

400 MHz Low Power 2:8 Fan-Out Buffer with Universal Inputs and Outputs

Check for Samples: [CDCUN1208LP](#)

FEATURES

- Configuration Options (via pins or SPI/I²C):
 - Input Type (HCSL, LVDS, LVCMOS)
 - Output Type (HCSL, LVDS, LVCMOS)
 - Signal Edge Rate (Slow, Medium, Fast)
 - Clock Input Divide Value (/1, /2, /4, /8) – IN2 only
- Low Power Consumption and Power Management Features Including 1.8V Operation and Output Enable Control
- Integrated Voltage Regulators Improve PSNR
- Excellent Additive Jitter Performance
 - 200 fs RMS (10kHz-20MHz), LVDS at 100MHz

- Maximum Operating Frequency:
 - Differential Mode: up to 400 MHz
 - LVCMOS Mode: up to 250 MHz
- ESD Protection Exceeds 2kV HBM, 500V CDM
- Industrial Temperature Range (–40°C to 85°C)
- Wide Supply Range (1.8V, 2.5V, or 3.3V)

APPLICATIONS

- Communications Systems (Ethernet, PCI Express)
- Computing Systems (Ethernet, PCIe, USB)
- Consumer (Set top boxes, video equipment)
- Office Automation

DESCRIPTION

The CDCUN1208LP is a 2:8 fan-out buffer featuring a wide operating supply range, two universal differential/single-ended inputs, and universal outputs (HCSL, LVDS, or LVCMOS) with edge rate control. One of the device inputs includes a divider that provides divide values of /1, /2, /4, or /8. The CDCUN1208LP is offered in a 32 pin QFN package reducing the solution footprint. The device is flexible and easy to use. The state of certain pins determines device configuration at power up. Alternately, the CDCUN1208LP provides a SPI/I²C port with which a host processor controls device settings. The CDCUN1208LP delivers excellent additive jitter performance, and low power consumption. The output section includes four dedicated supply pins enabling the operation of output ports from different power supply domains. This provides the ability to clock devices switching at different LVCMOS levels without the need for external logic level translation circuitry.

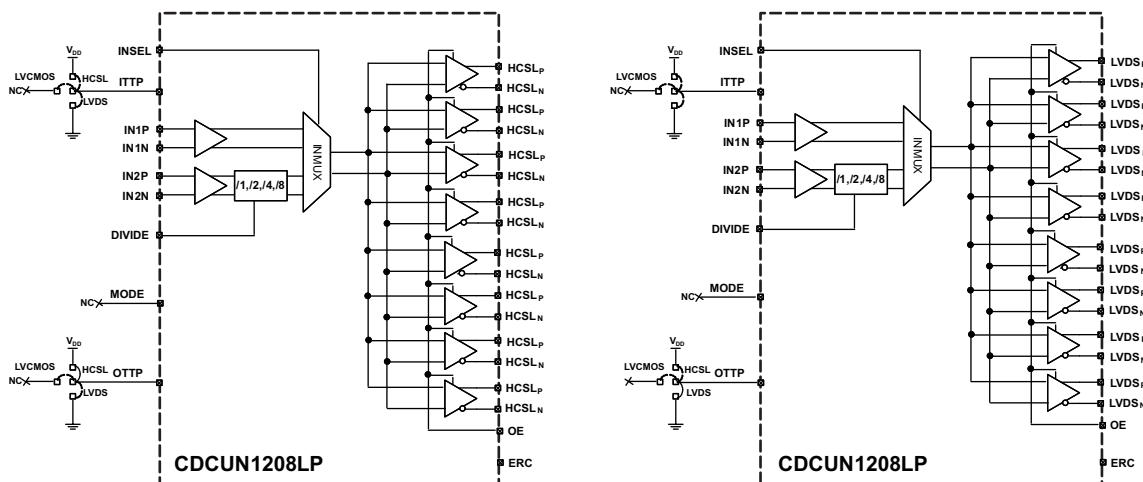

Figure 1. CDCUN1208LP Applications – HCSL and LVDS Fan-Out Buffer Mode

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

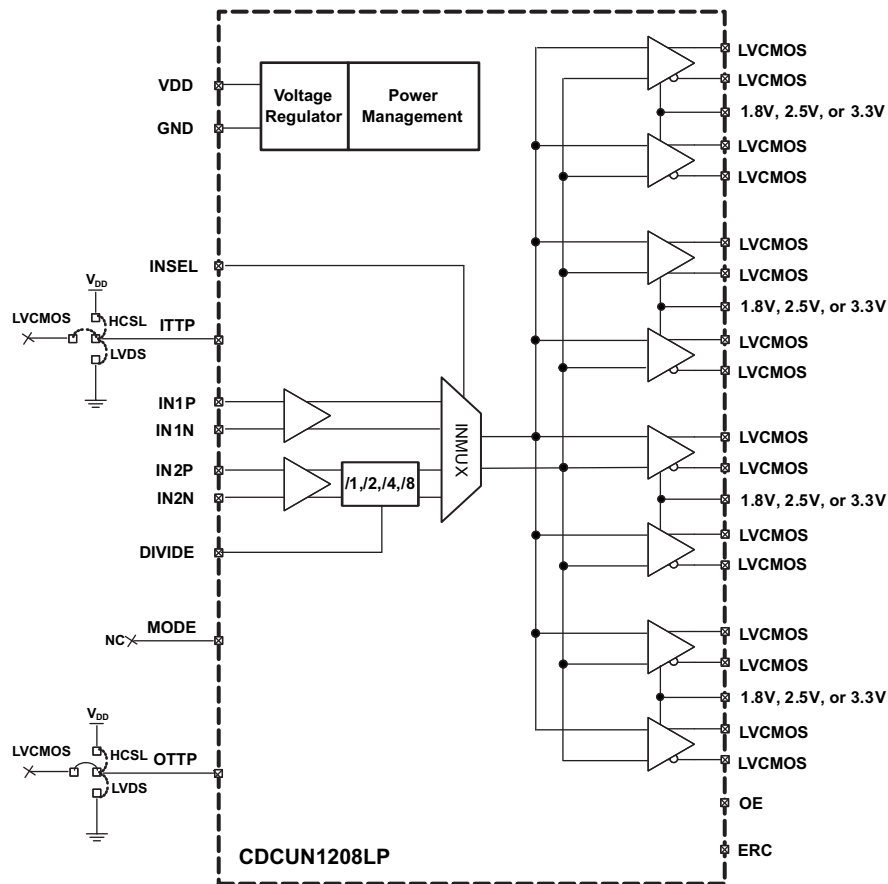

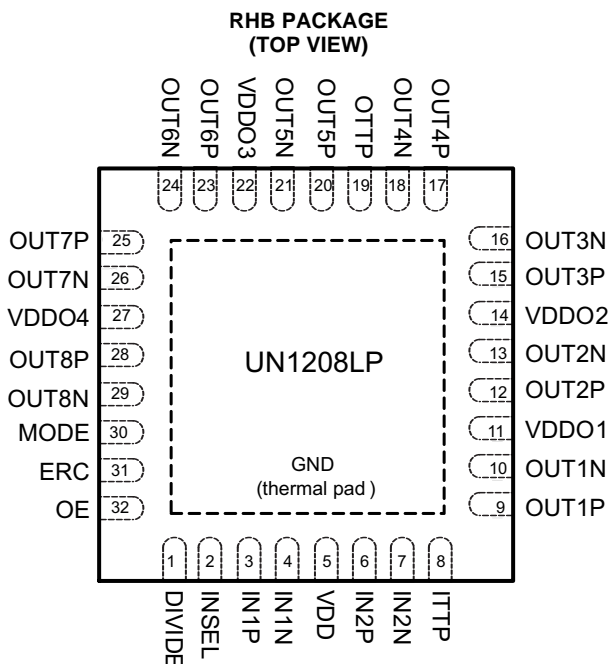

Figure 2. CDCUN1208LP Typical Application Example – LVCMOS Output Mode

PIN FUNCTIONS⁽¹⁾

NAME	PIN NUMBER	DESCRIPTION
GND	Thermal Pad	Power supply ground and thermal relief
VDD	5	Device Power Supply, Provides power to the input section and clock distribution section. Use a power supply voltage that corresponds to the switching levels of clock input(s) (i.e. 1.8V, 2.5V, or 3.3V).
MODE	30	Device Control Mode Select OPEN = Device Configured via pins (Pin Mode) HIGH = Device Configured via I ² C LOW = Device Configured via SPI Note: For information on control via the serial interface (I ² C/ SPI), see DEVICE CONTROL USING THE HOST INTERFACE section.
DIVIDE	1	Input Divider Pin Control (HIGH = /4, LOW = /2, OPEN = /1)
OE	32	Device Output Enable HIGH = Enable, LOW = Disable
ERC	31	Output Edge Rate Control HIGH = Medium, LOW = Slow, OPEN = Fast
INSEL	2	Input Multiplexer Control
ITTP	8	Input Type Select (HIGH = HCSL, LOW = LVDS, OPEN = LVCMOS)
IN1P	3	Universal Input 1 – Positive Terminal
IN1N	4	Universal Input 1 – Negative Terminal, Ground if using IN1 in single-ended mode
IN2P	6	Universal Input 2 – Positive Terminal
IN2N	7	Universal Input 2 – Negative Terminal, Ground if using IN2 in single-ended mode
OTTP	19	Output Type Select (HIGH = HCSL, LOW = LVDS, OPEN = LVCMOS)
OUT1P	9	Output 1 – Positive Terminal
OUT1N	10	Output 1 – Negative Terminal
VDDO1	11	Output Power Supply – OUT1, OUT2
OUT2P	12	Output 2 – Positive Terminal

(1) This pin list applies to operation of the device in pin mode. In host mode, certain pins take on an alternate function as outlined in [Table 9](#).

PIN FUNCTIONS⁽¹⁾ (continued)

NAME	PIN NUMBER	DESCRIPTION
OUT2N	13	Output 2 – Negative Terminal
VDDO2	14	Output Power Supply – OUT3, OUT4; Output bank OUT1 – OUT4 regulator power supply (apply power if any of OUT1 – OUT4 are needed)
OUT3P	15	Output 3 – Positive Terminal
OUT3N	16	Output 3 – Negative Terminal
OUT4P	17	Output 4 – Positive Terminal
OUT4N	18	Output 4 – Negative Terminal
OUT5P	20	Output 5 – Positive Terminal
OUT5N	21	Output 5 – Negative Terminal
VDDO3	22	Output Power Supply - OUT5, OUT6
OUT6P	23	Output 6 – Positive Terminal
OUT6N	24	Output 6 – Negative Terminal
OUT7P	25	Output 7 – Positive Terminal
OUT7N	26	Output 7 – Negative Terminal
VDDO4	27	Output Power Supply – OUT7, OUT8 Output bank OUT5 – OUT8 regulator power supply (apply power if any of OUT5 – OUT8 are needed)
OUT8P	28	Output 8 – Positive Terminal
OUT8N	29	Output 8 – Negative Terminal

ORDERING INFORMATION

T _A	PACKAGED DEVICES	FEATURES
–40°C to 85°C	CDCUN1208LPRHBT	32-pin QFN (RHB) package, small tape and reel
–40°C to 85°C	CDCUN1208LPRHBR	32-pin QFN (RHB) package, tape and reel

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

	VALUE	UNIT
V _{DDxx} Supply voltage range ⁽²⁾	–0.5 to 4.6	V
V _{IN} Input voltage range ⁽³⁾	–0.5 to V _{DDIx} + 0.5	V
V _{OUT} Output voltage range ⁽³⁾	–0.5 to V _{DDOx} + 0.5	V
I _{IN} Input current	20	mA
I _{OUT} Output current	50	mA
T _{STG} Storage temperature range	–65 to 150	°C

(1) Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

(2) All supply voltages must be supplied simultaneously

(3) The input and output negative voltage ratings may be exceeded if the input and output clamp–current ratings are observed.

THERMAL INFORMATION

THERMAL METRIC ⁽¹⁾		CDCUN1208LP	UNITS
		QFN32	
		32 PINS	
θ_{JA}	Junction-to-ambient thermal resistance	32.5	°C/W
θ_{JCTop}	Junction-to-case (top) thermal resistance	24.2	
θ_{JB}	Junction-to-board thermal resistance	6.6	
ψ_{JT}	Junction-to-top characterization parameter	0.3	
ψ_{JB}	Junction-to-board characterization parameter	6.6	
θ_{JCbott}	Junction-to-case (bottom) thermal resistance	1.6	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

RECOMMENDED OPERATING CONDITIONS

$T_A = -40^{\circ}\text{C TO } 85^{\circ}\text{C}$

				MIN	NOM	MAX	UNIT
POWER SUPPLIES⁽¹⁾							
V_{DD}	DC Power Supply - Core	1.8V Mode		1.7	1.8	1.9	V
V_{DDOx}	DC Power Supply - Output	1.8V Mode		1.7	1.8	1.9	V
V_{DD}	DC Power Supply - Core	2.5V Mode		2.375	2.5	2.625	V
V_{DDOx}	DC Power Supply - Output	2.5V Mode		2.375	2.5	2.625	V
V_{DD}	DC Power Supply - Core	3.3V Mode		2.97	3.3	3.63	V
V_{DDOx}	DC Power Supply - Output	3.3V Mode		2.97	3.3	3.63	V
TEMPERATURE							
T_A	Free- Air Temperature			–40		85	°C

(1) For proper device operation, the core power supply voltage (pin 5) must be applied either before the application of any output power supply or simultaneously with the application of the output power supplies. The application of an output power supply prior to the application of the core power supply could result in improper device behavior.

Table 1. CDCUN1208LP Power Consumption ($T_A = -40^{\circ}\text{C to } 85^{\circ}\text{C}$)

PARAMETER	DEVICE SETTINGS (See Table 2) ⁽¹⁾							TEST CONFIGURATION	DESCRIPTION	MAX CURRENT $V_{DD} = 1.8\text{V}$ $f_{OUT} = f_{IN} = 100\text{ MHz}$	MAX CURRENT $V_{DD} = 3.3\text{V}$ $f_{OUT} = f_{IN} = 100\text{ MHz}$	UNIT
	MODE	OE	ERC	OTTP	INSEL	ITTP	PD Bit					
$I_{PD1.8,3.3}$	L or H	L	X	X	X	L	H	Host Configuration Mode (see Host Configuration Mode)	Device Power Down	3	4	mA
$I_{CORE1.8,3.3}$	O	L	X	X	X	L	X	Figure 19a,b,c	Device Outputs Off	26	35	mA
$I_{HCSL1.8,3.3}$	O	H	O	H	L	O	X	Figure 19a	HCSL Buffer Current Consumption ⁽²⁾	23	23	mA
$I_{LVDS1.8,3.3}$	O	H	O	L	L	O	X	Figure 19b	LVDS Buffer Current Consumption ⁽²⁾	9	9	mA
$I_{LVCMOS1.8,3.3}$	O	H	O	O	L	O	X	Figure 19c	LVCMOS Buffer Current Consumption (one side) ⁽²⁾	8	11	mA
$I_{DEV-HCSL1.8,3.3}$	O	H	O	H	L	O	X	Figure 19a	Device Current Consumption – HCSL Mode	200	200	mA
$I_{DEV-LVDS1.8,3.3}$	O	H	O	L	L	O	X	Figure 19b	Device Current Consumption – LVDS Mode	80	90	mA
$I_{DEV-LVCMOS1.8,3.3}$	O	H	O	O	L	O	X	Figure 19c	Device Current Consumption – LVCMOS Mode	130	210	mA

(1) H = Input High, L = Input Low; O = Input Open

(2) Buffer current consumption values represent the average of the current drawn by V_{DDO1} , V_{DDO2} , V_{DDO3} , and V_{DDO4} divided by 8 (differential mode) or 16 (single-ended mode).

t_{PU}	Time from power applied to stable clock output ⁽⁹⁾	Pin mode, $f_{out} = 100$ MHz, OE asserted, measured from time V_{DD} is valid to stable output		1		ms

- (1) Single-ended measurement includes overshoot. Measurement is taken at load capacitors C_L (see [Figure 12](#)).
- (2) Single-ended measurement, includes undershoot Measurement is taken at load capacitors C_L (see [Figure 12](#)).
- (3) Measurement is taken at load capacitors C_L (see [Figure 12](#)). If $V_{DDOX} = 1.8V$, the specified minimum V_{OH} is 550 mV.
- (4) T_{STABLE} is the time the differential clock must maintain a minimum ± 150 mV differential voltage after rising/falling edges before it is allowed to droop back into the $V_{RB} \pm 100$ mV differential range. See [Figure 5](#).
- (5) $t_{Rfin} = t_{Ffin} \geq 0.6$ V/ns.
- (6) Measured from -150 mV to +150 mV on the differential waveform. The signal must be monotonic through the measurement region for rise and fall time. The 300 mV measurement window is centered on the differential zero crossing. Slow is 0.53V/ns, medium is 1.05V/ns, and fast is 2.1V/ns. The PCIe CEM spec. has a window of 0.6V/ns to 4V/ns.
- (7) Assumes input duty cycle = 50%.
- (8) Skew measured between identical output types with identical loads, identical output power supplies, and identical edge rate settings.
- (9) Parameter depends significantly on power supply design and supply voltage rise time.

FUNCTIONAL DESCRIPTION

DEVICE CONTROL USING CONFIGURATION PINS

Figure 28 illustrates and Table 2 lists the CDCUN1208LP device settings using the configuration pins. Some pins sense three different states (HIGH, LOW, OPEN) according to Figure 28 and [DIGITAL INPUT ELECTRICAL CHARACTERISTICS – OE \(SCL\), INSEL, ITTP, OTTP, DIVIDE \(SDA/MOSI\), ERC\(ADDR/CS\), MODE](#). The device samples the state of the pins at power up and configures the device accordingly. Certain pins including INSEL and OE are sampled continuously; thus changes of state of INSEL or OE controls the device instantly.

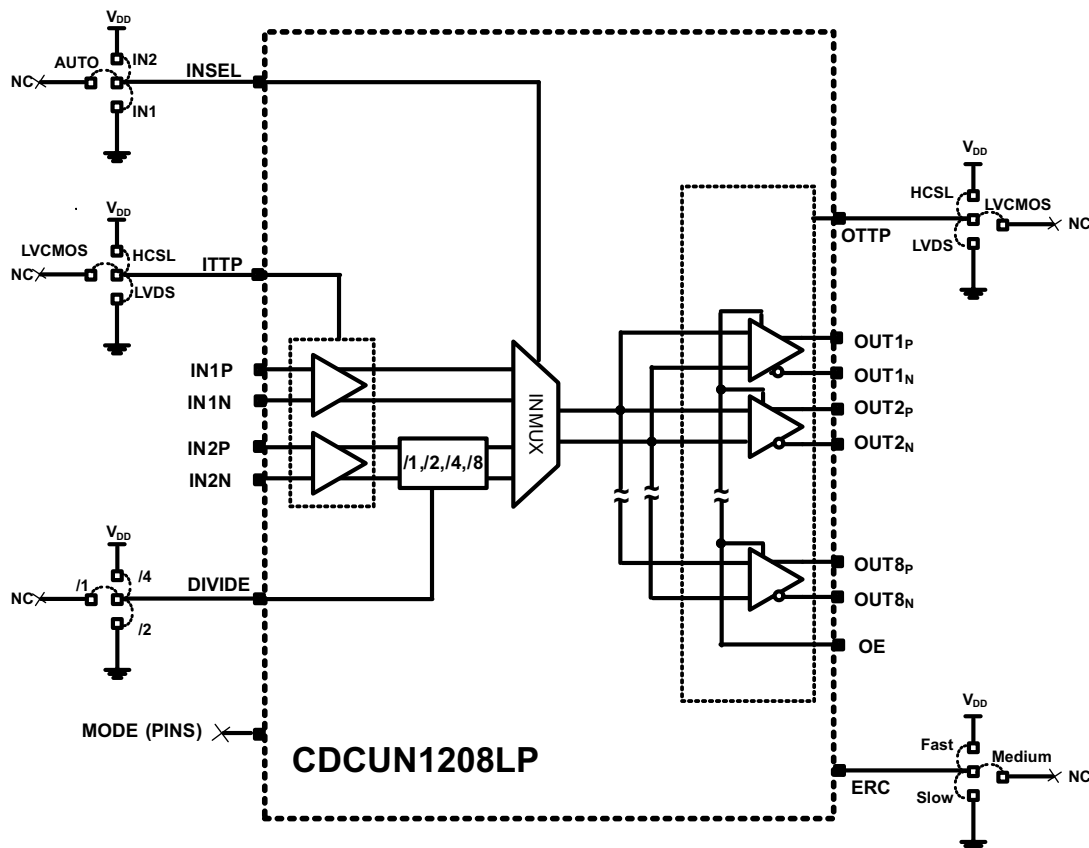

Figure 28. CDCUN1208LP Pin Configuration Overview

Table 2. CDCUN1208LP Pin Configuration Summary

PIN NAME	PIN NUMBER	DEFINITION	DEVICE CONFIGURATION DETAILS
DEVICE OUTPUTS			
OTTP	19	Output Type Setting	See Table 3
ERC	31	Edge Rate Control	See Table 4
OE	32	Device Global Output Enable	See Table 5
DEVICE INPUTS			
ITTP	8	Input Type Setting	See Table 6
DIVIDE	1	IN2 Input Divider Control	See Table 7
INSEL	2	Input Multiplexer Setting	See Table 8

CDCUN1208LP

SCAS928 –MAY 2012

www.ti.com

Configuration of Output Type (OTTP)

Table 3 shows how to set the output buffer type using the OTTP pin. This setting affects all device outputs equally. Certain combinations of output buffers include a dedicated power supply pin which must be properly bypassed. If the device output configuration is set to LVCMOS, then the supply voltage applied establishes the switching thresholds corresponding to the supply provided according to [CLOCK OUTPUT BUFFER ELECTRICAL CHARACTERISTICS \(OUTPUT MODE = LVCMOS\)](#). For example, if OUT1 and OUT2 are supplied with a 1.8V power supply via the VDDO1 pin, the switching thresholds are set to the 1.8V logic domain. The system may have other logic supplies (1.8V, 2.5V, or 3.3V) connected to the device on different output buffer supply domains simultaneously. This enables the device to clock devices operating on different supplies without the need for external logic level translation buffers. The CDCUN1208LP automatically adjusts the switching thresholds corresponding to these common logic power supply voltages. For more information regarding the power supplies for the output section, see [DEVICE POWER SUPPLY CONNECTIONS AND SEQUENCING](#).

Table 3. CDCUN1208LP Pin Configuration of Output Type

OTTP (Pin 19)	OUTPUT TYPE
LOW	LVDS
HIGH	HCSL
OPEN	LVCMOS

Configuration of Edge Rate Control (ERC)

The CDCUN1208LP supports Edge Rate Control (ERC) used to tailor jitter and EMI performance from device outputs. Table 4 shows the edge rate control setting. This setting affects all device outputs equally. Each edge rate setting is unique to the output buffer type selected as described in [CLOCK OUTPUT BUFFER CHARACTERISTICS \(OUTPUT MODE = LVDS\)](#), [CLOCK OUTPUT BUFFER CHARACTERISTICS \(OUTPUT MODE = HCSL\)](#), and [CLOCK OUTPUT BUFFER ELECTRICAL CHARACTERISTICS \(OUTPUT MODE = LVCMOS\)](#).

Table 4. CDCUN1208LP Pin Configuration of Output Edge Rate

ERC (Pin 31)	OUTPUT EDGE RATE
LOW	SLOW
HIGH	MEDIUM
OPEN	FAST

Control of Output Enable (OE)

Table 5 shows how the output enable pin controls the device outputs. The OE pin is sampled continuously so that the application may turn on/off the output buffers at any time.

Table 5. CDCUN1208LP Pin Control of Output Enable

OE (Pin 32)	OUTPUT ENABLE
LOW	DISABLED
HIGH	ENABLED
OPEN	RESERVED ⁽¹⁾

- (1) Leaving the Output Enable pin OPEN will cause the CDCUN1208LP to malfunction. This pin must be driven high or low at all times

INPUT PORTS (IN1, IN2)

Configuration of the Input Type (ITTP)

[Table 6](#) describes how to set the input buffers to the appropriate switching levels using the ITTP pin. For proper input termination, see [Figure 43](#).

Table 6. CDCUN1208LP Pin Control of Input Type (ITTP)

ITTP (Pin 8)	ITTP SETTING
LOW	LVDS
HIGH	HCSL
OPEN	LVC MOS

Configuration of the IN2 Divider (INDIV)

[Table 7](#) describes how to set the input divider using the DIVIDE pin. If the /8 setting is desired, then this feature is accessed via the host configuration method only refer to section [DEVICE CONTROL USING THE HOST INTERFACE](#).

Table 7. CDCUN1208LP Pin Control of INDIV Divider

DIVIDE (Pin 1)	INDIV DIVIDER SETTING
LOW	/2
HIGH	/4
OPEN	/1

SMART INPUT MULTIPLEXER (INMUX)

The Smart Multiplexer supports manual and automatic switching between IN1 and IN2. If enabled, the Smart Multiplexer switches automatically between clock inputs based on a prioritization scheme shown in Table 8. If using the Smart Multiplexer Auto Mode, the frequencies of the clocks applied to the smart multiplexer via IN1 and IN2 (via the divider) may differ by up to 20%. The phase relationship between clock inputs has no restriction. The smart multiplexer includes signal conditioning that provides glitch suppression.⁽¹⁾

Upon the detection of a loss of signal on the input with higher priority, the smart multiplexer switches over to the other clock input on the first incoming rising edge. During this switching operation, the output of the smart multiplexer is low. Upon restoration of the higher priority clock, the smart multiplexer waits until it detects four complete cycles from the higher priority clock prior to switching the output of the smart multiplexer back to the higher priority clock. During this switching operation, the output of the smart multiplexer remains high until the next falling edge as shown in Figure 29.

Pin Configuration of the Smart Input Multiplexer (INMUX)

Table 8 shows how to control the Smart Input Multiplexer. In Pin Configuration mode, the INSEL pin is sampled continuously so that the application may select the input clock at any time.

Table 8. Control of INMUX via the INSEL Pin

INSEL(Pin 2)	IN1 BUFFER SETTING	IN2 BUFFER SETTING
LOW	ON and selected by INSEL Multiplexer	OFF
HIGH	OFF	ON and selected by INSEL Mux
OPEN	Smart Multiplexer selects input. IN1 is the primary input (it has the highest priority, therefore if it is available, the smart multiplexer selects IN1)	

Figure 29. CDCUN1208LP Smart Multiplexer Operation

(1) This implementation does not implement a phase build-out mechanism; rather, analog filtering insuring a smooth transition at device outputs.

DEVICE CONTROL USING THE HOST INTERFACE

Host configuration mode affords a greater degree of flexibility. Unlike pin configuration mode in which the pin settings affect the entire device, host configuration mode enables the user to apply different settings to each input and output port as depicted in Figure 30. This includes the ability to mix and match output type, edge rate control, and output enable settings. The host interface is enabled/selected by strapping the MODE pin either high (for I²C) or low (for SPI) and resetting the device. Additional device features are accessible only through the host interface as well. For instance, the user can configure the input divider (IDIV) to /8 in host configuration mode only. Additionally, the system can power down the device through device registers.

OE and INSEL in Host Configuration Mode

In host configuration mode, the OE pin is no longer available; therefore buffers are controlled individually via the host interface. The input multiplexer can be controlled either via the pin or via the device registers in accordance with Table 11.

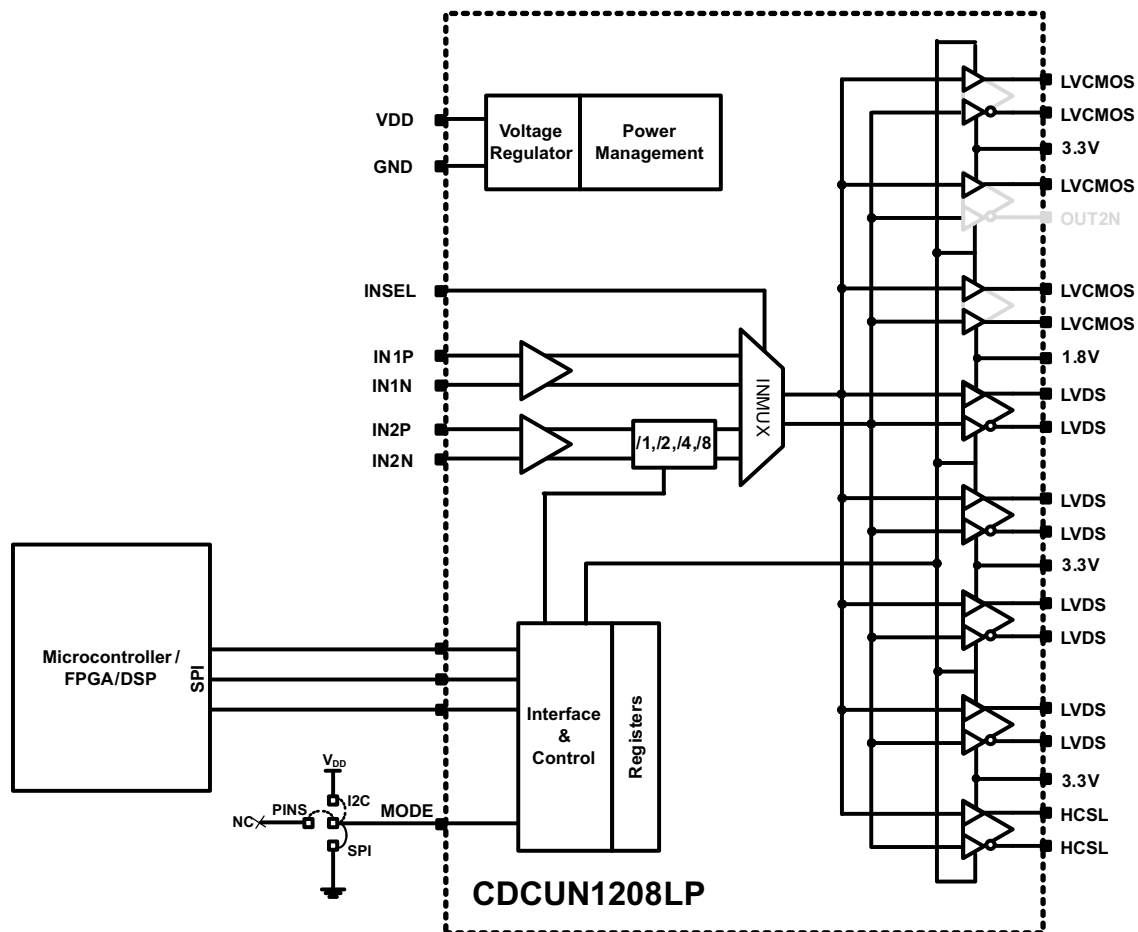

Figure 30. CDCUN1208LP Host Configuration – Typical Application

CDCUN1208LP

SCAS928 –MAY 2012

www.ti.com

When the host interface is enabled, certain pins take on alternative functions according to [Table 9](#).

Table 9. CDCUN1208LP Host Configuration Pins

PIN NAME IN HOST MODE	ALT PIN NAME IN PIN MODE (MODE = OPEN)	PIN NUMBER	PIN NAME IN HOST PROGRAMMING MODE (MODE/Pin 30 is tied high or low)	PIN NAME IN PIN CONFIGURATION MODE (only if MODE/Pin 30 is OPEN)
MODE		30	Programming Mode 1 = I ² C, 0 = SPI, OPEN = Pins (alternative description applies)	
SDA/MOSI	DIVIDE	1	Host Interface Data (I ² C), SPI Master Output Slave Input (Data In)	Input Divider Pin Control
MISO	OTTP	19	SPI Master Input Slave Output (DataOut)	Output Type (OTTP) Pin Control
SCL	OE	32	Host Interface Clock	Device Output Enable 1 = Enable, 0 = Disable
ADDR/CS	ERC	31	Host Interface Address (I ² C)/Chip Select (SPI)	Output Edge Rate Control 1 = Fast, 0 = Slow, OPEN = Medium

The CDCUN1208LP samples the MODE pin after the device exits the power on reset (POR) state. The device is placed in the RESET state in one of two ways: a power on reset (POR) circuit automatically resets the device after power is applied; or through the RESET bit (R15[1]) in register memory (see [Table 11](#)). This RESET bit is only accessible in host configuration mode. If the MODE pin (pin 11) is open (no connection), then the device is placed in the pin configuration mode and all settings are determined by the state of various pins according to [Table 2](#) and [Figure 28](#). If the MODE pin is low, then device enables the SPI interface; and, if MODE is high, then I²C is enabled.

(1) When configuring device inputs as LVCMOS, apply the signal-ended clock signal to INxP and leave INxN either floating or ground it. The power supply voltage (1.8V, 2.5V, or 3.3V) applied to V_{DD} (pin 5) establishes the switching thresholds for IN1 and IN2 in LVCMOS mode.

HOST INTERFACE HARDWARE INFORMATION

SPI Communication

A SPI communication link includes a master and one or more slaves. Table 9 lists the four signal lines that form a SPI communication link. Figure 32 shows the format for SPI messages. The SPI master (host) initiates communication by asserting SCS low. Information on SDI/SDO is latched on each rising edge of SCL. The first bit transmitted on SDI establishes the direction of the SPI transfer. Next, the master transmits the address to be written/read (up to 15 bits). If the operation is a write, the master transmits 16 data bits on SDI. If the transfer is a read, the slave transmits 16 data bits on SDO (the master continues to clock the transfer via SCL). Figure 34 and Table 12 show the timing specifications for SPI.

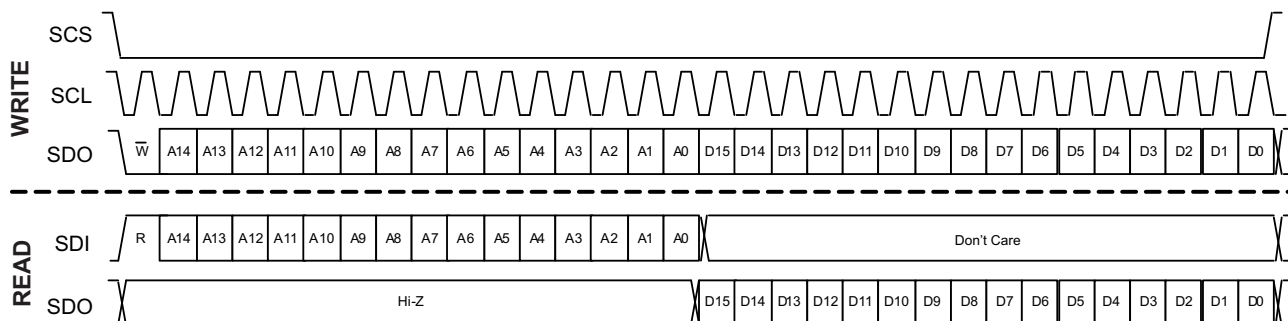

Figure 32. SPI Message Format

CDCUN1208LP SPI Addressing

Figure 33 shows how to construct the address field for SPI messages to/from the CDCUN1208LP. The device is assigned a 4-bit fixed address (0001b). In order for the host to communicate with the CDCUN1208LP, the address must include this fixed value in the correct position for the device to recognize the message.

Writing to the CDCUN1208LP

To initiate a SPI data transfer, the master (host) asserts the SCS (serial chip select) pin low (see [Figure 32](#)). The first rising edge of the clock signal (SCL) transfers the bit presented on the SDI pin of the CDCUN1208LP. This bit signals if a read (first bit high) or a write (first bit low) will transpire. The master shifts data to the slave with each rising edge of SCL. Following the W/R bit are 4 fixed bits followed by 11 bits that specify the address of the target register in the register file (see [Figure 33](#)). The 16 bits that follow are the data payload. If the master sends an incomplete message, (i.e. the master de-asserts the SCS pin high prior to a complete message transmission), then the slave aborts the transfer, and device makes no changes to the register file or the hardware. The master signals the slave of the completed transfer and disables the SPI port by de-asserting the SCS pin high.

Reading from the CDCUN1208LP

As with the write operation, the master first initiates a SPI transfer by asserting the SCS pin low. The host signals a read operation by shifting a logical high in the first bit position, signaling the slave that the master is initiating a read data transfer from the slave. Thereafter, the master specifies the address of interest according to [Figure 33](#). During the 16 clock cycles that follow, the slave presents the data from the register specified in the first half of the message on the SDO pin. The master signals the slave that the transfer is complete by de-asserting the SCS pin high.

Block Write/Read Operation

The CDCUN1208LP supports a block write and block read operation. The master need only specify the lowest address of the sequence of addresses that the host needs to access. The CDCUN1208LP will automatically increment the internal register address pointer if the SCS pin remains active low after the SPI port finishes the initial 32-bit transmission sequence. Each transmission of 16 bits (a data payload width) results in the slave automatically incrementing the address pointer (provided the SCS pin remains active low for all sequences).

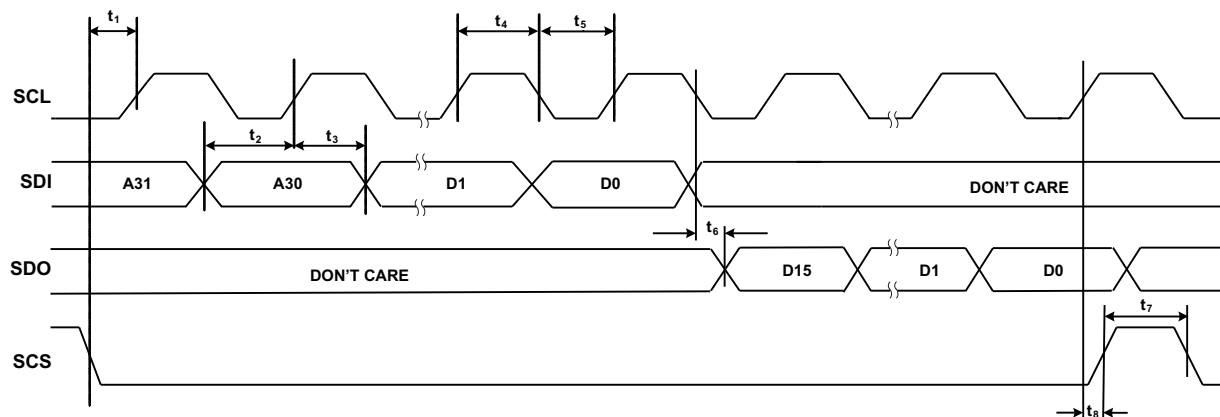

Figure 34. SPI Timing Diagram

Table 12. SPI Timing Specifications

SYMBOL	PARAMETER	MIN	TYP	MAX	UNITS
f_{Clock}	Clock Frequency for the SCL			20	MHz
t_1	SCS to SCL setup time	10			ns
t_2	SDI to SCL setup time	10			ns
t_3	SDO to SCL hold time	10			ns
t_4	SCL high duration	25			ns
t_5	SCL low duration	25			ns
t_6	SCL to SDO Setup time	10			ns
t_7	SCS Pulse Width	20			ns
t_8	SCL to SCS release time	10			ns

I²C Communication

The CDCUN1208LP incorporates an I²C port compliant with I²C Bus Specification V2.1 (7-bit addressing). Some highlights are contained herein to provide clarity with respect to how communication between the host and the CDCUN1208LP is facilitated. The I²C bus comprises two signals (clock – SCL, and data – SDA). I²C implements a master-slave protocol and supports multi-master implementations. Unlike SPI that implements a chip select signal for device level addressing and separate data signals for transmit and receive, I²C embeds the device address in the serial data stream. Because of this, devices that reside on the I²C must have a unique bus address. I²C also uses the protocol to control the direction of data flow through the data signaling line.

Message Transmission

Data and Address Bits

When transmitting address or data bits, the transmitter must only change the state of SDA when SCL is low. During the time that SCL is high, SDA must be stable (no transitions).

Figure 35. I²C Data/Address Bit Transmission

Special Symbols – Start (S) and Stop (P)

Messages are framed by the master by generating a START and a STOP symbol. The START symbol is signaled by transitioning the SDA line from high to low while the SCL line is high. The STOP symbol is signaled by transitioning the SDA line from low to high while the SCL line is high.

Figure 36. I²C Bus START and STOP Symbol Generation

Special Symbols – Acknowledge (ACK)

The acknowledge symbol must be sent by the receiver during the 9th clock cycle after the transmitter sends a byte of data. The transmitter allows the SDA pin to go high and the receiver pulls the line low to acknowledge the receipt of the byte (leaving the SDA high indicates that the byte was not received). If this occurs the transmitter issues a STOP and retransmits the message. If the receiver is not prepared to receive another byte, it can suspend transmission by holding the SDA line low during the ACK time slot. When the receiver is ready to receive another byte, it releases the SDA line.

Generic Message Frame

Figure 37 shows a typical format for I²C messages. The message frame is bracketed by the START and STOP symbols (both generated by the master). If a START symbol has not been transmitted, then the bus is considered 'available'. If a START symbol has been transmitted and a STOP symbol has not been transmitted, the bus is considered 'busy'. The first 8 bits transmitted include the R/W bit and a 7-bit I²C address field. The reception of each byte grouping that is transmitted must be acknowledged by the receiver. Next, the high byte of the data pay load is transmitted (MSB first) followed by an acknowledgement by the receiver. Finally the low byte is sent. After acknowledgement, the master sends a STOP symbol to end the message frame.

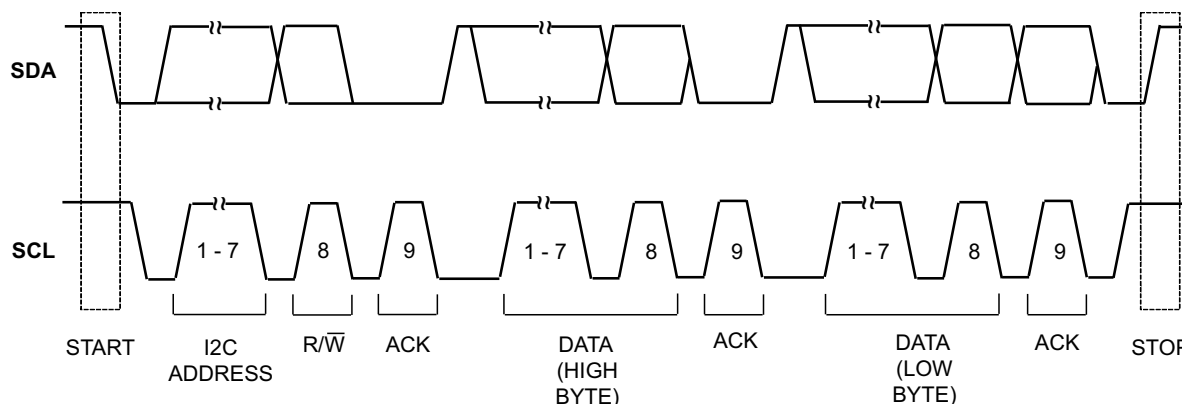

Figure 37. I²C Message Format

CDCUN1208LP Message Format

Figure 38 shows the format of addressing and flow control for I²C messages to/from the CDCUN1208LP. A message includes two address fields. The I²C Address is used to support multiple devices on the bus (each device must have a unique I²C address). The Register Address specifies which register of the device identified by the I²C Address is to be written/read.

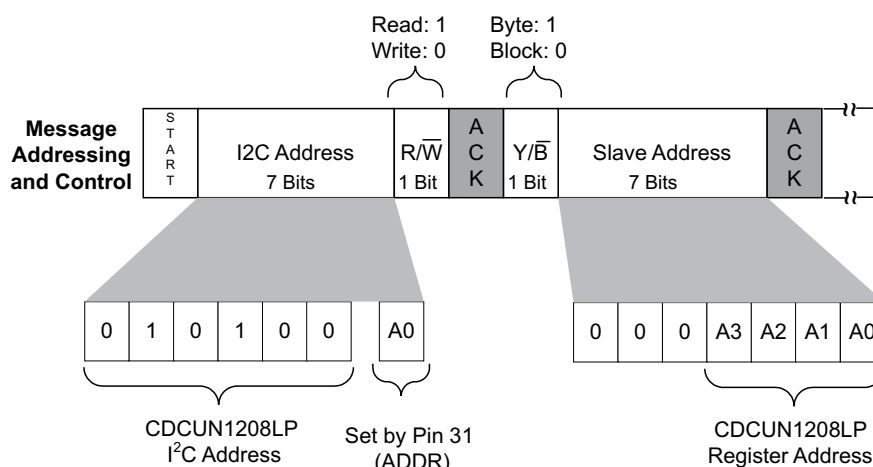

Figure 38. CDCUN1208LP I²C Message - Addressing

CDCUN1208LP Device Addressing (I²C Address)

Figure 38 outlines the construction of the I²C Address shown in Figure 37. The highest 6 bits are assigned to the target device family (are unique to a specific target device family) and are 'hard wired'. The lowest address bit (A0) corresponds to address bit that can be set via pin 31 on the CDCUN1208LP (see Table 9). This allows up to two CDCUN1208LPs to reside on the same I²C bus. The next 8 bits transmitted is called the Register Address.

CDCUN1208LP Device Addressing (Register Address)

Likewise, [Figure 38](#) shows the format of the register address field of the I²C message. The first bit determines if the transfer is a byte or a block (more than one byte). The CDCUN1208LP register width is 16 bits (2 bytes), therefore, generally block addressing is used to access each register in its entirety. Because the I²C protocol requires that the slave address is a 7-bit field, the leading 3-bits are all '0' while the trailing 4-bits specify the device register of interest.

I²C Master/Slave Handshaking

[Figure 39](#) shows the handshaking between the master (host) and the slave (CDCUN1208LP) that the I²C protocol supports. In all cases, the master drives the SCL (clock line); however, depending on the direction of transfer/acknowledgement, the master or the slave device drives SDA (data line).

Figure 39. I²C Master/Slave Handshaking Example

Block Read/Write

For “Block Write/Read” operations, the bytes are accessed in sequential order from lowest to highest byte (with most significant bit first) with the ability to stop after any complete byte has been transferred. The start address of the transfer is specified in the same way a single word transfer is initiated.

I²C Timing

Figure 40 and Table 13 provide details regarding the timing requirements for I²C:

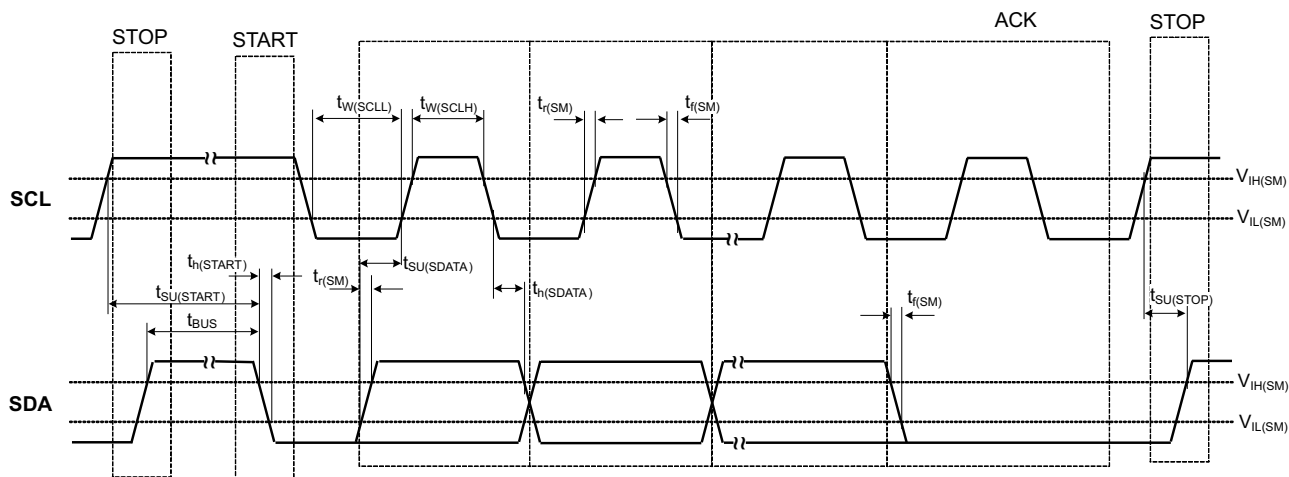

Figure 40. I²C Timing Diagram

Table 13. I²C Timing Requirements

SYMBOL	PARAMETER	MIN	MAX	UNITS
f_{SCL}	SCL Clock Frequency	0	100	kHz
$t_{SU}(START)$	START Setup Time (SCL high before SDA low)	4.7		μs
$t_{H}(START)$	START Hold Time (SCL low after SDA low)	4.0		μs
$t_{W}(SCLL)$	SCL Low-pulse duration	4.7		μs
$t_{W}(SCLH)$	SCL High-pulse duration	4.0		μs
$t_{H}(SDA)$	SDA Hold Time (SDA valid after SCL low)	0	3.45	μs
$t_{SU}(SDA)$	SDA Setup Time	250		ns
t_r	SCL / SDA input rise time		1000	ns
t_f	SCL / SDA input fall time		300	ns
$t_{SU}(STOP)$	STOP Setup Time	4.0		μs
t_{BUS}	Bus free time between a STOP and START condition	4.7		μs

APPLICATION INFORMATION

PCI EXPRESS APPLICATIONS

Figure 41 shows a typical application in which the receiver is off board. The PCIe Specification (CEM2.0) requires that all source termination is on the motherboard (not on the daughter card). For this reason, the termination resistors are placed as shown. Additionally, source resistors are employed to eliminate ringing. In this case, Z_L can vary between 40Ω and 60Ω and R_S can range from 22Ω to 33Ω .

Figure 41. Typical Configuration – Off Board Receiver

Figure 42 shows a typical application in which the receiver is on-board. In this case, series resistors are not required to eliminate ringing as proper termination is achieved. In this case two termination resistors, $Z_L = 49.9\Omega$ are placed close to the receiver.

Figure 42. Typical Configuration – On Board Connection

DEVICE POWER SUPPLY CONNECTIONS AND SEQUENCING

VDD (pin 5) is the core power supply of the device while VDDOx (pins 11, 14, 22, and 27) provide power for the output sections. The core supply must be present either before the application of the output power supplies or be present simultaneously. Applying an output power supply voltage on any of the VDDOx pins prior to the application of power to the core supply pin will potentially result in improper device operation.

VDDO2 (pin 14) and VDDO4 (pin 27) provide power for OUT1/OUT2 and OUT7/OUT8 respectively. Additionally, these pins provide power to integrated voltage regulators that condition power for two banks of outputs. For example, the regulator associated with OUT1–OUT4 receives power from the VDDO2 pin. Consequently, if the application requires one or two outputs from a bank of four, then the application must use OUT3/OUT4 and apply power via VDDO2⁽¹⁾. Likewise, the regulator that conditions power for OUT5–OUT8 receives power from VDDO4 (pin 27). If the application uses subset of OUT5–OUT8, then OUT7/OUT8 must be used. For example, if the application will use 6 of the 8 output channels, then VDDO1, VDDO2, and VDDO4 (along with OUT1–OUT4, and OUT7–OUT8) must be used. If the application requires the use of 7 of the 8 output channels, the VDDO1–VDDO4 are used, and OUT1–OUT7 or OUT1–OUT6 and OUT8 could be used.

(1) If OUT1 or OUT2 are used and VDDO1 is powered but not VDDO2, the CDCUN1208LP will not function properly. Likewise, if OUT5 or OUT6 are used and VDDO3 is powered but not VDDO4, then the device will not function properly either.

DEVICE INPUTS (IN1, IN2)

Figure 43 shows how to interface certain common signaling formats to the device inputs of the CDCUN1208LP. This entails both proper signal termination as well as input buffer configuration via the input type (ITTP) pin.

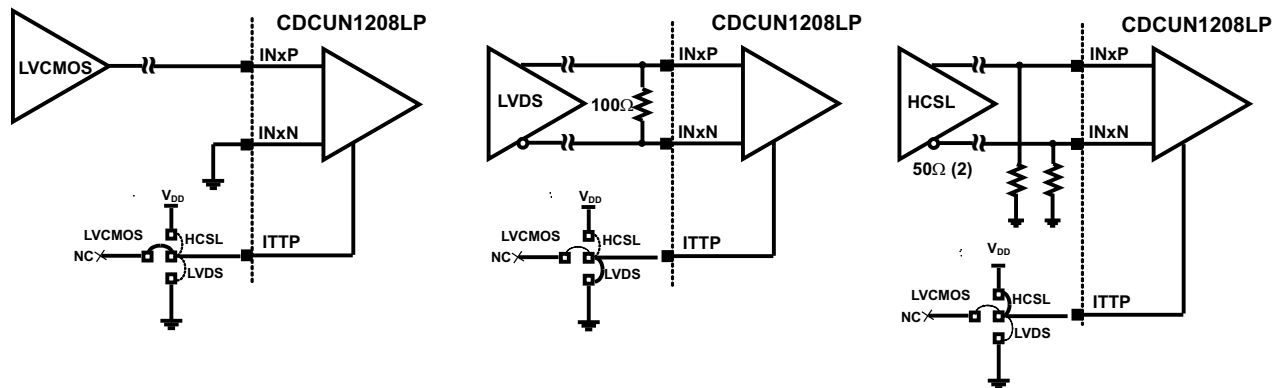

Figure 43. Common Interfaces to Device Inputs – DC Coupling

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/ Ball Finish	MSL Peak Temp ⁽³⁾	Samples (Requires Login)
CDCUN1208LPRHBR	ACTIVE	QFN	RHB	32	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	
CDCUN1208LPRHBT	ACTIVE	QFN	RHB	32	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

PLASTIC QUAD FLATPACK NO-LEAD

4204326/D 06/11

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - QFN (Quad Flatpack No-Lead) Package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - Falls within JEDEC MO-220.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

NOTE: A. All linear dimensions are in millimeters

RHB (S-PVQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
 - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
