω
RF2 Port Impedance	Z_{RF2}			75		Ω

[a] The power supply voltage must be applied before all other voltages.

Figure 3. Maximum Operating CW RF Input Power vs. Frequency ($Z_s = Z_L = 75\Omega$)

Electrical Characteristics

Table 4. Electrical Characteristics (General)

Refer to the application circuit in Figure 60 for the required circuit and use $L1 = L2 = 0\Omega$. The specifications in this table apply at $V_{DD} = +5.0V$, $T_{EP} = +25^{\circ}C$, $f_{RF} = 500MHz$, $Z_S = Z_L = 75\Omega$, signal applied to RF1, minimum attenuation, $P_{IN} = 0dBm$ for small signal parameters, $P_{IN} = +20dBm$ per tone for two tone tests, V_{MODE} is LOW or HIGH, and Evaluation Board (EVKit) trace and connector losses are de-embedded, unless otherwise noted.

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
V_{MODE} Logic Input HIGH	V_{IH}	$3.9V \leq V_{DD} \leq 5.5V$	1.07 [a]		3.6	V
		$V_{DD} < 3.9V$	1.07		$V_{DD} - 0.3$	
V_{MODE} Logic Input LOW	V_{IL}		0		0.63	V
V_{DD} Current	I_{DD}			1.4	2.5	mA
V_{MODE} Current	I_{MODE}		-40		40	μA
V_{CTRL} Current	I_{CTRL}		-50		50	μA
Attenuation Slope	ATT_{SLOPE}	$V_{MODE} = LOW$		10		dB/V
		$V_{MODE} = HIGH$		-10		
Attenuation Variation over Temperature (reference to $+25^{\circ}C$)	ATT_{VAR}	$f_{RF} = 50MHz$ ($-40^{\circ}C$ to $105^{\circ}C$, over full signal range of V_{CTRL})		± 1		dB
Settling Time	t_{SETTLE}	Any 1dB step in the 0dB to 33dB control range, 50% of V_{CTRL} signal to RF settled to within $\pm 0.1dB$		25		μs

[a] Specifications in the minimum/maximum columns that are shown in **bold italics** are guaranteed by test. Specifications in these columns that are not shown in bold italics are guaranteed by design characterization.

Electrical Characteristics (continued)

Table 5. Electrical Characteristics (No External RF Tuning)

Refer to the application circuit in Figure 60 for the required circuit and use $L1 = L2 = 0\Omega$. The specifications in this table apply at $V_{DD} = +5.0V$, $T_{EP} = +25^\circ C$, $f_{RF} = 500MHz$, $Z_S = Z_L = 75\Omega$, signal applied to RF1, minimum attenuation, $P_{IN} = 0dBm$ for small signal parameters, $P_{IN} = +20dBm$ per tone for two tone tests, V_{MODE} is LOW or HIGH, and Evaluation Board (EVKit) trace and connector losses are de-embedded, unless otherwise noted.

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Insertion Loss, IL	A_{MIN}	Minimum attenuation		1.1	1.8 [a]	dB
Maximum Attenuation	A_{MAX}	$f_{RF} = 5MHz$		23		dB
		$f_{RF} = 10MHz$		28		
		$f_{RF} = 500MHz$	33	35		
		$300MHz < f_{RF} \leq 1800MHz$		35		
Attenuation Variation [c]	A_{VAR}	$V_{CTRL} = 1.0V$, $V_{MODE} = LOW$		± 1.5		dB
		$V_{CTRL} = 2.1V$, $V_{MODE} = LOW$		± 2.8		
Relative Insertion Phase	$\Phi_{\Delta MAX}$	At maximum attenuation relative to minimum attenuation		9		deg

Thermal Characteristics

Table 7. Package Thermal Characteristics

Parameter	Symbol	Value	Units
Junction to Ambient Thermal Resistance	θ_{JA}	80.6	°C/W
Junction to Case Thermal Resistance (case is defined as the exposed paddle)	θ_{JC-BOT}	5.1	°C/W
Moisture Sensitivity Rating (Per J-STD-020)		MSL 1	

Typical Operating Conditions (TOCs)

Unless otherwise noted:

- $V_{DD} = +5.0V$
- $Z_S = Z_L = 75\Omega$
- $T_{EP} = +25^\circ C$
- RF trace and connector losses removed for insertion loss and attenuation results. All other results include the PCB trace and connector losses and mismatched effects.
- $P_{IN} = 0dBm$ for all small signal tests
 - $P_{IN} = +20dBm/tone$ for two tone linearity tests (RF1 port driven)
- Two tone frequency spacing
 - 1MHz for $5MHz \leq f_{RF} < 50MHz$
 - 5MHz for $50MHz \leq f_{RF} < 500MHz$
 - 50MHz for $500MHz \leq f_{RF} < 3500MHz$
- All temperatures are referenced to the exposed paddle.
- Extended band tuning uses $L1 = 2.4nH$ and $L2 = 2.8nH$ to improve RF1 and RF2 port match.

Application Information

The F2270 has been optimized for use in high performance RF applications from 5MHz to 1800MHz and has a full operating range of 5MHz to 3000MHz.

Default Start-up

V_{MODE} should be tied to either logic LOW (ground) or logic HIGH. If the V_{CTRL} pin is left floating, the part will power up in the minimum attenuation state when $V_{MODE} = \text{LOW}$ or in the maximum attenuation state when $V_{MODE} = \text{HIGH}$.

V_{MODE}

The V_{MODE} pin is used to set the slope of the attenuation. The attenuation is varied by V_{CTRL} as described in the next section. Setting V_{MODE} to a logic LOW (HIGH) will set the attenuation slope to negative (positive). A negative (positive) slope is defined as an increased (decreased) attenuation with increasing V_{CTRL} voltage. The Evaluation Kit provides has an on-board jumper to manually set V_{MODE} . Install a jumper on header J7 from V_{MODE} to the pin marked Lo (Hi) to set the device for a negative (positive) slope (see Figure 58).

V_{CTRL}

The voltage level on the V_{CTRL} pin is used to control the attenuation of the F2270. At $V_{CTRL} = 0V$, the attenuation is a minimum (maximum) in the negative (positive) slope mode. An increasing voltage on V_{CTRL} produces an increasing (decreasing) attenuation respectively. The V_{CTRL} pin has an on-chip pull-up ESD diode so V_{DD} should be applied before V_{CTRL} is applied (see "Recommended Operating Conditions" for details). If this sequencing is not possible, then resistor R5 in the application circuit (see Figure 60) should be set to $1k\Omega$ to limit the current into the V_{CTRL} pin.

RF1 and RF2 Ports

The F2270 is a bi-directional device, allowing RF1 or RF2 to be used as the RF input. RF1 has some enhanced linearity performance, and therefore should be used as the RF input, when possible, for best results. The F2270 has been designed to accept high RF input power levels; therefore, V_{DD} must be applied prior to the application of RF power to ensure reliability. DC blocking capacitors are required on the RF pins and should be set to a value that results in a low reactance over the frequency range of interest. External series inductors can be added on the RF1 and RF2 lines close to the device to improve the higher frequency match.

Power Supplies

The V_{DD} supply pin should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade performance, and fast transients can trigger ESD clamps and cause them to fail. Supply voltage changes or transients should have a slew rate smaller than $1V/20\mu s$. In addition, all control pins should remain at 0V ($\pm 0.3V$) while the supply voltage ramps or while it returns to zero.

Control Pin Interface

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, or ringing, etc., then implementing the circuit shown in Figure 57 at the input of each control pin is recommended. This applies to control pins 14 (V_{CTRL}) and 16 (V_{MODE}) as shown in Figure 57. Note the recommended resistor and capacitor values do not necessarily match the Evaluation Kit BOM for the case of poor control signal integrity.

Extended Bandwidth Tuning (EBT)

There are cases where the return loss for the RF ports needs to be better than 18 dB across the frequency range. For this case, adding series inductors just next to the package on the RF ports will accomplish this. The addition of these inductors, 2.4nH on RF1 and 2.8nH on RF2, will degrade the insertion loss and return loss at frequencies above 2GHz.

TP3	1	Test Point Black	5001	Keystone Electronics
U1	1	75 Ω Voltage Variable Attenuator	F2270NLGK	IDT
	1	Printed Circuit Board	F2270 Rev 02	IDT
R6, R8	0	DNP		

[a] Series inductors are added on the RF port to improve the high-frequency port match (extended band). If not required then the 0 Ω resistor can be used.

Evaluation Kit Operation

Below is a basic setup procedure for configuring and testing the F2270 Evaluation Kit (EVM).

Pre-Configure EVM

This section is a guide to setting up the EVM for testing. To configure the board for a negative attenuation slope (increasing attenuation with increasing V_{CTRL} voltage), install a header-shunt shorting pin 2 (center pin) and pin 3 (labeled Lo) on header J7 (see Figure 58). For a positive slope (decreasing attenuation with increasing V_{CTRL} voltage), this header-shunt should short pin 1 (labeled Hi) to pin 2 (center pin) on J7.

Power Supply Setup

Without making any connections to the EVM, set up one fixed power supply (V_{CC}) for 5V with a current limit of 10mA and one variable power supply (V_{CTRL}) set to 0V with a current limit of 5mA. Disable both power supplies.

RF Test Setup

Set the RF test setup to the desired frequency and power ranges within the specified operating limits noted in this datasheet.

Disable the output power of all the RF sources.

Connect EVM to the test setup.

With the RF sources and power supplies disabled, connect the fixed 5V power supply to connector J3, the variable supply to J4, and the RF connections to the desired RF ports.

Powering Up the EVM

Enable the V_{CC} power supply and observe a DC current of approximately 1.4mA.

Enable the V_{CTRL} power supply.

Enable the RF sources. Verify that the DC current remains at about 1.4mA.

If the J7 connection is set for a negative (positive) attenuation slope, then increasing the variable supply will produce increased (decreased) attenuation for the attenuator path (J1 to J2).

Powering Down the EVM

Disable the RF power applied to the device.

Adjust the V_{CTRL} power supply down to 0V and disable it.

Disable the V_{CC} power supply.

Disconnect the EVM from the RF test setup.

Marking Diagram

Line 1 "A01" is for lot code.

Line 2 "637" = has one digit for the year and week that the part was assembled.

Line 2 "W" is the assembler code.

Line 3 is the abbreviated part number.

Ordering Information

Orderable Part Number	Package	MSL Rating	Shipping Packaging	Operating Temperature
F2270NLGK	3.0mm x 3.0mm x 0.9mm 16-QFN	1	Tray	-40°C to +105°C
F2270NLGK8	3.0mm x 3.0mm x 0.9mm 16-QFN	1	Reel	-40°C to +105°C

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
