Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: http://www.renesas.com

April 1st, 2010 Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (http://www.renesas.com)

Send any inquiries to http://www.renesas.com/inquiry.

Notice

- 1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
- 2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
- 3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
- 4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
- 5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
- 6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
- 7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anticrime systems; safety equipment; and medical equipment not specifically designed for life support.
 - "Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
- 8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
- 9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
- 10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
- 11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics
- 12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majorityowned subsidiaries.
- (Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

Notes regarding these materials

- This document is provided for reference purposes only so that Renesas customers may select the appropriate Renesas products for their use. Renesas neither makes warranties or representations with respect to the accuracy or completeness of the information contained in this document nor grants any license to any intellectual property rights or any other rights of Renesas or any third party with respect to the information in this document.
- 2. Renesas shall have no liability for damages or infringement of any intellectual property or other rights arising out of the use of any information in this document, including, but not limited to, product data, diagrams, charts, programs, algorithms, and application circuit examples.
- 3. You should not use the products or the technology described in this document for the purpose of military applications such as the development of weapons of mass destruction or for the purpose of any other military use. When exporting the products or technology described herein, you should follow the applicable export control laws and regulations, and procedures required by such laws and regulations.
- 4. All information included in this document such as product data, diagrams, charts, programs, algorithms, and application circuit examples, is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas products listed in this document, please confirm the latest product information with a Renesas sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas such as that disclosed through our website. (http://www.renesas.com)
- Renesas has used reasonable care in compiling the information included in this document, but Renesas assumes no liability whatsoever for any damages incurred as a result of errors or omissions in the information included in this document.
- 6. When using or otherwise relying on the information in this document, you should evaluate the information in light of the total system before deciding about the applicability of such information to the intended application. Renesas makes no representations, warranties or guaranties regarding the suitability of its products for any particular application and specifically disclaims any liability arising out of the application and use of the information in this document or Renesas products.
- 7. With the exception of products specified by Renesas as suitable for automobile applications, Renesas products are not designed, manufactured or tested for applications or otherwise in systems the failure or malfunction of which may cause a direct threat to human life or create a risk of human injury or which require especially high quality and reliability such as safety systems, or equipment or systems for transportation and traffic, healthcare, combustion control, aerospace and aeronautics, nuclear power, or undersea communication transmission. If you are considering the use of our products for such purposes, please contact a Renesas sales office beforehand. Renesas shall have no liability for damages arising out of the uses set forth above.
- 8. Notwithstanding the preceding paragraph, you should not use Renesas products for the purposes listed below:
 - (1) artificial life support devices or systems
 - (2) surgical implantations
 - (3) healthcare intervention (e.g., excision, administration of medication, etc.)
 - (4) any other purposes that pose a direct threat to human life
 - Renesas shall have no liability for damages arising out of the uses set forth in the above and purchasers who elect to use Renesas products in any of the foregoing applications shall indemnify and hold harmless Renesas Technology Corp., its affiliated companies and their officers, directors, and employees against any and all damages arising out of such applications.
- 9. You should use the products described herein within the range specified by Renesas, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas shall have no liability for malfunctions or damages arising out of the use of Renesas products beyond such specified ranges.
- 10. Although Renesas endeavors to improve the quality and reliability of its products, IC products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Please be sure to implement safety measures to guard against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other applicable measures. Among others, since the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
- 11. In case Renesas products listed in this document are detached from the products to which the Renesas products are attached or affixed, the risk of accident such as swallowing by infants and small children is very high. You should implement safety measures so that Renesas products may not be easily detached from your products. Renesas shall have no liability for damages arising out of such detachment.
- 12. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written approval from Renesas.
- 13. Please contact a Renesas sales office if you have any questions regarding the information contained in this document, Renesas semiconductor products, or if you have any other inquiries.

General Precautions on Handling of Product

1. Treatment of NC Pins

Note: Do not connect anything to the NC pins.

The NC (not connected) pins are either not connected to any of the internal circuitry or are used as test pins or to reduce noise. If something is connected to the NC pins, the operation of the LSI is not guaranteed.

2. Treatment of Unused Input Pins

Note: Fix all unused input pins to high or low level.

Generally, the input pins of CMOS products are high-impedance input pins. If unused pins are in their open states, intermediate levels are induced by noise in the vicinity, a pass-through current flows internally, and a malfunction may occur.

3. Processing before Initialization

Note: When power is first supplied, the product's state is undefined.

The states of internal circuits are undefined until full power is supplied throughout the chip and a low level is input on the reset pin. During the period where the states are undefined, the register settings and the output state of each pin are also undefined. Design your system so that it does not malfunction because of processing while it is in this undefined state. For those products which have a reset function, reset the LSI immediately after the power supply has been turned on.

4. Prohibition of Access to Undefined or Reserved Addresses

Note: Access to undefined or reserved addresses is prohibited.

The undefined or reserved addresses may be used to expand functions, or test registers may have been be allocated to these addresses. Do not access these registers; the system's operation is not guaranteed if they are accessed.

Configuration of This Manual

This manual comprises the following items:

- 1. General Precautions on Handling of Product
- 2. Configuration of This Manual
- 3. Preface
- 4. Contents
- 5. Overview
- 6. Description of Functional Modules
 - CPU and System-Control Modules
 - · On-Chip Peripheral Modules

The configuration of the functional description of each module differs according to the module. However, the generic style includes the following items:

- i) Feature
- ii) Input/Output Pin
- iii) Register Description
- iv) Operation
- v) Usage Note

When designing an application system that includes this LSI, take notes into account. Each section includes notes in relation to the descriptions given, and usage notes are given, as required, as the final part of each section.

- 7. List of Registers
- 8. Electrical Characteristics
- 9. Appendix
- 10. Main Revisions and Additions in this Edition (only for revised versions)

The list of revisions is a summary of points that have been revised or added to earlier versions. This does not include all of the revised contents. For details, see the actual locations in this manual.

11. Index

Preface

The H8/36079 Group and H8/36077 Group are single-chip microcomputers made up of the high-speed H8/300H CPU employing Renesas Technology original architecture as their cores, and the peripheral functions required to configure a system. The H8/300H CPU has an instruction set that is compatible with the H8/300 CPU.

Target Users: This manual was written for users who will be using the H8/36079 Group and

H8/36077 Group in the design of application systems. Target users are expected to

understand the fundamentals of electrical circuits, logical circuits, and

microcomputers.

Objective: This manual was written to explain the hardware functions and electrical

characteristics of the H8/36079 Group and H8/36077 Group to the target users. Refer to the H8/300H Series Software Manual for a detailed description of the

instruction set.

Notes on reading this manual:

In order to understand the overall functions of the chip
 Read the manual according to the contents. This manual can be roughly categorized into parts on the CPU, system control functions, peripheral functions and electrical characteristics.

 In order to understand the details of the CPU's functions Read the H8/300H Series Software Manual.

In order to understand the details of a register when its name is known
 Read the index that is the final part of the manual to find the page number of the entry on the register. The addresses, bits, and initial values of the registers are summarized in section 21, List of Registers.

Example: Register name: The following notation is used for cases when the same or a

similar function, e.g. serial communication interface, is

implemented on more than one channel:

XXX_N (XXX is the register name and N is the channel

number)

Bit order: The MSB is on the left and the LSB is on the right.

Notes:

When using an on-chip emulator (E7, E8) for H8/36079 and H8/36077 program development and debugging, the following restrictions must be noted.

- 1. The NMI pin is reserved for the E7 or E8, and cannot be used.
- 2. Pins P85, P86, and P87 cannot be used. In order to use these pins, additional hardware must be provided on the user board.
- 3. The following areas are used by the E7 or E8, and are not available to the user.

H8/36079 Group: H'01F000 to H'01FFFF

H8/36077 Group: H'D000 to H'DFFF

4. The following areas must on no account be accessed.

H8/36079 Group: H'FFF780 to H'FFFB7F

H8/36077 Group: H'F780 to H'FB7F

- 5. In usage with the E7 or E8, address breaks can be set as either available to the user or for use by the E7 or E8. If address breaks are set as being used by the E7, the address break control registers must not be accessed.
- 6. In usage with the E7 or E8, NMI is an input/output pin (open-drain in output mode), P85 and P87 are input pins, and P86 is an output pin.
- 7. Use channel 1 of the SCI3 (P21/RXD, P22/TXD) in on-board programming mode by boot mode.
- 8. In usage with the E7 or E8, the power supply voltage for H8/36079 Group products must be greater than the reset detection voltage of the low voltage detection circuit.

Related Manuals: The latest versions of all related manuals are available from our web site.

Please ensure you have the latest versions of all documents you require.

Section 1 Overview

1.1 Features

- High-speed H8/300H CPU with an internal 16-bit architecture
 - Upwardly compatible with H8/300 CPU at the object level
 - Sixteen 16-bit general registers
 - 62 basic instructions
- Various peripheral functions
 - RTC (can be used as a free running counter)
 - Timer B1 (8-bit timer)
 - Timer V (8-bit timer)
 - Timer Z (16-bit timer)
 - 14-bit PWM
 - Watchdog timer
 - SCI (asynchronous or clock synchronous serial communication interface) × 2 channels
 - I²C bus interface (conforms to the I²C bus interface format that is advocated by Philips Electronics)
 - 10-bit A/D converter
 - POR/LVD (power-on reset & low-voltage detection circuit)
 - On-chip oscillator

• On-chip memory

| Product Classification | Product Model | ROM Size | RAM Size | Remarks | | | |
|--|-------------------|-------------|------------|-------------|------------|----------|--|
| Flash memory version (F-ZTAT™ version) | H8/36079 Group | 5.0-V model | H8/36079GF | HD64F36079G | 128 Kbytes | 6 Kbytes | |
| | | 3.3-V model | H8/36079LF | HD64F36079L | _ | | |
| | | 5.0-V model | H8/36078GF | HD64F36078G | 96 Kbytes | _ | |
| | | 3.3-V model | H8/36078LF | HD64F36078L | _ | | |
| | H8/36077 | 5.0-V model | H8/36077GF | HD64F36077G | 56 Kbytes | 4 Kbytes | |
| | Group | 3.3-V model | H8/36077LF | HD64F36077L | _ | | |
| | | 5.0-V model | H8/36074GF | HD64F36074G | 32 Kbytes | _ | |
| | | 3.3-V model | H8/36074LF | HD64F36074L | _ | | |

Operating voltage and maximum operating frequency

| Product Classification | | Product Model | Operating Voltage Range | Maximum Operating Frequency Remarks | | |
|--|--|---------------|-------------------------------|-------------------------------------|----------------|----------|
| Flash memory version (F-ZTAT™ version) | | 5.0-V model | H8/36079GF | HD64F36079G | 4.5 V to 5.5 V | 20.0 MHz |
| | | 3.3-V model | H8/36079LF | HD64F36079L | 3.0 V to 3.6 V | 16.0 MHz |
| | | 5.0-V model | H8/36078GF | HD64F36078G | 4.5 V to 5.5 V | 20.0 MHz |
| | | 3.3-V model | H8/36078LF | HD64F36078L | 3.0 V to 3.6 V | 16.0 MHz |
| | | 5.0-V model | H8/36077GF | HD64F36077G | 4.5 V to 5.5 V | 20.0 MHz |
| | | 3.3-V model | H8/36077LF | HD64F36077L | 3.0 V to 3.6 V | 16.0 MHz |
| | | 5.0-V model | H8/36074GF | HD64F36074G | 4.5 V to 5.5 V | 20.0 MHz |
| | | 3.3-V model | H8/36074LF | HD64F36074L | 3.0 V to 3.6 V | 16.0 MHz |

• CPU Operating mode and address space

| Product Classification | | Product Model | Address Space | CPU Operating Mode | Remarks | | |
|-------------------------------|----------|---------------|------------------|--------------------------|-------------------------|----------|--|
| Flash memory version | H8/36079 | 5.0-V model | H8/36079GF | HD64F36079G | 16 Mbytes Advanced mode | Advanced | |
| (F-ZTAT [™] version) | Group | 3.3-V model | H8/36079LF | HD64F36079L | | | |
| | | 5.0-V model | H8/36078GF | HD64F36078G | | | |
| | | 3.3-V model | H8/36078LF | HD64F36078L | - | | |
| | H8/36077 | 5.0-V model | H8/36077GF | HD64F36077G | 64 Kbytes | Normal | |
| | Group | 3.3-V model | H8/36077LF | HD64F36077L | - - | mode | |
| | | 5.0-V model | H8/36074GF | HD64F36074G | | | |
| | | 3.3-V model | H8/36074LF | HD64F36074L | | | |

- General I/O ports
 - I/O pins: 47 I/O pins, including 8 for large currents ($I_{ot} = 20 \text{ mA}$, @ $V_{ot} = 1.5 \text{ V}$)
 - Input-only pins: 8 (also used for analog input)
- I²C bus interface (conforms to the I²C bus interface format put forward by Philips Electronics)
- Supports various power-down modes

Note: F-ZTAT TM is a trademark of Renesas Technology Corp.

• Compact package

| Package | Code | Body Size | Pin Pitch |
|---------|--------|----------------|-----------|
| LQFP-64 | FP-64K | 10.0 × 10.0 mm | 0.5 mm |
| QFP-64 | FP-64A | 14.0 × 14.0 mm | 0.8 mm |

1.4 Pin Functions

Table 1.1 Pin Functions

| Туре | Symbol | Pin No. FP-64K FP-64A | - I/O | Functions |
|-------------------|------------------|-----------------------------|----------|---|
| Power source pins | V _{cc} | 12 | Input | Power supply pin. Connect this pin to the system power supply. |
| | V _{ss} | 9 | Input | Ground pin. Connect this pin to the system power supply (0V). |
| | AV _{cc} | 3 | Input | Analog power supply pin for the A/D converter. When the A/D converter is not used, connect this pin to the system power supply. |
| | V _{CL} | 6 | Input | See section 20, Power Supply Circuit, for a typical connection. |
| Clock pins | OSC1 | 11 | Input | These pins connect with crystal or ceramic |
| | OSC2/ CLKOUT | 10 | Output | resonator for the system clock, or can be used to input an external clock. When the on-chip oscillator is used, the system clock can be output on OSC2 pin. |
| | | | | See section 5, Clock Pulse Generator, for a typical connection. |
| | X1 | 5 | Input | These pins connect with a 32.768 kHz crystal |
| | X2 | 4 | Output | resonator for the subclock. See section 5, Clock Pulse Generator, for a typical connection. |
| System control | RES | 7 | Input | Reset pin. The pull-up resistor (typ. 150 k Ω) is incorporated. When driven low, this LSI is reset. |
| | TEST | 8 | Input | Test pin. Connect this pin to Vss. |
| Interrupt pins | NMI | 35 | Input | Non-maskable interrupt request input pin. Be sure to pull up by a resistor. |
| | IRQ0 to IRQ3 | 51 to 54 | Input | External interrupt request input pins. Can select the rising or falling edge. |
| | WKP0 to | 13, 14, 19 to 22 | Input | External interrupt request input pins. Can select the rising or falling edge. |
| RTC | TMOW | 23 | Output | This is an output pin for a divided clock. |
| Timer B1 | TMIB1 | 52 | Input | External event input pin |

| | | Pin No. | | |
|---|------------------|------------------|----------|---|
| Туре | Symbol | FP-64K FP-64A | - I/O | Functions |
| Timer V | TMOV | 30 | Output | This is an output pin for a waveform generated by the output compare function. |
| | TMCIV | 29 | Input | External event input pin |
| | TMRIV | 28 | Input | Counter reset input pin |
| | TRGV | 54 | Input | Counter start trigger input pin |
| Timer Z | FTIOA0 | 36 | I/O | Output compare output/input capture input/external clock input pin |
| | FTIOB0 | 34 | I/O | Output compare output/input capture input/PWM output pin |
| | FTIOC0 | 33 | I/O | Output compare output/input capture input/PWM sync output pin (at a reset, complementary PWM mode) |
| | FTIOD0 | 32 | I/O | Output compare output/input capture input/PWM output pin |
| | FTIOA1 | 37 | I/O | Output compare output/input capture input/PWM output pin (at a reset, complementary PWM mode) |
| | FTIOB1 to FTIOD1 | 38 to 40 | I/O | Output compare output/input capture input/PWM output pin |
| 14-bit PWM | PWM | 24 | Output | 14-bit PWM square wave output pin |
| I ² C bus interface 2 (IIC2) | SDA | 26 | I/O | I ² C data I/O pin. Can directly drive a bus by NMOS open-drain output. When using this pin, external pull-up resistor is required. |
| | SCL | 27 | I/O | I ² C clock I/O pin. Can directly drive a bus by NMOS open-drain output. When using this pin, external pull-up resistor is required. |
| Serial com- munication | TXD, TXD_2 | 46, 50 | Output | Transmit data output pin |

Section 2 CPU

Microcontrollers of the H8/36079 Group and H8/36077 Group have an H8/300H CPU with an internal 32-bit architecture that provides upward compatibility with the H8/300CPU. Products of the H8/36079 Group support an advanced mode with a 16-Mbyte address space while those of the H8/36077 Group support a normal mode with a 64-Kbyte address space.

- Upward compatibility with H8/300 CPUs
 - Can execute object programs for H8/300 CPUs
 - Additional eight 16-bit extended registers
 - 32-bit transfer and arithmetic and logic instructions are added
 - Signed multiply and divide instructions are added.
- General-register architecture
 - Sixteen 16-bit general registers also usable as sixteen 8-bit registers and eight 16-bit registers, or eight 32-bit registers
- Sixty-two basic instructions
 - 8/16/32-bit data transfer and arithmetic and logic instructions
 - Multiply and divide instructions
 - Powerful bit-manipulation instructions
- Eight addressing modes
 - Register direct [Rn]
 - Register indirect [@ERn]
 - Register indirect with displacement [@(d:16,ERn) or @(d:24,ERn)]
 - Register indirect with post-increment or pre-decrement [@ERn+ or @-ERn]
 - Absolute address [@aa:8, @aa:16, @aa:24]
 - Immediate [#xx:8, #xx:16, or #xx:32]
 - Program-counter relative [@(d:8,PC) or @(d:16,PC)]
 - Memory indirect [@@aa:8]
- Address space
 - H8/36079 Group: 16 Mbytes
 - H8/36077 Group: 64 Kbytes

- · High-speed operation
 - All frequently-used instructions execute in one or two states
 - 8/16/32-bit register-register add/subtract: 2 state
 - 8×8 -bit register-register multiply: 14 states
 - 16 ÷ 8-bit register-register divide: 14 states
 - 16×16 -bit register-register multiply: 22 states
 - 32 ÷ 16-bit register-register divide: 22 states
- CPU operating mode
 - H8/36079 Group: Advanced mode
 - H8/36077 Group: Normal mode
- Power-down state
 - Transition to power-down state by SLEEP instruction

Address Space and Memory Map 2.1

Figure 2.1 shows the memory map of the address space of H8/36079 Group and H8/36077 Group.

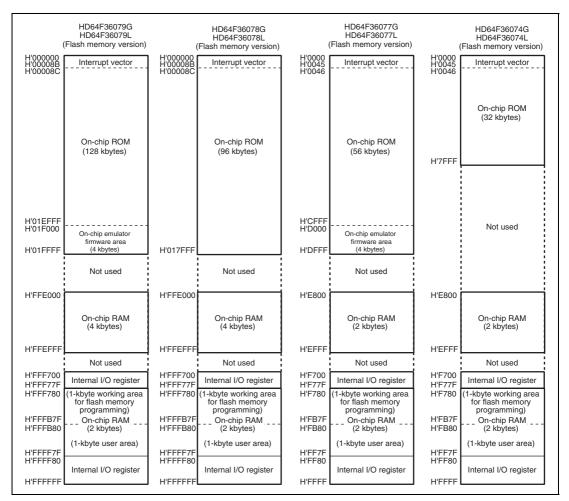

Figure 2.1 Memory Map

2.2 Register Configuration

The H8/300H CPU has the internal registers shown in figure 2.2. There are two types of registers; general registers and control registers. The control registers are a 24-bit program counter (PC), and an 8-bit condition-code register (CCR).

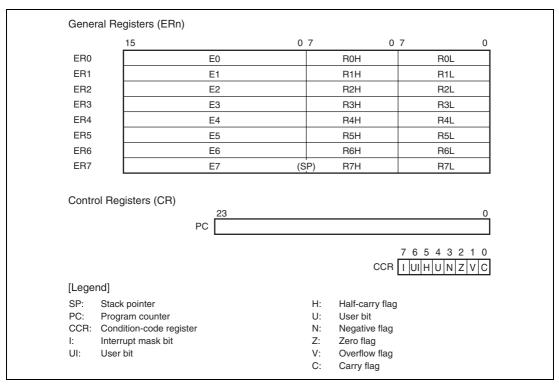

Figure 2.2 CPU Registers

2.2.1 General Registers

The H8/300H CPU has eight 32-bit general registers. These general registers are all functionally identical and can be used as both address registers and data registers. The general registers are available for use as 32-, 16-, and 8-bit data registers. Figure 2.3 illustrates the usage of the general registers. When the general registers are used as 32-bit registers or address registers, they are designated by the letters ER (ER0 to ER7).

The ER registers are divided into 16-bit general registers designated by the letters E (E0 to E7) and R (R0 to R7). These registers are functionally equivalent, providing a maximum of sixteen 16-bit registers. The E registers (E0 to E7) are also referred to as extended registers.

The R registers are divided into 8-bit registers designated by the letters RH (R0H to R7H) and RL (R0L to R7L). These registers are functionally equivalent, providing a maximum of sixteen 8-bit registers.

The usage of each register can be selected independently.

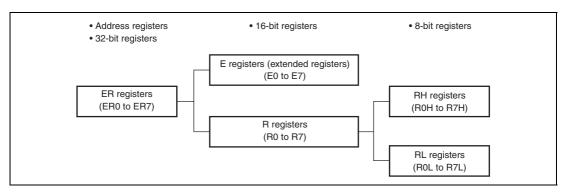

Figure 2.3 Usage of General Registers

General register ER7 has the function of stack pointer (SP) in addition to its general-register function, and is used implicitly in exception handling and subroutine calls. Figure 2.4 shows the relationship between the stack pointer and the stack area.

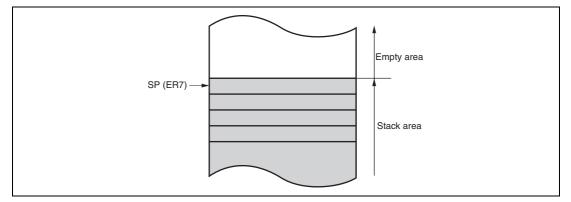

Figure 2.4 Relationship between Stack Pointer and Stack Area

2.2.2 Program Counter (PC)

This 24-bit counter indicates the address of the next instruction the CPU will execute. The length of all CPU instructions is 2 bytes (one word), so the least significant PC bit is ignored. (When an instruction is fetched, the least significant PC bit is regarded as 0). The PC is initialized when the start address is loaded by the vector address generated during reset exception-handling sequence.

2.2.3 Condition-Code Register (CCR)

This 8-bit register contains internal CPU status information, including an interrupt mask bit (I) and half-carry (H), negative (N), zero (Z), overflow (V), and carry (C) flags. The I bit is initialized to 1 by reset exception-handling sequence, but other bits are not initialized.

Some instructions leave flag bits unchanged. Operations can be performed on the CCR bits by the LDC, STC, ANDC, ORC, and XORC instructions. The N, Z, V, and C flags are used as branching conditions for conditional branch (Bcc) instructions.

For the action of each instruction on the flag bits, see appendix A.1, Instruction List.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 7 | I | 1 | R/W | Interrupt Mask Bit |
| | | | | Masks interrupts other than NMI when set to 1. NMI is accepted regardless of the I bit setting. The I bit is set to 1 at the start of an exception-handling sequence. |
| 6 | UI | Undefined | R/W | User Bit |
| | | | | Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions. |
| 5 | Н | Undefined | R/W | Half-Carry Flag |
| | | | | When the ADD.B, ADDX.B, SUB.B, SUBX.B, CMP.B, or NEG.B instruction is executed, this flag is set to 1 if there is a carry or borrow at bit 3, and cleared to 0 otherwise. When the ADD.W, SUB.W, CMP.W, or NEG.W instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 11, and cleared to 0 otherwise. When the ADD.L, SUB.L, CMP.L, or NEG.L instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 27, and cleared to 0 otherwise. |
| 4 | U | Undefined | R/W | User Bit |
| | | | | Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions. |
| 3 | N | Undefined | R/W | Negative Flag |
| | | | | Stores the value of the most significant bit of data as a sign bit. |
| 2 | Z | Undefined | R/W | Zero Flag |
| | | | | Set to 1 to indicate zero data, and cleared to 0 to indicate non-zero data. |
| 1 | V | Undefined | R/W | Overflow Flag |
| | | | | Set to 1 when an arithmetic overflow occurs, and cleared to 0 at other times. |
| 0 | С | Undefined | R/W | Carry Flag |
| | | | | Set to 1 when a carry occurs, and cleared to 0 otherwise. Used by: |
| | | | | Add instructions, to indicate a carry |
| | | | | Subtract instructions, to indicate a borrow |
| | | | | Shift and rotate instructions, to indicate a carry |
| | | | | The carry flag is also used as a bit accumulator by bit manipulation instructions. |

2.3 Data Formats

The H8/300H CPU can process 1-bit, 4-bit (BCD), 8-bit (byte), 16-bit (word), and 32-bit (longword) data. Bit-manipulation instructions operate on 1-bit data by accessing bit n (n = 0, 1, 2, ..., 7) of byte operand data. The DAA and DAS decimal-adjust instructions treat byte data as two digits of 4-bit BCD data.

2.3.1 General Register Data Formats

Figure 2.5 shows the data formats in general registers.

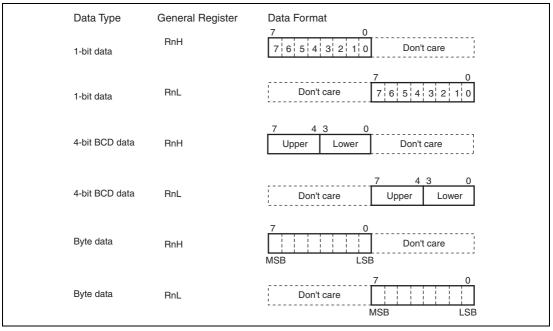

Figure 2.5 General Register Data Formats (1)

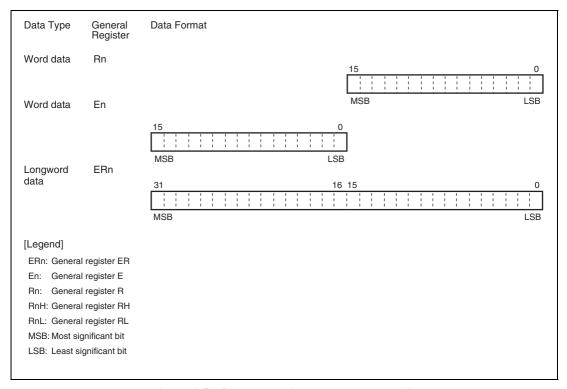

Figure 2.5 General Register Data Formats (2)

2.3.2 Memory Data Formats

Figure 2.6 shows the data formats in memory. The H8/300H CPU can access word data and longword data in memory, however word or longword data must begin at an even address. If an attempt is made to access word or longword data at an odd address, an address error does not occur, however the least significant bit of the address is regarded as 0, so access begins the preceding address. This also applies to instruction fetches.

When ER7 (SP) is used as an address register to access the stack area, the operand size should be word or longword.

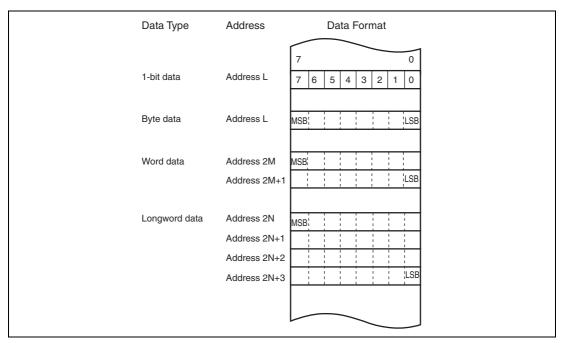

Figure 2.6 Memory Data Formats

2.4 Instruction Set

2.4.1 Table of Instructions Classified by Function

The H8/300H CPU has 62 instructions. Tables 2.2 to 2.9 summarize the instructions in each functional category. The notation used in tables 2.2 to 2.9 is defined below.

Table 2.1 Operation Notation

| Symbol | Description |
|---------------|--|
| Rd | General register (destination)* |
| Rs | General register (source)* |
| Rn | General register* |
| ERn | General register (32-bit register or address register) |
| (EAd) | Destination operand |
| (EAs) | Source operand |
| CCR | Condition-code register |
| N | N (negative) flag in CCR |
| Z | Z (zero) flag in CCR |
| V | V (overflow) flag in CCR |
| С | C (carry) flag in CCR |
| PC | Program counter |
| SP | Stack pointer |
| #IMM | Immediate data |
| disp | Displacement |
| + | Addition |
| _ | Subtraction |
| × | Multiplication |
| ÷ | Division |
| ^ | Logical AND |
| V | Logical OR |
| \oplus | Logical XOR |
| \rightarrow | Move |
| ~ | NOT (logical complement) |
| :3/:8/:16/:24 | 3-, 8-, 16-, or 24-bit length |

Note: * General registers include 8-bit registers (R0H to R7H, R0L to R7L), 16-bit registers (R0 to R7, E0 to E7), and 32-bit registers/address register (ER0 to ER7).

Table 2.2 Data Transfer Instructions

| Instruction | Size* | Function |
|-------------|-------|---|
| MOV | B/W/L | (EAs) → Rd, Rs → (EAd) Moves data between two general registers or between a general register and memory, or moves immediate data to a general register. |
| MOVFPE | В | (EAs) → Rd Cannot be used in this LSI. |
| MOVTPE | В | $Rs \rightarrow (EAs)$ Cannot be used in this LSI. |
| POP | W/L | @SP+ \rightarrow Rn Pops a general register from the stack. POP.W Rn is identical to MOV.W @SP+, Rn. POP.L ERn is identical to MOV.L @SP+, ERn. |
| PUSH | W/L | $Rn \rightarrow @-SP$ Pushes a general register onto the stack. PUSH.W Rn is identical to MOV.W Rn, @-SP. PUSH.L ERn is identical to MOV.L ERn, @-SP. |

Note: * Refers to the operand size.

B: ByteW: WordL: Longword

Table 2.3 Arithmetic Operations Instructions (1)

| Instruction | Size* | Function |
|--------------|-------|---|
| ADD SUB | B/W/L | Rd \pm Rs \rightarrow Rd, Rd \pm #IMM \rightarrow Rd Performs addition or subtraction on data in two general registers, or on immediate data and data in a general register (immediate byte data cannot be subtracted from byte data in a general register. Use the SUBX or ADD instruction.) |
| ADDX SUBX | В | Rd \pm Rs \pm C \rightarrow Rd, Rd \pm #IMM \pm C \rightarrow Rd Performs addition or subtraction with carry on byte data in two general registers, or on immediate data and data in a general register. |
| INC DEC | B/W/L | $Rd \pm 1 \rightarrow Rd$, $Rd \pm 2 \rightarrow Rd$ Increments or decrements a general register by 1 or 2. (Byte operands can be incremented or decremented by 1 only.) |
| ADDS SUBS | L | Rd \pm 1 \rightarrow Rd, Rd \pm 2 \rightarrow Rd, Rd \pm 4 \rightarrow Rd Adds or subtracts the value 1, 2, or 4 to or from data in a 32-bit register. |
| DAA DAS | В | Rd (decimal adjust) \rightarrow Rd Decimal-adjusts an addition or subtraction result in a general register by referring to the CCR to produce 4-bit BCD data. |
| MULXU | B/W | Rd \times Rs \rightarrow Rd Performs unsigned multiplication on data in two general registers: either 8 bits \times 8 bits \rightarrow 16 bits or 16 bits \times 16 bits \rightarrow 32 bits. |
| MULXS | B/W | Rd \times Rs \rightarrow Rd Performs signed multiplication on data in two general registers: either 8 bits \times 8 bits \rightarrow 16 bits or 16 bits \times 16 bits \rightarrow 32 bits. |
| DIVXU | B/W | Rd \div Rs \rightarrow Rd Performs unsigned division on data in two general registers: either 16 bits \div 8 bits \rightarrow 8-bit quotient and 8-bit remainder or 32 bits \div 16 bits \rightarrow 16-bit quotient and 16-bit remainder. |

B: Byte W: Word

L: Longword

Table 2.3 Arithmetic Operations Instructions (2)

| Instruction | Size* | Function |
|-------------|-------|---|
| DIVXS | B/W | Rd \div Rs \rightarrow Rd Performs signed division on data in two general registers: either 16 bits \div 8 bits \rightarrow 8-bit quotient and 8-bit remainder or 32 bits \div 16 bits \rightarrow 16-bit quotient and 16-bit remainder. |
| CMP | B/W/L | Rd – Rs, Rd – #IMM Compares data in a general register with data in another general register or with immediate data, and sets CCR bits according to the result. |
| NEG | B/W/L | $0-Rd \rightarrow Rd$ Takes the two's complement (arithmetic complement) of data in a general register. |
| EXTU | W/L | Rd (zero extension) → Rd Extends the lower 8 bits of a 16-bit register to word size, or the lower 16 bits of a 32-bit register to longword size, by padding with zeros on the left. |
| EXTS | W/L | Rd (sign extension) → Rd Extends the lower 8 bits of a 16-bit register to word size, or the lower 16 bits of a 32-bit register to longword size, by extending the sign bit. |

B: ByteW: WordL: Longword

Table 2.4 Logic Operations Instructions

| Instruction | Size* | Function |
|-------------|-------|---|
| AND | B/W/L | $Rd \wedge Rs \rightarrow Rd$, $Rd \wedge \#IMM \rightarrow Rd$ Performs a logical AND operation on a general register and another general register or immediate data. |
| OR | B/W/L | $Rd \lor Rs \to Rd$, $Rd \lor \#IMM \to Rd$ Performs a logical OR operation on a general register and another general register or immediate data. |
| XOR | B/W/L | $Rd \oplus Rs \rightarrow Rd$, $Rd \oplus \#IMM \rightarrow Rd$ Performs a logical exclusive OR operation on a general register and another general register or immediate data. |
| NOT | B/W/L | $^{\sim}(Rd) \to (Rd)$ Takes the one's complement (logical complement) of general register contents. |

B: ByteW: WordL: Longword

Table 2.5 Shift Instructions

| Instruction | Size* | Function |
|----------------|-------|---|
| SHAL SHAR | B/W/L | Rd (shift) \rightarrow Rd Performs an arithmetic shift on general register contents. |
| SHLL SHLR | B/W/L | Rd (shift) → Rd Performs a logical shift on general register contents. |
| ROTL ROTR | B/W/L | Rd (rotate) → Rd Rotates general register contents. |
| ROTXL ROTXR | B/W/L | Rd (rotate) \rightarrow Rd Rotates general register contents through the carry flag. |

Note: * Refers to the operand size.

B: ByteW: WordL: Longword

Table 2.6 Bit Manipulation Instructions (1)

| Instruction | Size* | Function | |
|-------------|-------|---|--|
| BSET | В | 1 → (<bit-no.> of <ead>) Sets a specified bit in a general register or memory operand to 1. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.</ead></bit-no.> | |
| BCLR | В | 0 → (<bit-no.> of <ead>) Clears a specified bit in a general register or memory operand to 0. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.</ead></bit-no.> | |
| BNOT | В | ~(<bit-no.> of <ead>) → (<bit-no.> of <ead>) Inverts a specified bit in a general register or memory operand. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.</ead></bit-no.></ead></bit-no.> | |
| BTST | В | \sim (<bit-no.> of <ead>) \rightarrow Z Tests a specified bit in a general register or memory operand and sets or clears the Z flag accordingly. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.</ead></bit-no.> | |
| BAND | В | $C \land (\mbox{\ensuremath{carry}}\ \mbox{\ensuremath{CAd}\xspace}) \to C$ ANDs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag. | |
| BIAND | В | $C \land \neg$ (<bit-no.> of <ead>) $\rightarrow C$ ANDs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.</ead></bit-no.> | |
| BOR | В | $C \lor (\text{sbit-No.} \gt \text{of} \lt \text{EAd} \gt) \to C$ ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag. | |
| BIOR | В | C $\vee \sim$ (<bit-no.> of <ead>) \to C ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.</ead></bit-no.> | |

B: Byte

Table 2.6 Bit Manipulation Instructions (2)

| Instruction | Size* | Function | |
|-------------|-------|---|--|
| BXOR | В | $C \oplus (\text{-bit-No}) \circ f < \text{EAd}) \to C$ XORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag. | |
| BIXOR | В | $C \oplus \sim (<\text{bit-No.}> \text{ of } <\text{EAd>}) \to C$ XORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data. | |
| BLD | В | (bit-No.> of <ead>) \rightarrow C Transfers a specified bit in a general register or memory operand to the carry flag.</ead> | |
| BILD | В | \sim (<bit-no.> of <ead>) \rightarrow C Transfers the inverse of a specified bit in a general register or memory operand to the carry flag. The bit number is specified by 3-bit immediate data.</ead></bit-no.> | |
| BST | В | C ightharpoonup (bit-No.> of <ead>) Transfers the carry flag value to a specified bit in a general register or memory operand.</ead> | |
| BIST | В | $^{\sim}$ C \rightarrow (<bit-no.> of <ead>) Transfers the inverse of the carry flag value to a specified bit in a general register or memory operand. The bit number is specified by 3-bit immediate data.</ead></bit-no.> | |

B: Byte

Table 2.7 Branch Instructions

| Instruction | Size | Function | | |
|-------------|------|--|-------------------------------|----------------------------|
| Bcc* | _ | Branches to a specified address if a specified condition is true. The branching conditions are listed below. | | |
| | | Mnemonic | Description | Condition |
| | | BRA(BT) | Always (true) | Always |
| | | BRN(BF) | Never (false) | Never |
| | | BHI | High | $C \lor Z = 0$ |
| | | BLS | Low or same | C ∨ Z = 1 |
| | | BCC(BHS) | Carry clear (high or same) | C = 0 |
| | | BCS(BLO) | Carry set (low) | C = 1 |
| | | BNE | Not equal | Z = 0 |
| | | BEQ | Equal | Z = 1 |
| | | BVC | Overflow clear | V = 0 |
| | | BVS | Overflow set | V = 1 |
| | | BPL | Plus | N = 0 |
| | | ВМІ | Minus | N = 1 |
| | | BGE | Greater or equal | N ⊕ V = 0 |
| | | BLT | Less than | N ⊕ V = 1 |
| | | BGT | Greater than | $Z\lor(N\oplus V)=0$ |
| | | BLE | Less or equal | $Z_{\vee}(N \oplus V) = 1$ |
| IMP | | D | | 1 - 4-1 |
| JMP | _ | Branches unconditionally to a specified address. | | |
| BSR | | Branches to a subroutine at a specified address. | | |
| JSR | | Branches to a subroutine at a specified address. | | |
| RTS | | Returns from a subroutine | | |

Note: * Bcc is the general name for conditional branch instructions.

Table 2.8 System Control Instructions

| Instruction | Size* | Function | |
|-------------|-------|--|--|
| TRAPA | _ | Starts trap-instruction exception handling. | |
| RTE | _ | Returns from an exception-handling routine. | |
| SLEEP | _ | Causes a transition to a power-down state. | |
| LDC | B/W | (EAs) → CCR Moves the source operand contents to the CCR. The CCR size is one byte, but in transfer from memory, data is read by word access. | |
| STC | B/W | CCR → (EAd) Transfers the CCR contents to a destination location. The condition code register size is one byte, but in transfer to memory, data is written by word access. | |
| ANDC | В | $CCR \land \#IMM \rightarrow CCR$ Logically ANDs the CCR with immediate data. | |
| ORC | В | CCR ∨ #IMM → CCR Logically ORs the CCR with immediate data. | |
| XORC | В | $CCR \oplus \#IMM \rightarrow CCR$ Logically XORs the CCR with immediate data. | |
| NOP | _ | $PC + 2 \rightarrow PC$ Only increments the program counter. | |

B: Byte W: Word

Table 2.9 Block Data Transfer Instructions

| Instruction | Size | Function |
|-------------|------|---|
| EEPMOV.B | _ | if R4L \neq 0 then Repeat @ER5+ \rightarrow @ER6+, R4L-1 \rightarrow R4L Until R4L = 0 else next; |
| EEPMOV.W | _ | if R4 \neq 0 then Repeat @ER5+ \rightarrow @ER6+, R4-1 \rightarrow R4 Until R4 = 0 else next; |
| | | Transfers a data block. Starting from the address set in ER5, transfers data for the number of bytes set in R4L or R4 to the address location set in ER6. |
| | | Execution of the next instruction begins as soon as the transfer is completed. |

2.4.2 **Basic Instruction Formats**

H8/300H CPU instructions consist of 2-byte (1-word) units. An instruction consists of an operation field (op), a register field (r), an effective address extension (EA), and a condition field (cc).

Figure 2.7 shows examples of instruction formats.

Operation Field

Indicates the function of the instruction, the addressing mode, and the operation to be carried out on the operand. The operation field always includes the first four bits of the instruction. Some instructions have two operation fields.

Register Field

Specifies a general register. Address registers are specified by 3 bits, and data registers by 3 bits or 4 bits. Some instructions have two register fields. Some have no register field.

Effective Address Extension

8, 16, or 32 bits specifying immediate data, an absolute address, or a displacement. A24-bit address or displacement is treated as a 32-bit data in which the first 8 bits are 0 (H'00).

Condition Field

Specifies the branching condition of Bcc instructions.

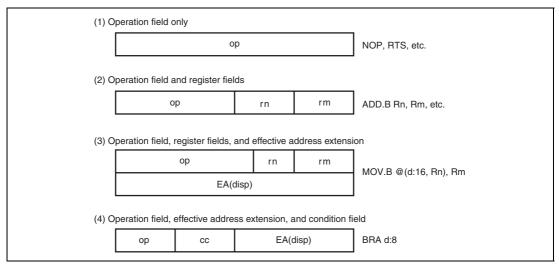

Figure 2.7 Instruction Formats

2.5 Addressing Modes and Effective Address Calculation

2.5.1 Addressing Modes

The H8/300H CPU supports the eight addressing modes listed in table 2.10. Each instruction uses a subset of these addressing modes. Addressing modes that can be used differ depending on the instruction. For details, refer to appendix A.4, Combinations of Instructions and Addressing Modes.

Arithmetic and logic instructions can use the register direct and immediate modes. Data transfer instructions can use all addressing modes except program-counter relative and memory indirect. Bit-manipulation instructions use register direct, register indirect, or the absolute addressing mode (@aa:8) to specify an operand, and register direct (BSET, BCLR, BNOT, and BTST instructions) or immediate (3-bit) addressing mode to specify a bit number in the operand.

Table 2.10 Addressing Modes

| No. | Addressing Mode | Symbol |
|-----|--|-------------------------|
| 1 | Register direct | Rn |
| 2 | Register indirect | @ERn |
| 3 | Register indirect with displacement | @(d:16,ERn)/@(d:24,ERn) |
| 4 | Register indirect with post-increment Register indirect with pre-decrement | @ERn+ @–ERn |
| 5 | Absolute address | @aa:8/@aa:16/@aa:24 |
| 6 | Immediate | #xx:8/#xx:16/#xx:32 |
| 7 | Program-counter relative | @(d:8,PC)/@(d:16,PC) |
| 8 | Memory indirect | @ @ aa:8 |

(1) Register Direct—Rn

The register field of the instruction specifies an 8-, 16-, or 32-bit general register containing the operand. R0H to R7H and R0L to R7L can be specified as 8-bit registers. R0 to R7 and E0 to E7 can be specified as 16-bit registers. ER0 to ER7 can be specified as 32-bit registers.

(2) Register Indirect—@ERn

The register field of the instruction code specifies an address register (ERn), the lower 24 bits of which contain the address of the operand on memory.

(3) Register Indirect with Displacement—@(d:16, ERn) or @(d:24, ERn)

A 16-bit or 24-bit displacement contained in the instruction is added to an address register (ERn) specified by the register field of the instruction, and the lower 24 bits of the sum the address of a memory operand. A 16-bit displacement is sign-extended when added.

(4) Register Indirect with Post-Increment or Pre-Decrement—@ERn+ or @-ERn

(a) Register indirect with post-increment—@ERn+

The register field of the instruction code specifies an address register (ERn) the lower 24 bits of which contains the address of a memory operand. After the operand is accessed, 1, 2, or 4 is added to the address register contents (32 bits) and the sum is stored in the address register. The value added is 1 for byte access, 2 for word access, or 4 for longword access. For the word or longword access, the register value should be even.

(b) Register indirect with pre-decrement—@-ERn

The value 1, 2, or 4 is subtracted from an address register (ERn) specified by the register field in the instruction code, and the lower 24 bits of the result is the address of a memory operand. The result is also stored in the address register. The value subtracted is 1 for byte access, 2 for word access, or 4 for longword access. For the word or longword access, the register value should be even.

(5) Absolute Address—@aa:8, @aa:16, @aa:24

The instruction code contains the absolute address of a memory operand. The absolute address may be 8 bits long (@aa:8), 16 bits long (@aa:16), 24 bits long (@aa:24)

For an 8-bit absolute address, the upper 16 bits are all assumed to be 1 (H'FFFF). For a 16-bit absolute address the upper 8 bits are a sign extension. A 24-bit absolute address can access the entire address space.

Table 2.11 shows the access ranges of absolute addresses according to the modes of operation of each product group.

Table 2.11 Absolute Address Access Ranges

| Absolute Address | Normal Mode | Advanced Mode |
|------------------|------------------|----------------------|
| 8 bits (@aa:8) | H'FF00 to H'FFFF | H'FFFF00 to H'FFFFFF |
| 16 bits (@aa:16) | H'0000 to H'FFFF | H'000000 to H'007FFF |
| | | H'FF8000 to H'FFFFFF |
| 24 bits (@aa:24) | H'0000 to H'FFFF | H'000000 to H'FFFFFF |

(6) Immediate—#xx:8, #xx:16, or #xx:32

The instruction contains 8-bit (#xx:8), 16-bit (#xx:16), or 32-bit (#xx:32) immediate data as an operand.

The ADDS, SUBS, INC, and DEC instructions contain immediate data implicitly. Some bit manipulation instructions contain 3-bit immediate data in the instruction code, specifying a bit number. The TRAPA instruction contains 2-bit immediate data in its instruction code, specifying a vector address.

(7) Program-Counter Relative—@(d:8, PC) or @(d:16, PC)

This mode is used in the BSR instruction. An 8-bit or 16-bit displacement contained in the instruction is sign-extended and added to the 24-bit PC contents to generate a branch address. The PC value to which the displacement is added is the address of the first byte of the next instruction, so the possible branching range is -126 to +128 bytes (-63 to +64 words) or -32766 to +32768 bytes (-16383 to +16384 words) from the branch instruction. The resulting value should be an even number.

(8) Memory Indirect—@@aa:8

This mode can be used by the JMP and JSR instructions. The instruction code contains an 8-bit absolute address specifying a memory operand. This memory operand contains a branch address. The memory operand is accessed by longword access. The first byte of the memory operand is ignored, generating a 24-bit branch address. Figure 2.8 shows how to specify branch address for in memory indirect mode. The upper bits of the absolute address are all assumed to be 0, so the address range is 0 to 255 (H'0000 to H'00FF).

Note that the first part of the address range is also the exception vector area.

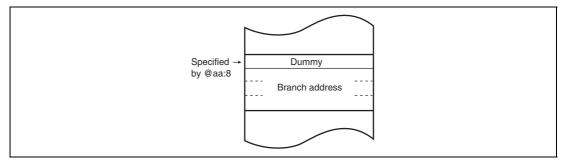

Figure 2.8 Branch Address Specification in Memory Indirect Mode

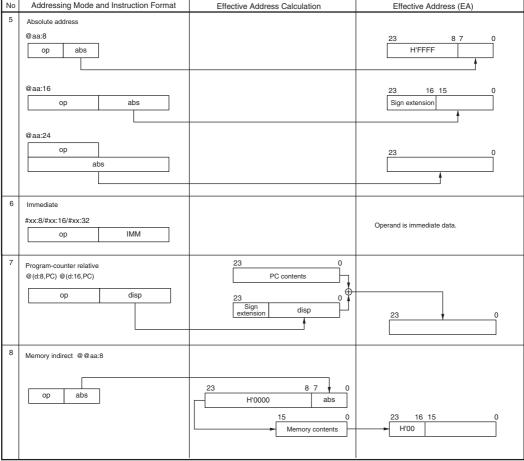

2.5.2 Effective Address Calculation

Table 2.12 indicates how effective addresses are calculated in each addressing mode. For operation in normal mode, the upper 8 bits of the effective address are ignored in order to generate a 16-bit effective address. For operation in advanced mode, the 24-bit result of effective address calculation is generated as the address.

Table 2.12 Effective Address Calculation (1)

| No | Addressing Mode and Instruction Format | Effective Address Calculation | Effective Address (EA) |
|----|---|---|---------------------------------------|
| 1 | Register direct(Rn) op rm rn | | Operand is general register contents. |
| 2 | Register indirect(@ERn) op r | 31 0 General register contents | 23 0 |
| 3 | Register indirect with displacement @(d:16,ERn) or @(d:24,ERn) op r disp | 31 0 General register contents 31 0 Sign extension disp | 23 0 |
| 4 | Register indirect with post-increment or pre-decrement *Register indirect with post-increment @ERn+ op r *Register indirect with pre-decrement @-ERn op r op r | General register contents 1, 2, or 4 General register contents 1, 2, or 4 The value to be added or subtracted is 1 when the operand is byte size, 2 for word size, and 4 for longword size. | 23 0 |

Table 2.12 Effective Address Calculation (2)

r, rm,rn: Register field
op: Operation field
disp: Displacement
IMM: Immediate data
abs: Absolute address

2.6 Basic Bus Cycle

CPU operation is synchronized by a system clock (ϕ) or a subclock (ϕ_{SUB}). The period from a rising edge of ϕ or ϕ_{SUB} to the next rising edge is called one state. A bus cycle consists of two states or three states. The cycle differs depending on whether access is to on-chip memory or to on-chip peripheral modules.

2.6.1 Access to On-Chip Memory (RAM, ROM)

Access to on-chip memory takes place in two states. The data bus width is 16 bits, allowing access in byte or word size. Figure 2.9 shows the on-chip memory access cycle.

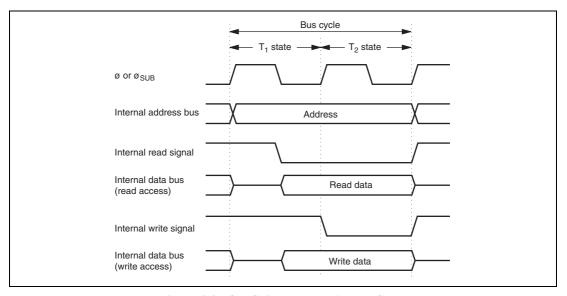

Figure 2.9 On-Chip Memory Access Cycle

2.6.2 On-Chip Peripheral Modules

On-chip peripheral modules are accessed in two states or three states. The data bus width is 8 bits or 16 bits depending on the register. For description on the data bus width and number of accessing states of each register, refer to section 21.1, Register Addresses (Address Order). Registers with 16-bit data bus width can be accessed by word size only. Registers with 8-bit data bus width can be accessed by byte or word size. When a register with 8-bit data bus width is accessed by word size, a bus cycle occurs twice. In two-state access, the operation timing is the same as that for on-chip memory.

Figure 2.10 shows the operation timing in the case of three-state access to an on-chip peripheral module.

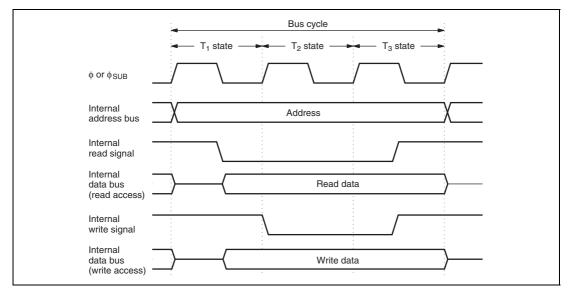

Figure 2.10 On-Chip Peripheral Module Access Cycle (3-State Access)

2.7 CPU States

There are four CPU states: the reset state, program execution state, program halt state, and exception-handling state. The program execution state includes active mode and subactive mode. For the program halt state, there are a sleep mode, standby mode, and sub-sleep mode. These states are shown in figure 2.11. Figure 2.12 shows the state transitions. For details on program execution state and program halt state, refer to section 6, Power-Down Modes. For details on exception processing, refer to section 3, Exception Handling.

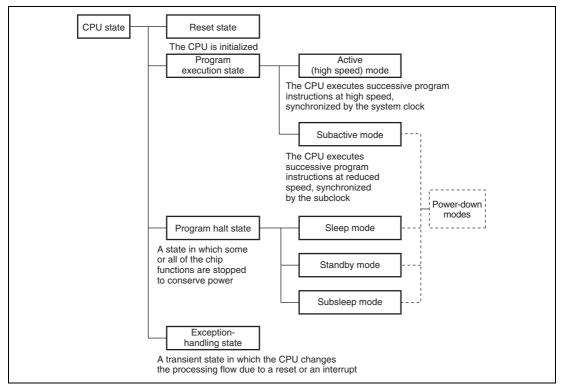

Figure 2.11 CPU Operation States

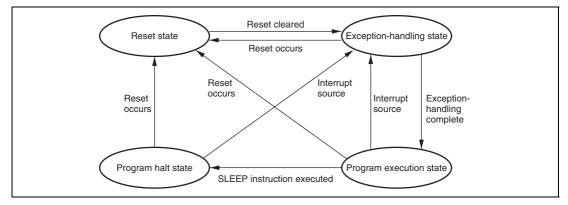

Figure 2.12 State Transitions

2.8 Usage Notes

2.8.1 Notes on Data Access to Empty Areas

The address space of this LSI includes empty areas in addition to the ROM, RAM, and on-chip I/O registers areas available to the user. When data is transferred from CPU to empty areas, the transferred data will be lost. This action may also cause the CPU to malfunction. When data is transferred from an empty area to CPU, the contents of the data cannot be guaranteed.

2.8.2 EEPMOV Instruction

EEPMOV is a block-transfer instruction and transfers the number of bytes indicated by R4L and starting at the address indicated by R5 to the address indicated by R6. In products for normal-mode operation, set R4L and R6 so that the final address at the destination for transfer (value of R6 + R4L) does not exceed H'FFFF (the value of R6 must not change from H'FFFF to H'0000 during execution). In products for advanced-mode operation, set R4L and R6 so that the final address at the destination for transfer (value of R6 + R4L) does not exceed H'FFFFFF (the value of R6 must not change from H'FFFFFF to H'000000 during execution).

2.8.3 Bit-Manipulation Instruction

The BSET, BCLR, BNOT, BST, and BIST instructions read data from the specified address in byte units, manipulate the data of the target bit, and write data to the same address again in byte units. Special care is required when using these instructions in cases where two registers are assigned to the same address, or when a bit is directly manipulated for a port or a register containing a write-only bit, because this may rewrite data of a bit other than the bit to be manipulated.

(1) Bit Manipulation for Two Registers Assigned to the Same Address

Example 1: Bit manipulation for the timer load register and timer counter (Applicable for timer B1 in the H8/36079 Group and H8/36077 Group.)

Figure 2.13 shows an example of a timer in which two timer registers are assigned to the same address. When a bit-manipulation instruction accesses the timer load register and timer counter of a reloadable timer, since these two registers share the same address, the following operations takes place.

- 1. Data is read in byte units.
- 2. The CPU sets or resets the bit to be manipulated with the bit-manipulation instruction.
- 3. The written data is written again in byte units to the timer load register.

The timer is counting, so the value read is not necessarily the same as the value in the timer load register. As a result, bits other than the intended bit in the timer counter may be modified and the modified value may be written to the timer load register.

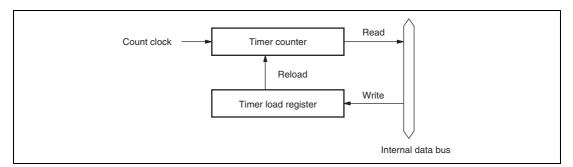

Figure 2.13 Example of Timer Configuration with Two Registers
Allocated to Same Address

Example 2: The BSET instruction is executed for port 5.

P57 and P56 are input pins, with a low-level signal input at P57 and a high-level signal input at P56. P55 to P50 are output pins and output low-level signals. An example to output a high-level signal at P50 with a BSET instruction is shown below.

Prior to executing BSET instruction

| | P57 | P56 | P55 | P54 | P53 | P52 | P51 | P50 |
|--------------|--------------|---------------|--------------|--------------|--------------|--------------|--------------|--------------|
| Input/output | Input | Input | Output | Output | Output | Output | Output | Output |
| Pin state | Low level | High level | Low level | Low level | Low level | Low level | Low level | Low level |
| PCR5 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| PDR5 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

• BSET instruction executed instruction

| BSET | #0, | @PDR5 |
|------|-----|-------|
| | | |

The BSET instruction is executed for port 5.

• After executing BSET instruction

| | P57 | P56 | P55 | P54 | P53 | P52 | P51 | P50 |
|--------------|--------------|---------------|--------------|--------------|--------------|--------------|--------------|---------------|
| Input/output | Input | Input | Output | Output | Output | Output | Output | Output |
| Pin state | Low level | High level | Low level | Low level | Low level | Low level | Low level | High level |
| PCR5 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| PDR5 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 |

- Description on operation
- 1. When the BSET instruction is executed, first the CPU reads port 5.

Since P57 and P56 are input pins, the CPU reads the pin states (low-level and high-level input).

P55 to P50 are output pins, so the CPU reads the value in PDR5. In this example PDR5 has a value of H'80, but the value read by the CPU is H'40.

- 2. Next, the CPU sets bit 0 of the read data to 1, changing the PDR5 data to H'41.
- 3. Finally, the CPU writes H'41 to PDR5, completing execution of BSET instruction.

As a result of the BSET instruction, bit 0 in PDR5 becomes 1, and P50 outputs a high-level signal. However, bits 7 and 6 of PDR5 end up with different values. To prevent this problem, store a copy of the PDR5 data in a work area in memory. Perform the bit manipulation on the data in the work area, then write this data to PDR5.

• Prior to executing BSET instruction

| MOV.B | #80, | R0L | |
|-------|------|-------|--|
| MOV.B | ROL, | @RAMO | |
| MOV.B | ROL, | @PDR5 | |

The PDR5 value (H'80) is written to a work area in memory (RAM0) as well as to PDR5.

| | P57 | P56 | P55 | P54 | P53 | P52 | P51 | P50 |
|--------------|--------------|---------------|--------------|--------------|--------------|--------------|--------------|--------------|
| Input/output | Input | Input | Output | Output | Output | Output | Output | Output |
| Pin state | Low level | High level | Low level | Low level | Low level | Low level | Low level | Low level |
| PCR5 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| PDR5 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| RAM0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

• BSET instruction executed

| BSET | #0, | @RAM0 |
|------|-----|-------|

The BSET instruction is executed designating the PDR5 work area (RAM0).

• After executing BSET instruction

| MOV.B | @RAMO, ROL | |
|-------|------------|--|
| MOV.B | ROL, @PDR5 | |

The work area (RAM0) value is written to PDR5.

| | P57 | P56 | P55 | P54 | P53 | P52 | P51 | P50 |
|--------------|--------------|---------------|--------------|--------------|--------------|--------------|--------------|---------------|
| Input/output | Input | Input | Output | Output | Output | Output | Output | Output |
| Pin state | Low level | High level | Low level | Low level | Low level | Low level | Low level | High level |
| PCR5 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| PDR5 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| RAM0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

(2) Bit manipulation in a register containing a write-only bit

Example 3: BCLR instruction executed designating port 5 control register PCR5

P57 and P56 are input pins, with a low-level signal input at P57 and a high-level signal input at P56. P55 to P50 are output pins that output low-level signals. An example of setting the P50 pin as an input pin by the BCLR instruction is shown below. It is assumed that a high-level signal will be input to this input pin.

• Prior to executing BCLR instruction

| | P57 | P56 | P55 | P54 | P53 | P52 | P51 | P50 |
|--------------|--------------|---------------|--------------|--------------|--------------|--------------|--------------|--------------|
| Input/output | Input | Input | Output | Output | Output | Output | Output | Output |
| Pin state | Low level | High level | Low level | Low level | Low level | Low level | Low level | Low level |
| PCR5 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| PDR5 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

BCLR instruction executed

| BCLR #0, @PCR5 |
|----------------|
|----------------|

The BCLR instruction is executed for PCR5.

• After executing BCLR instruction

| | P57 | P56 | P55 | P54 | P53 | P52 | P51 | P50 |
|--------------|--------------|---------------|--------------|--------------|--------------|--------------|--------------|---------------|
| Input/output | Output | Output | Output | Output | Output | Output | Output | Input |
| Pin state | Low level | High level | Low level | Low level | Low level | Low level | Low level | High level |
| PCR5 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| PDR5 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

- Description on operation
- 1. When the BCLR instruction is executed, first the CPU reads PCR5. Since PCR5 is a write-only register, the CPU reads a value of H'FF, even though the PCR5 value is actually H'3F.
- 2. Next, the CPU clears bit 0 in the read data to 0, changing the data to H'FE.
- 3. Finally, H'FE is written to PCR5 and BCLR instruction execution ends.

As a result of this operation, bit 0 in PCR5 becomes 0, making P50 an input port. However, bits 7 and 6 in PCR5 change to 1, so that P57 and P56 change from input pins to output pins. To prevent this problem, store a copy of the PDR5 data in a work area in memory and manipulate data of the bit in the work area, then write this data to PDR5.

• Prior to executing BCLR instruction

| MOV.B | #3F, | R0L |
|-------|------|-------|
| MOV.B | ROL, | @RAMO |
| MOV.B | ROL, | @PCR5 |

The PCR5 value (H'3F) is written to a work area in memory (RAM0) as well as to PCR5.

| | P57 | P56 | P55 | P54 | P53 | P52 | P51 | P50 |
|--------------|--------------|---------------|--------------|--------------|--------------|--------------|--------------|--------------|
| Input/output | Input | Input | Output | Output | Output | Output | Output | Output |
| Pin state | Low level | High level | Low level | Low level | Low level | Low level | Low level | Low level |
| PCR5 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| PDR5 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| RAM0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |

• BCLR instruction executed

| BCLR | #0, | @RAMO |
|------|--------|---------|
| БСПК | 11 0 , | GIUIIIO |

The BCLR instructions executed for the PCR5 work area (RAM0).

• After executing BCLR instruction

| MOV.B | @RAMO, ROL | |
|-------|------------|--|
| MOV.B | ROL, @PCR5 | |

The work area (RAM0) value is written to PCR5.

| | P57 | P56 | P55 | P54 | P53 | P52 | P51 | P50 |
|--------------|--------------|---------------|--------------|--------------|--------------|--------------|--------------|---------------|
| Input/output | Input | Input | Output | Output | Output | Output | Output | Output |
| Pin state | Low level | High level | Low level | Low level | Low level | Low level | Low level | High level |
| PCR5 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 |
| PDR5 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| RAM0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 0 |

Section 3 Exception Handling

Exception handling may be caused by a reset, a trap instruction (TRAPA), or interrupts.

Reset

A reset has the <u>highest exception</u> priority. Exception handling starts as soon as the reset is cleared by the \overline{RES} pin. The chip is also reset when the watchdog timer overflows, and exception handling starts. Exception handling is the same as exception handling by the \overline{RES} pin.

• Trap Instruction

Exception handling starts when a trap instruction (TRAPA) is executed. The TRAPA instruction generates a vector address corresponding to a vector number from 0 to 3, as specified in the instruction code. Exception handling can be executed at all times in the program execution state, regardless of the setting of the I bit in CCR.

Interrupts

External interrupts other than NMI and internal interrupts other than address break are masked by the I bit in CCR, and kept masked while the I bit is set to 1. Exception handling starts when the current instruction or exception handling ends, if an interrupt request has been issued.

3.1 Exception Sources and Vector Address

Table 3.1 shows the vector addresses and priority of each exception handling. When more than one interrupt is requested, handling is performed from the interrupt with the highest priority.

Table 3.1 Exception Sources and Vector Address

| Relative Module | Exception Sources | Vector Number | Normal Mode | Advanced Mode | Priority |
|---------------------------|--|------------------|------------------|----------------------|------------|
| RES pin Watchdog timer | Reset | 0 | H'0000 to H'0001 | H'000000 to H'000003 | High • |
| _ | Reserved for system use | 1 to 6 | H'0002 to H'000D | H'000004 to H'00001B | _ |

3.2 Register Descriptions

Interrupts are controlled by the following registers.

- Interrupt edge select register 1 (IEGR1)
- Interrupt edge select register 2 (IEGR2)
- Interrupt enable register 1 (IENR1)
- Interrupt enable register 2 (IENR2)
- Interrupt flag register 1 (IRR1)
- Interrupt flag register 2 (IRR2)
- Wakeup interrupt flag register (IWPR)

3.2.1 Interrupt Edge Select Register 1 (IEGR1)

IEGR1 selects the direction of an edge that generates interrupt requests of pins \overline{NMI} and $\overline{IRQ3}$ to $\overline{IRQ0}$.

| | | Initial | | |
|--------|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 | NMIEG | 0 | R/W | NMI Edge Select |
| | | | | 0: Falling edge of NMI pin input is detected |
| | | | | 1: Rising edge of NMI pin input is detected |
| 6 to 4 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 3 | IEG3 | 0 | R/W | IRQ3 Edge Select |
| | | | | 0: Falling edge of IRQ3 pin input is detected |
| | | | | 1: Rising edge of IRQ3 pin input is detected |
| 2 | IEG2 | 0 | R/W | IRQ2 Edge Select |
| | | | | 0: Falling edge of IRQ2 pin input is detected |
| | | | | 1: Rising edge of IRQ2 pin input is detected |
| 1 | IEG1 | 0 | R/W | IRQ1 Edge Select |
| | | | | 0: Falling edge of IRQ1 pin input is detected |
| | | | | 1: Rising edge of IRQ1 pin input is detected |
| 0 | IEG0 | 0 | R/W | IRQ0 Edge Select |
| | | | | 0: Falling edge of IRQ0 pin input is detected |
| | | | | 1: Rising edge of IRQ0 pin input is detected |
| | | | | |

3.2.2 Interrupt Edge Select Register 2 (IEGR2)

IEGR2 selects the direction of an edge that generates interrupt requests of the pins \overline{ADTRG} and $\overline{WKP5}$ to $\overline{WKP0}$.

| | | Initial | | |
|------|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7, 6 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 5 | WPEG5 | 0 | R/W | WKP5 Edge Select |
| | | | | 0: Falling edge of WKP5(ADTRG) pin input is detected |
| | | | | 1: Rising edge of WKP5(ADTRG) pin input is detected |
| 4 | WPEG4 | 0 | R/W | WKP4 Edge Select |
| | | | | 0: Falling edge of WKP4 pin input is detected |
| | | | | 1: Rising edge of WKP4 pin input is detected |
| 3 | WPEG3 | 0 | R/W | WKP3 Edge Select |
| | | | | 0: Falling edge of WKP3 pin input is detected |
| | | | | 1: Rising edge of WKP3 pin input is detected |
| 2 | WPEG2 | 0 | R/W | WKP2 Edge Select |
| | | | | 0: Falling edge of WKP2 pin input is detected |
| | | | | 1: Rising edge of WKP2 pin input is detected |
| 1 | WPEG1 | 0 | R/W | WKP1Edge Select |
| | | | | 0: Falling edge of WKP1 pin input is detected |
| | | | | 1: Rising edge of WKP1 pin input is detected |
| 0 | WPEG0 | 0 | R/W | WKP0 Edge Select |
| | | | | 0: Falling edge of WKP0 pin input is detected |
| | | | | 1: Rising edge of WKP0 pin input is detected |

3.2.3 Interrupt Enable Register 1 (IENR1)

IENR1 enables direct transition interrupts, RTC interrupts, and external pin interrupts.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 7 | IENDT | 0 | R/W | Direct Transfer Interrupt Enable |
| | | | | When this bit is set to 1, direct transition interrupt requests are enabled. |
| 6 | IENTA | 0 | R/W | RTC Interrupt Enable |
| | | | | When this bit is set to 1, RTC interrupt requests are enabled. |
| 5 | IENWP | 0 | R/W | Wakeup Interrupt Enable |
| | | | | This bit is an enable bit, which is common to the pins WKP5 to WKP0. When the bit is set to 1, interrupt requests are enabled. |
| 4 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1. |
| 3 | IEN3 | 0 | R/W | IRQ3 Interrupt Enable |
| | | | | When this bit is set to 1, interrupt requests of the $\overline{\mbox{IRQ3}}$ pin are enabled. |
| 2 | IEN2 | 0 | R/W | IRQ2 Interrupt Enable |
| | | | | When this bit is set to 1, interrupt requests of the $\overline{\mbox{IRQ2}}$ pin are enabled. |
| 1 | IEN1 | 0 | R/W | IRQ1 Interrupt Enable |
| | | | | When this bit is set to 1, interrupt requests of the $\overline{\mbox{IRQ1}}$ pin are enabled. |
| 0 | IEN0 | 0 | R/W | IRQ0 Interrupt Enable |
| | | | | When this bit is set to 1, interrupt requests of the $\overline{\mbox{IRQ0}}$ pin are enabled. |

When disabling interrupts by clearing bits in an interrupt enable register, or when clearing bits in an interrupt flag register, always do so while interrupts are masked (I=1). If the above clear operations are performed while I=0, and as a result a conflict arises between the clear instruction and an interrupt request, exception handling for the interrupt will be executed after the clear instruction has been executed.

3.2.4 Interrupt Enable Register 2 (IENR2)

IENR2 enables, timer B1 overflow interrupts.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 7, 6 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |
| 5 | IENTB1 | 0 | R/W | Timer B1 Interrupt Enable When this bit is set to 1, timer B1 overflow interrupt requests are enabled. |
| 4 to 0 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |

When disabling interrupts by clearing bits in an interrupt enable register, or when clearing bits in an interrupt flag register, always do so while interrupts are masked (I=1). If the above clear operations are performed while I=0, and as a result a conflict arises between the clear instruction and an interrupt request, exception handling for the interrupt will be executed after the clear instruction has been executed.

3.2.5 Interrupt Flag Register 1 (IRR1)

IRR1 is a status flag register for direct transition interrupts, RTC interrupts, and $\overline{IRQ3}$ to $\overline{IRQ0}$ interrupt requests.

| | | Initial | | |
|-----|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 | IRRDT | 0 | R/W | Direct Transfer Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When a direct transfer is made by executing a SLEEP instruction while DTON in SYSCR2 is set to 1. |
| | | | | [Clearing condition] |
| | | | | When IRRDT is cleared by writing 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|------|----------|------------------|-----|---|
| 6 | IRRTA | 0 | R/W | RTC Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When the RTC counter value overflows |
| | | | | [Clearing condition] |
| | | | | When IRRTA is cleared by writing 0 |
| 5, 4 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 3 | IRRI3 | 0 | R/W | IRQ3 Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When $\overline{\text{IRQ3}}$ pin is designated for interrupt input and the designated signal edge is detected. |
| | | | | [Clearing condition] |
| | | | | When IRRI3 is cleared by writing 0 |
| 2 | IRRI2 | 0 | R/W | IRQ2 Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When $\overline{\text{IRQ2}}$ pin is designated for interrupt input and the designated signal edge is detected. |
| | | | | [Clearing condition] |
| | | | | When IRRI2 is cleared by writing 0 |
| 1 | IRRI1 | 0 | R/W | IRQ1 Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When $\overline{\text{IRQ1}}$ pin is designated for interrupt input and the designated signal edge is detected. |
| | | | | [Clearing condition] |
| | | | | When IRRI1 is cleared by writing 0 |
| 0 | IRRI0 | 0 | R/W | IRQ0 Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When $\overline{\text{IRQ0}}$ pin is designated for interrupt input and the designated signal edge is detected. |
| | | | | [Clearing condition] |
| | | | | When IRRI0 is cleared by writing 0 |

3.2.6 Interrupt Flag Register 2 (IRR2)

IRR2 is a status flag register for timer B1 overflow interrupts.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|---|
| 7, 6 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |
| 5 | IRRTB1 | 0 | R/W | Timer B1 Interrupt Request flag |
| | | | | [Setting condition] |
| | | | | When the timer B1 counter value overflows |
| | | | | [Clearing condition] |
| | | | | When IRRTB1 is cleared by writing 0 |
| 4 to 0 | _ | All 1 | | Reserved |
| | | | | These bits are always read as 1. |

3.2.7 Wakeup Interrupt Flag Register (IWPR)

IWPR is a status flag register for $\overline{WKP5}$ to $\overline{WKP0}$ interrupt requests.

| | | Initial | | |
|------|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7, 6 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 5 | IWPF5 | 0 | R/W | WKP5 Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When $\overline{\text{WKP5}}$ pin is designated for interrupt input and the designated signal edge is detected. |
| | | | | [Clearing condition] |
| | | | | When IWPF5 is cleared by writing 0. |
| 4 | IWPF4 | 0 | R/W | WKP4 Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When $\overline{\text{WKP4}}$ pin is designated for interrupt input and the designated signal edge is detected. |
| | | | | [Clearing condition] |
| | | | | When IWPF4 is cleared by writing 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-------|---|
| 3 | IWPF3 | 0 | R/W | · |
| 3 | IVVPF3 | U | IT/VV | WKP3 Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When $\overline{\text{WKP3}}$ pin is designated for interrupt input and the designated signal edge is detected. |
| | | | | [Clearing condition] |
| | | | | When IWPF3 is cleared by writing 0. |
| 2 | IWPF2 | 0 | R/W | WKP2 Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When $\overline{\text{WKP2}}$ pin is designated for interrupt input and the designated signal edge is detected. |
| | | | | [Clearing condition] |
| | | | | When IWPF2 is cleared by writing 0. |
| 1 | IWPF1 | 0 | R/W | WKP1 Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When $\overline{\text{WKP1}}$ pin is designated for interrupt input and the |
| | | | | designated signal edge is detected. |
| | | | | [Clearing condition] |
| | | | | When IWPF1 is cleared by writing 0. |
| 0 | IWPF0 | 0 | R/W | WKP0 Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When $\overline{\text{WKP0}}$ pin is designated for interrupt input and the designated signal edge is detected. |
| | | | | [Clearing condition] |
| | | | | When IWPF0 is cleared by writing 0. |

3.3 Reset Exception Handling

When the \overline{RES} pin goes low, all processing halts and this LSI enters the reset. The internal state of the CPU and the registers of the on-chip peripheral modules are initialized by the reset. To ensure that this LSI is reset at power-up, hold the \overline{RES} pin low until the clock pulse generator output stabilizes. To reset the chip during operation, hold the \overline{RES} pin low for at least 10 system clock cycles. When the \overline{RES} pin goes high after being held low for the necessary time, this LSI starts reset exception handling. The reset exception handling sequence is shown in figure 3.1. However, for the reset exception handling sequence of the product with on-chip power-on reset circuit, refer to section 19, Band-Gap Circuit, Power-On Reset, and Low-Voltage Detection Circuits.

The reset exception handling sequence is as follows:

- 1. Set the I bit in the condition code register (CCR) to 1.
- 2. The CPU generates a reset exception handling vector address, the data in that address is sent to the program counter (PC) as the start address, and program execution starts from that address. The reset exception handling vector address is H'0000 to H'0001 for normal mode operation and H'000000 to H'000003 in advanced mode operation.

3.4 Interrupt Exception Handling

3.4.1 External Interrupts

As the external interrupts, there are NMI, IRQ3 to IRQ0, and WKP5 to WKP0 interrupts.

(1) NMI Interrupt

NMI interrupt is requested by input signal edge to pin $\overline{\text{NMI}}$. This interrupt is detected by either rising edge sensing or falling edge sensing, depending on the setting of bit NMIEG in IEGR1. NMI is the highest-priority interrupt, and can always be accepted without depending on the I bit value in CCR.

(2) IRQ3 to IRQ0 Interrupts

IRQ3 to IRQ0 interrupts are requested by input signals to pins $\overline{IRQ3}$ to $\overline{IRQ0}$. These four interrupts are given different vector addresses, and are detected individually by either rising edge sensing or falling edge sensing, depending on the settings of bits IEG3 to IEG0 in IEGR1. When pins $\overline{IRQ3}$ to $\overline{IRQ0}$ are designated for interrupt input in PMR1 and the designated signal edge is input, the corresponding bit in IRR1 is set to 1, requesting the CPU of an interrupt. These interrupts can be masked by setting bits IEN3 to IEN0 in IENR1.

(3) WKP5 to WKP0 Interrupts

WKP5 to WKP0 interrupts are requested by input signals to pins WKP5 to WKP0. These six interrupts have the same vector addresses, and are detected individually by either rising edge sensing or falling edge sensing, depending on the settings of bits WPEG5 to WPEG0 in IEGR2.

When pins $\overline{WKP5}$ to $\overline{WKP0}$ are designated for interrupt input in PMR5 and the designated signal edge is input, the corresponding bit in IWPR is set to 1, requesting the CPU of an interrupt. These interrupts can be masked by setting bit IENWP in IENR1.

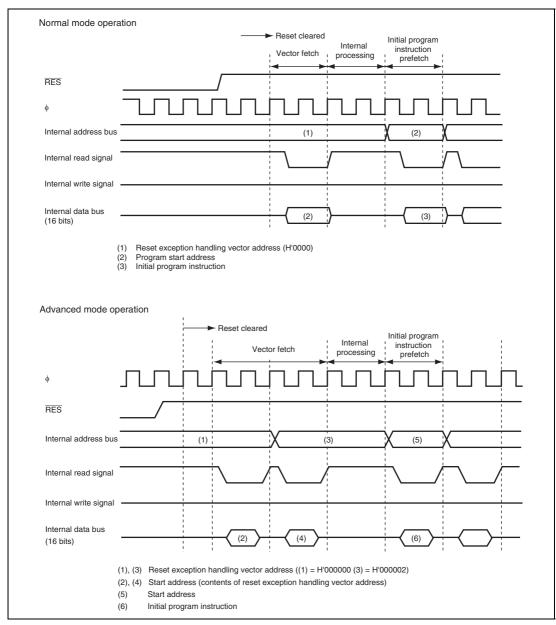

Figure 3.1 Reset Sequence

3.4.2 Internal Interrupts

Each on-chip peripheral module has a flag to show the interrupt request status and the enable bit to enable or disable the interrupt. For RTC interrupt requests and direct transfer interrupt requests generated by execution of a SLEEP instruction, this function is included in IRR1, IRR2, IENR1, and IENR2.

When an on-chip peripheral module requests an interrupt, the corresponding interrupt request status flag is set to 1, requesting the CPU of an interrupt. These interrupts can be masked by writing 0 to clear the corresponding enable bit.

3.4.3 Interrupt Handling Sequence

Interrupts are controlled by an interrupt controller.

Interrupt operation is described as follows.

- 1. If an interrupt occurs while the NMI or interrupt enable bit is set to 1, an interrupt request signal is sent to the interrupt controller.
- When multiple interrupt requests are generated, the interrupt controller requests to the CPU for the interrupt handling with the highest priority at that time according to table 3.1. Other interrupt requests are held pending.
- 3. The CPU accepts the NMI and address break without depending on the I bit value. Other interrupt requests are accepted, if the I bit is cleared to 0 in CCR; if the I bit is set to 1, the interrupt request is held pending.
- 4. If the CPU accepts the interrupt after processing of the current instruction is completed, interrupt exception handling will begin. First, both PC and CCR are pushed onto the stack. The state of the stack at this time is shown in figure 3.2. The PC value pushed onto the stack is the address of the first instruction to be executed upon return from interrupt handling.
- 5. Then, the I bit of CCR is set to 1, masking further interrupts excluding the NMI and address break. Upon return from interrupt handling, the values of I bit and other bits in CCR will be restored and returned to the values prior to the start of interrupt exception handling.
- 6. Next, the CPU generates the vector address corresponding to the accepted interrupt, and transfers the address to PC as a start address of the interrupt handling-routine. Then a program starts executing from the address indicated in PC.

Figure 3.3 shows a typical interrupt sequence where the program area is in the on-chip ROM and the stack area is in the on-chip RAM.

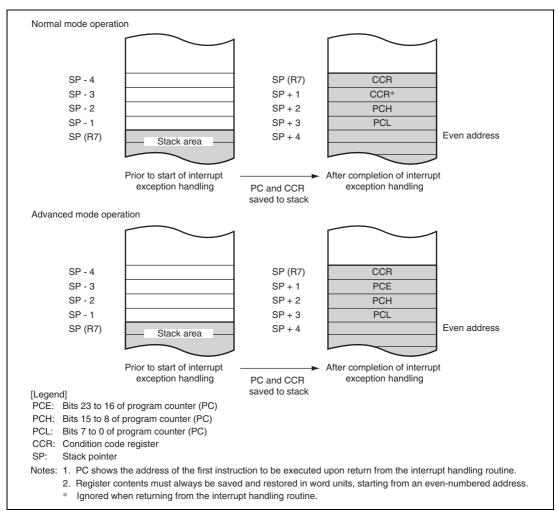

Figure 3.2 Stack Status after Exception Handling

REJ09B0216-0300

3.4.4 Interrupt Response Time

Table 3.2 shows the number of wait states after an interrupt request flag is set until the first instruction of the interrupt handling-routine is executed.

Table 3.2 Interrupt Wait States

| Item | States | Total |
|--|---------|--------------------------|
| Waiting time for completion of executing instruction*1 | 1 to 23 | 15 to 37 |
| Saving of PC and CCR to stack | 4 | (17 to 39)* ² |
| Vector fetch | 2 (4)*2 | |
| Instruction fetch | 4 | |
| Internal processing | 4 | |

Notes: 1. Not including EEPMOV instruction.

2. The value in parentheses is the number of states in advance mode.

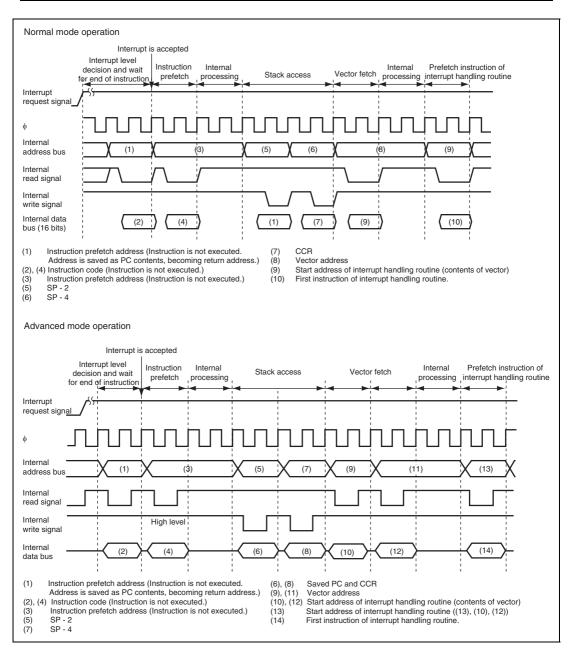

Figure 3.3 Interrupt Sequence

3.5 Usage Notes

3.5.1 Interrupts after Reset

If an interrupt is accepted after a reset and before the stack pointer (SP) is initialized, the PC and CCR will not be saved correctly, leading to a program crash. To prevent this, all interrupt requests, including NMI, are disabled immediately after a reset. Since the first instruction of a program is always executed immediately after the reset state ends, make sure that this instruction initializes the stack pointer (example: MOV.W #xx: 16, SP).

3.5.2 Notes on Stack Area Use

When word data is accessed, the least significant bit of the address is regarded as 0. Access to the stack always takes place in word size, so the stack pointer (SP: R7) should never indicate an odd address. Use PUSH Rn (MOV.W Rn, @-SP) or POP Rn (MOV.W @SP+, Rn) to save or restore register values.

3.5.3 Notes on Rewriting Port Mode Registers

When a port mode register is rewritten to switch the functions of external interrupt pins, $\overline{IRQ3}$ to $\overline{IRQ0}$, and $\overline{WKP5}$ to $\overline{WKP0}$, the interrupt request flag may be set to 1.

When switching a pin function, mask the interrupt before setting the bit in the port mode register. After accessing the port mode register, execute at least one instruction (e.g., NOP), then clear the interrupt request flag from 1 to 0.

Figure 3.4 shows a port mode register setting and interrupt request flag clearing procedure.

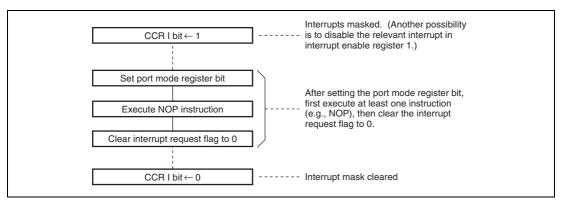

Figure 3.4 Port Mode Register Setting and Interrupt Request Flag Clearing Procedure

Section 4 Address Break

The address break simplifies on-board program debugging. It requests an address break interrupt when the set break condition is satisfied. The interrupt request is not affected by the I bit of CCR. Break conditions that can be set include instruction execution at a specific address and a combination of access and data at a specific address. With the address break function, the execution start point of a program containing a bug is detected and execution is branched to the correcting program. Figure 4.1 shows a block diagram of the address break.

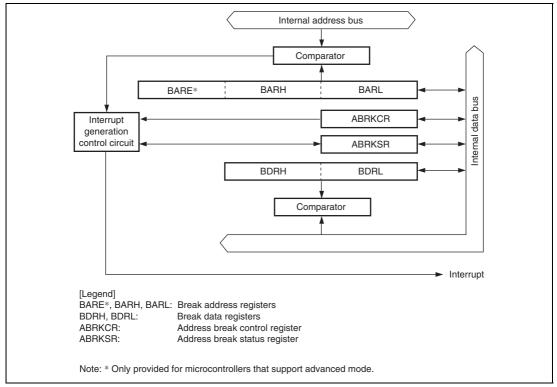

Figure 4.1 Block Diagram of Address Break

4.1 Register Descriptions

Address break has the following registers.

- Address break control register (ABRKCR)
- Address break status register (ABRKSR)
- Break address register (BARH, BARL)
- Break data register (BDRH, BDRL)

4.1.1 Address Break Control Register (ABRKCR)

ABRKCR sets address break conditions.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 7 | RTINTE | 1 | R/W | RTE Interrupt Enable |
| | | | | When this bit is 0, the interrupt immediately after executing RTE is masked and then one instruction must be executed. When this bit is 1, the interrupt is not masked. |
| 6 | CSEL1 | 0 | R/W | Condition Select 1 and 0 |
| 5 | CSEL0 | 0 | R/W | These bits set address break conditions. |
| | | | | 00: Instruction execution cycle |
| | | | | 01: CPU data read cycle |
| | | | | 10: CPU data write cycle |
| | | | | 11: CPU data read/write cycle |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 4 | ACMP2 | 0 | R/W | Address Compare Condition Select 2 to 0 |
| 3 | ACMP1 | 0 | R/W | These bits set the comparison condition between the |
| 2 | ACMP0 | 0 | R/W | address set in BAR and the internal address bus. |
| | | | | Normal mode |
| | | | | 000: Compares 16-bit addresses |
| | | | | 001: Compares the higher-order 12 bits of the addresses |
| | | | | 010: Compares the higher-order 8 bits of the addresses |
| | | | | 011: Compares the higher-order 4 bits of the addresses |
| | | | | 1XX: Reserved (setting prohibited) |
| | | | | Advanced mode |
| | | | | 000: Compares 24-bit addresses |
| | | | | 001: Compares the higher-order 20 bits of the addresses |
| | | | | 010: Compares the higher-order 16 bits of the addresses |
| | | | | 011: Compares the higher-order 12 bits of the addresses |
| | | | | 1XX: Reserved (setting prohibited) |
| 1 | DCMP1 | 0 | R/W | Data Compare Condition Select 1 and 0 |
| 0 | DCMP0 | 0 | R/W | These bits set the comparison condition between the data set in BDR and the internal data bus. |
| | | | | 00: No data comparison |
| | | | | 01: Compares lower 8-bit data between BDRL and data bus |
| | | | | 10: Compares upper 8-bit data between BDRH and data bus |
| | | | | 11: Compares 16-bit data between BDR and data bus |

[Legend] X: Don't care.

When an address break is set in the data read cycle or data write cycle, the data bus used will depend on the combination of the byte/word access and address. Table 4.1 shows the access and data bus used. When an I/O register space with an 8-bit data bus width is accessed in word size, a byte access is generated twice. For details on data widths of each register, see section 21.1, Register Addresses (Address Order).

Table 4.1 Access and Data Bus Used

| | Word | Access | Byte Access | | |
|---|--------------|--------------|--------------|--------------|--|
| | Even Address | Odd Address | Even Address | Odd Address | |
| ROM space | Upper 8 bits | Lower 8 bits | Upper 8 bits | Upper 8 bits | |
| RAM space | Upper 8 bits | Lower 8 bits | Upper 8 bits | Upper 8 bits | |
| I/O register with 8-bit data bus width | Upper 8 bits | Upper 8 bits | Upper 8 bits | Upper 8 bits | |
| I/O register with 16-bit data bus width | Upper 8 bits | Lower 8 bits | _ | _ | |

4.1.2 Address Break Status Register (ABRKSR)

ABRKSR consists of the address break interrupt flag and the address break interrupt enable bit.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 7 | ABIF | 0 | R/W | Address Break Interrupt Flag |
| | | | | [Setting condition] |
| | | | | When the condition set in ABRKCR is satisfied |
| | | | | [Clearing condition] |
| | | | | When 0 is written after ABIF=1 is read |
| 6 | ABIE | 0 | R/W | Address Break Interrupt Enable |
| | | | | When this bit is 1, an address break interrupt request is enabled. |
| 5 to 0 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |

4.1.3 Break Address Registers (BARE, BARH, BARL)

Settings of the address where an address-break interrupt is to be generated are made in the break address registers (BAR: BARE*, BARH and BARL). For microcontrollers that support normal-mode operation, BAR is a 16-bit readable/writable register with initial value H'FFFF. For microcontrollers that support advanced-mode operation, BAR is a 24-bit readable/writable register with the initial value H'FFFFFF. When setting an instruction execution cycle as the address break condition, set BAR to the address of the first byte of the instruction.

Note: * BARE is only provided for microcontrollers that support advanced-mode operation.

4.1.4 Break Data Registers (BDRH, BDRL)

BDRH and BDRL are 16-bit read/write registers that set the data for generating an address break interrupt. BDRH is compared with the upper 8-bit data bus. BDRL is compared with the lower 8-bit data bus. When memory or registers are accessed by byte, the upper 8-bit data bus is used for even and odd addresses in the data transmission. Therefore, comparison data must be set in BDRH for byte access. For word access, the data bus used depends on the address. See section 4.1.1, Address Break Control Register (ABRKCR), for details. The initial value of this register is undefined.

4.2 Operation

When the ABIF and ABIE bits in ABRKSR are set to 1, the address break function generates an interrupt request to the CPU. The ABIF bit in ABRKSR is set to 1 by the combination of the address set in BAR, the data set in BDR, and the conditions set in ABRKCR. When the interrupt request is accepted, interrupt exception handling starts after the instruction being executed ends. The address break interrupt is not masked by the I bit in CCR of the CPU.

Figures 4.2 show the operation examples of the address break interrupt setting.

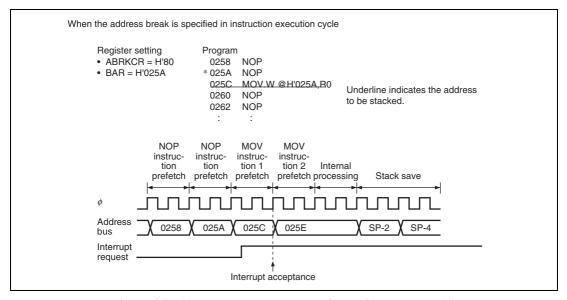

Figure 4.2 Address Break Interrupt Operation Example (1)

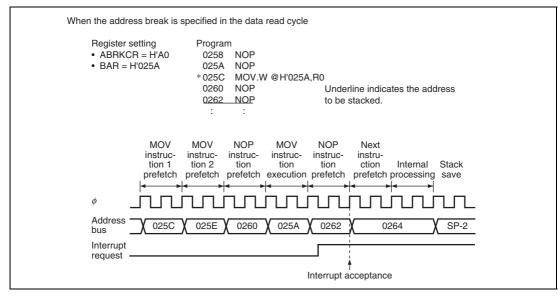

Figure 4.2 Address Break Interrupt Operation Example (2)

Section 5 Clock Pulse Generator

The clock pulse generator (CPG) consists of a system clock generating circuitry, a subclock generating circuitry, and two prescalers. The system clock generating circuitry includes an external clock oscillator, a duty correction circuit, an on-chip oscillator, an RC clock divider, a clock select circuit, and a system clock divider. The subclock generating circuitry includes a subclock oscillator, and a subclock divider. The CPG can function as a clock generating circuitry itself or in combination with an external oscillator. Figure 5.1 shows a block diagram of the clock pulse generator.

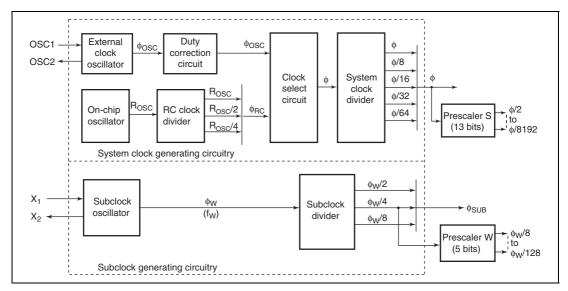

Figure 5.1 Block Diagram of Clock Pulse Generator

The system clock (ϕ) and subclock (ϕ_{SUB}) are basic clocks on which the CPU and on-chip peripheral modules operate. The system clock is divided into from $\phi/2$ to $\phi/8192$ by prescaler S. The subclock is divided into from $\phi_w/8$ to $\phi_w/128$ by prescaler W. These divided clocks are supplied to respective peripheral modules.

5.1 Features

Choice of two clock sources

On-chip oscillator clock

Clock by an external oscillator output

Choice of two types of RC oscillation frequency by the user software

16 MHz

20 MHz

Frequency trimming

Since the initial frequency of the on-chip oscillator in the flash memory version is within the range of two frequencies shown above, it is normally unnecessary to trim the frequency. It is, however, still possible to adjust it by rewriting the trimming registers.

Backup of the external oscillation halt

This system detects the external oscillator halt. If detected, the system clock source is automatically switched to the on-chip oscillator clock.

• Interrupt can be requested to the CPU when the system clock is switched from the external clock to the on-chip oscillator clock.

5.2 Register Descriptions

The CPG has the following registers.

- RC control register (RCCR)
- RC trimming data protect register (RCTRMDPR)
- RC trimming data register (RCTRMDR)
- Clock control/status register (CKCSR)

5.2.1 RC Control Register (RCCR)

RCCR controls the on-chip oscillator.

| | | Initial | | |
|--------|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | RCSTP | 0 | R/W | On-Chip Oscillator Standby |
| | | | | The on-chip oscillator standby state is entered by setting this bit to 1. |
| 6 | FSEL | 1 | R/W | Frequency Select for On-chip Oscillator |
| | | | | 0: 16 MHz |
| | | | | 1: 20 MHz |
| 5 | VCLSEL | 0 | R/W | Power Supply Select for On-chip Oscillator |
| | | | | 0: Selects VBGR |
| | | | | 1: Selects VCL |
| | | | | When the VCL power is selected, the accuracy of the on- chip oscillator frequency cannot be guaranteed. |
| 4 to 2 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |
| 1 | RCPSC1 | 1 | R/W | Division Ratio Select for On-chip Oscillator |
| 0 | RCPSC0 | 0 | R/W | The division ratio of $\mathbf{R}_{\mathrm{osc}}$ changes right after rewriting this bit. |
| | | | | These bits can be written to only when the CKSTA bit in CKCSR is 0. |
| | | | | 0x: R _{osc} (not divided) |
| | | | | 10: R _{osc} /2 |
| | | | | 11: R _{osc} /4 |

5.2.2 RC Trimming Data Protect Register (RCTRMDPR)

RCTRMDPR controls RCTRMDPR itself and writing to RCTRMDR. Use the MOV instruction to rewrite this register. Bit manipulation instruction cannot change the settings.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 7 | WRI | 1 | W | Write Inhibit |
| | | | | Only when writing 0 to this bit, this register can be written to. This bit is always read as 1. |
| 6 | PRWE | 0 | R/W | Protect Information Write Enable |
| | | | | Bits 5 and 4 can be written to when this bit is set to 1. |
| | | | | [Setting condition] |
| | | | | When writing 0 to the WRI bit and writing 1 to the PRWE bit |
| | | | | [Clearing conditions] |
| | | | | • Reset |
| | | | | When writing 0 to the WRI bit and writing 0 to the PRWE bit |
| 5 | LOCKDW | 0 | R/W | Trimming Data Register Lock Down |
| | | | | The RC trimming data register (RCTRMDR) cannot be written to when this bit is set to 1. Once this bit is set to 1, this register cannot be written to until a reset is input even if 0 is written to this bit. |
| | | | | [Setting condition] |
| | | | | When writing 0 to the WRI bit and writing 1 to the LOCKDW bit while the PRWE bit is 1 |
| | | | | [Clearing condition] |
| | | | | Reset |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 4 | TRMDRWE | 0 | R/W | Trimming Data Register Write Enable |
| | | | | This register can be written to when the LOCKDW bit is 0 and this bit is 1. |
| | | | | [Setting condition] |
| | | | | When writing 0 to the WRI bit while writing 1 to the TRMDRWE bit while the PRWE bit is 1 |
| | | | | [Clearing conditions] |
| | | | | Reset |
| | | | | When writing 0 to the WRI bit and writing 0 to the TRMDRWE bit while the PRWE bit is 1 |
| 3 to 0 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |

5.2.3 RC Trimming Data Register (RCTRMDR)

RCTRMDR stores the trimming data of the on-chip oscillator frequency (FSEL = 1, 20 MHz).

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 7 | TRMD7 | (0)* | R/W | Trimming Data (FSEL = 1, 20 MHz) |
| 6 | TRMD6 | (0)* | R/W | The trimming data is loaded from the flash memory to this |
| 5 | TRMD5 | (0)* | R/W | register right after a reset. |
| 4 | TRMD4 | (0)* | R/W | The on-chip oscillator clock (FSEL = 1, 20 MHz) can be trimmed by changing these bits. |
| 3 | TRMD3 | (0)* | R/W | , 5 5 |
| 2 | TRMD2 | (0)* | R/W | The frequency of the on-chip oscillator clock changes right after writing these bits. These bits are initialized to |
| 1 | TRMD1 | (0)* | R/W | H'00. |
| 0 | TRMD0 | (0)* | R/W | Changes in frequency are shown below (bit TRMD7 is a sign bit). |

Note: * These values are initialized to the trimming data loaded from the flash memory.

5.2.4 Clock Control/Status Register (CKCSR)

CKCSR selects the port C function, controls switching the system clocks, and indicates the system clock state.

| Bit | Bit Name | Initial Value | R/W | Descript | ion | | | |
|-----|----------|------------------|-----|--|----------------|-------------------------------|--|--|
| 7 | PMRC1 | 0 | R/W | Port C F | unction Select | t 1 and 2 | | |
| 6 | PMRC0 | 0 | R/W | PMRC | 1 PMRC0 | PC1 | PC0 | |
| | | | | 0 | 0 | I/O | I/O | |
| | | | | 1 | 0 | CLKOUT | I/O | |
| | | | | 0 | 1 | (Open) | OSC1 (external clock input) | |
| | | | | 1 | 1 | OSC2 | OSC1 | |
| | | | | | | | | |
| 5 | OSCBAKE | 0 | R/W | External Clock Backup Enable | | | | |
| | | | | 0: Extern | al clock back | up disabled | | |
| | | | | 1: Extern | al clock back | up enabled | | |
| | | | | The external oscillation detecting circuit is enabled when this bit is 1. When the external oscillator halt is detected while this LSI operates on the external input signal, the system clock source is automatically switched to the on chip oscillator regardless of the value of bit 4 in this register. | | | | |
| | | | | or to | n the on-chip | oscillator clo the on-chip | tecting circuit operates ock. When this bit is set oscillator to the standby RCCR. | |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 4 | OSCSEL | 0 | R/W | LSI Operating Clock Select |
| | | | | • When OSCBAKE = 0 |
| | | | | This bit is used to forcibly select the system clock of this LSI. |
| | | | | The on-chip oscillator clock selected as the system clock source |
| | | | | 1: The external input selected as the system clock source |
| | | | | • When OSCBAKE = 1 |
| | | | | This bit is used to switch the on-chip oscillator clock to the external clock. While this LSI is operating on the on-chip oscillator clock, setting this bit to 1 switches the system clocks to the external clock. |
| | | | | [Setting condition] |
| | | | | When 1 is written to this bit while CKSWIF = 0 |
| | | | | [Clearing conditions] |
| | | | | When 0 is written to this bit |
| | | | | When the external oscillator halt is detected while OSCBAKE = 1 |
| 3 | CKSWIE | 0 | R/W | Clock Switching Interrupt Enable |
| | | | | Setting this bit to 1 enables the clock switching interrupt request. |
| 2 | CKSWIF | 0 | R/W | Clock Switching Interrupt Request Flag |
| | | | | [Setting condition] |
| | | | | When the external clock is switched to the on-chip |
| | | | | oscillator clock as the system clock source |
| | | | | [Clearing condition] |
| - | | | | When writing 0 after reading as 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 1 | OSCHLT | 1 | R | External Oscillator Halt Detecting Flag |
| | | | | • When OSCBAKE = 1 |
| | | | | This bit indicates the checking result of the external oscillator state. |
| | | | | 0: External oscillator is running |
| | | | | 1: External oscillator is halted. |
| | | | | • When OSCBAKE = 0 |
| | | | | This bit is non-deterministic; always read as 1. |
| 0 | CKSTA | 0 | R | LSI Operating Clock Status |
| | | | | 0: This LSI operates on the on-chip oscillator clock. |
| | | | | 1: This LSI operates on the external clock. |

5.3 System Clock Select Operation

Figure 5.2 shows the state transition of the system clock.

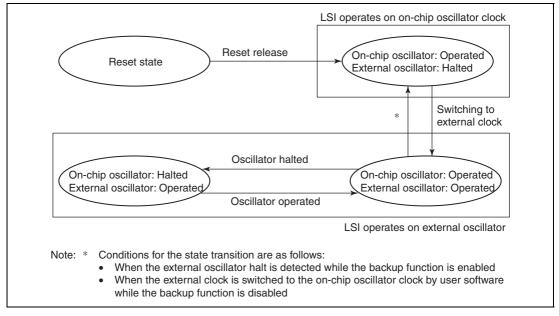

Figure 5.2 State Transition of System Clock

5.3.1 Clock Control Operation

The LSI system clock is generated by the on-chip oscillator clock after a reset. The system clock sources are switched from the on-chip oscillator to the external clock by the user software. Figure 5.3 shows the flowchart to switch clocks with the external clock backup function enabled. Figures 5.4 and 5.5 show the flowcharts to switch clocks with the external clock backup function disabled.

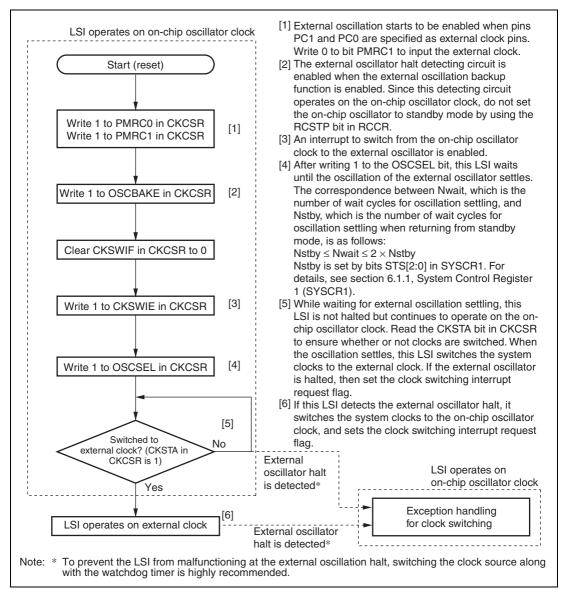

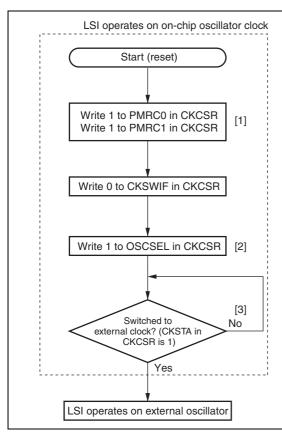

Figure 5.3 Flowchart of Clock Switching with Backup Function Enabled

- [1] External oscillation starts to be enabled when pins PC1 and PC0 are specified as external clock pins. Write 0 to bit PMRC1 to input the external clock.
- [2] After writing 1 to the OSCSEL bit, this LSI waits until the oscillation of the external oscillator settles. The correspondence between Nwait, which is the number of wait cycles for oscillation settling, and Nstby, which is the number of wait cycles for oscillation settling when returning from standby mode, is as follows:
 Nstby ≤ Nwait ≤ 2 × Nstby
 Nstby is set by bits STS[2:0] in SYSCR1. For details, see section 6.1.1, System Control Register 1 (SYSCR1).
- [3] While the system is waiting for the external oscillation settling, this LSI is not halted but continues to operate on the on-chip oscillator clock. Read the value of the CKSTA bit in CKCSR to ensure that the system clocks are switched.

Figure 5.4 Flowchart of Clock Switching with Backup Function Disabled (1) (From On-Chip Oscillator Clock to External Clock)

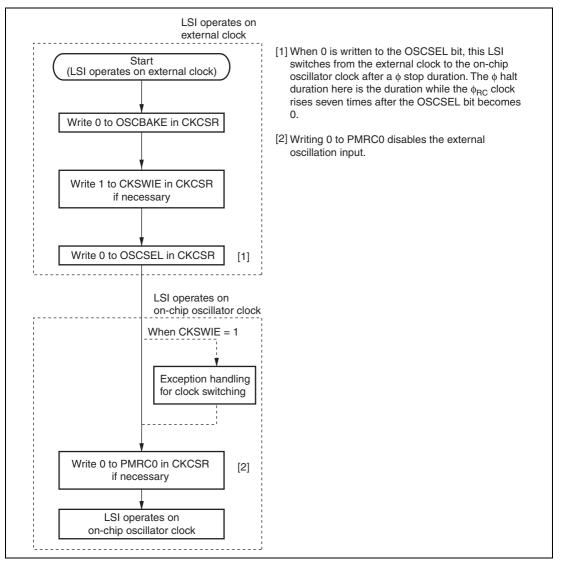

Figure 5.5 Flowchart of Clock Switching with Backup Function Disabled (2) (From External Clock to On-Chip Oscillator Clock)

5.3.2 Clock Switching Timing

The timing for switching clocks are shown in figures 5.6 to 5.8.

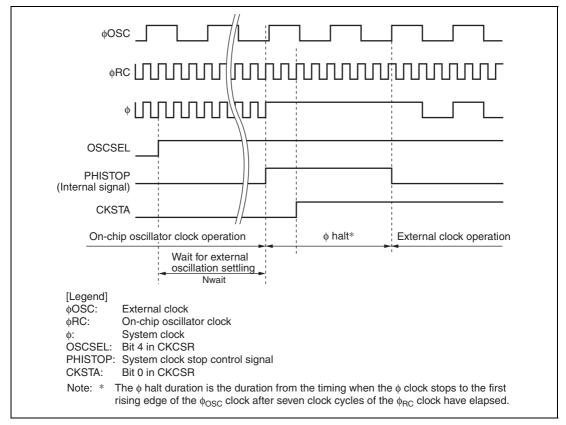

Figure 5.6 Timing Chart of Switching from On-Chip Oscillator Clock to External Clock

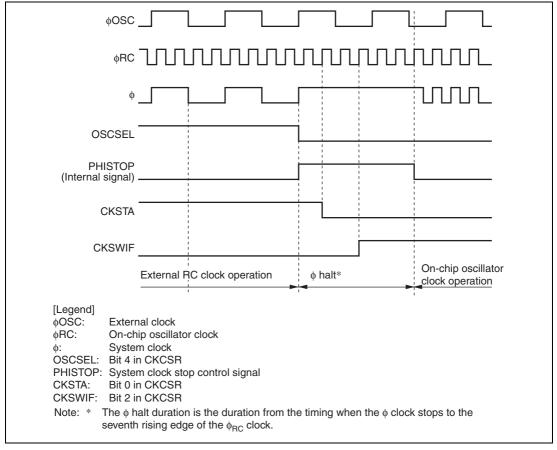

Figure 5.7 Timing Chart to Switch from External Clock to On-Chip Oscillator Clock

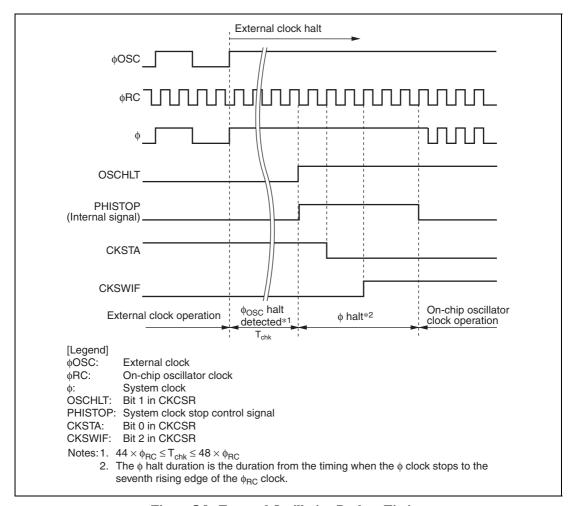

Figure 5.8 External Oscillation Backup Timing

5.4 Trimming of On-Chip Oscillator Frequency

Users can trim the on-chip oscillator clock, supplying the external reference pulses with the input capture function in internal timer Z. An example of trimming flow and a timing chart are shown in figures 5.9 and 5.10, respectively. Because RCTRMDR is initialized by a reset, when users have trimmed the frequencies, some operations after a reset are necessary, such as trimming it again or saving the trimming value in an external device for later reloading.

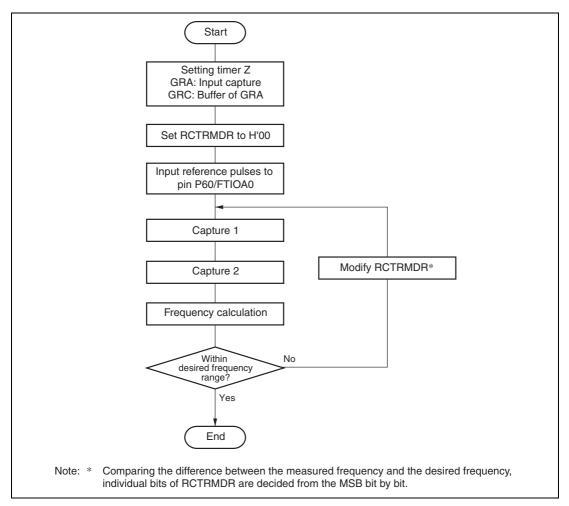

Figure 5.9 Example of Trimming Flow for On-Chip Oscillator Clock

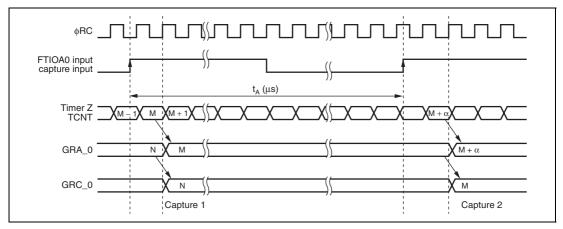

Figure 5.10 Timing Chart of Trimming of On-Chip Oscillator Frequency

The on-chip oscillator frequency is gained by the expression below. Since the input-capture input is sampled by the ϕ_{RC} clock, the calculated result may include a sampling error of ± 1 cycle of the ϕ_{RC} clock.

$$\phi RC = \frac{(M + \alpha) - M}{t_A} \quad (MHz)$$

 $\begin{array}{ll} \phi RC \colon & \text{Frequency of on-chip oscillator (MHz)} \\ t_A \colon & \text{Period of reference clock (μs)} \end{array}$

M: Timer Z counter value

5.5 External Oscillators

There are two methods to supply external clock pulses into this LSI: connecting a crystal or ceramic resonator, and an external clock. Oscillation pins OSC1 and OSC2 are common with general ports PC0 and PC1, respectively. To set pins PC0 and PC1 as crystal resonator or external clock input ports, refer to section 5.2.4, Clock Control/Status Register (CKCSR).

Figure 5.11 shows a block diagram of an external clock oscillator.

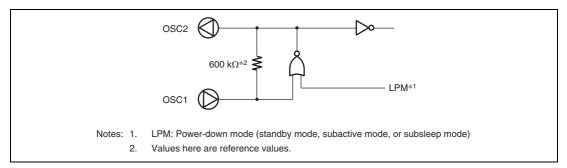

Figure 5.11 Block Diagram of External Clock Oscillator

5.5.1 Connecting Crystal Resonator

Figure 5.12 shows an example of connecting a crystal resonator. An AT-cut parallel-resonance crystal resonator should be used. Figure 5.13 shows the equivalent circuit of a crystal resonator. A resonator having the characteristics given in table 5.1 should be used.

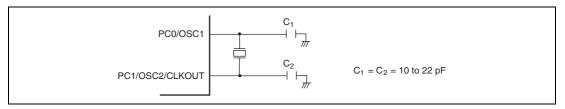

Figure 5.12 Example of Connection to Crystal Resonator

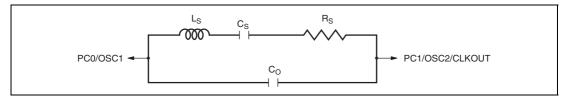

Figure 5.13 Equivalent Circuit of Crystal Resonator

Table 5.1 Crystal Resonator Parameters

| Frequency (MHz) | 4 | 8 | 10 | 16 | 20 | |
|-----------------------|-------|------|-------------|------|------|--|
| R _s (Max.) | 120 Ω | 80 Ω | $60~\Omega$ | 50 Ω | 40 Ω | |
| C _o (Max.) | | | 70 pF | | | |

5.5.2 Connecting Ceramic Resonator

Figure 5.14 shows an example of connecting a ceramic resonator.

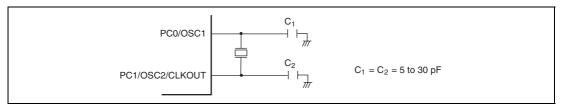

Figure 5.14 Example of Connection to Ceramic Resonator

5.5.3 Inputting External Clock

To use the external clock, input the external clock on pin OSC1. Figure 5.15 shows an example of connection. The duty cycle of the external clock signal must range from 45 to 55%.

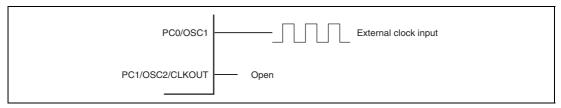

Figure 5.15 Example of External Clock Input

5.6 Subclock Oscillator

Figure 5.16 shows a block diagram of the subclock oscillator.

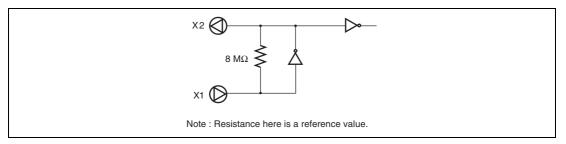

Figure 5.16 Block Diagram of Subclock Oscillator

5.6.1 Connecting 32.768-kHz Crystal Resonator

Clock pulses can be supplied to the subclock divider by connecting a 32.768-kHz crystal resonator, as shown in figure 5.17. Figure 5.18 shows the equivalent circuit of the 32.768-kHz crystal resonator.

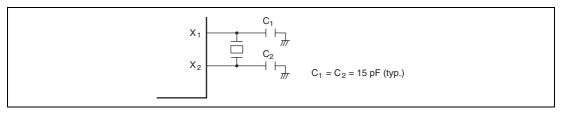

Figure 5.17 Typical Connection to 32.768-kHz Crystal Resonator

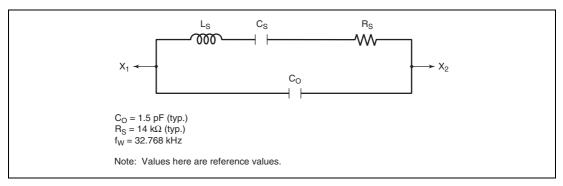

Figure 5.18 Equivalent Circuit of 32.768-kHz Crystal Resonator

5.6.2 Pin Connection when Not Using Subclock

When the subclock is not used, connect pin X1 to VCL or VSS and leave pin X2 open, as shown in figure 5.19.

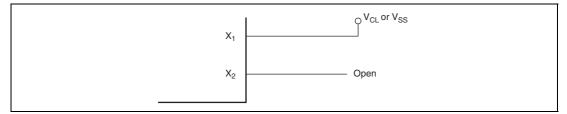

Figure 5.19 Pin Connection when not Using Subclock

5.7 Prescaler

5.7.1 Prescaler S

Prescaler S is a 13-bit counter using the system clock (ϕ) as its input clock. The outputs, which are divided clocks, are used as internal clocks by the on-chip peripheral modules. Prescaler S is initialized to H'0000 by a reset, and starts counting on exit from the reset state. In standby mode and subsleep mode, the external clock oscillator stops. Prescaler S also stops and is initialized to H'0000. It cannot be read from or written to by the CPU.

The outputs from prescaler S are shared by the on-chip peripheral modules. The division ratio can be set separately for each on-chip peripheral module. In active mode and sleep mode, the clock input to prescaler S is a system clock with the division ratio specified by bits MA2 to MA0 in SYSCR2.

5.7.2 Prescaler W

Prescaler W is a 5-bit counter using a 32.768-kHz signal divided by 4 as its input clock. The divided output is used for clock time base operation of the RTC. Prescaler W is initialized to H'00 by a reset, and starts counting on exit from the reset state. Even in standby mode, subactive mode, or subsleep mode, prescaler W continues functioning.

5.8 Usage Notes

5.8.1 Note on Resonators

Resonator characteristics are closely related to board design and should be carefully evaluated by the user, referring to the examples shown in this section. Resonator circuit parameters will differ depending on the resonator element, stray capacitance of the PCB, and other factors. Suitable values should be determined in consultation with the resonator element manufacturer. Design the circuit so that the resonator element never receives voltages exceeding its maximum rating.

5.8.2 Notes on Board Design

When using a crystal resonator (ceramic resonator), place the resonator and its load capacitors as close as possible to pins OSC1 and OSC2. Other signal lines should be routed away from the oscillator circuit to prevent induction from interfering with correct oscillation (see figure 5.20).

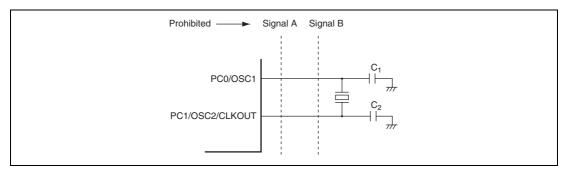

Figure 5.20 Example of Incorrect Board Design

Section 6 Power-Down Modes

This LSI has six modes of operation after a reset. These include a normal active mode and four power-down modes, in which power consumption is significantly reduced. Module standby mode reduces power consumption by selectively halting on-chip module functions.

Active mode

The CPU and all on-chip peripheral modules are operable on the system clock. The system clock frequency can be selected from \$\phi\osc, \phi\osc/8\$, \$\phi\osc/16\$, \$\phi\osc/32\$, and \$\phi\osc/64\$.

• Subactive mode

The CPU and all on-chip peripheral modules are operable on the subclock. The subclock frequency can be selected from $\phi w/2$, $\phi w/4$, and $\phi w/8$.

Sleep mode

The CPU halts. On-chip peripheral modules are operable on the system clock.

Subsleep mode

The CPU halts. On-chip peripheral modules are operable on the subclock.

Standby mode

The CPU and all on-chip peripheral modules halt. When the clock time-base function is selected, the RTC is operable.

• Module standby mode

Independent of the above modes, power consumption can be reduced by halting on-chip peripheral modules that are not used in module units.

6.1 Register Descriptions

The registers related to power-down modes are listed below.

- System control register 1 (SYSCR1)
- System control register 2 (SYSCR2)
- Module standby control register 1 (MSTCR1)
- Module standby control register 2 (MSTCR2)

6.1.1 System Control Register 1 (SYSCR1)

SYSCR1 controls the power-down modes, as well as SYSCR2.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | SSBY | 0 | R/W | Software Standby |
| | | | | This bit selects the mode to transit after the execution of the SLEEP instruction. |
| | | | | 0: Enters sleep mode or subsleep mode. |
| | | | | 1: Enters standby mode. |
| | | | | For details, see table 6.2. |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 6 | STS2 | 0 | R/W | Standby Timer Select 2 to 0 |
| 5 | STS1 | 0 | R/W | These bits set the wait time from when the external clock oscillator starts functioning until the clock is supplied, in |
| 4 | STS0 | 0 | R/W | shifting from standby mode, subactive mode, or subsleep mode, to active mode or sleep mode. During the wait time, this LSI automatically selects the on-chip oscillator clock as its system clock and counts the number of wait states. Select a wait time of 6.5 ms (oscillation stabilization time) or longer, depending on the operating frequency. Table 6.1 shows the relationship between the STS2 to STS0 values and the wait time. |
| | | | | When using an external clock, set the wait time to be 100 μs or longer. |
| | | | | These bits also set the wait states for external oscillation stabilization when system clock is switched from the on-chip oscillator clock to the external clock by user software. |
| | | | | The relationship between Nwait (number of wait states for oscillation stabilization) and Nstby (number of wait states for recovering to the standby mode) is as follows. |
| | | | | $Nstby \leq Nwait \leq 2 \times Nstby$ |
| 3 | NESEL | 0 | R/W | Noise Elimination Sampling Frequency Select |
| | | | | The subclock pulse generator generates the watch clock signal (ϕ_w) and the external clock pulse generator generates the oscillator clock $(\phi_{\rm osc}).$ This bit selects the sampling frequency of the oscillator clock when the watch clock signal (ϕ_w) is sampled. When $\phi_{\rm osc} = 4$ to 20 MHz, clear NESEL to 0. |
| | | | | 0: Sampling rate is $\phi_{\rm osc}/16$ |
| | | | | 1: Sampling rate is $\phi_{osc}/4$ |
| 2 to 0 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |

Table 6.1 Operating Frequency and Waiting Time

| I | Bit Name | | | | Operating Frequency | | | | | | | |
|------|----------|------|----------------|--------|---------------------|--------|-------|-------|-------|--|--|--|
| STS2 | STS1 | STS0 | Waiting Time | 20 MHz | 16 MHz | 10 MHz | 8 MHz | 5 MHz | 4 MHz | | | |
| 0 | 0 | 0 | 8,192 states | 0.4 | 0.5 | 0.8 | 1.0 | 1.6 | 2.0 | | | |
| | | 1 | 16,384 states | 0.8 | 1.0 | 1.6 | 2.0 | 3.3 | 4.1 | | | |
| | 1 | 0 | 32,768 states | 1.6 | 2.0 | 3.3 | 4.1 | 6.6 | 8.2 | | | |
| | | 1 | 65,536 states | 3.3 | 4.1 | 6.6 | 8.2 | 13.1 | 16.4 | | | |
| 1 | 0 | 0 | 131,072 states | 6.6 | 8.2 | 13.1 | 16.4 | 26.2 | 32.8 | | | |
| | | 1 | 1,024 states | 0.05 | 0.06 | 0.10 | 0.13 | 0.20 | 0.26 | | | |
| | 1 | 0 | 128 states | 0.00 | 0.00 | 0.01 | 0.02 | 0.03 | 0.03 | | | |
| | | 1 | 16 states | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | 0.00 | | | |

Note: Time unit is ms.

6.1.2 System Control Register 2 (SYSCR2)

SYSCR2 controls the power-down modes, as well as SYSCR1.

| Bit Name Value R/W Description 7 SMSEL 0 R/W Sleep Mode Selection 6 LSON 0 R/W Low Speed on Flag 5 DTON 0 R/W Direct Transfer on Flag These bits select the mode to enter after the execution of the selection | |
|--|----------|

| These bits select the mode to enter after the exe | |
| | |
| a SLEEP instruction, as well as bit SSBY of SYS | |
| For details, see table 6.2. | <u> </u> |
| 4 MA2 0 R/W Active Mode Clock Select 2 to 0 | |
| 3 MA1 0 R/W These bits select the operating clock frequency | |
| 2 MA0 0 R/W and sleep modes. The operating clock frequency changes to the set frequency after the SLEEP in is executed. | |
| 0XX: φ _{osc} | |
| 100: $\phi_{\rm osc}/8$ | |
| 101: $\phi_{\rm osc}/16$ | |
| 110: $\phi_{\rm osc}/32$ | |
| 111: $\phi_{\rm osc}$ /64 | |
| 1 SA1 0 R/W Subactive Mode Clock Select 1 and 0 | |
| O SAO O R/W These bits select the operating clock frequency subactive and subsleep modes. The operating confrequency changes to the set frequency after the instruction is executed. | lock |
| 00: φ _w /8 | |
| 01: $\phi_{_{\! \! \! \! \! \! \! \! \! \! \! \! \! \! \! \! \! \! $ | |
| 1Χ: φ _w /2 | |

[Legend] X: Don't care.

6.1.3 Module Standby Control Register 1 (MSTCR1)

MSTCR1 allows the on-chip peripheral modules to enter a standby state in module units.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | _ | 0 | _ | Reserved |
| | | | | This bit is always read as 0. |
| 6 | MSTIIC | 0 | R/W | IIC2 Module Standby |
| | | | | IIC2 enters standby mode when this bit is set to 1 |
| 5 | MSTS3 | 0 | R/W | SCI3 Module Standby |
| | | | | SCI3 enters standby mode when this bit is set to 1 |
| 4 | MSTAD | 0 | R/W | A/D Converter Module Standby |
| | | | | A/D converter enters standby mode when this bit is set to 1 |
| 3 | MSTWD | 0 | R/W | Watchdog Timer Module Standby |
| | | | | Watchdog timer enters standby mode when this bit is set to 1.When the internal oscillator is selected for the watchdog timer clock, the watchdog timer operates regardless of the setting of this bit |
| 2 | _ | 0 | _ | Reserved |
| | | | | This bit is always read as 0. |
| 1 | MSTTV | 0 | R/W | Timer V Module Standby |
| | | | | Timer V enters standby mode when this bit is set to 1 |
| 0 | MSTTA | 0 | R/W | RTC Module Standby |
| | | | | RTC enters standby mode when this bit is set to 1 |

6.1.4 Module Standby Control Register 2 (MSTCR2)

MSTCR2 allows the on-chip peripheral modules to enter a standby state in module units.

| Bit | Bit Name | Initial Value | R/W | Description |
|------|----------|------------------|-----|---|
| 7 | MSTS3_2 | 0 | R/W | SCI3_2 Module Standby |
| | | | | SCI3_2 enters standby mode when this bit is set to1 |
| 6, 5 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |
| 4 | MSTTB1 | 0 | R/W | Timer B1 Module Standby |
| | | | | Timer B1 enters standby mode when this bit is set to1 |
| 3, 2 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |
| 1 | MSTTZ | 0 | R/W | Timer Z Module Standby |
| | | | | Timer Z enters standby mode when this bit is set to1 |
| 0 | MSTPWM | 0 | R/W | PWM Module Standby |
| | | | | PWM enters standby mode when this bit is set to1 |

6.2 Mode Transitions and States of LSI

Figure 6.1 shows the possible transitions among these operating modes. A transition is made from the program execution state to the program halt state by executing a SLEEP instruction. Interrupts allow for returning from the program halt state to the program execution state. A direct transition between active mode and subactive mode, which are both program execution states, can be made without halting the program. The operating frequency can also be changed in the same modes by making a transition directly from active mode to active mode, and from subactive mode to subactive mode. \overline{RES} input enables transitions from a mode to the reset state. Table 6.2 shows the transition conditions of each mode after the SLEEP instruction is executed and a mode to return by an interrupt. Table 6.3 shows the internal states of the LSI in each mode.

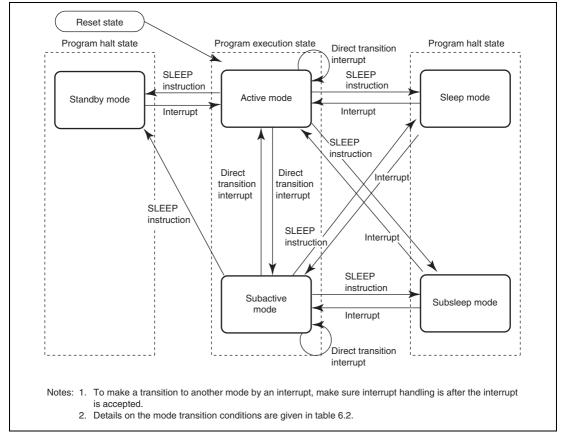

Figure 6.1 Mode Transition Diagram

Table 6.2 Transition Mode after SLEEP Instruction Execution and Transition Mode due to Interrupt

| DTON | SSBY | SMSEL | LSON | Transition Mode after SLEEP Instruction Execution | Transition Mode due to Interrupt |
|------|------|-------|------|---|----------------------------------|
| 0 | 0 | 0 | 0 | Sleep mode | Active mode |
| | | | 1 | _ | Subactive mode |
| | | 1 | 0 | Subsleep mode | Active mode |
| | | | 1 | _ | Subactive mode |
| | 1 | Х | Х | Standby mode | Active mode |
| 1 | Х | 0* | 0 | Active mode (direct transition) | _ |
| | X | Х | 1 | Subactive mode (direct transition) | _ |

X: Don't care.

Note: * When a state transition is performed while SMSEL is 1, timer V, SCI3, SCI3_2 and the A/D converter are reset, and all registers are set to their initial values. To use these functions after entering active mode, reset the registers.

Table 6.3 Internal State in Each Operating Mode

| Function | | Active Mode | Sleep Mode | Subactive Mode | Subsleep Mode | Standby Mode | |
|---------------------------|-------------------|-------------|-------------|--|------------------|---|--|
| External clock oscillator | | Functioning | Functioning | Halted | Halted | Halted | |

| | A/D converter | Functioning | Functioning | Reset | Reset | Reset | |
| | LVD | Functioning | Functioning | Functioning | Functioning | Functioning | |

Note: * Registers can be read or written in subactive mode.

6.2.1 Sleep Mode

In sleep mode, CPU operation is halted but the on-chip peripheral modules function at the clock frequency set by the MA2, MA1, and MA0 bits in SYSCR2. CPU register contents are retained. When an interrupt is requested, sleep mode is cleared and interrupt exception handling starts. Sleep mode is not cleared if the I bit of the condition code register (CCR) is set to 1 or the requested interrupt is disabled in the interrupt enable register. After sleep mode is cleared, a transition is made to active mode when the LSON bit in SYSCR2 is 0, and a transition is made to subactive mode when the bit is 1.

When the RES pin goes low, the CPU goes into the reset state and sleep mode is cleared.

6.2.2 Standby Mode

In standby mode, the external clock oscillator is halted, and operation of the CPU and on-chip peripheral modules is halted. However, as long as the rated voltage is supplied, the contents of CPU registers, on-chip RAM, and some on-chip peripheral module registers are retained. On-chip RAM contents will be retained as long as the voltage set by the RAM data retention voltage is provided. The I/O ports go to the high-impedance state.

Standby mode is cleared by an interrupt. When an interrupt is requested, the on-chip oscillator starts functioning. The external oscillator also starts functioning when used. After the time set by the STS2 to STS0 bits in SYSCR1 has elapsed, standby mode is cleared and the CPU starts interrupt exception handling. Standby mode is not cleared if the I bit in the condition code register (CCR) is set to 1 or the requested interrupt is disabled by the interrupt enable bit.

When the \overline{RES} pin is driven low in standby mode, the on-chip oscillator starts functioning. Once the oscillator starts, the system clock is supplied to the entire chip. The \overline{RES} pin must be kept low for the rated period set by the power-on reset circuit, until the oscillator stabilizes. If the \overline{RES} pin is driven high after the oscillator has stabilized, the internal reset signal is cleared and the CPU starts reset exception handling.

6.2.3 Subsleep Mode

In subsleep mode, operation of the CPU and on-chip peripheral modules other than RTC is halted. As long as a required voltage is applied, the contents of CPU registers, the on-chip RAM, and some registers of the on-chip peripheral modules are retained. I/O ports keep the same states as before the transition.

Subsleep mode is cleared by an interrupt. When an interrupt is requested, subsleep mode is cleared and interrupt exception handling starts. Subsleep mode is not cleared if the I bit of CCR is set to 1 or the requested interrupt is disabled in the interrupt enable register. After subsleep mode is cleared, a transition is made to active mode when the LSON bit in SYSCR2 is 0, and a transition is made to subactive mode when the bit is 1. After the time set in bits STS2 to STS0 in SYSCR1 has elapsed, a transition is made to active mode.

When the \overline{RES} pin is driven low in standby mode, the on-chip oscillator starts functioning. Once the oscillator starts, the system clock is supplied to the entire chip. The \overline{RES} pin must be kept low for the rated period set by the power-on reset circuit, until the oscillator stabilizes. If the \overline{RES} pin is driven high after the oscillator has stabilized, the internal reset signal is cleared and the CPU starts reset exception handling.

6.2.4 Subactive Mode

The operating frequency of subactive mode is selected from $\phi_w/2$, $\phi_w/4$, and $\phi_w/8$ by the SA1 and SA0 bits in SYSCR2. After the SLEEP instruction is executed, the operating frequency changes to the frequency which is set before the execution.

When the SLEEP instruction is executed in subactive mode, a transition to sleep mode, subsleep mode, standby mode, active mode, or subactive mode is made, depending on the combination of SYSCR1 and SYSCR2.

When the \overline{RES} pin is driven low in standby mode, the on-chip oscillator starts functioning. Once the oscillator starts, the system clock is supplied to the entire chip. The \overline{RES} pin must be kept low for the rated period set by the power-on reset circuit, until the oscillator stabilizes. If the \overline{RES} pin is driven high after the oscillator has stabilized, the internal reset signal is cleared and the CPU starts reset exception handling.

6.3 Operating Frequency in Active Mode

Operation in active mode is clocked at the frequency designated by the MA2, MA1, and MA0 bits in SYSCR2. The operating frequency changes to the set frequency after SLEEP instruction execution.

6.4 Direct Transition

The CPU can execute programs in two modes: active and subactive modes. A direct transition is a transition between these two modes without stopping program execution. A direct transition can be made by executing a SLEEP instruction while the DTON bit in SYSCR2 is set to 1. The direct transition also enables operating frequency modification in active or subactive mode. After the mode transition, direct transition interrupt exception handling starts.

If the direct transition interrupt is disabled in interrupt enable register 1, a transition is made instead to sleep or subsleep mode. Note that if a direct transition is attempted while the I bit in CCR is set to 1, sleep or subsleep mode will be entered, and the resulting mode cannot be cleared by means of an interrupt.

6.4.1 Direct Transition from Active Mode to Subactive Mode

The time from the start of SLEEP instruction execution to the end of interrupt exception handling (the direct transition time) is calculated by equation (1).

Direct transition time = {(number of SLEEP instruction execution states) + (number of internal processing states)}× (tcyc before transition) + (number of interrupt exception handling states) × (tsubcyc after transition) (1)

Example

Direct transition time = $(2 + 1) \times tosc + 14 \times 8tw = 3tosc + 112tw$ (when the CPU operating clock of $\phi_{osc} \rightarrow \phi_{w}/8$ is selected)

Legend

tosc: OSC clock cycle time tw: Watch clock cycle time tcyc: System clock (ϕ) cycle time tsubcyc: Subclock (ϕ _{SUB}) cycle time

6.4.2 Direct Transition from Subactive Mode to Active Mode

The time from the start of SLEEP instruction execution to the end of interrupt exception handling (the direct transition time) is calculated by equation (2).

Direct transition time = {(number of SLEEP instruction execution states) + (number of internal processing states)} \times (tsubcyc before transition) + {(waiting time set in bits STS2 to STS0) + (number of interrupt exception handling states)} \times (tcyc after transition) (2)

Example

Direct transition time = $(2 + 1) \times 8$ tw + $(8192 + 14) \times$ tosc = 24tw + 8206tosc (when the CPU operating clock of $\phi_w/8 \rightarrow \phi_w$ and a waiting time of 8192 states are selected)

Legend

tosc: OSC clock cycle time tw: Watch clock cycle time tcyc: System clock (ϕ) cycle time tsubcyc: Subclock (ϕ _{SUB}) cycle time

6.5 Module Standby Function

The module-standby function can be set to any peripheral module. In module standby mode, the clock supply to modules stops to enter the power-down mode. Module standby mode enables each on-chip peripheral module to enter the standby state by setting a bit that corresponds to each module to 1 and cancels the mode by clearing the bit to 0.

Section 7 ROM

The features of the flash memory built into this LSI are summarized below.

- Programming/erase methods
 - The flash memory is programmed 128 bytes at a time. Erase is performed in single-block units. To erase the entire flash memory, each block must be erased in turn.
- Reprogramming capability
 - The flash memory can be reprogrammed up to 1,000 times (Min.).
- On-board programming
 - On-board programming/erasing can be done in boot mode, in which the boot program built into the chip is started to erase or program of the entire flash memory. In normal user program mode, individual blocks can be erased or programmed.
- Programmer mode
 - Flash memory can be programmed/erased in programmer mode using a PROM programmer, as well as in on-board programming mode.
- Automatic bit rate adjustment
 - For data transfer in boot mode, this LSI's bit rate can be automatically adjusted to match the transfer bit rate of the host.
- Programming/erasing protection
 - Sets software protection against flash memory programming/erasing.
- Power-down mode
 - Operation of the power supply circuit can be partly halted in subactive mode. As a result, flash memory can be read with low power consumption.

7.1 **Block Configuration**

Figure 7.1 shows the block configuration of flash memory of each product model. The thick lines indicate erasing units, the narrow lines indicate programming units, and the values are addresses. Erasing is performed in erasing units shown in these figures. Programming is performed in 128byte units starting from an address with lower eight bits H'00 or H'80.

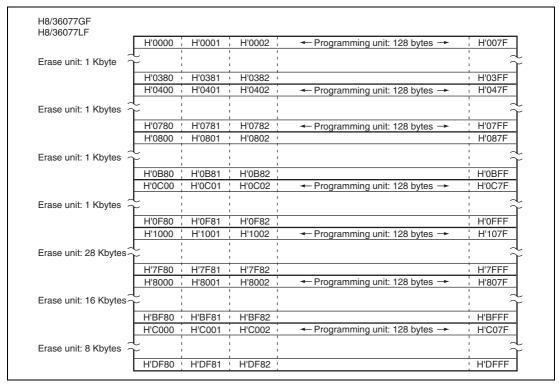

Figure 7.1 Flash Memory Block Configuration (3) (H8/36077GF and H8/36077LF)

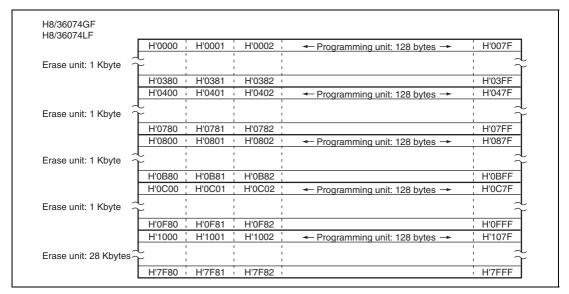

Figure 7.1 Flash Memory Block Configuration (4) (H8/36074GF and H8/36074LF)

7.2 Register Descriptions

The flash memory has the following registers.

- Flash memory control register 1 (FLMCR1)
- Flash memory control register 2 (FLMCR2)
- Erase block register 1 (EBR1)
- Flash memory power control register (FLPWCR)
- Flash memory enable register (FENR)

7.2.1 Flash Memory Control Register 1 (FLMCR1)

FLMCR1 is a register that makes the flash memory change to program mode, program-verify mode, erase mode, or erase-verify mode. For details on register setting, refer to section 7.4, Flash Memory Programming/Erasing.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 7 | _ | 0 | _ | Reserved |
| | | | | This bit is always read as 0. |
| 6 | SWE | 0 | R/W | Software Write Enable |
| | | | | When this bit is set to 1, flash memory programming/erasing is enabled. When this bit is cleared to 0, other FLMCR1 register bits and all EBR1 bits cannot be set. |
| 5 | ESU | 0 | R/W | Erase Setup |
| | | | | When this bit is set to 1, the flash memory changes to the erase setup state. When it is cleared to 0, the erase setup state is cancelled. Set this bit to 1 before setting the E bit to 1 in FLMCR1. |
| 4 | PSU | 0 | R/W | Program Setup |
| | | | | When this bit is set to 1, the flash memory changes to the program setup state. When it is cleared to 0, the program setup state is cancelled. Set this bit to 1 before setting the P bit in FLMCR1. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 3 | EV | 0 | R/W | Erase-Verify |
| | | | | When this bit is set to 1, the flash memory changes to erase-verify mode. When it is cleared to 0, erase-verify mode is cancelled. |
| 2 | PV | 0 | R/W | Program-Verify |
| | | | | When this bit is set to 1, the flash memory changes to program-verify mode. When it is cleared to 0, program-verify mode is cancelled. |
| 1 | E | 0 | R/W | Erase |
| | | | | When this bit is set to 1 while SWE=1 and ESU=1, the flash memory changes to erase mode. When it is cleared to 0, erase mode is cancelled. |
| 0 | Р | 0 | R/W | Program |
| | | | | When this bit is set to 1 while SWE=1 and PSU=1, the flash memory changes to program mode. When it is cleared to 0, program mode is cancelled. |

7.2.2 Flash Memory Control Register 2 (FLMCR2)

FLMCR2 is a register that displays the state of flash memory programming/erasing. FLMCR2 is a read-only register, and should not be written to.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 7 | FLER | 0 | R | Flash Memory Error |
| | | | | Indicates that an error has occurred during an operation on flash memory (programming or erasing). When FLER is set to 1, flash memory goes to the error-protection state. |
| | | | | See section 7.5.3, Error Protection, for details. |
| 6 to 0 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |

7.2.3 Erase Block Register 1 (EBR1)

EBR1 specifies the flash memory erase area block. EBR1 is initialized to H'00 when the SWE bit in FLMCR1 is 0. Do not set more than one bit at a time, as this will cause all the bits in EBR1 to be automatically cleared to 0.

(1) H8/36079GF and H8/36079LF

| | | Initial | | |
|-----|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 | EB7 | 0 | R/W | When this bit is set to 1, 32 Kbytes of H'018000 to H'01FFFF will be erased. |
| 6 | EB6 | 0 | R/W | When this bit is set to 1, 32 Kbytes of H'010000 to H'017FFF will be erased. |
| 5 | EB5 | 0 | R/W | When this bit is set to 1, H'008000 to H'00FFFF 32 Kbytes of H'010000 to H'017FFF will be erased. |
| 4 | EB4 | 0 | R/W | When this bit is set to 1, 28 Kbytes of H'001000 to H'007FFF will be erased. |
| 3 | EB3 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'000C00 to H'000FFF will be erased. |
| 2 | EB2 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'000800 to H'000BFF will be erased. |
| 1 | EB1 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'000400 to H'0007FF will be erased. |
| 0 | EB0 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'000000 to H'0003FF will be erased. |

(2) H8/36078GF and H8/36078LF

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 7 | _ | 0 | _ | Reserved. Although this bit is readable/writable, do not set this bit to 1. |
| 6 | EB6 | 0 | R/W | When this bit is set to 1, 32 Kbytes of H'010000 to H'017FFF will be erased. |
| 5 | EB5 | 0 | R/W | When this bit is set to 1, 32 Kbytes of H'008000 to H'00FFFF will be erased. |
| 4 | EB4 | 0 | R/W | When this bit is set to 1, 28 Kbytes of H'001000 to H'007FFF will be erased. |
| 3 | EB3 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'000C00 to H'000FFF will be erased. |
| 2 | EB2 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'000800 to H'000BFF will be erased. |
| 1 | EB1 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'000400 to H'0007FF will be erased. |
| 0 | EB0 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'000000 to H'0003FF will be erased. |

(3) H8/36077GF and H8/36077LF

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | _ | 0 | _ | Reserved. This bit is always read as 0. |
| 6 | EB6 | 0 | R/W | When this bit is set to 1, 8 Kbytes of H'C000 to H'DFFF will be erased. |
| 5 | EB5 | 0 | R/W | When this bit is set to 1, 16 Kbytes of H'8000 to H'BFFF will be erased. |
| 4 | EB4 | 0 | R/W | When this bit is set to 1, 28 Kbytes of H'1000 to H'7FFF will be erased. |
| 3 | EB3 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'0C00 to H'0FFF will be erased. |
| 2 | EB2 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'0800 to H'0BFF will be erased. |
| 1 | EB1 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'0400 to H'07FF will be erased. |
| 0 | EB0 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'0000 to H'03FF will be erased. |

(4) H8/36074GF and H8/36074LF

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| | | | | |
| 7 | _ | 0 | _ | Reserved. This bit is always read as 0. |
| 6 | _ | 0 | _ | Reserved. Although this bit is readable/writable, do not set this bit to 1. |
| 5 | _ | 0 | _ | Reserved. Although this bit is readable/writable, do not set this bit to 1. |
| 4 | EB4 | 0 | R/W | When this bit is set to 1, 28 Kbytes of H'1000 to H'7FFF will be erased. |
| 3 | EB3 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'0C00 to H'0FFF will be erased. |
| 2 | EB2 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'0800 to H'0BFF will be erased. |
| 1 | EB1 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'0400 to H'07FF will be erased. |
| 0 | EB0 | 0 | R/W | When this bit is set to 1, 1 Kbyte of H'0000 to H'03FF will be erased. |

7.2.4 Flash Memory Power Control Register (FLPWCR)

FLPWCR enables or disables a transition to the flash memory power-down mode when the LSI switches to subactive mode. There are two modes: mode in which operation of the power supply circuit of flash memory is partly halted in power-down mode and flash memory can be read, and mode in which even if a transition is made to subactive mode, operation of the power supply circuit of flash memory is retained and flash memory can be read.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 7 | PDWND | 0 | R/W | Power-Down Disable |
| | | | | When this bit is 0 and a transition is made to subactive mode, the flash memory enters the power-down mode. When this bit is 1, the flash memory remains in the normal mode even after a transition is made to subactive mode. |
| 6 to 0 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |

7.2.5 Flash Memory Enable Register (FENR)

Bit 7 (FLSHE) in FENR enables or disables the CPU access to the flash memory control registers, FLMCR1, FLMCR2, EBR1, and FLPWCR.

| Bit | Bit Name | Initial Value | R/W | Description | |
|--------|----------|------------------|-----|--|--|
| 7 | FLSHE | 0 | R/W | R/W Flash Memory Control Register Enable | |
| | | | | Flash memory control registers can be accessed when this bit is set to 1. Flash memory control registers cannot be accessed when this bit is set to 0. | |
| 6 to 0 | _ | All 0 | _ | Reserved | |
| | | | | These bits are always read as 0. | |

7.3 On-Board Programming Modes

There are two modes for programming/erasing of the flash memory; boot mode, which enables on-board programming/erasing, and programmer mode, in which programming/erasing is performed with a PROM programmer. On-board programming/erasing can also be performed in user program mode. At reset-start in reset mode, this LSI changes to a mode depending on the TEST pin settings, $\overline{\text{NMI}}$ pin settings, and input level of each port, as shown in table 7.1. The input level of each pin must be defined four states before the reset ends.

When changing to boot mode, the boot program built into this LSI is initiated. The boot program transfers the programming control program from the externally connected host to on-chip RAM via SCI3. After erasing the entire flash memory, the programming control program is executed. This can be used for programming initial values in the on-board state or for a forcible return when programming/erasing can no longer be done in user program mode. In user program mode, individual blocks can be erased and programmed by branching to the user program/erase control program prepared by the user.

Table 7.1 Setting Programming Modes

| TEST | NMI | P85 | PB0 | PB1 | PB2 | LSI State after Reset End |
|------|-----|-----|-----|-----|-----|---------------------------|
| 0 | 1 | Х | х | х | Х | User Mode |
| 0 | 0 | 1 | х | х | Х | Boot Mode |
| 1 | х | х | 0 | 0 | 0 | Programmer Mode |

[Legend] x: Don't care.

7.3.1 Boot Mode

Table 7.2 shows the boot mode operations between reset end and branching to the programming control program.

- 1. When boot mode is used, the flash memory programming control program must be prepared in the host beforehand. Prepare a programming control program in accordance with the description in section 7.4, Flash Memory Programming/Erasing.
- 2. SCI3 should be set to asynchronous mode, and the transfer format as follows: 8-bit data, 1 stop bit, and no parity.
- 3. When the boot program is initiated, the chip measures the low-level period of asynchronous SCI communication data (H'00) transmitted continuously from the host. The chip then calculates the bit rate of transmission from the host, and adjusts the SCI3 bit rate to match that of the host. The reset should end with the RxD pin high. The RxD and TxD pins should be

- pulled up on the board if necessary. After the reset is complete, it takes approximately 100 states before the chip is ready to measure the low-level period.
- 4. After matching the bit rates, the chip transmits one H'00 byte to the host to indicate the completion of bit rate adjustment. The host should confirm that this adjustment end indication (H'00) has been received normally, and transmit one H'55 byte to the chip. If reception could not be performed normally, initiate boot mode again by a reset. Depending on the host's transfer bit rate and system clock frequency of this LSI, there will be a discrepancy between the bit rates of the host and the chip. To operate the SCI properly, set the host's transfer bit rate and system clock frequency of this LSI within the ranges listed in table 7.3.
- 5. In boot mode, a part of the on-chip RAM area is used by the boot program. The area H'FFF780 to H'FFEEF for microcontrollers supporting advanced mode or H'F780 to H'FEEF for microcontrollers supporting normal mode, is the area to which the programming control program is transferred from the host. The boot program area cannot be used until the execution state in boot mode switches to the programming control program.
- 6. Before branching to the programming control program, the chip terminates transfer operations by SCI3 (by clearing the RE and TE bits in SCR to 0), however the adjusted bit rate value remains set in BRR. Therefore, the programming control program can still use it for transfer of program data or verify data with the host. The TxD pin is high (PCR22 = 1, P22 = 1). The contents of the CPU general registers are undefined immediately after branching to the programming control program. These registers must be initialized at the beginning of the programming control program, as the stack pointer (SP), in particular, is used implicitly in subroutine calls, etc.
- 7. Boot mode can be cleared by a reset. End the reset after driving the reset pin low, waiting at least 20 states, and then setting the NMI pin. Boot mode is also cleared when a WDT overflow occurs.
- 8. Do not change the TEST pin and $\overline{\text{NMI}}$ pin input levels in boot mode.

Table 7.2 Boot Mode Operation

| E | Host Operation | Communication Contents | LSI Operation |
|--|--|--|---|
| Item | Processing Contents | | Processing Contents |
| Boot mode initiation | | | Branches to boot program at reset-start. Boot program initiation |
| Bit rate adjustment | Continuously transmits data H'00 at specified bit rate. Transmits data H'55 when data H'00 is received error-free. | H'00, H'00 · · · H'00 H'00 H'55 | Measures low-level period of receive data H'00. Calculates bit rate and sets BRR in SCI3. Transmits data H'00 to host as adjustment end indication. H'55 reception. |
| Flash memory erase | Boot program ← erase error H'AA reception | H'FF H'AA | Checks flash memory data, erases all flash memory blocks in case of written data existing, and transmits data H'AA to host. (If erase could not be done, transmits data H'FF to host and aborts operation.) |
| Transfer of number of bytes of programming control program | Transmits number of bytes (N) of programming control program to be transferred as 2-byte data (low-order byte following high-order byte) Transmits 1-byte of programming control program (repeated for N times) | Upper bytes, lower bytes Echoback H'XX Echoback | Echobacks the 2-byte data received to host. Echobacks received data to host and also transfers it to RAM. (repeated for N times) |
| | H'AA reception ◀ | H'AA | Branches to programming control program transferred to on-chip RAM and starts execution. |

Table 7.3 System Clock Frequencies for which Automatic Adjustment of LSI Bit Rate is Possible

| Host Bit Rate | System Clock Frequency Range of LSI |
|---------------|-------------------------------------|
| 9,600 bps | 10 MHz |
| 4,800 bps | |

7.3.2 Programming/Erasing in User Program Mode

On-board programming/erasing of an individual flash memory block can also be performed in user program mode by branching to a user program/erase control program. The user must set branching conditions and provide on-board means of supplying programming data. The flash memory must contain the user program/erase control program or a program that provides the user program/erase control program from external memory. As the flash memory itself cannot be read during programming/erasing, transfer the user program/erase control program to on-chip RAM, as in boot mode. Figure 7.2 shows a sample procedure for programming/erasing in user program mode. Prepare a user program/erase control program in accordance with the description in section 7.4, Flash Memory Programming/Erasing.

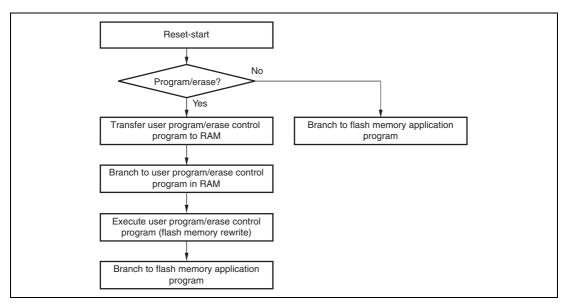

Figure 7.2 Programming/Erasing Flowchart Example in User Program Mode

7.4 Flash Memory Programming/Erasing

A software method using the CPU is employed to program and erase flash memory in the onboard programming modes. Depending on the FLMCR1 setting, the flash memory operates in one of the following four modes: Program mode, program-verify mode, erase mode, and erase-verify mode. The programming control program in boot mode and the user program/erase control program in user program mode use these operating modes in combination to perform programming/erasing. Flash memory programming and erasing should be performed in accordance with the descriptions in section 7.4.1, Program/Program-Verify and section 7.4.2, Erase/Erase-Verify, respectively.

7.4.1 Program/Program-Verify

When writing data or programs to the flash memory, the program/program-verify flowchart shown in figure 7.3 should be followed. Performing programming operations according to this flowchart will enable data or programs to be written to the flash memory without subjecting the chip to voltage stress or sacrificing program data reliability.

- 1. Programming must be done to an empty address. Do not reprogram an address to which programming has already been performed.
- 2. Programming should be carried out 128 bytes at a time. A 128-byte data transfer must be performed even if writing fewer than 128 bytes. In this case, H'FF data must be written to the extra addresses.
- 3. Prepare the following data storage areas in RAM: A 128-byte programming data area, a 128byte reprogramming data area, and a 128-byte additional-programming data area. Perform reprogramming data computation according to table 7.4, and additional programming data computation according to table 7.5.
- 4. Consecutively transfer 128 bytes of data in byte units from the reprogramming data area or additional-programming data area to the flash memory. The program address and 128-byte data are latched in the flash memory. The lower 8 bits of the start address in the flash memory destination area must be H'00 or H'80.
- 5. The time during which the P bit is set to 1 is the programming time. Table 7.6 shows the allowable programming times.
- 6. The watchdog timer (WDT) is set to prevent overprogramming due to program runaway, etc. An overflow cycle of approximately 6.6 ms is allowed.
- 7. For a dummy write to a verify address, write 1-byte data H'FF to an address whose lower 2 bits are B'00. Verify data can be read in words or in longwords from the address to which a dummy write was performed.

8. The maximum number of repetitions of the program/program-verify sequence of the same bit is 1,000.

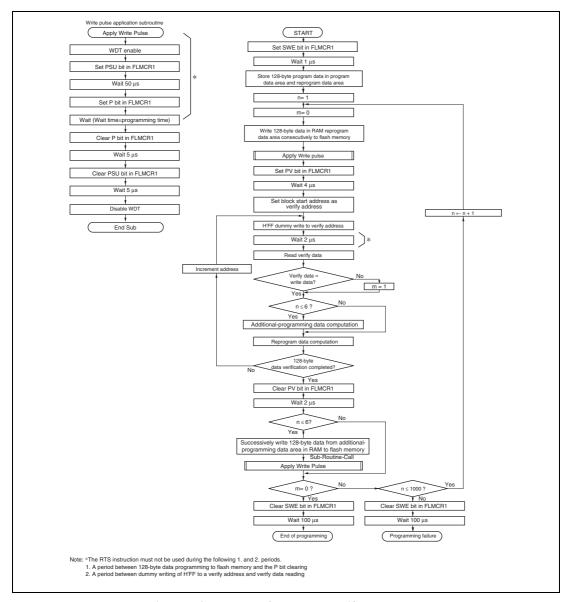

Figure 7.3 Program/Program-Verify Flowchart

Table 7.4 Reprogram Data Computation Table

| Program Data | Verify Data | Reprogram Data | Comments |
|--------------|-------------|----------------|-------------------------|
| 0 | 0 | 1 | Programming completed |
| 0 | 1 | 0 | Reprogram bit |
| 1 | 0 | 1 | _ |
| 1 | 1 | 1 | Remains in erased state |

 Table 7.5
 Additional-Program Data Computation Table

| Reprogram Data | Verify Data | Additional-Program Data | Comments |
|----------------|-------------|----------------------------|---------------------------|
| 0 | 0 | 0 | Additional-program bit |
| 0 | 1 | 1 | No additional programming |
| 1 | 0 | 1 | No additional programming |
| 1 | 1 | 1 | No additional programming |

Table 7.6 Programming Time

| n (Number of Writes) | Programming Time | In Additional Programming | Comments |
|-------------------------|---------------------|------------------------------|----------|
| 1 to 6 | 30 | 10 | |
| 7 to 1,000 | 200 | _ | |

Note: Time shown in μs.

7.4.2 Erase/Erase-Verify

When erasing flash memory, the erase/erase-verify flowchart shown in figure 7.4 should be followed.

- 1. Prewriting (setting erase block data to all 0s) is not necessary.
- 2. Erasing is performed in block units. Make only a single-bit specification in the erase block register (EBR1). To erase multiple blocks, each block must be erased in turn.
- 3. The time during which the E bit is set to 1 is the flash memory erase time.
- 4. The watchdog timer (WDT) is set to prevent overerasing due to program runaway, etc. An overflow cycle of approximately 19.8 ms is allowed.
- 5. For a dummy write to a verify address, write 1-byte data H'FF to an address whose lower two bits are B'00. Verify data can be read in longwords from the address to which a dummy write was performed.
- 6. If the read data is not erased successfully, set erase mode again, and repeat the erase/erase-verify sequence as before. The maximum number of repetitions of the erase/erase-verify sequence is 100.

7.4.3 Interrupt Handling when Programming/Erasing Flash Memory

All interrupts, including the NMI interrupt, are disabled while flash memory is being programmed or erased, or while the boot program is executing, for the following three reasons:

- 1. Interrupt during programming/erasing may cause a violation of the programming or erasing algorithm, with the result that normal operation cannot be assured.
- 2. If interrupt exception handling starts before the vector address is written or during programming/erasing, a correct vector cannot be fetched and the CPU malfunctions.
- If an interrupt occurs during boot program execution, normal boot mode sequence cannot be carried out.

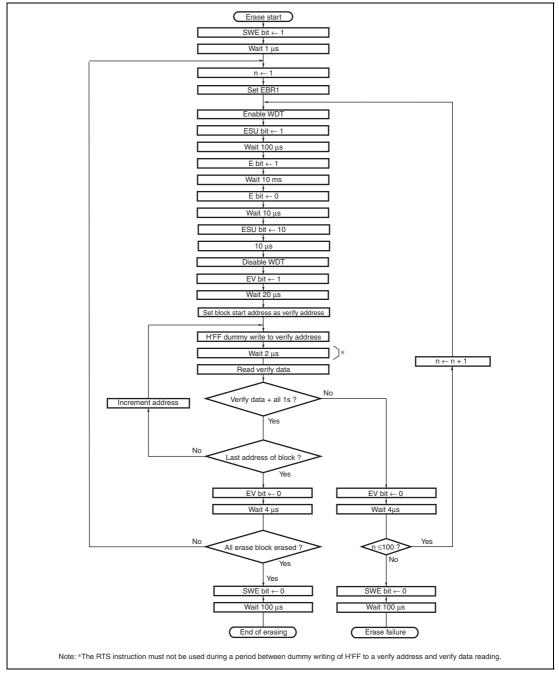

Figure 7.4 Erase/Erase-Verify Flowchart

7.5 Program/Erase Protection

There are three kinds of flash memory program/erase protection; hardware protection, software protection, and error protection.

7.5.1 Hardware Protection

Hardware protection refers to a state in which programming/erasing of flash memory is forcibly disabled or aborted because of a transition to reset, subactive mode, subsleep mode, or standby mode. Flash memory control register 1 (FLMCR1), flash memory control register 2 (FLMCR2), and erase block register 1 (EBR1) are initialized. In a reset via the \overline{RES} pin, the reset state is not entered unless the \overline{RES} pin is held low until oscillation stabilizes after powering on. In the case of a reset during operation, hold the \overline{RES} pin low for the \overline{RES} pulse width specified in the AC Characteristics section.

7.5.2 Software Protection

Software protection can be implemented against programming/erasing of all flash memory blocks by clearing the SWE bit in FLMCR1. When software protection is in effect, setting the P or E bit in FLMCR1 does not cause a transition to program mode or erase mode. By setting the erase block register 1 (EBR1), erase protection can be set for individual blocks. When EBR1 is set to H'00, erase protection is set for all blocks.

7.5.3 Error Protection

In error protection, an error is detected when CPU runaway occurs during flash memory programming/erasing, or operation is not performed in accordance with the program/erase algorithm, and the program/erase operation is forcibly aborted. Aborting the program/erase operation prevents damage to the flash memory due to overprogramming or overerasing.

When the following errors are detected during programming/erasing of flash memory, the FLER bit in FLMCR2 is set to 1, and the error protection state is entered.

- When the flash memory of the relevant address area is read during programming/erasing (including vector read and instruction fetch)
- Immediately after exception handling excluding a reset during programming/erasing
- When a SLEEP instruction is executed during programming/erasing

The FLMCR1, FLMCR2, and EBR1 settings are retained, however program mode or erase mode is aborted at the point at which the error occurred. Program mode or erase mode cannot be reentered by re-setting the P or E bit. However, PV and EV bit settings are retained, and a transition can be made to verify mode. Error protection can be cleared only by a reset.

7.6 Programmer Mode

In programmer mode, a PROM programmer can be used to perform programming/erasing via a socket adapter, just as a discrete flash memory. Use a PROM programmer that supports the MCU device type with the on-chip 128-kbyte flash memory (FZTAT64V5).

7.7 Power-Down States for Flash Memory

In user mode, the flash memory will operate in either of the following states:

- Normal operating mode
 The flash memory can be read and written to at high speed.
- Power-down operating mode
 The power supply circuit of flash memory can be partly halted. As a result, flash memory can be read with low power consumption.
- Standby mode
 All flash memory circuits are halted.

Table 7.7 shows the correspondence between the operating modes of this LSI and the flash memory. In subactive mode, the flash memory can be set to operate in power-down mode with the PDWND bit in FLPWCR. When the flash memory returns to its normal operating state from power-down mode or standby mode, a period to stabilize operation of the power supply circuits that were stopped is needed. When the flash memory returns to its normal operating state, bits STS2 to STS0 in SYSCR1 must be set to provide a wait time of at least 20 μ s, even when the external clock is being used.

Table 7.7 Flash Memory Operating States

Flash Memory Operating State

| LSI Operating State | PDWND = 0 (Initial Value) | PDWND = 1 |
|-----------------------------------|---------------------------|-----------------------|
| Active mode Normal operating mode | | Normal operating mode |
| Subactive mode | Power-down mode | Normal operating mode |
| Sleep mode | Normal operating mode | Normal operating mode |
| Subsleep mode | Standby mode | Standby mode |
| Standby mode | Standby mode | Standby mode |

Section 8 RAM

Microcontrollers of the H8/36079 Group and H8/36077 Group have an on-chip high-speed static RAM. The RAM is connected to the CPU by a 16-bit data bus, enabling two-state access by the CPU to both byte data and word data.

| Product Classifica | ation | RAM Size | RAM Address | | | |
|--------------------|----------|---------------------|------------------|----------|--------------------------------|--|
| Flash memory | H8/36079 | 5.0-V specification | H8/36079GF | 6 Kbytes | H'FFE000 to H'FFEFFF, | |
| version Group | Group | 3.3-V specification | H8/36079LF | _ | H'FFF780 to H'FFFF7F*1 | |
| (F-ZTAT version) | | 5.0-V specification | H8/36078GF | _ | | |
| | | 3.3-V specification | H8/36078LF | _ | | |
| | H8/36077 | | H8/36077GF | 4 Kbytes | H'E800 to H'EFFF, | |
| Group | | 3.3-V specification | ation H8/36077LF | | H'F780 to H'FF7F* ² | |
| | | 5.0-V specification | H8/36074GF | _ | | |
| | | 3.3-V specification | H8/36074LF | _ | | |

Notes: 1. When the E7 or E8 is used, area H'FFF780 to H'FFFB7F must not be accessed.

2. When the E7 or E8 is used, area H'F780 to H'FB7F must not be accessed.

Section 9 I/O Ports

This LSI has 47 general I/O ports and 8 general input-only ports. Port 6 is a large current port, which can drive 20 mA ($@V_{OL} = 1.5 \text{ V}$) when a low level signal is output. Any of these ports can become an input port immediately after a reset. They can also be used as I/O pins of the on-chip peripheral modules or external interrupt input pins, and these functions can be switched depending on the register settings. The registers for selecting these functions can be divided into two types: those included in I/O ports and those included in each on-chip peripheral module. General I/O ports are comprised of the port control register for controlling inputs/outputs and the port data register for storing output data and can select inputs/outputs in bit units.

For functions in each port, see appendix B.1, I/O Port Block Diagrams. For the execution of bit-manipulation instructions to the port control register and port data register, see section 2.8.3, Bit-Manipulation Instruction.

9.1 Port 1

Port 1 is a general I/O port also functioning as IRQ interrupt input pins, an RTC output pin, a 14-bit PWM output pin, a timer B1 input pin, and a timer V input pin. Figure 9.1 shows its pin configuration.

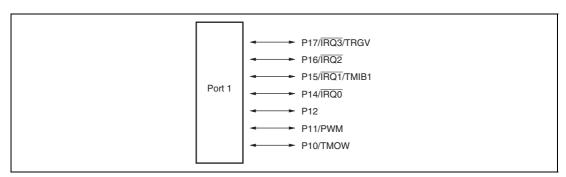

Figure 9.1 Port 1 Pin Configuration

Port 1 has the following registers.

- Port mode register 1 (PMR1)
- Port control register 1 (PCR1)
- Port data register 1 (PDR1)
- Port pull-up control register 1 (PUCR1)

9.1.1 Port Mode Register 1 (PMR1)

PMR1 switches the functions of pins in port 1 and port 2.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 7 | IRQ3 | 0 | R/W | This bit selects the function of pin P17/IRQ3/TRGV. |
| | | | | 0: General I/O port |
| | | | | 1: IRQ3/TRGV input pin |
| 6 | IRQ2 | 0 | R/W | This bit selects the function of pin P16/IRQ2. |
| | | | | 0: General I/O port |
| | | | | 1: IRQ2 input pin |
| 5 | IRQ1 | 0 | R/W | This bit selects the function of pin P15/IRQ1/TMIB1. |
| | | | | 0: General I/O port |
| | | | | 1: IRQ1/TMIB1 input pin |
| 4 | IRQ0 | 0 | R/W | This bit selects the function of pin P14/IRQ0. |
| | | | | 0: General I/O port |
| | | | | 1: IRQ0 input pin |
| 3 | TXD2 | 0 | R/W | This bit selects the function of pin P72/TXD_2. |
| | | | | 0: General I/O port |
| | | | | 1: TXD_2 output pin |
| 2 | PWM | 0 | R/W | This bit selects the function of pin P11/PWM. |
| | | | | 0: General I/O port |
| | | | | 1: PWM output pin |
| 1 | TXD | 0 | R/W | This bit selects the function of pin P22/TXD. |
| | | | | 0: General I/O port |
| | | | | 1: TXD output pin |
| 0 | TMOW | 0 | R/W | This bit selects the function of pin P10/TMOW. |
| | | | | 0: General I/O port |
| | | | | 1: TMOW output pin |

9.1.2 Port Control Register 1 (PCR1)

PCR1 selects inputs/outputs in bit units for pins to be used as general I/O ports of port 1.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | PCR17 | 0 | W | When the corresponding pin is designated in PMR1 as a |
| 6 | PCR16 | 0 | W | general I/O pin, setting a PCR1 bit to 1 makes the |
| 5 | PCR15 | 0 | W | corresponding pin an output port, while clearing the bit to 0 makes the pin an input port. |
| 4 | PCR14 | 0 | W | Bit 3 is a reserved bit. |
| 3 | _ | _ | _ | |
| 2 | PCR12 | 0 | W | |
| 1 | PCR11 | 0 | W | |
| 0 | PCR10 | 0 | W | |

9.1.3 Port Data Register 1 (PDR1)

PDR1 is a general I/O port data register of port 1.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | P17 | 0 | R/W | PDR1 stores output data for port 1 pins. |
| 6 | P16 | 0 | R/W | If PDR1 is read while PCR1 bits are set to 1, the value |
| 5 | P15 | 0 | R/W | stored in PDR1 are read. If PDR1 is read while PCR1 bits are cleared to 0, the pin states are read regardless of the |
| 4 | P14 | 0 | R/W | value stored in PDR1. |
| 3 | _ | 1 | _ | Bit 3 is a reserved bit. This bit is always read as 1. |
| 2 | P12 | 0 | R/W | |
| 1 | P11 | 0 | R/W | |
| 0 | P10 | 0 | R/W | |

9.1.4 Port Pull-Up Control Register 1 (PUCR1)

PUCR1 controls the pull-up MOS in bit units of the pins set as the input ports.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | PUCR17 | 0 | R/W | Only bits for which PCR1 is cleared are valid. The pull-up |
| 6 | PUCR16 | 0 | R/W | MOS of P17 to P14 and P12 to P10 pins enter the on- |
| 5 | PUCR15 | 0 | R/W | state when these bits are set to 1, while they enter the off-state when these bits are cleared to 0. |
| 4 | PUCR14 | 0 | R/W | Bit 3 is a reserved bit. This bit is always read as 1. |
| 3 | _ | 1 | _ | |
| 2 | PUCR12 | 0 | R/W | |
| 1 | PUCR11 | 0 | R/W | |
| 0 | PUCR10 | 0 | R/W | |

9.1.5 Pin Functions

The correspondence between the register specification and the port functions is shown below.

P17/IRQ3/TRGV pin

| Register | PMR1 | PCR1 | |
|---------------|------|-------|---------------------------|
| Bit Name | IRQ3 | PCR17 | Pin Function |
| Setting value | 0 | 0 | P17 input pin |
| | | 1 | P17 output pin |
| | 1 | Х | IRQ3 input/TRGV input pin |

[Legend] x: Don't care.

P16/IRQ2 pin

| Register | PMR1 | PCR1 | |
|---------------|------|-------|----------------|
| Bit Name | IRQ2 | PCR16 | Pin Function |
| Setting value | 0 | 0 | P16 input pin |
| | | 1 | P16 output pin |
| | 1 | Х | IRQ2 input pin |

[Legend] x: Don't care.

P15/IRQ1/TMIB1 pin

| Register | PMR1 | PCR1 | |
|---------------|------|-------|----------------------------|
| Bit Name | IRQ1 | PCR15 | Pin Function |
| Setting value | 0 | 0 | P15 input pin |
| | | 1 | P15 output pin |
| | 1 | Х | IRQ1 input/TMIB1 input pin |

[Legend] x: Don't care.

$P14/\overline{IRQ0}\;pin$

| Register | PMR1 | PCR1 | |
|---------------|------|-------|----------------|
| Bit Name | IRQ0 | PCR14 | Pin Function |
| Setting value | 0 | 0 | P14 input pin |
| | | 1 | P14 output pin |
| | 1 | Х | ĪRQ0 input pin |

[Legend] x: Don't care.

P12 pin

| Register | PCR1 | | |
|---------------|-------|----------------|--|
| Bit Name | PCR12 | Pin Function | |
| Setting value | 0 | P12 input pin | |
| | 1 | P12 output pin | |

P11/PWM pin

| Register | PMR1 | PCR1 | |
|---------------|------|-------|----------------|
| Bit Name | PWM | PCR11 | Pin Function |
| Setting value | 0 | 0 | P11 input pin |
| | | 1 | P11 output pin |
| | 1 | Х | PWM output pin |

[Legend] x: Don't care.

P10/TMOW pin

| Register | PMR1 | PCR1 | |
|---------------|------|-------|-----------------|
| Bit Name | TMOW | PCR10 | Pin Function |
| Setting value | 0 | 0 | P10 input pin |
| | | 1 | P10 output pin |
| | 1 | х | TMOW output pin |

[Legend] x: Don't care.

9.2 Port 2

Port 2 is a general I/O port also functioning as SCI3 I/O pins. Each pin of the port 2 is shown in figure 9.2. The register settings of PMR1 and SCI3 have priority for functions of the pins for both uses.

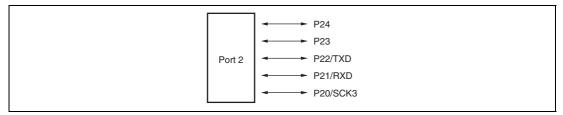

Figure 9.2 Port 2 Pin Configuration

Port 2 has the following registers.

- Port control register 2 (PCR2)
- Port data register 2 (PDR2)
- Port mode register 3 (PMR3)

9.2.1 Port Control Register 2 (PCR2)

PCR2 selects inputs/outputs in bit units for pins to be used as general I/O ports of port 2.

| | | Initial | | |
|--------|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 to 5 | _ | _ | _ | Reserved |
| 4 | PCR24 | 0 | W | When each of the port 2 pins P24 to P20 functions as a |
| 3 | PCR23 | 0 | W | general I/O port, setting a PCR2 bit to 1 makes the corresponding pin an output port, while clearing the bit to |
| 2 | PCR22 | 0 | W | 0 makes the pin an input port. |
| 1 | PCR21 | 0 | W | |
| 0 | PCR20 | 0 | W | |

9.2.2 Port Data Register 2 (PDR2)

PDR2 is a general I/O port data register of port 2.

| | | Initial | | |
|--------|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 to 5 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 4 | P24 | 0 | R/W | PDR2 stores output data for port 2 pins. |
| 3 | P23 | 0 | R/W | If PDR2 is read while PCR2 bits are set to 1, the value |
| 2 | P22 | 0 | R/W | stored in PDR2 is read. If PDR2 is read while PCR2 bits |
| 1 | P21 | 0 | R/W | are cleared to 0, the pin states are read regardless of the value stored in PDR2. |
| 0 | P20 | 0 | R/W | |
| | | | | |

9.2.3 Port Mode Register 3 (PMR3)

PMR3 selects the CMOS output or NMOS open-drain output for port 2.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 7 to 5 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |
| 4 | POF24 | 0 | R/W | When the bit is set to 1, the corresponding pin is cut off |
| 3 | POF23 | 0 | R/W | by PMOS and it functions as the NMOS open-drain output. When cleared to 0, the pin functions as the CMOS output. |
| 2 to 0 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |

9.2.4 Pin Functions

The correspondence between the register specification and the port functions is shown below.

P24 pin

| Register | PCR2 | |
|---------------|-------|----------------|
| Bit Name | PCR24 | Pin Function |
| Setting Value | 0 | P24 input pin |
| | 1 | P24 output pin |

P23 pin

| Register | PCR2 | |
|---------------|-------|----------------|
| Bit Name | PCR23 | Pin Function |
| Setting Value | 0 | P23 input pin |
| | 1 | P23 output pin |

P22/TXD pin

| Register | PMR1 | PCR2 | | |
|---------------|------|-------|----------------|--|
| Bit Name | TXD | PCR22 | Pin Function | |
| Setting Value | 0 | 0 | P22 input pin | |
| | | 1 | P22 output pin | |
| | 1 | Х | TXD output pin | |

[Legend] x: Don't care.

P21/RXD pin

| Register | SCR3 | PCR2 | |
|---------------|------|-------|----------------|
| Bit Name | RE | PCR21 | Pin Function |
| Setting Value | 0 | 0 | P21 input pin |
| | | 1 | P21 output pin |
| | 1 | Х | RXD input pin |

[Legend] x: Don't care.

P20/SCK3 pin

| Register | SCR3 | | SMR | PCR2 | |
|---------------|------|------|-----|-------|-----------------|
| Bit Name | CKE1 | CKE0 | COM | PCR20 | Pin Function |
| Setting Value | 0 | 0 | 0 | 0 | P20 input pin |
| | | | | 1 | P20 output pin |
| | 0 | 0 | 1 | х | SCK3 output pin |
| | 0 | 1 | Х | Х | SCK3 output pin |
| | 1 | Х | х | Х | SCK3 input pin |

[Legend] x: Don't care.

9.3 Port 3

Port 3 is a general I/O port. Each pin of the port 3 is shown in figure 9.3.

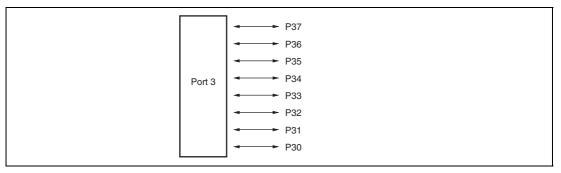

Figure 9.3 Port 3 Pin Configuration

Port 3 has the following registers.

- Port control register 3 (PCR3)
- Port data register 3 (PDR3)

9.3.1 Port Control Register 3 (PCR3)

PCR3 selects inputs/outputs in bit units for pins to be used as general I/O ports of port 3.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 7 | PCR37 | 0 | W | Setting a PCR3 bit to 1 makes the corresponding pin an |
| 6 | PCR36 | 0 | W | output port, while clearing the bit to 0 makes the pin an input port. |
| 5 | PCR35 | 0 | W | input port. |
| 4 | PCR34 | 0 | W | |
| 3 | PCR33 | 0 | W | |
| 2 | PCR32 | 0 | W | |
| 1 | PCR31 | 0 | W | |
| 0 | PCR30 | 0 | W | |

9.3.2 Port Data Register 3 (PDR3)

PDR3 is a general I/O port data register of port 3.

| | | Initial | | |
|-----|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 | P37 | 0 | R/W | PDR3 stores output data for port 3 pins. |
| 6 | P36 | 0 | R/W | If PDR3 is read while PCR3 bits are set to 1, the value |
| 5 | P35 | 0 | R/W | stored in PDR3 is read. If PDR3 is read while PCR3 bits |
| 4 | P34 | 0 | R/W | are cleared to 0, the pin states are read regardless of the value stored in PDR3. |
| 3 | P33 | 0 | R/W | |
| 2 | P32 | 0 | R/W | |
| 1 | P31 | 0 | R/W | |
| 0 | P30 | 0 | R/W | |

9.3.3 Pin Functions

The correspondence between the register specification and the port functions is shown below.

P37 pin

| Register | PCR3 | |
|---------------|-------|----------------|
| Bit Name | PCR37 | Pin Function |
| Setting Value | 0 | P37 input pin |
| | 1 | P37 output pin |

P36 pin

| Register | PCR3 | |
|---------------|-------|----------------|
| Bit Name | PCR36 | Pin Function |
| Setting Value | 0 | P36 input pin |
| | 1 | P36 output pin |

P35 pin

| Register | PCR3 | |
|---------------|-------|----------------|
| Bit Name | PCR35 | Pin Function |
| Setting Value | 0 | P35 input pin |
| | 1 | P35 output pin |

P34 pin

| Register | PCR3 | | |
|---------------|-------|----------------|--|
| Bit Name | PCR34 | Pin Function | |
| Setting Value | 0 | P34 input pin | |
| | 1 | P34 output pin | |

P33 pin

| Register | PCR3 | |
|---------------|-------|----------------|
| Bit Name | PCR33 | Pin Function |
| Setting Value | 0 | P33 input pin |
| | 1 | P33 output pin |

P32 pin

| Register | PCR3 | | |
|---------------|-------|----------------|--|
| Bit Name | PCR32 | Pin Function | |
| Setting Value | 0 | P32 input pin | |
| | 1 | P32 output pin | |

P31 pin

| Register | PCR3 | |
|-------------------------------|-------|----------------|
| Bit Name | PCR31 | Pin Function |
| Setting Value 0 P31 input pin | | P31 input pin |
| | 1 | P31 output pin |

P30 pin

| Register | PCR3 | | |
|---------------|-------|----------------|--|
| Bit Name | PCR30 | Pin Function | |
| Setting Value | 0 | P30 input pin | |
| | 1 | P30 output pin | |

9.4 Port 5

Port 5 is a general I/O port also functioning as an I²C bus interface I/O pin, an A/D trigger input pin, and wakeup interrupt input pin. Each pin of the port 5 is shown in figure 9.4. The register setting of the I²C bus interface register has priority for functions of the pins P57/SCL and P56/SDA. Since the output buffer for pins P56 and P57 has the NMOS push-pull structure, it differs from an output buffer with the CMOS structure in the high-level output characteristics (see section 22, Electrical Characteristics).

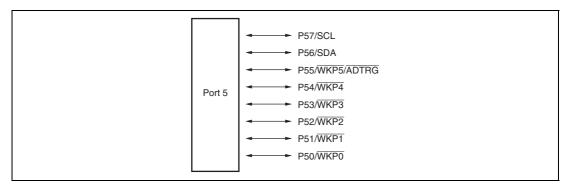

Figure 9.4 Port 5 Pin Configuration

Port 5 has the following registers.

- Port mode register 5 (PMR5)
- Port control register 5 (PCR5)
- Port data register 5 (PDR5)
- Port pull-up control register 5 (PUCR5)

9.4.1 Port Mode Register 5 (PMR5)

PMR5 switches the functions of pins in port 5.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | POF57 | 0 | R/W | When the bit is set to 1, the corresponding pin is cut off |
| 6 | POF56 | 0 | R/W | by PMOS and it functions as the NMOS open-drain output. When cleared to 0, the pin functions as the CMOS output. |
| 5 | WKP5 | 0 | R/W | This bit selects the function of pin P55/WKP5/ADTRG. |
| | | | | 0: General I/O port |
| | | | | 1: WKP5/ADTRG input pin |
| 4 | WKP4 | 0 | R/W | This bit selects the function of pin P54/WKP4. |
| | | | | 0: General I/O port |
| | | | | 1: WKP4 input pin |
| 3 | WKP3 | 0 | R/W | This bit selects the function of pin P53/WKP3. |
| | | | | 0: General I/O port |
| | | | | 1: WKP3 input pin |
| 2 | WKP2 | 0 | R/W | This bit selects the function of pin P52/WKP2. |
| | | | | 0: General I/O port |
| | | | | 1: WKP2 input pin |
| 1 | WKP1 | 0 | R/W | This bit selects the function of pin P51/WKP1. |
| | | | | 0: General I/O port |
| | | | | 1: WKP1 input pin |
| 0 | WKP0 | 0 | R/W | This bit selects the function of pin P50/WKP0. |
| | | | | 0: General I/O port |
| | | | | 1: WKP0 input pin |

9.4.2 Port Control Register 5 (PCR5)

PCR5 selects inputs/outputs in bit units for pins to be used as general I/O ports of port 5.

| | | Initial | | |
|-----|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 | PCR57 | 0 | W | When each of the port 5 pins P57 to P50 functions as a |
| 6 | PCR56 | 0 | W | general I/O port, setting a PCR5 bit to 1 makes the corresponding pin an output port, while clearing the bit to |
| 5 | PCR55 | 0 | W | 0 makes the pin an input port. |
| 4 | PCR54 | 0 | W | |
| 3 | PCR53 | 0 | W | |
| 2 | PCR52 | 0 | W | |
| 1 | PCR51 | 0 | W | |
| 0 | PCR50 | 0 | W | |

9.4.3 Port Data Register 5 (PDR5)

PDR5 is a general I/O port data register of port 5.

| D:4 | Dit Nama | Initial | D/M | December |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | P57 | 0 | R/W | Stores output data for port 5 pins. |
| 6 | P56 | 0 | R/W | If PDR5 is read while PCR5 bits are set to 1, the value |
| 5 | P55 | 0 | R/W | stored in PDR5 are read. If PDR5 is read while PCR5 bits are cleared to 0, the pin states are read regardless of the |
| 4 | P54 | 0 | R/W | value stored in PDR5. |
| 3 | P53 | 0 | R/W | |
| 2 | P52 | 0 | R/W | |
| 1 | P51 | 0 | R/W | |
| 0 | P50 | 0 | R/W | |

9.4.4 Port Pull-Up Control Register 5 (PUCR5)

PUCR5 controls the pull-up MOS in bit units of the pins set as the input ports.

| Bit | Bit Name | Initial Value | R/W | Description |
|------|----------|------------------|-----|---|
| 7, 6 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |
| 5 | PUCR55 | 0 | R/W | Only bits for which PCR5 is cleared are valid. The pull-up |
| 4 | PUCR54 | 0 | R/W | MOS of the corresponding pins enter the on-state when |
| 3 | PUCR53 | 0 | R/W | these bits are set to 1, while they enter the off-state when these bits are cleared to 0. |
| 2 | PUCR52 | 0 | R/W | |
| 1 | PUCR51 | 0 | R/W | |
| 0 | PUCR50 | 0 | R/W | |

9.4.5 Pin Functions

The correspondence between the register specification and the port functions is shown below.

P57/SCL pin

| Register | ICCR1 | PCR5 | |
|---------------|-------|-------|----------------|
| Bit Name | ICE | PCR57 | Pin Function |
| Setting Value | 0 | 0 | P57 input pin |
| | | 1 | P57 output pin |
| | 1 | х | SCL I/O pin |

[Legend] x: Don't care.

SCL performs the NMOS open-drain output, that enables a direct bus drive.

P56/SDA pin

| Register | ICCR1 | PCR5 | |
|---------------|-------|-------|----------------|
| Bit Name | ICE | PCR56 | Pin Function |
| Setting Value | 0 | 0 | P56 input pin |
| | | 1 | P56 output pin |
| | 1 | Х | SDA I/O pin |

[Legend] x: Don't care.

SDA performs the NMOS open-drain output that enables a direct bus drive.

P55/WKP5/ADTRG pin

| Register | PMR5 | PCR5 | |
|---------------|------|-------|----------------------|
| Bit Name | WKP5 | PCR55 | Pin Function |
| Setting Value | 0 | 0 | P55 input pin |
| | | 1 | P55 output pin |
| | 1 | Х | WKP5/ADTRG input pin |

[Legend] x: Don't care.

P54/WKP4 pin

| Bit Name | WKP4 | PCR54 | Pin Function |
| Setting Value | 0 | 0 | P54 input pin |
| | | 1 | P54 output pin |
| | 1 | Х | WKP4 input pin |

P53/WKP3 pin

| Register | PMR5 | PCR5 | |
|---------------|------|-------|----------------|
| Bit Name | WKP3 | PCR53 | Pin Function |
| Setting Value | 0 | 0 | P53 input pin |
| | | 1 | P53 output pin |
| | 1 | Х | WKP3 input pin |

[Legend] x: Don't care.

P52/WKP2 pin

| Register | PMR5 | PCR5 | |
|---------------|------|-------|----------------|
| Bit Name | WKP2 | PCR52 | Pin Function |
| Setting Value | 0 | 0 | P52 input pin |
| | | 1 | P52 output pin |
| | 1 | Х | WKP2 input pin |

[Legend] x: Don't care.

$P51/\overline{WKP1}$ pin

| Register | PMR5 | PCR5 | |
|---------------|------|-------|----------------|
| Bit Name | WKP1 | PCR51 | Pin Function |
| Setting Value | 0 | 0 | P51 input pin |
| | | 1 | P51 output pin |
| | 1 | х | WKP1 input pin |

[Legend] x: Don't care.

$P50/\overline{WKP0}$ pin

| Register | PMR5 | PCR5 | |
|---------------|------|-------|----------------|
| Bit Name | WKP0 | PCR50 | Pin Function |
| Setting Value | 0 | 0 | P50 input pin |
| | | 1 | P50 output pin |
| | 1 | Х | WKP0 input pin |

9.5 Port 6

Port 6 is a general I/O port also functioning as a timer Z I/O pin. Each pin of the port 6 is shown in figure 9.5. The register setting of the timer Z has priority for functions of the pins for both uses.

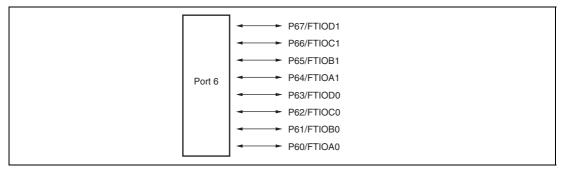

Figure 9.5 Port 6 Pin Configuration

Port 6 has the following registers.

- Port control register 6 (PCR6)
- Port data register 6 (PDR6)

9.5.1 Port Control Register 6 (PCR6)

PCR6 selects inputs/outputs in bit units for pins to be used as general I/O ports of port 6.

| | | Initial | | |
|-----|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 | PCR67 | 0 | W | When each of the port 6 pins P67 to P60 functions as a |
| 6 | PCR66 | 0 | W | general I/O port, setting a PCR6 bit to 1 makes the corresponding pin an output port, while clearing the bit to |
| 5 | PCR65 | 0 | W | 0 makes the pin an input port. |
| 4 | PCR64 | 0 | W | |
| 3 | PCR63 | 0 | W | |
| 2 | PCR62 | 0 | W | |
| 1 | PCR61 | 0 | W | |
| 0 | PCR60 | 0 | W | |

9.5.2 Port Data Register 6 (PDR6)

PDR6 is a general I/O port data register of port 6.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | P67 | 0 | R/W | Stores output data for port 6 pins. |
| 6 | P66 | 0 | R/W | If PDR6 is read while PCR6 bits are set to 1, the value |
| 5 | P65 | 0 | R/W | stored in PDR6 are read. If PDR6 is read while PCR6 bits are cleared to 0, the pin states are read regardless of the |
| 4 | P64 | 0 | R/W | value stored in PDR6. |
| 3 | P63 | 0 | R/W | |
| 2 | P62 | 0 | R/W | |
| 1 | P61 | 0 | R/W | |
| 0 | P60 | 0 | R/W | |

9.5.3 Pin Functions

The correspondence between the register specification and the port functions is shown below.

P67/FTIOD1 pin

| Register | TOER | TFCR | TPMR | TIORC1 | PCR6 | |
|---------------|------|------------------|-------|-----------------|-------|----------------------------|
| Bit Name | ED1 | CMD1 and CMD0 | PWMD1 | IOD2 to IOD0 | PCR67 | Pin Function |
| Setting Value | 1 | 00 | 0 | 000 or 1xx | 0 | P67 input/FTIOD1 input pin |
| | | | | | 1 | P67 output pin |
| | 0 | 00 | 0 | 001 or 01x | х | FTIOD1 output pin |

9.6 Port 7

Port 7 is a general I/O port also functioning as a timer V I/O pin and SCI3_2 I/O pin. Each pin of the port 7 is shown in figure 9.6. The register settings of the timer V and SCI3_2 have priority for functions of the pins for both uses.

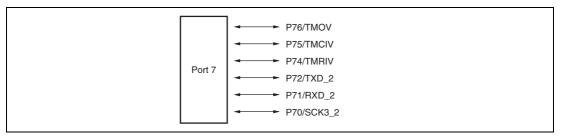

Figure 9.6 Port 7 Pin Configuration

Port 7 has the following registers.

- Port control register 7 (PCR7)
- Port data register 7 (PDR7)

9.6.1 Port Control Register 7 (PCR7)

PCR7 selects inputs/outputs in bit units for pins to be used as general I/O ports of port 7.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | _ | _ | _ | When each of the port 7 pins P76 to P74 and P72 to P70 |
| 6 | PCR76 | 0 | W | functions as a general I/O port, setting a PCR7 bit to 1 |
| 5 | PCR75 | 0 | W | makes the corresponding pin an output port, while clearing the bit to 0 makes the pin an input port. |
| 4 | PCR74 | 0 | W | Bits 7 and 3 are reserved bits. |
| 3 | _ | | _ | |
| 2 | PCR72 | 0 | W | |
| 1 | PCR71 | 0 | W | |
| 0 | PCR70 | 0 | W | |

9.6.2 Port Data Register 7 (PDR7)

PDR7 is a general I/O port data register of port 7.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | _ | 1 | _ | Stores output data for port 7 pins. |
| 6 | P76 | 0 | R/W | If PDR7 is read while PCR7 bits are set to 1, the value |
| 5 | P75 | 0 | R/W | stored in PDR7 are read. If PDR7 is read while PCR7 bits are cleared to 0, the pin states are read regardless of the |
| 4 | P74 | 0 | R/W | value stored in PDR7. |
| 3 | _ | 1 | | Bits 7 and 3 are reserved bits. These bits are always read |
| 2 | P72 | 0 | R/W | as 1. |
| 1 | P71 | 0 | R/W | |
| 0 | P70 | 0 | R/W | |

9.6.3 Pin Functions

The correspondence between the register specification and the port functions is shown below.

P76/TMOV pin

| Register | TCSRV | PCR7 | |
|---------------|-----------------------------|-------|-----------------|
| Bit Name | OS3 to OS0 | PCR76 | Pin Function |
| Setting Value | 0000 | 0 | P76 input pin |
| | | 1 | P76 output pin |
| | Other than the above values | х | TMOV output pin |

[Legend] x: Don't care.

P75/TMCIV pin

| Register | PCR7 | |
|---------------|-------|----------------------------|
| Bit Name | PCR75 | Pin Function |
| Setting Value | 0 | P75 input/TMCIV input pin |
| | 1 | P75 output/TMCIV input pin |

P74/TMRIV pin

| Register | PCR7 | |
|---------------|-------|----------------------------|
| Bit Name | PCR74 | Pin Function |
| Setting Value | 0 | P74 input/TMRIV input pin |
| | 1 | P74 output/TMRIV input pin |

P72/TXD_2 pin

| Register | PMR1 | PCR7 | |
|---------------|------|-------|------------------|
| Bit Name | TXD2 | PCR72 | Pin Function |
| Setting Value | 0 | 0 | P72 input pin |
| | | 1 | P72 output pin |
| | 1 | х | TXD_2 output pin |

[Legend] x: Don't care.

P71/RXD_2 pin

| Register | SCR3_2 | PCR7 | |
|---------------|--------|-------|-----------------|
| Bit Name | RE | PCR71 | Pin Function |
| Setting Value | 0 | 0 | P71 input pin |
| | | 1 | P71 output pin |
| | 1 | х | RXD_2 input pin |

[Legend] x: Don't care.

P70/SCK3_2 pin

| Register | Register SCR3_2 | | SMR2 PCR7 | | | |
|---------------|-----------------|------|-----------|-------|-------------------|--|
| Bit Name | CKE1 | CKE0 | COM | PCR70 | Pin Function | |
| Setting Value | 0 | 0 | 0 | 0 | P70 input pin | |
| | | | | 1 | P70 output pin | |
| | 0 | 0 | 1 | х | SCK3_2 output pin | |
| | 0 | 1 | х | х | SCK3_2 output pin | |
| | 1 | х | х | х | SCK3_2 input pin | |

9.7 Port 8

Port 8 is a general I/O port. Each pin of the port 8 is shown in figure 9.7.

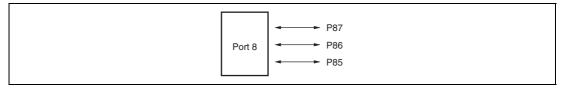

Figure 9.7 Port 8 Pin Configuration

Port 8 has the following registers.

- Port control register 8 (PCR8)
- Port data register 8 (PDR8)

9.7.1 Port Control Register 8 (PCR8)

PCR8 selects inputs/outputs in bit units for pins to be used as general I/O ports of port 8.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|---|
| 7 | PCR87 | 0 | W | When each of the port 8 pins P87 to P85 functions as a |
| 6 | PCR86 | 0 | W | general I/O port, setting a PCR8 bit to 1 makes the corresponding pin an output port, while clearing the bit to |
| 5 | PCR85 | 0 | W | 0 makes the pin an input port. |
| 4 to 0 | _ | _ | _ | Reserved |

9.7.2 Port Data Register 8 (PDR8)

PDR8 is a general I/O port data register of port 8.

| Bit | Bit Name | Initial Value | R/W | Description | |
|--------|----------|------------------|-----|---|--|
| 7 | P87 | 0 | R/W | PDR8 stores output data for port 8 pins. | |
| 6 | P86 | 0 | R/W | If PDR8 is read while PCR8 bits are set to 1, the value | |
| 5 | P85 | 0 | R/W | stored in PDR8 is read. If PDR8 is read while PCR8 bits are cleared to 0, the pin states are read regardless of the value stored in PDR8. | |
| 4 to 0 | _ | All 1 | _ | Reserved | |
| | | | | These bits are always read as 1. | |

9.7.3 Pin Functions

The correspondence between the register specification and the port functions is shown below.

P87 pin

| Register | PCR8 | |
|---------------|-------|----------------|
| Bit Name | PCR87 | Pin Function |
| Setting Value | 0 | P87 input pin |
| | 1 | P87 output pin |

P86 pin

| Register | PCR8 | |
|---------------|-------|----------------|
| Bit Name | PCR86 | Pin Function |
| Setting Value | 0 | P86 input pin |
| | 1 | P86 output pin |

P85 pin

| Register | PCR8 | |
|---------------|-------|----------------|
| Bit Name | PCR85 | Pin Function |
| Setting Value | 0 | P85 input pin |
| | 1 | P85 output pin |

9.8 Port B

Port B is an input port also functioning as an A/D converter analog input pin. Each pin of the port B is shown in figure 9.8.

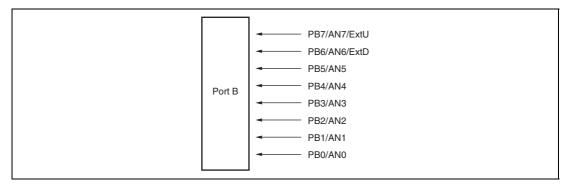

Figure 9.8 Port B Pin Configuration

Port B has the following register.

• Port data register B (PDRB)

9.8.1 Port Data Register B (PDRB)

PDRB is a general input-only port data register of port B.

| | | Initial | | | | |
|-----|----------|---------|-----|---|--|--|
| Bit | Bit Name | Value | R/W | Description | | |
| 7 | PB7 | _ | R | The input value of each pin is read by reading this | | |
| 6 | PB6 | _ | R | register. | | |
| 5 | PB5 | _ | R | However, if a port B pin is designated as an analog inpu | | |
| 4 | PB4 | _ | R | channel by ADCSR in the A/D converter or as an external comparison voltage input pin by LVDCR in the low- | | |
| 3 | PB3 | _ | R | voltage detection circuit, the corresponding bit is read | | |
| 2 | PB2 | _ | R | as 0. | | |
| 1 | PB1 | _ | R | | | |
| 0 | PB0 | _ | R | | | |

9.8.2 Pin Functions

The correspondence between the register specification and the port functions is shown below.

PB0/AN0 pin

| Register | | | | | |
|---------------|------------|-------|-----|-----|----------------|
| Bit Name | SCAN | CH2 | CH1 | CH0 | Pin Function |
| Setting Value | 0 | 0 | 0 | 0 | AN0 input pin |
| | 1 | | х | х | |
| | Other than | above | | | PB0 output pin |

[Legend] x: Don't care.

PB1/AN1 pin

| Register ADC | | | ADCSR | | |

| | 0 | | | 0 | 1 | AN6 input pin |
| | 1 | | | х | | |
| | Other than | n above | | | 0 | PB6 input/ExtD input pin |
| | | | | | 1 | PB6 input pin |

[Legend] x: Don't care.

PB7/AN7/ExtU pin

| Register | | | ADCSR | | | |
|---------------|------------|---------|-------|-----|-------|--------------------------|
| Bit Name | SCAN | CH2 | CH1 | CH0 | VDDII | Pin Function |
| Setting Value | 0 | | 1 | | 0 | AN7 input/ExtU |
| | 1 | | | | | input pin |
| | 0 | | | | 1 | AN7 input pin |
| | 1 | | | | | |
| | Other than | n above | | | 0 | PB7 input/ExtU input pin |
| | | | | | 1 | PB7 input pin |

9.9 Port C

Port C is a general I/O port also functioning as an external oscillation pin and clock output pin. Each pin of the port C is shown in figure 9.9. The register setting of CKCSR has priority for functions of the pins for both uses.

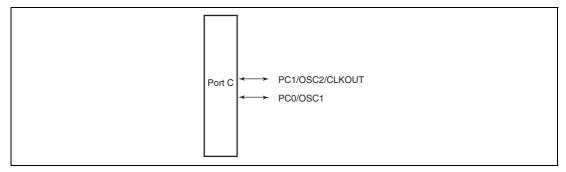

Figure 9.9 Port C Pin Configuration

Port C has the following registers.

- Port control register C (PCRC)
- Port data register C (PDRC)

9.9.1 Port Control Register C (PCRC)

PCRC selects inputs/outputs in bit units for pins to be used as general I/O ports of port C.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|---|
| 7 to 2 | _ | _ | _ | Reserved |
| 1 | PCRC1 | 0 | W | When each of the port C pins, PC1 and PC0, functions as |
| 0 | PCRC0 | 0 | W | an general I/O port, setting a PCRC bit to 1 makes the corresponding pin an output port, while clearing the bit to 0 makes the pin an input port. |

9.9.2 Port Data Register C (PDRC)

PDRC is a general I/O port data register of port C.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|---|
| 7 to 2 | _ | _ | _ | Reserved |
| 1 | PC1 | 0 | R/W | These bits store output data for port C pins. |
| 0 | PC0 | 0 | R/W | If PDRC is read while PCRC bits are set to 1, the value stored in PDRC is read. If PDRC is read while PCRC bits are cleared to 0, the pin states are read regardless of the value stored in PDRC. |

9.9.3 Pin Functions

The correspondence between the register specification and the port functions is shown below.

PC1/OSC2/CLKOUT pin

| Register | | CKCSR | PCRC | | |
|---------------|-------|-------|-------|----------------------|--|
| Bit Name | PMRC1 | PMRC0 | PCRC1 | Pin Function | |
| Setting value | 0 | 0 | 0 | PC1 input pin | |
| | | | 1 | PC1 output pin | |
| | | 1 | х | Open | |
| | 1 | 0 | х | CLKOUT output pin | |
| | | 1 | x | OSC2 oscillation pin | |

[Legend] x: Don't care.

PC0/OSC1 pin

| Register | CKCSR | PCRC | |
|---------------|-------|-------|----------------------|
| Bit Name | PMRC0 | PCRC0 | Pin Function |
| Setting value | e 0 | 0 | PC0 input pin |
| | | 1 | PC0 output pin |
| | 1 | х | OSC1 oscillation pin |

Section 10 Realtime Clock (RTC)

The realtime clock (RTC) is a timer used to count time ranging from a second to a week. Figure 10.1 shows the block diagram of the RTC.

10.1 Features

- Counts seconds, minutes, hours, and day-of-week
- Start/stop function
- Reset function
- Readable/writable counter of seconds, minutes, hours, and day-of-week with BCD codes
- Periodic (seconds, minutes, hours, days, and weeks) interrupts
- 8-bit free running counter
- Selection of clock source

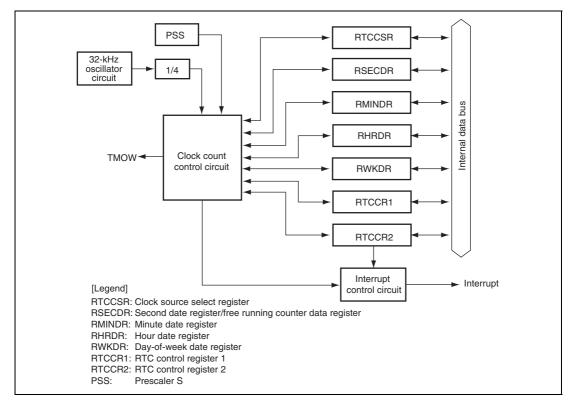

Figure 10.1 Block Diagram of RTC

10.2 Input/Output Pin

Table 10.1 shows the RTC input/output pin.

Table 10.1 Pin Configuration

| Name | Abbreviation | I/O | Function |
|--------------|--------------|--------|--------------------------|
| Clock output | TMOW | Output | RTC divided clock output |

10.3 Register Descriptions

The RTC has the following registers.

- Second data register/free running counter data register (RSECDR)
- Minute data register (RMINDR)
- Hour data register (RHRDR)
- Day-of-week data register (RWKDR)
- RTC control register 1 (RTCCR1)
- RTC control register 2 (RTCCR2)
- Clock source select register (RTCCSR)

10.3.1 Second Data Register/Free Running Counter Data Register (RSECDR)

RSECDR counts the BCD-coded second value. The setting range is decimal 00 to 59. It is an 8-bit read register used as a counter, when it operates as a free running counter. For more information on reading seconds, minutes, hours, and day-of-week, see section 10.4.3, Data Reading Procedure.

| | | Initial | | |
|-----|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 | BSY | _ | R | RTC Busy |
| | | | | This bit is set to 1 when the RTC is updating (operating) the values of second, minute, hour, and day-of-week data registers. When this bit is 0, the values of second, minute, hour, and day-of-week data registers must be adopted. |
| 6 | SC12 | _ | R/W | Counting Ten's Position of Seconds |
| 5 | SC11 | _ | R/W | Counts on 0 to 5 for 60-second counting. |
| 4 | SC10 | _ | R/W | |
| 3 | SC03 | _ | R/W | Counting One's Position of Seconds |
| 2 | SC02 | _ | R/W | Counts on 0 to 9 once per second. When a carry is |
| 1 | SC01 | _ | R/W | generated, 1 is added to the ten's position. |
| 0 | SC00 | _ | R/W | |

10.3.2 Minute Data Register (RMINDR)

RMINDR counts the BCD-coded minute value on the carry generated once per minute by the RSECDR counting. The setting range is decimal 00 to 59.

| D'' | D'AL. | Initial | D.044 | S |
|-----|----------|---------|-------|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 | BSY | _ | R | RTC Busy |
| | | | | This bit is set to 1 when the RTC is updating (operating) the values of second, minute, hour, and day-of-week data registers. When this bit is 0, the values of second, minute, hour, and day-of-week data registers must be adopted. |
| 6 | MN12 | _ | R/W | Counting Ten's Position of Minutes |
| 5 | MN11 | _ | R/W | Counts on 0 to 5 for 60-minute counting. |
| 4 | MN10 | _ | R/W | |
| 3 | MN03 | _ | R/W | Counting One's Position of Minutes |
| 2 | MN02 | _ | R/W | Counts on 0 to 9 once per minute. When a carry is |
| 1 | MN01 | _ | R/W | generated, 1 is added to the ten's position. |
| 0 | MN00 | _ | R/W | |

10.3.3 Hour Data Register (RHRDR)

RHRDR counts the BCD-coded hour value on the carry generated once per hour by RMINDR. The setting range is either decimal 00 to 11 or 00 to 23 by the selection of the 12/24 bit in RTCCR1.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 7 | BSY | _ | R | RTC Busy |
| | | | | This bit is set to 1 when the RTC is updating (operating) the values of second, minute, hour, and day-of-week data registers. When this bit is 0, the values of second, minute, hour, and day-of-week data registers must be adopted. |
| 6 | _ | 0 | _ | Reserved |
| | | | | This bit is always read as 0. |
| 5 | HR11 | _ | R/W | Counting Ten's Position of Hours |
| 4 | HR10 | _ | R/W | Counts on 0 to 2 for ten's position of hours. |
| 3 | HR03 | _ | R/W | Counting One's Position of Hours |
| 2 | HR02 | _ | R/W | Counts on 0 to 9 once per hour. When a carry is |
| 1 | HR01 | _ | R/W | generated, 1 is added to the ten's position. |
| 0 | HR00 | _ | R/W | |

10.3.4 Day-of-Week Data Register (RWKDR)

RWKDR counts the BCD-coded day-of-week value on the carry generated once per day by RHRDR. The setting range is decimal 0 to 6 using bits WK2 to WK0.

| | | Initial | | |
|--------|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 | BSY | _ | R | RTC Busy |
| | | | | This bit is set to 1 when the RTC is updating (operating) the values of second, minute, hour, and day-of-week data registers. When this bit is 0, the values of second, minute, hour, and day-of-week data registers must be adopted. |
| 6 to 3 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |
| 2 | WK2 | _ | R/W | Day-of-Week Counting |
| 1 | WK1 | _ | R/W | Day-of-week is indicated with a binary code |
| 0 | WK0 | _ | R/W | 000: Sunday |
| | | | | 001: Monday |
| | | | | 010: Tuesday |
| | | | | 011: Wednesday |
| | | | | 100: Thursday |
| | | | | 101: Friday |
| | | | | 110: Saturday |
| | | | | 111: Reserved (setting prohibited) |

10.3.5 RTC Control Register 1 (RTCCR1)

RTCCR1 controls start/stop and reset of the clock timer. For the definition of time expression, see figure 10.2.

| D: | Dit Name | Initial | DAM | Paradiation |
|--------|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | RUN | _ | R/W | RTC Operation Start |
| | | | | 0: Stops RTC operation |
| | | | | 1: Starts RTC operation |
| 6 | 12/24 | _ | R/W | Operating Mode |
| | | | | 0: RTC operates in 12-hour mode. RHRDR counts on 0 to 11. |
| | | | | 1: RTC operates in 24-hour mode. RHRDR counts on 0 to 23. |
| 5 | PM | _ | R/W | a.m./p.m. |
| | | | | 0: Indicates a.m. when RTC is in the 12-hour mode. |
| | | | | 1: Indicates p.m. when RTC is in the 12-hour mode. |
| 4 | RST | 0 | R/W | Reset |
| | | | | 0: Normal operation |
| | | | | 1: Resets registers and control circuits except RTCCSR and this bit. Clear this bit to 0 after having been set to 1. |
| 3 | INT | _ | R/W | Interrupt Generation Timing |
| | | | | Generates a second, minute, hour, or day-of-week periodic interrupt during RTC busy period. |
| | | | | Generates a second, minute, hour, or day-of-week periodic interrupt immediately after completing RTC busy period. |
| 2 to 0 | _ | All 0 | | Reserved |
| | | | | These bits are always read as 0. |

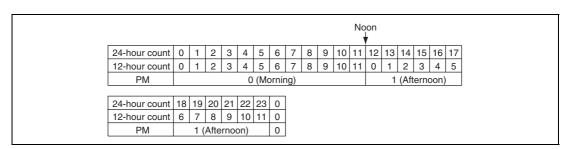

Figure 10.2 Definition of Time Expression

10.3.6 RTC Control Register 2 (RTCCR2)

RTCCR2 controls RTC periodic interrupts of weeks, days, hours, minutes, and seconds. Enabling interrupts of weeks, days, hours, minutes, and seconds sets the IRRTA flag to 1 in the interrupt flag register 1 (IRR1) when an interrupt occurs. It also controls an overflow interrupt of a free running counter when RTC operates as a free running counter.

| | | Initial | | |
|------|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7, 6 | _ | All 0 | _ | Reserved |
| | | | | These bits are always read as 0. |
| 5 | FOIE | _ | R/W | Free Running Counter Overflow Interrupt Enable |
| | | | | 0: Disables an overflow interrupt |
| | | | | 1: Enables an overflow interrupt |
| 4 | WKIE | _ | R/W | Week Periodic Interrupt Enable |
| | | | | 0: Disables a week periodic interrupt |
| | | | | 1: Enables a week periodic interrupt |
| 3 | DYIE | _ | R/W | Day Periodic Interrupt Enable |
| | | | | 0: Disables a day periodic interrupt |
| | | | | 1: Enables a day periodic interrupt |
| 2 | HRIE | _ | R/W | Hour Periodic Interrupt Enable |
| | | | | 0: Disables an hour periodic interrupt |
| | | | | 1: Enables an hour periodic interrupt |
| 1 | MNIE | _ | R/W | Minute Periodic Interrupt Enable |
| | | | | 0: Disables a minute periodic interrupt |
| | | | | 1: Enables a minute periodic interrupt |
| 0 | SEIE | _ | R/W | Second Periodic Interrupt Enable |
| | | | | 0: Disables a second periodic interrupt |
| | | | | 1: Enables a second periodic interrupt |

10.3.7 Clock Source Select Register (RTCCSR)

RTCCSR selects clock source. A free running counter controls start/stop of counter operation by the RUN bit in RTCCR1. When a clock other than 32.768 kHz is selected, the RTC is disabled and operates as an 8-bit free running counter. When the RTC operates as an 8-bit free running counter, RSECDR enables counter values to be read. An interrupt can be generated by setting 1 to the FOIE bit in RTCCR2 and enabling an overflow interrupt of the free running counter. A clock in which the system clock is divided by 32, 16, 8, or 4 is output in active or sleep mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|------|--|
| | DIL Name | | R/VV | <u>_</u> |
| 7 | _ | 0 | _ | Reserved |
| | | | | This bit is always read as 0. |
| 6 | RCS6 | 0 | R/W | Clock Output Selection |
| 5 | RCS5 | 0 | R/W | Selects a clock output from the TMOW pin when setting TMOW in PMR1 to 1. |
| | | | | 00: φ/4 |
| | | | | 01: _{\$\phi\$\$} /8 |
| | | | | 10: _{\$\phi\$} /16 |
| | | | | 11: |
| 4 | _ | 0 | _ | Reserved |
| | | | | This bit is always read as 0. |
| 3 | RCS3 | 1 | R/W | Clock Source Selection |

| | | | | 0101: $\phi/2048$ ····· Free running counter operation |
| | | | | 0110: $\phi/4096$ ····· Free running counter operation |
| | | | | 0111: φ/8192······ Free running counter operation |
| | | | | 1XXX: 32.768 kHz···RTC operation |

10.4 Operation

10.4.1 Initial Settings of Registers after Power-On

The RTC registers that store second, minute, hour, and day-of week data are not reset by a RES input. Therefore, all registers must be set to their initial values after power-on. Once the register setting are made, the RTC provides an accurate time as long as power is supplied regardless of a RES input.

10.4.2 Initial Setting Procedure

Figure 10.3 shows the procedure for the initial setting of the RTC. To set the RTC again, also follow this procedure.

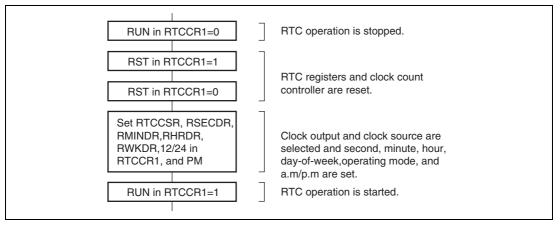

Figure 10.3 Initial Setting Procedure

10.4.3 Data Reading Procedure

When the seconds, minutes, hours, or day-of-week datum is updated while time data is being read, the data obtained may not be correct, and so the time data must be read again. Figure 10.4 shows an example in which correct data is not obtained. In this example, since only RSECDR is read after data update, about 1-minute inconsistency occurs.

To avoid reading in this timing, the following processing must be performed.

- 1. Check the setting of the BSY bit, and when the BSY bit changes from 1 to 0, read from the second, minute, hour, and day-of-week registers. When about 62.5 ms is passed after the BSY bit is set to 1, the registers are updated, and the BSY bit is cleared to 0.
- 2. Making use of interrupts, read from the second, minute, hour, and day-of week registers after the IRRTA flag in IRR1 is set to 1 and the BSY bit is confirmed to be 0.
- 3. Read from the second, minute, hour, and day-of week registers twice in a row, and if there is no change in the read data, the read data is used.

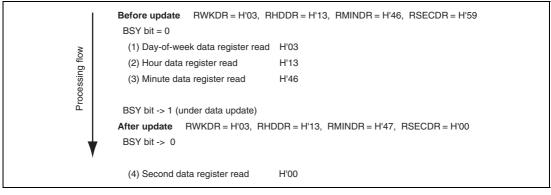

Figure 10.4 Example: Reading of Inaccurate Time Data

10.5 Interrupt Sources

There are five kinds of RTC interrupts: week interrupts, day interrupts, hour interrupts, minute interrupts, and second interrupts.

When using an interrupt, initiate the RTC last after other registers are set. Do not set multiple interrupt enable bits in RTCCR2 simultaneously to 1.

When an interrupt request of the RTC occurs, the IRRTA flag in IRR1 is set to 1. When clearing the flag, write 0.

Table 10.2 Interrupt Sources

| Interrupt Name | Interrupt Source | Interrupt Enable Bit |
|---------------------------|---|----------------------|
| Overflow interrupt | Occurs when the free running counter is overflowed. | FOIE |
| Week periodic interrupt | Occurs every week when the day-of-week date register value becomes 0. | WKIE |
| Day periodic interrupt | Occurs every day when the day-of-week date register is counted. | DYIE |
| Hour periodic interrupt | Occurs every hour when the hour date register is counted. | HRIE |
| Minute periodic interrupt | Occurs every minute when the minute date register is counted. | MNIE |
| Second periodic interrupt | Occurs every second when the second date register is counted. | SCIE |

Section 11 Timer B1

Timer B1 is an 8-bit timer that increments each time a clock pulse is input. This timer has two operating modes, interval and auto reload. Figure 11.1 shows a block diagram of timer B1.

11.1 **Features**

- Selection of seven internal clock sources ($\phi/8192$, $\phi/2048$, $\phi/512$, $\phi/256$, $\phi/64$, $\phi/16$, and $\phi/4$) or an external clock (can be used to count external events).
- An interrupt is generated when the counter overflows.

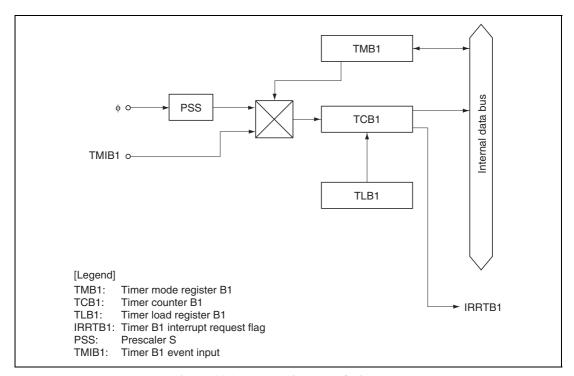

Figure 11.1 Block Diagram of Timer B1

11.2 Input/Output Pin

Table 11.1 shows the timer B1 pin configuration.

Table 11.1 Pin Configuration

| Name | Abbreviation | 1/0 | Function |
|----------------------|--------------|-------|---------------------|
| Timer B1 event input | TMIB1 | Input | Event input to TCB1 |

11.3 Register Descriptions

The timer B1 has the following registers.

- Timer mode register B1 (TMB1)
- Timer counter B1 (TCB1)
- Timer load register B1 (TLB1)

11.3.1 Timer Mode Register B1 (TMB1)

TMB1 selects the auto-reload function and input clock.

| | | Initial | | |
|--------|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 | TMB17 | 0 | R/W | Auto-reload function select |
| | | | | 0: Interval timer function selected |
| | | | | 1: Auto-reload function selected |
| 6 to 3 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 2 | TMB12 | 0 | R/W | Clock select |
| 1 | TMB11 | 0 | R/W | 000: Internal clock: φ/8192 |
| 0 | TMB10 | 0 | R/W | 001: Internal clock: φ/2048 |
| | | | | 010: Internal clock: φ/512 |
| | | | | 011: Internal clock: φ/256 |
| | | | | 100: Internal clock: φ/64 |
| | | | | 101: Internal clock: φ/16 |
| | | | | 110: Internal clock: φ/4 |
| | | | | 111: External event (TMIB1): rising or falling edge* |
| | | | | Note: * The edge of the external event signal is selected by bit IEG1 in the interrupt edge select register 1 (IEGR1). See section 3.2.1, Interrupt Edge Select Register 1 (IEGR1), for details. Before setting TMB12 to TMB10 to 1, IRQ1 in the port mode register 1 (PMR1) should be set to 1. |

11.3.2 Timer Counter B1 (TCB1)

TCB1 is an 8-bit read-only up-counter, which is incremented by internal clock input. The clock source for input to this counter is selected by bits TMB12 to TMB10 in TMB1. TCB1 values can be read by the CPU at any time. When TCB1 overflows from H'FF to H'00 or to the value set in TLB1, the IRRTB1 flag in IRR2 is set to 1. TCB1 is allocated to the same address as TLB1. TCB1 is initialized to H'00.

11.3.3 Timer Load Register B1 (TLB1)

TLB1 is an 8-bit write-only register for setting the reload value of TCB1. When a reload value is set in TLB1, the same value is loaded into TCB1 as well, and TCB1 starts counting up from that value. When TCB1 overflows during operation in auto-reload mode, the TLB1 value is loaded into TCB1. Accordingly, overflow periods can be set within the range of 1 to 256 input clocks. TLB1 is allocated to the same address as TCB1. TLB1 is initialized to H'00.

11.4 Operation

11.4.1 Interval Timer Operation

When bit TMB17 in TMB1 is cleared to 0, timer B1 functions as an 8-bit interval timer. Upon reset, TCB1 is cleared to H'00 and bit TMB17 is cleared to 0, so up-counting and interval timing resume immediately. The operating clock of timer B1 is selected from seven internal clock signals output by prescaler S, or an external clock input at pin TMB1. The selection is made by bits TMB12 to TMB10 in TMB1.

After the count value in TMB1 reaches H'FF, the next clock signal input causes timer B1 to overflow, setting flag IRRTB1 in IRR2 to 1. If IENTB1 in IENR2 is 1, an interrupt is requested to the CPU.

At overflow, TCB1 returns to H'00 and starts counting up again. During interval timer operation (TMB17 = 0), when a value is set in TLB1, the same value is set in TCB1.

11.4.2 Auto-Reload Timer Operation

Setting bit TMB17 in TMB1 to 1 causes timer B1 to function as an 8-bit auto-reload timer. When a reload value is set in TLB1, the same value is loaded into TCB1, becoming the value from which TCB1 starts its count. After the count value in TCB1 reaches H'FF, the next clock signal input causes timer B1 to overflow. The TLB1 value is then loaded into TCB1, and the count continues from that value. The overflow period can be set within a range from 1 to 256 input clocks, depending on the TLB1 value.

The clock sources and interrupts in auto-reload mode are the same as in interval mode. In auto-reload mode (TMB17 = 1), when a new value is set in TLB1, the TLB1 value is also loaded into TCB1.

11.4.3 Event Counter Operation

Timer B1 can operate as an event counter in which TMIB1 is set to an event input pin. External event counting is selected by setting bits TMB12 to TMB10 in TMB1 to 1. TCB1 counts up at rising or falling edge of an external event signal input at pin TMB1.

When timer B1 is used to count external event input, bit IRQ1 in PMR1 should be set to 1 and IEN1 in IENR1 should be cleared to 0 to disable IRQ1 interrupt requests.

11.5 Timer B1 Operating Modes

Table 11.2 shows the timer B1 operating modes.

Table 11.2 Timer B1 Operating Modes

| Operati | ng Mode | Reset | Active | Sleep | Subactive | Subsleep | Standby |
|---------|-------------|-------|-----------|-----------|-----------|----------|----------|
| TCB1 | Interval | Reset | Functions | Functions | Halted | Halted | Halted |
| | Auto-reload | Reset | Functions | Functions | Halted | Halted | Halted |
| TMB1 | | Reset | Functions | Retained | Retained | Retained | Retained |

Section 12 Timer V

Timer V is an 8-bit timer based on an 8-bit counter. Timer V counts external events. Comparematch signals with two registers can also be used to reset the counter, request an interrupt, or output a pulse signal with an arbitrary duty cycle. Counting can be initiated by a trigger input at the TRGV pin, enabling pulse output control to be synchronized to the trigger, with an arbitrary delay from the trigger input. Figure 12.1 shows a block diagram of timer V.

12.1 **Features**

- Choice of seven clock signals is available. Choice of six internal clock sources ($\phi/128$, $\phi/64$, $\phi/32$, $\phi/16$, $\phi/8$, $\phi/4$) or an external clock.
- Counter can be cleared by compare match A or B, or by an external reset signal. If the count stop function is selected, the counter can be halted when cleared.
- Timer output is controlled by two independent compare match signals, enabling pulse output with an arbitrary duty cycle, PWM output, and other applications.
- Three interrupt sources: compare match A, compare match B, timer overflow
- Counting can be initiated by trigger input at the TRGV pin. The rising edge, falling edge, or both edges of the TRGV input can be selected.

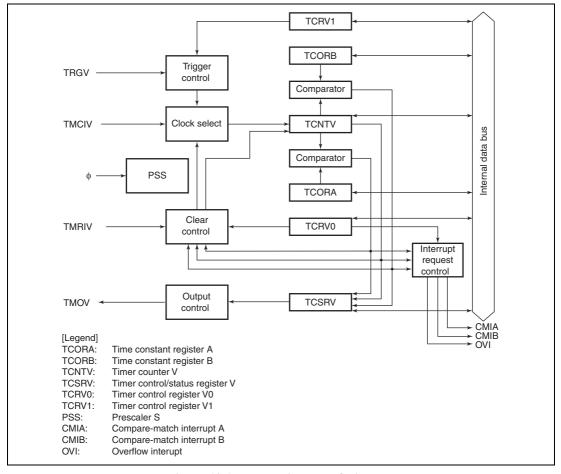

Figure 12.1 Block Diagram of Timer V

12.2 Input/Output Pins

Table 12.1 shows the timer V pin configuration.

Table 12.1 Pin Configuration

| Name | Abbreviation | n I/O | Function |
|---------------------|--------------|--------|------------------------------------|
| Timer V output | TMOV | Output | Timer V waveform output |
| Timer V clock input | TMCIV | Input | Clock input to TCNTV |
| Timer V reset input | TMRIV | Input | External input to reset TCNTV |
| Trigger input | TRGV | Input | Trigger input to initiate counting |

12.3 Register Descriptions

Time V has the following registers.

- Timer counter V (TCNTV)
- Timer constant register A (TCORA)
- Timer constant register B (TCORB)
- Timer control register V0 (TCRV0)
- Timer control/status register V (TCSRV)
- Timer control register V1 (TCRV1)

12.3.1 Timer Counter V (TCNTV)

TCNTV is an 8-bit up-counter. The clock source is selected by bits CKS2 to CKS0 in timer control register V0 (TCRV0). The TCNTV value can be read and written by the CPU at any time. TCNTV can be cleared by an external reset input signal, or by compare match A or B. The clearing signal is selected by bits CCLR1 and CCLR0 in TCRV0.

When TCNTV overflows, OVF is set to 1 in timer control/status register V (TCSRV).

TCNTV is initialized to H'00.

12.3.2 Time Constant Registers A and B (TCORA, TCORB)

TCORA and TCORB have the same function.

TCORA and TCORB are 8-bit read/write registers.

TCORA and TCNTV are compared at all times. When the TCORA and TCNTV contents match, CMFA is set to 1 in TCSRV. If CMIEA is also set to 1 in TCRV0, a CPU interrupt is requested. Note that they must not be compared during the T3 state of a TCORA write cycle.

Timer output from the TMOV pin can be controlled by the identifying signal (compare match A) and the settings of bits OS3 to OS0 in TCSRV.

TCORA and TCORB are initialized to H'FF.

12.3.3 Timer Control Register V0 (TCRV0)

TCRV0 selects the input clock signals of TCNTV, specifies the clearing conditions of TCNTV, and controls each interrupt request.

| | 5 4.14 | Initial | | 5 |
|---------|---------------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | CMIEB | 0 | R/W | Compare Match Interrupt Enable B |
| | | | | When this bit is set to 1, interrupt request from the CMFB bit in TCSRV is enabled. |
| 6 | CMIEA | 0 | R/W | Compare Match Interrupt Enable A |
| | | | | When this bit is set to 1, interrupt request from the CMFA bit in TCSRV is enabled. |
| 5 | OVIE | 0 | R/W | Timer Overflow Interrupt Enable |
| | | | | When this bit is set to 1, interrupt request from the OVF bit in TCSRV is enabled. |
| 4 | CCLR1 | 0 | R/W | Counter Clear 1 and 0 |
| 3 | CCLR0 | 0 | R/W | These bits specify the clearing conditions of TCNTV. |
| | | | | 00: Clearing is disabled |
| | | | | 01: Cleared by compare match A |
| | | | | 10: Cleared by compare match B |
| | | | | Cleared on the rising edge of the TMRIV pin. The operation of TCNTV after clearing depends on TRGE in TCRV1. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 2 | CKS2 | 0 | R/W | Clock Select 2 to 0 |
| 1 | CKS1 | 0 | R/W | These bits select clock signals to input to TCNTV and the |
| 0 | CKS0 | 0 | R/W | counting condition in combination with ICKS0 in TCRV1. |
| | | | | Refer to table 12.2. |

Table 12.2 Clock Signals to Input to TCNTV and Counting Conditions

| | TCRV0 | | TCRV1 | | | |
|-------|-------|-------|-------|--|--|--|
| Bit 2 | Bit 1 | Bit 0 | Bit 0 | | | |
| CKS2 | CKS1 | CKS0 | ICKS0 | Description | | |
| 0 | 0 | 0 | _ | Clock input prohibited | | |
| | | 1 | 0 | Internal clock: counts on \$\phi/4\$, falling edge | | |
| | | | 1 | Internal clock: counts on \phi/8, falling edge | | |
| | 1 | 0 | 0 | Internal clock: counts on \$\phi\$/16, falling edge | | |
| | | | 1 | Internal clock: counts on \$\phi/32\$, falling edge | | |
| | | 1 | 0 | Internal clock: counts on \phi/64, falling edge | | |
| | | | 1 | Internal clock: counts on \$\phi\$/128, falling edge | | |
| 1 | 0 | 0 | _ | Clock input prohibited | | |
| | | 1 | _ | External clock: counts on rising edge | | |
| | 1 | 0 | _ | External clock: counts on falling edge | | |
| | | 1 | _ | External clock: counts on rising and falling edge | | |

12.3.4 Timer Control/Status Register V (TCSRV)

TCSRV indicates the status flag and controls outputs by using a compare match.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | CMFB | 0 | R/W | Compare Match Flag B |
| | | | | Setting condition: |
| | | | | When the TCNTV value matches the TCORB value |
| | | | | Clearing condition: |
| | | | | After reading CMFB = 1, cleared by writing 0 to CMFB |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 6 | CMFA | 0 | R/W | Compare Match Flag A |
| | | | | Setting condition: |
| | | | | When the TCNTV value matches the TCORA value |
| | | | | Clearing condition: |
| | | | | After reading CMFA = 1, cleared by writing 0 to CMFA |
| 5 | OVF | 0 | R/W | Timer Overflow Flag |
| | | | | Setting condition: |
| | | | | When TCNTV overflows from H'FF to H'00 |
| | | | | Clearing condition: |
| | | | | After reading OVF = 1, cleared by writing 0 to OVF |
| 4 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1. |
| 3 | OS3 | 0 | R/W | Output Select 3 and 2 |
| 2 | OS2 | 0 | R/W | These bits select an output method for the TMOV pin by the compare match of TCORB and TCNTV. |
| | | | | 00: No change |
| | | | | 01: 0 output |
| | | | | 10: 1 output |
| | | | | 11: Output toggles |
| 1 | OS1 | 0 | R/W | Output Select 1 and 0 |
| 0 | OS0 | 0 | R/W | These bits select an output method for the TMOV pin by the compare match of TCORA and TCNTV. |
| | | | | 00: No change |
| | | | | 01: 0 output |
| | | | | 10: 1 output |
| | | | | 11: Output toggles |

OS3 and OS2 select the output level for compare match B. OS1 and OS0 select the output level for compare match A. The two output levels can be controlled independently. After a reset, the timer output is 0 until the first compare match.

12.3.5 Timer Control Register V1 (TCRV1)

TCRV1 selects the edge at the TRGV pin, enables TRGV input, and selects the clock input to TCNTV.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|---|
| 7 to 5 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 4 | TVEG1 | 0 | R/W | TRGV Input Edge Select |
| 3 | TVEG0 | 0 | R/W | These bits select the TRGV input edge. |
| | | | | 00: TRGV trigger input is prohibited |
| | | | | 01: Rising edge is selected |
| | | | | 10: Falling edge is selected |
| | | | | 11: Rising and falling edges are both selected |
| 2 | TRGE | 0 | R/W | TCNT starts counting up by the input of the edge which is selected by TVEG1 and TVEG0. |
| | | | | 0: Disables starting counting-up TCNTV by the input of the TRGV pin and halting counting-up TCNTV when TCNTV is cleared by a compare match. |
| | | | | Enables starting counting-up TCNTV by the input of the TRGV pin and halting counting-up TCNTV when TCNTV is cleared by a compare match. |
| 1 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1. |
| 0 | ICKS0 | 0 | R/W | Internal Clock Select 0 |
| | | | | This bit selects clock signals to input to TCNTV in combination with CKS2 to CKS0 in TCRV0. |
| | | | | Refer to table 12.2. |

12.4 Operation

12.4.1 Timer V Operation

- According to table 12.2, six internal/external clock signals output by prescaler S can be
 selected as the timer V operating clock signals. When the operating clock signal is selected,
 TCNTV starts counting-up. Figure 12.2 shows the count timing with an internal clock signal
 selected, and figure 12.3 shows the count timing with both edges of an external clock signal
 selected.
- 2. When TCNTV overflows (changes from H'FF to H'00), the overflow flag (OVF) in TCRV0 will be set. The timing at this time is shown in figure 12.4. An interrupt request is sent to the CPU when OVIE in TCRV0 is 1.
- 3. TCNTV is constantly compared with TCORA and TCORB. Compare match flag A or B (CMFA or CMFB) is set to 1 when TCNTV matches TCORA or TCORB, respectively. The compare-match signal is generated in the last state in which the values match. Figure 12.5 shows the timing. An interrupt request is generated for the CPU when CMIEA or CMIEB in TCRV0 is 1.
- 4. When a compare match A or B is generated, the TMOV responds with the output value selected by bits OS3 to OS0 in TCSRV. Figure 12.6 shows the timing when the output is toggled by compare match A.
- 5. When CCLR1 or CCLR0 in TCRV0 is 01 or 10, TCNTV can be cleared by the corresponding compare match. Figure 12.7 shows the timing.
- 6. When CCLR1 or CCLR0 in TCRV0 is 11, TCNTV can be cleared by the rising edge of the input of TMRIV pin. A TMRIV input pulse-width of at least 1.5 system clocks is necessary. Figure 12.8 shows the timing.
- 7. When a counter-clearing source is generated with TRGE in TCRV1 set to 1, the counting-up is halted as soon as TCNTV is cleared. TCNTV resumes counting-up when the edge selected by TVEG1 or TVEG0 in TCRV1 is input from the TGRV pin.

12.5 Timer V Application Examples

12.5.1 Pulse Output with Arbitrary Duty Cycle

Figure 12.9 shows an example of output of pulses with an arbitrary duty cycle.

- 1. Set bits CCLR1 and CCLR0 in TCRV0 so that TCNTV will be cleared by compare match with TCORA.
- 2. Set bits OS3 to OS0 in TCSRV so that the output will go to 1 at compare match with TCORA and to 0 at compare match with TCORB.
- 3. Set bits CKS2 to CKS0 in TCRV0 and bit ICKS0 in TCRV1 to select the desired clock source.
- 4. With these settings, a waveform is output without further software intervention, with a period determined by TCORA and a pulse width determined by TCORB.

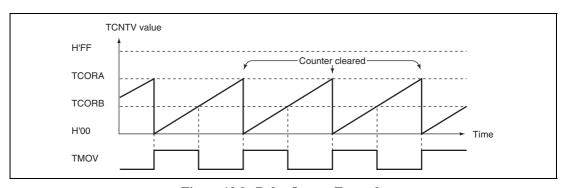

Figure 12.9 Pulse Output Example

12.5.2 Pulse Output with Arbitrary Pulse Width and Delay from TRGV Input

The trigger function can be used to output a pulse with an arbitrary pulse width at an arbitrary delay from the TRGV input, as shown in figure 12.10. To set up this output:

- 1. Set bits CCLR1 and CCLR0 in TCRV0 so that TCNTV will be cleared by compare match with TCORB.
- 2. Set bits OS3 to OS0 in TCSRV so that the output will go to 1 at compare match with TCORA and to 0 at compare match with TCORB.
- 3. Set bits TVEG1 and TVEG0 in TCRV1 and set TRGE to select the falling edge of the TRGV input.
- 4. Set bits CKS2 to CKS0 in TCRV0 and bit ICKS0 in TCRV1 to select the desired clock source.
- 5. After these settings, a pulse waveform will be output without further software intervention, with a delay determined by TCORA from the TRGV input, and a pulse width determined by (TCORB TCORA).

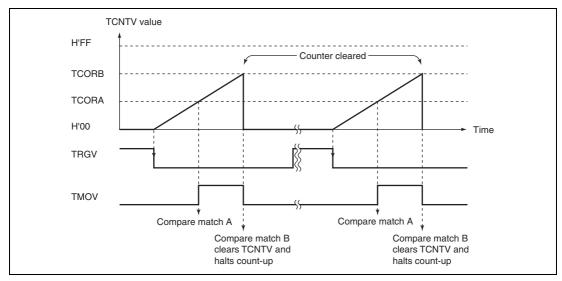

Figure 12.10 Example of Pulse Output Synchronized to TRGV Input

12.6 Usage Notes

The following types of contention or operation can occur in timer V operation.

- 1. Writing to registers is performed in the T3 state of a TCNTV write cycle. If a TCNTV clear signal is generated in the T3 state of a TCNTV write cycle, as shown in figure 12.11, clearing takes precedence and the write to the counter is not carried out. If counting-up is generated in the T3 state of a TCNTV write cycle, writing takes precedence.
- 2. If a compare match is generated in the T3 state of a TCORA or TCORB write cycle, the write to TCORA or TCORB takes precedence and the compare match signal is inhibited. Figure 12.12 shows the timing.
- 3. If compare matches A and B occur simultaneously, any conflict between the output selections for compare match A and compare match B is resolved by the following priority: toggle output > output 1 > output 0.
- 4. Depending on the timing, TCNTV may be incremented by a switch between different internal clock sources. When TCNTV is internally clocked, an increment pulse is generated from the falling edge of an internal clock signal, that is divided system clock (φ). Therefore, as shown in figure 12.3 the switch is from a high clock signal to a low clock signal, the switchover is seen as a falling edge, causing TCNTV to increment. TCNTV can also be incremented by a switch between internal and external clocks.

Section 13 Timer Z

The timer Z has a 16-bit timer with two channels. Figures 13.1, 13.2, and 13.3 show the block diagrams of entire timer Z, its channel 0, and its channel 1, respectively. For details on the timer Z functions, refer to table 13.1.

13.1 Features

- Capability to process up to eight inputs/outputs
- Eight general registers (GR): four registers for each channel
 - Independently assignable output compare or input capture functions
- Selection of five counter clock sources: four internal clocks (φ, φ/2, φ/4, and φ/8) and an external clock
- Seven selectable operating modes
 - Output compare function
 - Selection of 0 output, 1 output, or toggle output
 - Input capture function
 - Rising edge, falling edge, or both edges
 - Synchronous operation
 - Timer counters_0 and _1 (TCNT_0 and TCNT_1) can be written simultaneously.
 - Simultaneous clearing by compare match or input capture is possible.
 - PWM mode
 - Up to six-phase PWM output can be provided with desired duty ratio.
 - Reset synchronous PWM mode
 - Three-phase PWM output for normal and counter phases
 - Complementary PWM mode
 - Three-phase PWM output for non-overlapped normal and counter phases
 - The A/D conversion start trigger can be set for PWM cycles.
 - Buffer operation
 - The input capture register can be consisted of double buffers.
 - The output compare register can automatically be modified.
- High-speed access by the internal 16-bit bus
 - 16-bit TCNT and GR registers can be accessed in high speed by a 16-bit bus interface
- Any initial timer output value can be set
- Output of the timer is disabled by external trigger

• Eleven interrupt sources

— Four compare match/input capture interrupts and an overflow interrupt are available for each channel. An underflow interrupt can be set for channel 1.

Table 13.1 Timer Z Functions

| Item | | Channel 0 | Channel 1 | | | |
|---|------------|--|--|--|--|--|
| Count clock | | Internal clocks: φ, φ/2, φ/4, φ/8 External clock: FTIOA0 (TCLK) | | | | |

13.2 Input/Output Pins

Table 13.2 summarizes the timer Z pins.

Table 13.2 Pin Configuration

| Name | Abbreviation | Input/Output | Function |
|------------------------------------|--------------|--------------|--|
| Input capture/output compare A0 | FTIOA0 | Input/output | GRA_0 output compare output, GRA_0 input capture input, or external clock input (TCLK) |
| Input capture/output compare B0 | FTIOB0 | Input/output | GRB_0 output compare output, GRB_0 input capture input, or PWM output |
| Input capture/output compare C0 | FTIOC0 | Input/output | GRC_0 output compare output, GRC_0 input capture input, or PWM synchronous output (in reset synchronous PWM and complementary PWM modes) |
| Input capture/output compare D0 | FTIOD0 | Input/output | GRD_0 output compare output, GRD_0 input capture input, or PWM output |
| Input capture/output compare A1 | FTIOA1 | Input/output | GRA_1 output compare output, GRA_1 input capture input, or PWM output (in reset synchronous PWM and complementary PWM modes) |
| Input capture/output compare B1 | FTIOB1 | Input/output | GRB_1 output compare output, GRB_1 input capture input, or PWM output |
| Input capture/output compare C1 | FTIOC1 | Input/output | GRC_1 output compare output, GRC_1 input capture input, or PWM output |
| Input capture/output compare D1 | FTIOD1 | Input/output | GRD_1 output compare output, GRD_1 input capture input, or PWM output |

13.3 Register Descriptions

The timer Z has the following registers.

Common

- Timer start register (TSTR)
- Timer mode register (TMDR)
- Timer PWM mode register (TPMR)
- Timer function control register (TFCR)
- Timer output master enable register (TOER)
- Timer output control register (TOCR)

Channel 0

- Timer control register_0 (TCR_0)
- Timer I/O control register A_0 (TIORA_0)
- Timer I/O control register C_0 (TIORC_0)
- Timer status register_0 (TSR_0)
- Timer interrupt enable register_0 (TIER_0)
- PWM mode output level control register_0 (POCR_0)
- Timer counter_0 (TCNT_0)
- General register A_0 (GRA_0)
- General register B_0 (GRB_0)
- General register C_0 (GRC_0)
- General register D_0 (GRD_0)

Channel 1

- Timer control register_1 (TCR_1)
- Timer I/O control register A_1 (TIORA_1)
- Timer I/O control register C_1 (TIORC_1)
- Timer status register_1 (TSR_1)
- Timer interrupt enable register_1 (TIER_1)
- PWM mode output level control register_1 (POCR_1)
- Timer counter_1 (TCNT_1)
- General register A_1 (GRA_1)
- General register B_1 (GRB_1)

- General register C_1 (GRC_1)
- General register D_1 (GRD_1)

13.3.1 Timer Start Register (TSTR)

TSTR selects the operation/stop for the TCNT counter.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 7 to 2 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1, and cannot be modified. |
| 1 | STR1 | 0 | R/W | Channel 1 Counter Start |
| | | | | 0: TCNT_1 halts counting |
| | | | | 1: TCNT_1 starts counting |
| 0 | STR0 | 0 | R/W | Channel 0 Counter Start |
| | | | | 0: TCNT_0 halts counting |
| | | | | 1: TCNT_0 starts counting |

13.3.2 Timer Mode Register (TMDR)

TMDR selects buffer operation settings and synchronized operation.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | BFD1 | 0 | R/W | Buffer Operation D1 |
| | | | | 0: GRD_1 operates normally |
| | | | | GRB_1 and GRD_1 are used together for buffer operation |
| 6 | BFC1 | 0 | R/W | Buffer Operation C1 |
| | | | | 0: GRC_1 operates normally |
| | | | | GRA_1 and GRD_1 are used together for buffer operation |
| 5 | BFD0 | 0 | R/W | Buffer Operation D0 |
| | | | | 0: GRD_0 operates normally |
| | | | | GRB_0 and GRD_0 are used together for buffer operation |
| | | | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 4 | BFC0 | 0 | R/W | Buffer Operation C0 |
| | | | | 0: GRC_0 operates normally |
| | | | | GRA_0 and GRC_0 are used together for buffer operation |
| 3 to 1 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1, and cannot be modified. |
| 0 | SYNC | 0 | R/W | Timer Synchronization |
| | | | | TCNT_1 and TCNT_0 operate as a different timer counter |
| | | | | 1: TCNT_1 and TCNT_0 are synchronized |
| | | | | TCNT_1 and TCNT_0 can be pre-set or cleared synchronously |

13.3.3 Timer PWM Mode Register (TPMR)

TPMR sets the pin to enter PWM mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 7 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1, and cannot be modified. |
| 6 | PWMD1 | 0 | R/W | PWM Mode D1 |
| | | | | 0: FTIOD1 operates normally |
| | | | | 1: FTIOD1 operates in PWM mode |
| 5 | PWMC1 | 0 | R/W | PWM Mode C1 |
| | | | | 0: FTIOC1 operates normally |
| | | | | 1: FTIOC1 operates in PWM mode |
| 4 | PWMB1 | 0 | R/W | PWM Mode B1 |
| | | | | 0: FTIOB1 operates normally |
| | | | | 1: FTIOB1 operates in PWM mode |
| 3 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1, and cannot be modified. |

| | | Initial | | |
|-----|----------|---------|-----|--------------------------------|
| Bit | Bit Name | Value | R/W | Description |
| 2 | PWMD0 | 0 | R/W | PWM Mode D0 |
| | | | | 0: FTIOD0 operates normally |
| | | | | 1: FTIOD0 operates in PWM mode |
| 1 | PWMC0 | 0 | R/W | PWM Mode C0 |
| | | | | 0: FTIOC0 operates normally |
| | | | | 1: FTIOC0 operates in PWM mode |
| 0 | PWMB0 | 0 | R/W | PWM Mode B0 |
| | | | | 0: FTIOB0 operates normally |
| | | | | 1: FTIOB0 operates in PWM mode |

13.3.4 Timer Function Control Register (TFCR)

TFCR selects the settings and output levels for each operating mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 7 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1. |
| 6 | STCLK | 0 | R/W | External Clock Input Select |
| | | | | 0: External clock input is disabled |
| | | | | 1: External clock input is enabled |
| 5 | ADEG | 0 | R/W | A/D Trigger Edge Select |
| | | | | A/D module should be set to start an A/D conversion by the external trigger |
| | | | | 0: A/D trigger at the crest in complementary PWM mode |
| | | | | 1: A/D trigger at the trough in complementary PWM mode |
| 4 | ADTRG | 0 | R/W | External Trigger Disable |
| | | | | A/D trigger for PWM cycles is disabled in complementary PWM mode |
| | | | | A/D trigger for PWM cycles is enabled in complementary PWM mode |

| D: | Dit Name | Initial | DAM | Description |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 3 | OLS1 | 0 | R/W | Output Level Select 1 |
| | | | | Selects the counter-phase output levels in reset synchronous PWM mode or complementary PWM mode. |
| | | | | 0: Initial output is high and the active level is low. |
| | | | | 1: Initial output is low and the active level is high. |
| 2 | OLS0 | 0 | R/W | Output Level Select 0 |
| | | | | Selects the normal-phase output levels in reset synchronous PWM mode or complementary PWM mode. |
| | | | | 0: Initial output is high and the active level is low. |
| | | | | 1: Initial output is low and the active level is high. |
| | | | | Figure 13.4 shows an example of outputs in reset synchronous PWM mode and complementary PWM mode when OLS1 = 0 and OLS0 = 0. |
| 1 | CMD1 | 0 | R/W | Combination Mode 1 and 0 |
| 0 | CMD0 | 0 | R/W | 00: Channel 0 and channel 1 operate normally |
| | | | | 01: Channel 0 and channel 1 are used together to operate in reset synchronous PWM mode |
| | | | | Channel 0 and channel 1 are used together to operate in complementary PWM mode (transferred at the trough) |
| | | | | Channel 0 and channel 1 are used together to operate in complementary PWM mode (transferred at the crest) |
| | | | | Note: When reset synchronous PWM mode or complementary PWM mode is selected by these bits, this setting has the priority to the settings for PWM mode by each bit in TPMR. Stop TCNT_0 and TCNT_1 before making settings for reset synchronous PWM mode or complementary PWM mode. |

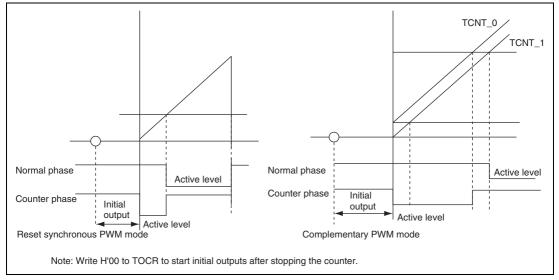

Figure 13.4 Example of Outputs in Reset Synchronous PWM Mode and Complementary PWM Mode

13.3.5 Timer Output Master Enable Register (TOER)

TOER enables/disables the outputs for channel 0 and channel 1. When $\overline{WKP4}$ is selected for inputs, if a low level signal is input to $\overline{WKP4}$, the bits in TOER are set to 1 to disable the output for timer Z.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | ED1 | 1 | R/W | Master Enable D1 |
| | | | | 0: FTIOD1 pin output is enabled according to the TPMR, TFCR, and TIORC_1 settings |
| | | | | 1: FTIOD1 pin output is disabled regardless of the TPMR, TFCR, and TIORC_1 settings (FTIOD1 pin is operated as an I/O port). |
| 6 | EC1 | 1 | R/W | Master Enable C1 |
| | | | | 0: FTIOC1 pin output is enabled according to the TPMR, TFCR, and TIORC_1 settings |
| | | | | 1: FTIOC1 pin output is disabled regardless of the TPMR, TFCR, and TIORC_1 settings (FTIOC1 pin is operated as an I/O port). |
| | | | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 5 | EB1 | 1 | R/W | Master Enable B1 |
| | | | | 0: FTIOB1 pin output is enabled according to the TPMR, TFCR, and TIORA_1 settings |
| | | | | 1: FTIOB1 pin output is disabled regardless of the TPMR, TFCR, and TIORA_1 settings (FTIOB1 pin is operated as an I/O port). |
| 4 | EA1 | 1 | R/W | Master Enable A1 |
| | | | | FTIOA1 pin output is enabled according to the TPMR, TFCR, and TIORA_1 settings |
| | | | | 1: FTIOA1 pin output is disabled regardless of the TPMR, TFCR, and TIORA_1 settings (FTIOA1 pin is operated as an I/O port). |
| 3 | ED0 | 1 | R/W | Master Enable D0 |
| | | | | 0: FTIOD0 pin output is enabled according to the TPMR, TFCR, and TIORC_0 settings |
| | | | | 1: FTIOD0 pin output is disabled regardless of the TPMR, TFCR, and TIORC_0 settings (FTIOD0 pin is operated as an I/O port). |
| 2 | EC0 | 1 | R/W | Master Enable C0 |
| | | | | 0: FTIOC0 pin output is enabled according to the TPMR, TFCR, and TIORC_0 settings |
| | | | | 1: FTIOC0 pin output is disabled regardless of the TPMR, TFCR, and TIORC_0 settings (FTIOC0 pin is operated as an I/O port). |
| 1 | EB0 | 1 | R/W | Master Enable B0 |
| | | | | 0: FTIOB0 pin output is enabled according to the TPMR, TFCR, and TIORA_0 settings |
| | | | | 1: FTIOB0 pin output is disabled regardless of the TPMR, TFCR, and TIORA_0 settings (FTIOB0 pin is operated as an I/O port). |
| 0 | EA0 | 1 | R/W | Master Enable A0 |
| | | | | 0: FTIOA0 pin output is enabled according to the TPMR, TFCR, and TIORA_0 settings |
| | | | | 1: FTIOA0 pin output is disabled regardless of the TPMR, TFCR, and TIORA_0 settings (FTIOA0 pin is operated as an I/O port). |

13.3.6 Timer Output Control Register (TOCR)

TOCR selects the initial outputs before the first occurrence of a compare match. Note that bits OLS1 and OLS0 in TFCR set these initial outputs in reset synchronous PWM mode and complementary PWM mode.

| | | Initial | | |
|-----|----------|---------|-----|--------------------------------|
| Bit | Bit Name | Value | R/W | Description |
| 7 | TOD1 | 0 | R/W | Output Level Select D1 |
| | | | | 0: 0 output at the FTIOD1 pin* |
| | | | | 1: 1 output at the FTIOD1 pin* |
| 6 | TOC1 | 0 | R/W | Output Level Select C1 |
| | | | | 0: 0 output at the FTIOC1 pin* |
| | | | | 1: 1 output at the FTIOC1 pin* |
| 5 | TOB1 | 0 | R/W | Output Level Select B1 |
| | | | | 0: 0 output at the FTIOB1 pin* |
| | | | | 1: 1 output at the FTIOB1 pin* |
| 4 | TOA1 | 0 | R/W | Output Level Select A1 |
| | | | | 0: 0 output at the FTIOA1 pin* |
| | | | | 1: 1 output at the FTIOA1 pin* |
| 3 | TOD0 | 0 | R/W | Output Level Select D0 |
| | | | | 0: 0 output at the FTIOD0 pin* |
| | | | | 1: 1 output at the FTIOD0 pin* |
| 2 | TOC0 | 0 | R/W | Output Level Select C0 |
| | | | | 0: 0 output at the FTIOC0 pin* |
| | | | | 1: 1 output at the FTIOC0 pin* |
| 1 | TOB0 | 0 | R/W | Output Level Select B0 |
| | | | | 0: 0 output at the FTIOB0 pin* |
| | | | | 1: 1 output at the FTIOB0 pin* |
| 0 | TOA0 | 0 | R/W | Output Level Select A0 |
| | | | | 0: 0 output at the FTIOA0 pin* |
| | | | | 1: 1 output at the FTIOA0 pin* |

Note: * The change of the setting is immediately reflected in the output value.

13.3.7 Timer Counter (TCNT)

The timer Z has two TCNT counters (TCNT_0 and TCNT_1), one for each channel. The TCNT counters are 16-bit readable/writable registers that increment/decrement according to input clocks. Input clocks can be selected by bits TPSC2 to TPSC0 in TCR. TCNT0 and TCNT 1 increment/decrement in complementary PWM mode, while they only increment in other modes.

The TCNT counters are initialized to H'0000 by compare matches with corresponding GRA, GRB, GRC, or GRD, or input captures to GRA, GRB, GRC, or GRD (counter clearing function). When the TCNT counters overflow, an OVF flag in TSR for the corresponding channel is set to 1. When TCNT_1 underflows, an UDF flag in TSR is set to 1. The TCNT counters cannot be accessed in 8-bit units; they must always be accessed as a 16-bit unit. TCNT is initialized to H'0000.

13.3.8 General Registers A, B, C, and D (GRA, GRB, GRC, and GRD)

GR are 16-bit registers. Timer Z has eight general registers (GR), four for each channel. The GR registers are dual function 16-bit readable/writable registers, functioning as either output compare or input capture registers. Functions can be switched by TIORA and TIORC.

The values in GR and TCNT are constantly compared with each other when the GR registers are used as output compare registers. When the both values match, the IMFA to IMFD flags in TSR are set to 1. Compare match outputs can be selected by TIORA and TIORC.

When the GR registers are used as input capture registers, the TCNT value is stored after detecting external signals. At this point, IMFA to IMFD flags in the corresponding TSR are set to 1. Detection edges for input capture signals can be selected by TIORA and TIORC.

When PWM mode, complementary PWM mode, or reset synchronous PWM mode is selected, the values in TIORA and TIORC are ignored. Upon reset, the GR registers are set as output compare registers (no output) and initialized to H'FFFF. The GR registers cannot be accessed in 8-bit units; they must always be accessed as a 16-bit unit.

13.3.9 Timer Control Register (TCR)

The TCR registers select a TCNT counter clock, an edge when an external clock is selected, and counter clearing sources. Timer Z has a total of two TCR registers, one for each channel.

| D: | Dit Name | Initial | DAM | Description |
|-----|----------|---------|-----|---|
| Bit | Bit Name | value | R/W | Description |
| 7 | CCLR2 | 0 | R/W | Counter Clear 2 to 0 |
| 6 | CCLR1 | 0 | R/W | 000: Disables TCNT clearing |
| 5 | CCLR0 | 0 | R/W | 001: Clears TCNT by GRA compare match/input capture*1 |
| | | | | 010: Clears TCNT by GRB compare match/input capture*1 |
| | | | | 011: Synchronization clear; Clears TCNT in synchronous with counter clearing of the other channel's timer* ² |
| | | | | 100: Disables TCNT clearing |
| | | | | 101: Clears TCNT by GRC compare match/input capture*1 |
| | | | | 110: Clears TCNT by GRD compare match/input capture*1 |
| | | | | 111: Synchronization clear; Clears TCNT in synchronous with counter clearing of the other channel's timer* ² |
| 4 | CKEG1 | 0 | R/W | Clock Edge 1 and 0 |
| 3 | CKEG0 | 0 | R/W | 00: Count at rising edge |
| | | | | 01: Count at falling edge |
| | | | | 1X: Count at both edges |
| 2 | TPSC2 | 0 | R/W | Time Prescaler 2 to 0 |
| 1 | TPSC1 | 0 | R/W | 000: Internal clock: count by ϕ |
| 0 | TPSC0 | 0 | R/W | 001: Internal clock: count by φ/2 |
| | | | | 010: Internal clock: count by φ/4 |
| | | | | 011: Internal clock: count by φ/8 |
| | | | | 1XX: External clock: count by FTIOA0 (TCLK) pin input |
| | | | | |

Notes: 1. When GR functions as an output compare register, TCNT is cleared by compare match.
When GR functions as input capture, TCNT is cleared by input capture.

- 2. Synchronous operation is set by TMDR.
- 3. X: Don't care

13.3.10 Timer I/O Control Register (TIORA and TIORC)

The TIOR registers control the general registers (GR). Timer Z has four TIOR registers (TIORA_0, TIORA_1, TIORC_0, and TIORC_1), two for each channel. In PWM mode including complementary PWM mode and reset synchronous PWM mode, the settings of TIOR are invalid.

TIORA: TIORA selects whether GRA or GRB is used as an output compare register or an input capture register. When an output compare register is selected, the output setting is selected. When an input capture register is selected, an input edge of an input capture signal is selected. TIORA also selects the function of FTIOA or FTIOB pin.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | value | R/W | Description |
| 7 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1. |
| 6 | IOB2 | 0 | R/W | I/O Control B2 to B0 |
| 5 | IOB1 | 0 | R/W | GRB is an output compare register: |
| 4 | IOB0 | 0 | R/W | 000: Disables pin output by compare match |
| | | | | 001: 0 output by GRB compare match |
| | | | | 010: 1 output by GRB compare match |
| | | | | 011: Toggle output by GRB compare match |
| | | | | GRB is an input capture register: |
| | | | | 100: Input capture to GRB at the rising edge |
| | | | | 101: Input capture to GRB at the falling edge |
| | | | | 11X: Input capture to GRB at both rising and falling edges |
| 3 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1. |

| Bit | Bit Name | Initial value | R/W | Description |
|-----|----------|------------------|-----|--|
| 2 | IOA2 | 0 | R/W | I/O Control A2 to A0 |
| 1 | IOA1 | 0 | R/W | GRA is an output compare register: |
| 0 | IOA0 | 0 | R/W | 000: Disables pin output by compare match |
| | | | | 001: 0 output by GRA compare match |
| | | | | 010: 1 output by GRA compare match |
| | | | | 011: Toggle output by GRA compare match |
| | | | | GRA is an input capture register: |
| | | | | 100: Input capture to GRA at the rising edge |
| | | | | 101: Input capture to GRA at the falling edge |
| | | | | 11X: Input capture to GRA at both rising and falling edges |

[Legend] X: Don't care.

TIORC: TIORC selects whether GRC or GRD is used as an output compare register or an input capture register. When an output compare register is selected, the output setting is selected. When an input capture register is selected, an input edge of an input capture signal is selected. TIORC also selects the function of FTIOC or FTIOD pin.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | value | R/W | Description |
| 7 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1. |

| | | | | 011: Toggle Output by GRC compare match |
| | | | | GRC is an input capture register: |
| | | | | 100: Input capture to GRC at the rising edge |
| | | | | 101: Input capture to GRC at the falling edge |
| | | | | 11X: Input capture to GRC at both rising and falling edges |

[Legend] X: Don't care.

13.3.11 Timer Status Register (TSR)

TSR indicates generation of an overflow/underflow of TCNT and a compare match/input capture of GRA, GRB, GRC, and GRD. These flags are interrupt sources. If an interrupt is enabled by a corresponding bit in TIER, TSR requests an interrupt for the CPU. Timer Z has two TSR registers, one for each channel.

| Bit | Bit Name | Initial value | R/W | Description |
|------|----------|------------------|-----|--|
| 7, 6 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 5 | UDF* | 0 | R/W | Underflow Flag |
| | | | | [Setting condition] |
| | | | | When TCNT_1 underflows |
| | | | | [Clearing condition] |
| | | | | • When 0 is written to UDF after reading UDF = 1 |
| 4 | OVF | 0 | R/W | Overflow Flag |
| | | | | [Setting condition] |
| | | | | When the TCNT value underflows |
| | | | | [Clearing condition] |
| | | | | When 0 is written to OVF after reading OVF = 1 |
| 3 | IMFD | 0 | R/W | Input Capture/Compare Match Flag D |
| | | | | [Setting conditions] |
| | | | | • When TCNT = GRD and GRD is functioning as output compare register |
| | | | | When TCNT value is transferred to GRD by input capture signal and GRD is functioning as input capture register |
| | | | | [Clearing condition] |
| | | | | • When 0 is written to IMFD after reading IMFD = 1 |

| Bit | Bit Name | Initial value | R/W | Description |
|-----|----------|------------------|-----|---|
| 2 | IMFC | 0 | R/W | Input Capture/Compare Match Flag C [Setting conditions] |
| | | | | When TCNT = GRC and GRC is functioning as output compare register |
| | | | | When TCNT value is transferred to GRC by input capture signal and GRC is functioning as input capture register |
| | | | | [Clearing condition] |
| | | | | • When 0 is written to IMFC after reading IMFC = 1 |
| 1 | IMFB | 0 | R/W | Input Capture/Compare Match Flag B [Setting conditions] When TCNT = GRB and GRB is functioning as output compare register When TCNT value is transferred to GRB by input capture signal and GRB is functioning as input capture register [Clearing condition] When 0 is written to IMFB after reading IMFB = 1 |
| 0 | IMFA | 0 | R/W | Input Capture/Compare Match Flag A [Setting conditions] When TCNT = GRA and GRA is functioning as output compare register When TCNT value is transferred to GRA by input capture signal and GRA is functioning as input capture register [Clearing condition] When 0 is written to IMFA after reading IMFA = 1 |

Note: Bit 5 is not the UDF flag in TSR_0. It is a reserved bit. It is always read as 1.

13.3.12 Timer Interrupt Enable Register (TIER)

TIER enables or disables interrupt requests for overflow or GR compare match/input capture. Timer Z has two TIER registers, one for each channel.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|----------|------------------|-----|---|
| 7 to 5 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 4 | OVIE | 0 | R/W | Overflow Interrupt Enable |
| | | | | Interrupt requests (OVI) by OVF or UDF flag are disabled |
| | | | | Interrupt requests (OVI) by OVF or UDF flag are enabled |
| 3 | IMIED | 0 | R/W | Input Capture/Compare Match Interrupt Enable D |
| | | | | 0: Interrupt requests (IMID) by IMFD flag are disabled |
| | | | | 1: Interrupt requests (IMID) by IMFD flag are enabled |
| 2 | IMIEC | 0 | R/W | Input Capture/Compare Match Interrupt Enable C |
| | | | | 0: Interrupt requests (IMIC) by IMFC flag are disabled |
| | | | | 1: Interrupt requests (IMIC) by IMFC flag are enabled |
| 1 | IMIEB | 0 | R/W | Input Capture/Compare Match Interrupt Enable B |
| | | | | 0: Interrupt requests (IMIB) by IMFB flag are disabled |
| | | | | 1: Interrupt requests (IMIB) by IMFB flag are enabled |
| 0 | IMIEA | 0 | R/W | Input Capture/Compare Match Interrupt Enable A |
| | | | | 0: Interrupt requests (IMIA) by IMFA flag are disabled |
| | | | | 1: Interrupt requests (IMIA) by IMFA flag are enabled |

13.3.13 PWM Mode Output Level Control Register (POCR)

POCR control the active level in PWM mode. Timer Z has two POCR registers, one for each channel.

| Bit | Bit Name | Initial value | R/W | Description |
|--------|----------|------------------|-----|---|
| 7 to 3 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 2 | POLD | 0 | R/W | PWM Mode Output Level Control D |
| | | | | 0: The output level of FTIOD is low-active |
| | | | | 1: The output level of FTIOD is high-active |
| 1 | POLC | 0 | R/W | PWM Mode Output Level Control C |
| | | | | 0: The output level of FTIOC is low-active |
| | | | | 1: The output level of FTIOC is high-active |
| 0 | POLB | 0 | R/W | PWM Mode Output Level Control B |
| | | | | 0: The output level of FTIOB is low-active |
| | | | | 1: The output level of FTIOB is high-active |

13.3.14 Interface with CPU

1. 16-bit register

TCNT and GR are 16-bit registers. Reading/writing in a 16-bit unit is enabled but disabled in an 8-bit unit since the data bus with the CPU is 16-bit width. These registers must always be accessed in a 16-bit unit. Figure 13.5 shows an example of accessing the 16-bit registers.

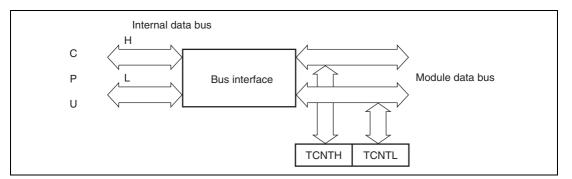

Figure 13.5 Accessing Operation of 16-Bit Register (between CPU and TCNT (16 bits))

2. 8-bit register

Registers other than TCNT and GR are 8-bit registers that are connected internally with the CPU in an 8-bit width. Figure 13.6 shows an example of accessing the 8-bit registers.

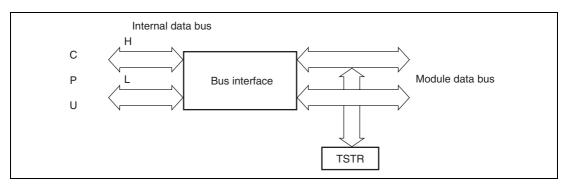

Figure 13.6 Accessing Operation of 8-Bit Register (between CPU and TSTR (8 bits))

13.4 Operation

13.4.1 Counter Operation

When one of bits STR0 and STR1 in TSTR is set to 1, the TCNT counter for the corresponding channel begins counting. TCNT can operate as a free-running counter, periodic counter, for example. Figure 13.7 shows an example of the counter operation setting procedure.

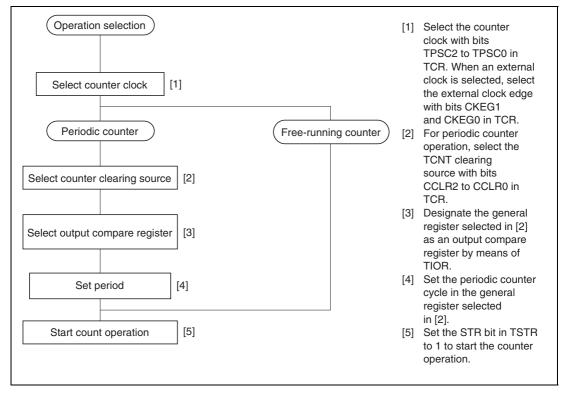

Figure 13.7 Example of Counter Operation Setting Procedure

1. Free-running count operation and periodic count operation

Immediately after a reset, the TCNT counters for channels 0 and 1 are all designated as free-running counters. When the relevant bit in TSTR is set to 1, the corresponding TCNT counter starts an increment operation as a free-running counter. When TCNT overflows, the OVF flag in TSR is set to 1. If the value of the OVIE bit in the corresponding TIER is 1 at this point, timer Z requests an interrupt. After overflow, TCNT starts an increment operation again from H'0000.

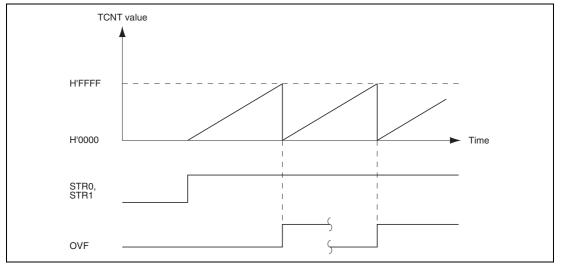

Figure 13.8 Free-Running Counter Operation

When compare match is selected as the TCNT clearing source, the TCNT counter for the relevant channel performs periodic count operation. The GR registers for setting the period are designated as output compare registers, and counter clearing by compare match is selected by means of bits CCLR1 and CCLR0 in TCR. After the settings have been made, TCNT starts an increment operation as a periodic counter when the corresponding bit in TSTR is set to 1. When the count value matches the value in GR, the IMFA, IMFB, IMFC, or IMFD flag in TSR is set to 1 and TCNT is cleared to H'0000.

If the value of the corresponding IMIEA, IMIEB, IMIEC, or IMIED bit in TIER is 1 at this point, the timer Z requests an interrupt. After a compare match, TCNT starts an increment operation again from H'0000.

Figure 13.9 illustrates periodic counter operation.

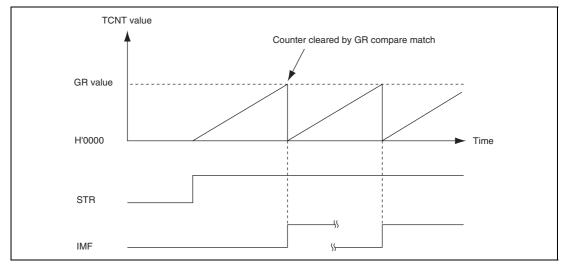

Figure 13.9 Periodic Counter Operation

2. TCNT count timing

A. Internal clock operation

A system clock (ϕ) or three types of clocks (ϕ /2, ϕ /4, or ϕ /8) that divides the system clock can be selected by bits TPSC2 to TPSC0 in TCR.

Figure 13.10 illustrates this timing.

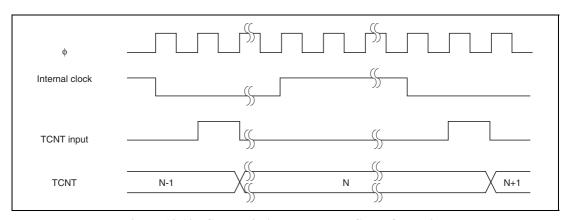

Figure 13.10 Count Timing at Internal Clock Operation

B. External clock operation

An external clock input pin (TCLK) can be selected by bits TPSC2 to TPSC0 in TCR, and a detection edge can be selected by bits CKEG1 and CKEG0. To detect an external clock, the rising edge, falling edge, or both edges can be selected. The pulse width of the external clock needs two or more system clocks. Note that an external clock does not operate correctly with the lower pulse width.

Figure 13.11 illustrates the detection timing of the rising and falling edges.

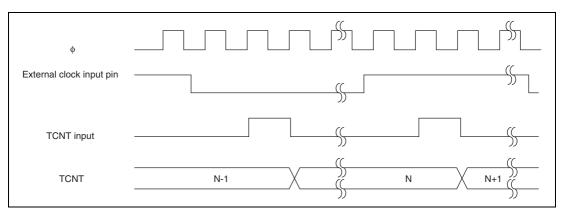

Figure 13.11 Count Timing at External Clock Operation (Both Edges Detected)

13.4.2 Waveform Output by Compare Match

Timer Z can perform 0, 1, or toggle output from the corresponding FTIOA, FTIOB, FTIOC, or FTIOD output pin using compare match A, B, C, or D.

Figure 13.12 shows an example of the setting procedure for waveform output by compare match.

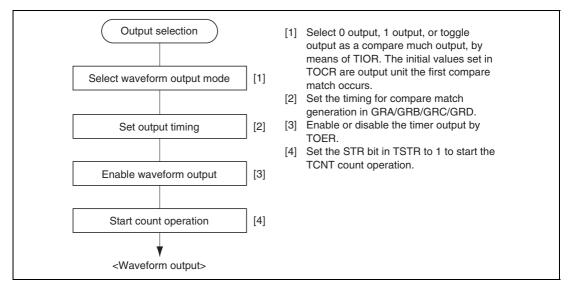

Figure 13.12 Example of Setting Procedure for Waveform Output by Compare Match

1. Examples of waveform output operation

Figure 13.13 shows an example of 0 output/1 output.

In this example, TCNT has been designated as a free-running counter, and settings have been made such that 0 is output by compare match A, and 1 is output by compare match B. When the set level and the pin level coincide, the pin level does not change.

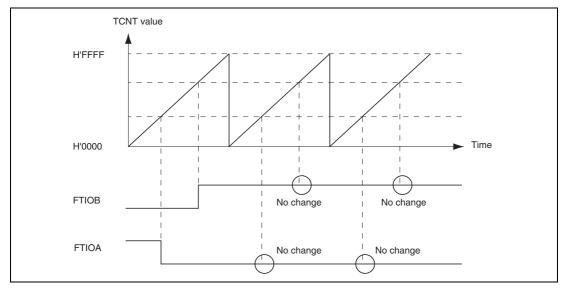

Figure 13.13 Example of 0 Output/1 Output Operation

Figure 13.14 shows an example of toggle output.

In this example, TCNT has been designated as a periodic counter (with counter clearing on compare match B), and settings have been made such that the output is toggled by both compare match A and compare match B.

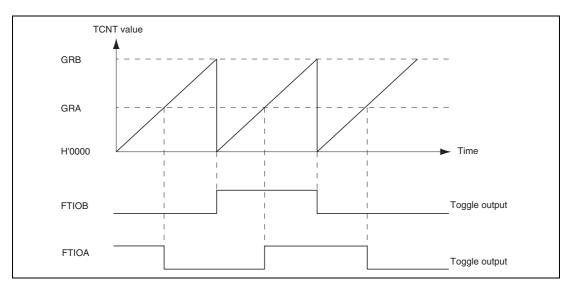

Figure 13.14 Example of Toggle Output Operation

2. Output compare timing

The compare match signal is generated in the last state in which TCNT and GR match (when TCNT changes from the matching value to the next value). When the compare match signal is generated, the output value selected in TIOR is output at the compare match output pin (FTIOA, FTIOB, FTIOC, or FTIOD). When TCNT matches GR, the compare match signal is generated only after the next TCNT input clock pulse is input.

Figure 13.15 shows an example of the output compare timing.

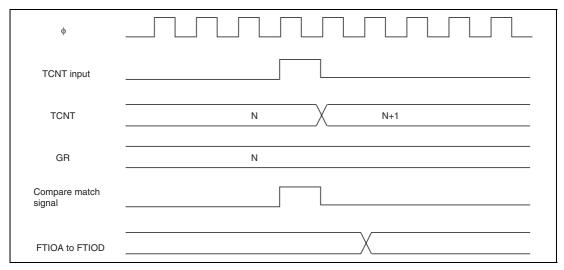

Figure 13.15 Output Compare Timing

13.4.3 **Input Capture Function**

The TCNT value can be transferred to GR on detection of the input edge of the input capture/output compare pin (FTIOA, FTIOB, FTIOC, or FTIOD). Rising edge, falling edge, or both edges can be selected as the detected edge. When the input capture function is used, the pulse width or period can be measured.

Figure 13.16 shows an example of the input capture operation setting procedure.

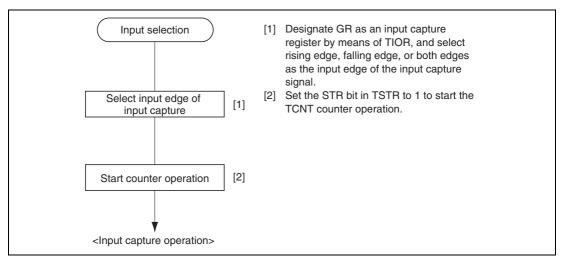

Figure 13.16 Example of Input Capture Operation Setting Procedure

1. Example of input capture operation

Figure 13.17 shows an example of input capture operation.

In this example, both rising and falling edges have been selected as the FTIOA pin input capture input edge, the falling edge has been selected as the FTIOB pin input capture input edge, and counter clearing by GRB input capture has been designated for TCNT.

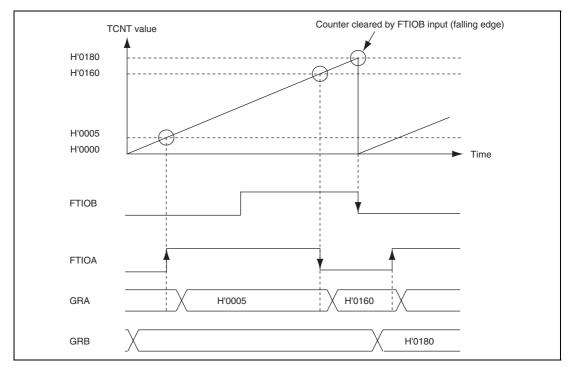

Figure 13.17 Example of Input Capture Operation

2. Input capture signal timing

Input capture on the rising edge, falling edge, or both edges can be selected through settings in TIOR. Figure 13.18 shows the timing when the rising edge is selected. The pulse width of the input capture signal must be at least two system clock (ϕ) cycles.

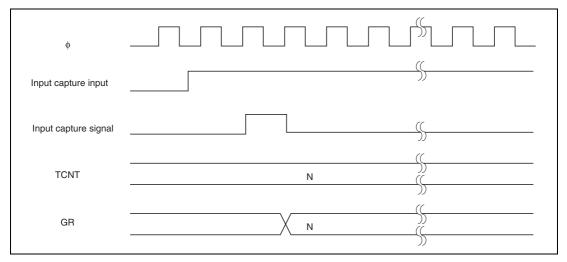

Figure 13.18 Input Capture Signal Timing

13.4.4 Synchronous Operation

In synchronous operation, the values in a number of TCNT counters can be rewritten simultaneously (synchronous presetting). Also, a number of TCNT counters can be cleared simultaneously by making the appropriate setting in TCR (synchronous clearing). Synchronous operation enables GR to be increased with respect to a single time base.

Figure 13.19 shows an example of the synchronous operation setting procedure.

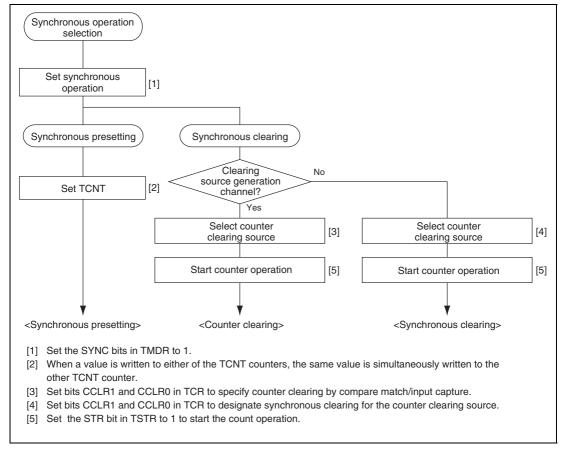

Figure 13.19 Example of Synchronous Operation Setting Procedure

Figure 13.20 shows an example of synchronous operation. In this example, synchronous operation has been selected, FTIOB0 and FTIOB1 have been designated for PWM mode, GRA_0 compare match has been set as the channel 0 counter clearing source, and synchronous clearing has been set for the channel 1 counter clearing source. In addition, the same input clock has been set as the counter input clock for channel 0 and channel 1. Two-phase PWM waveforms are output from pins FTIOB0 and FTIOB1. At this time, synchronous presetting and synchronous operation by GRA_0 compare match are performed by TCNT counters.

For details on PWM mode, see section 13.4.5, PWM Mode.

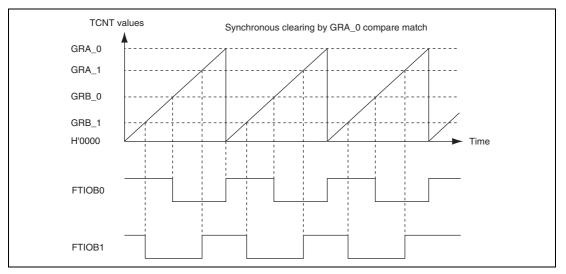

Figure 13.20 Example of Synchronous Operation

13.4.5 **PWM Mode**

In PWM mode, PWM waveforms are output from the FTIOB, FTIOC, and FTIOD output pins with GRA as a cycle register and GRB, GRC, and GRD as duty registers. The initial output level of the corresponding pin depends on the setting values of TOCR and POCR. Table 13.3 shows an example of the initial output level of the FTIOB0 pin.

The output level is determined by the POLB to POLD bits corresponding to POCR. When POLB is 0, the FTIOB output pin is set to 0 by compare match B and set to 1 by compare match A. When POLB is 1, the FTIOB output pin is set to 1 by compare match B and cleared to 0 by compare match A. In PWM mode, maximum 6-phase PWM outputs are possible.

Figure 13.21 shows an example of the PWM mode setting procedure.

Table 13.3 Initial Output Level of FTIOB0 Pin

| ТОВ0 | POLB | Initial Output Level |
|------|------|----------------------|
| 0 | 0 | 1 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 1 |

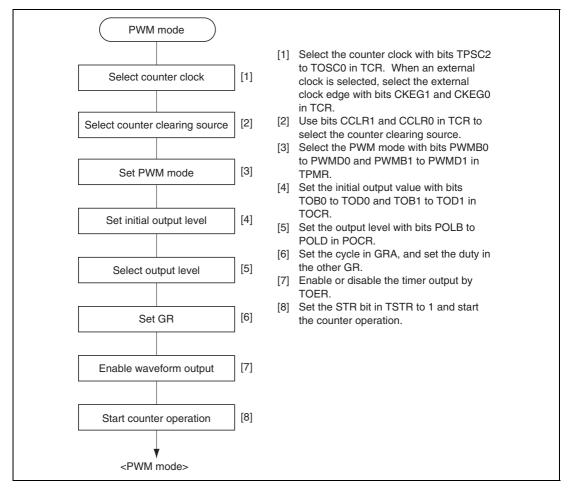

Figure 13.21 Example of PWM Mode Setting Procedure

Figure 13.22 shows an example of operation in PWM mode. The output signals go to 1 and TCNT is reset at compare match A, and the output signals go to 0 at compare match B, C, and D (TOB, TOC, and TOD = 0, POLB, POLC, and POLD = 0).

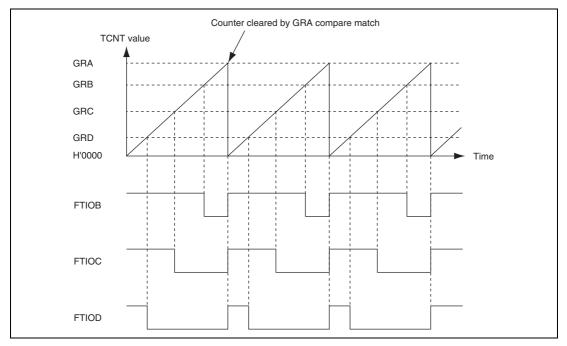

Figure 13.22 Example of PWM Mode Operation (1)

Figure 13.23 shows another example of operation in PWM mode. The output signals go to 0 and TCNT is reset at compare match A, and the output signals go to 1 at compare match B, C, and D (TOB, TOC, and TOD = 0, POLB, POLC, and POLD = 1).

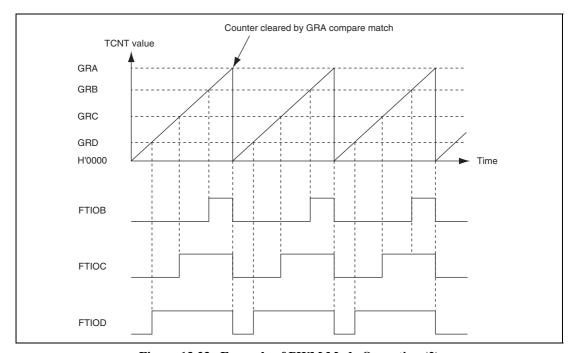

Figure 13.23 Example of PWM Mode Operation (2)

Figures 13.24 (when TOB, TOC, and TOD = 0, POLB, POLC, and POLD = 0) and 13.25 (when TOB, TOC, and TOD = 0, POLB, POLC, and POLD = 1) show examples of the output of PWM waveforms with duty cycles of 0% and 100% in PWM mode.

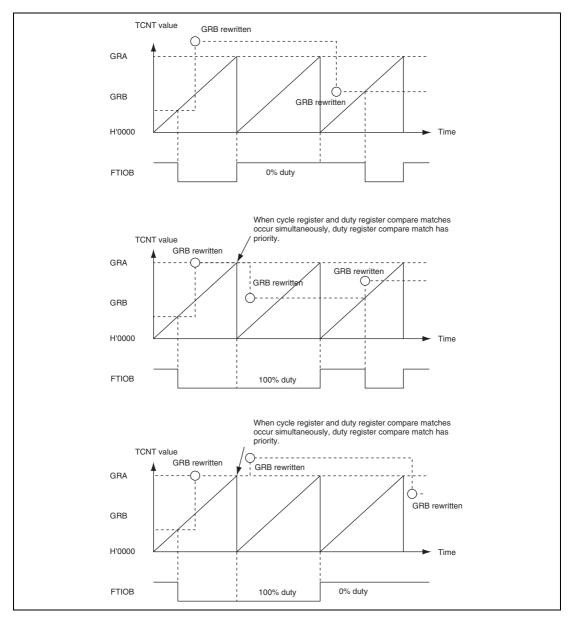

Figure 13.24 Example of PWM Mode Operation (3)

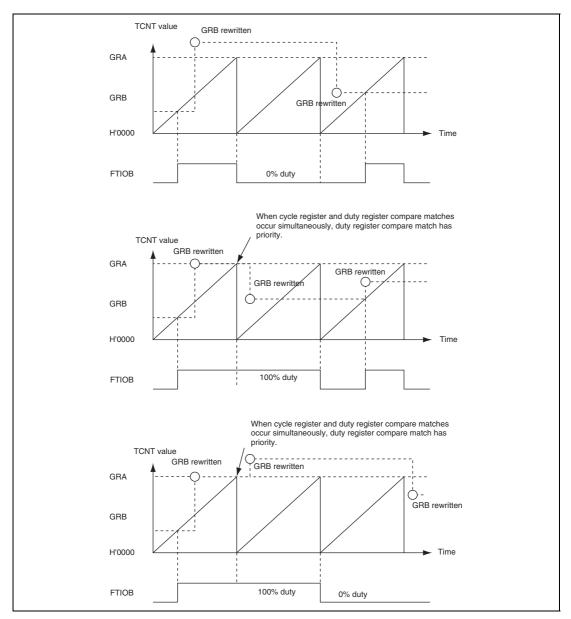

Figure 13.25 Example of PWM Mode Operation (4)

13.4.6 Reset Synchronous PWM Mode

Three normal- and counter-phase PWM waveforms are output by combining channels 0 and 1 that one of changing points of waveforms will be common.

In reset synchronous PWM mode, the FTIOB0 to FTIOD0 and FTIOA1 to FTIOD1 pins become PWM-output pins automatically. TCNT_0 performs an increment operation. Tables 13.4 and 13.5 show the PWM-output pins used and the register settings, respectively.

Figure 13.26 shows the example of reset synchronous PWM mode setting procedure.

Table 13.4 Output Pins in Reset Synchronous PWM Mode

| Channel | Pin Name | Input/Output | Pin Function |
|---------|----------|--------------|---|
| 0 | FTIOC0 | Output | Toggle output in synchronous with PWM cycle |
| 0 | FTIOB0 | Output | PWM output 1 |
| 0 | FTIOD0 | Output | PWM output 1 (counter-phase waveform of PWM output 1) |
| 1 | FTIOA1 | Output | PWM output 2 |
| 1 | FTIOC1 | Output | PWM output 2 (counter-phase waveform of PWM output 2) |
| 1 | FTIOB1 | Output | PWM output 3 |
| 1 | FTIOD1 | Output | PWM output 3 (counter-phase waveform of PWM output 3) |

Table 13.5 Register Settings in Reset Synchronous PWM Mode

| Register | Description |
|----------|--|
| TCNT_0 | Initial setting of H'0000 |
| TCNT_1 | Not used (independently operates) |
| GRA_0 | Sets counter cycle of TCNT_0 |
| GRB_0 | Set a changing point of the PWM waveform output from pins FTIOB0 and FTIOD0. |
| GRA_1 | Set a changing point of the PWM waveform output from pins FTIOA1 and FTIOC1. |
| GRB_1 | Set a changing point of the PWM waveform output from pins FTIOB1 and FTIOD1. |

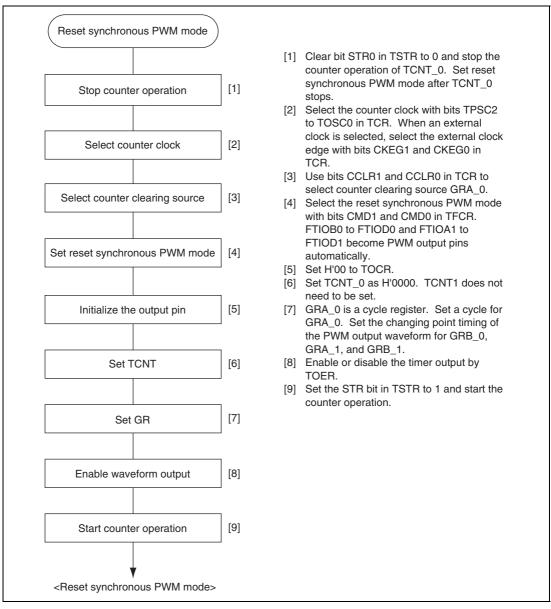

Figure 13.26 Example of Reset Synchronous PWM Mode Setting Procedure

Figures 13.27 and 13.28 show examples of operation in reset synchronous PWM mode.

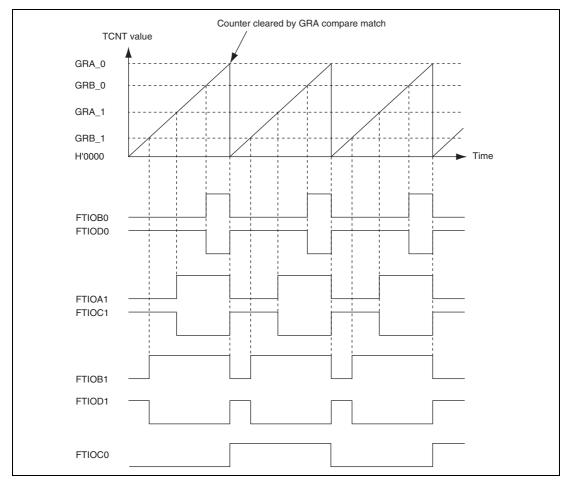

Figure 13.27 Example of Reset Synchronous PWM Mode Operation (OLS0 = OLS1 = 1)

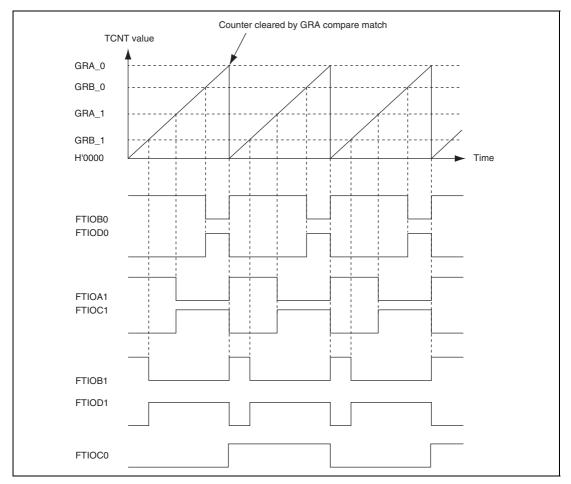

Figure 13.28 Example of Reset Synchronous PWM Mode Operation (OLS0 = OLS1 = 0)

In reset synchronous PWM mode, TCNT_0 and TCNT_1 perform increment and independent operations, respectively. However, GRA_1 and GRB_1 are separated from TCNT_1. When a compare match occurs between TCNT_0 and GRA_0, a counter is cleared and an increment operation is restarted from H'0000.

The PWM pin outputs 0 or 1 whenever a compare match between GRB_0, GRA_1, GRB_1 and TCNT_0 or counter clearing occur.

For details on operations when reset synchronous PWM mode and buffer operation are simultaneously set, refer to section 13.4.8, Buffer Operation.

13.4.7 Complementary PWM Mode

Three PWM waveforms for non-overlapped normal and counter phases are output by combining channels 0 and 1.

In complementary PWM mode, the FTIOB0 to FTIOD0 and FTIOA1 to FTIOD1 pins become PWM-output pins automatically. TCNT_0 and TCNT_1 perform an increment or decrement operation. Tables 13.6 and 13.7 show the output pins and register settings in complementary PWM mode, respectively.

Figure 13.29 shows the example of complementary PWM mode setting procedure.

Table 13.6 Output Pins in Complementary PWM Mode

| Channel | Pin Name | Input/Output | Pin Function |
|---------|----------|--------------|--|
| 0 | FTIOC0 | Output | Toggle output in synchronous with PWM cycle |
| 0 | FTIOB0 | Output | PWM output 1 |
| 0 | FTIOD0 | Output | PWM output 1 (counter-phase waveform non- overlapped with PWM output 1) |
| 1 | FTIOA1 | Output | PWM output 2 |
| 1 | FTIOC1 | Output | PWM output 2 (counter-phase waveform non- overlapped with PWM output 2) |
| 1 | FTIOB1 | Output | PWM output 3 |
| 1 | FTIOD1 | Output | PWM output 3 (counter-phase waveform non-overlapped with PWM output 3) |

Table 13.7 Register Settings in Complementary PWM Mode

| Register | Description |
|----------|--|
| TCNT_0 | Initial setting of non-overlapped periods (non-overlapped periods are differences with TCNT_1) |
| TCNT_1 | Initial setting of H'0000 |
| GRA_0 | Sets (upper limit value - 1) of TCNT_0 |
| GRB_0 | Set a changing point of the PWM waveform output from pins FTIOB0 and FTIOD0. |
| GRA_1 | Set a changing point of the PWM waveform output from pins FTIOA1 and FTIOC1. |
| GRB_1 | Set a changing point of the PWM waveform output from pins FTIOB1 and FTIOD1. |

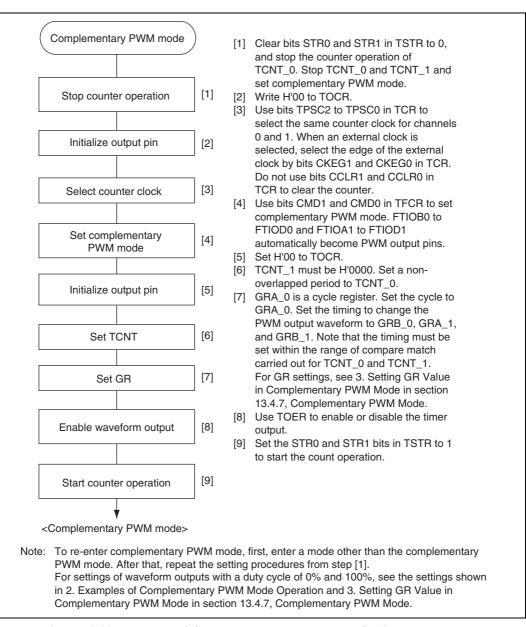

Figure 13.29 Example of Complementary PWM Mode Setting Procedure

1. Canceling Procedure of Complementary PWM Mode: Figure 13.30 shows the complementary PWM mode canceling procedure.

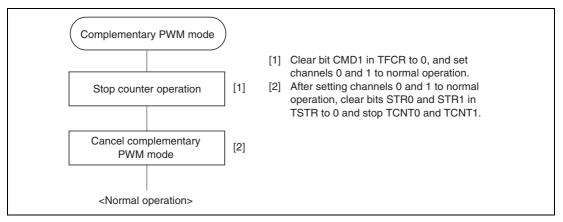

Figure 13.30 Canceling Procedure of Complementary PWM Mode

2. Examples of Complementary PWM Mode Operation: Figure 13.31 shows an example of complementary PWM mode operation. In complementary PWM mode, TCNT_0 and TCNT_1 perform an increment or decrement operation. When TCNT 0 and GRA 0 are compared and their contents match, the counter is decremented, and when TCNT_1 underflows, the counter is incremented. In GRA_0, GRA_1, and GRB_1, compare match is carried out in the order of TCNT $0 \rightarrow \text{TCNT } 1 \rightarrow \text{TCNT } 1 \rightarrow \text{TCNT } 0$ and PWM waveform is output, during one cycle of a up/down counter. In this mode, the initial setting will be TCNT_0 > TCNT_1.

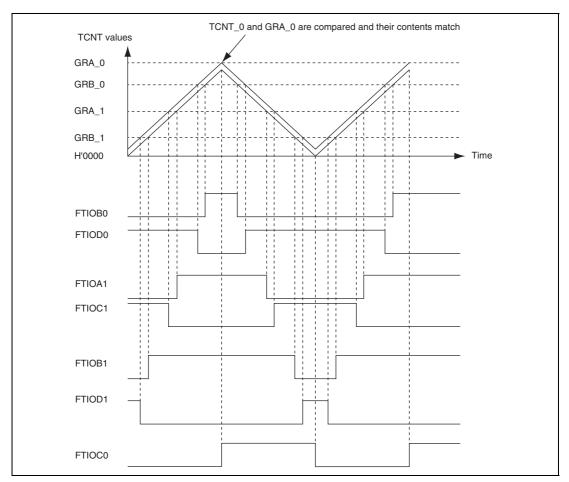

Figure 13.31 Example of Complementary PWM Mode Operation (1)

Figure 13.32 (1) and (2) show examples of PWM waveform output with 0% duty and 100% duty in complementary PWM mode (for one phase).

- TPSC2 = TPSC1 = TPSC0 = 0

 Set GRB_0 to H'0000 or a value equal to or more than GRA_0. The waveform with a duty cycle of 0% and 100% can be output. When buffer operation is used together, the duty cycles can easily be changed, including the above settings, during operation. For details on buffer operation, refer to section 13.4.8, Buffer Operation.
- Other than TPSC2 = TPSC1 = TPSC0 = 0

 Set GRB_0 to satisfy the following expression: GRA_0 + 1 < GRB_0 < H'FFFF. The waveform with a duty cycle of 0% and 100% can be output. For details on 0%- and 100%-duty cycle waveform output, see 3.C., Outputting a waveform with a duty cycle of 0% and 100% in section 13.4.7, Complementary PWM Mode.

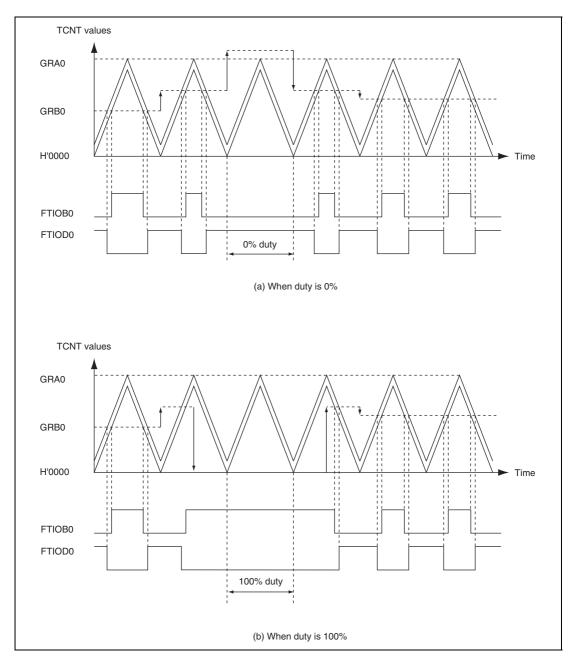

Figure 13.32 (1) Example of Complementary PWM Mode Operation $(TPSC2 = TPSC1 = TPSC0 = 0) \ (2)$

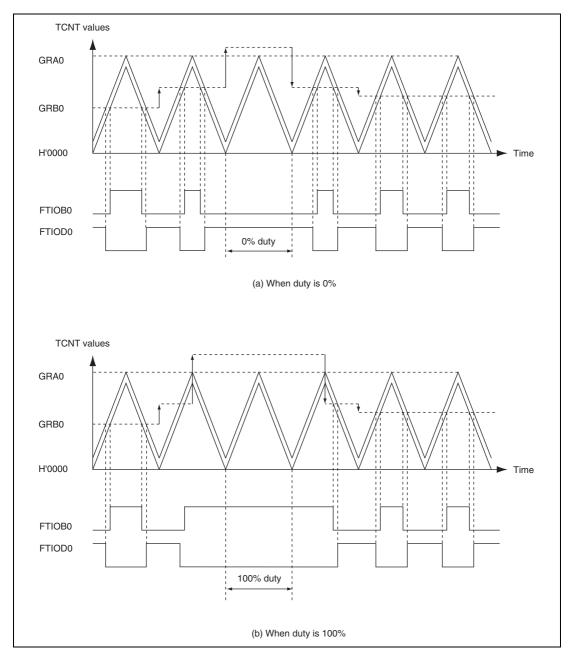

Figure 13.32 (2) Example of Complementary PWM Mode Operation (TPSC2 = TPSC1 = TPSC0 \neq 0) (3)

In complementary PWM mode, when the counter switches from up-counter to down-counter or vice versa, TCNT_0 and TCNT_1 overshoots or undershoots, respectively. In this case, the conditions to set the IMFA flag in channel 0 and the UDF flag in channel 1 differ from usual settings. Also, the transfer conditions in buffer operation differ from usual settings. Such timings are shown in figures 13.33 and 13.34.

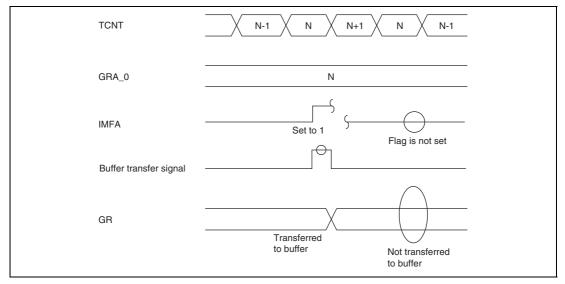

Figure 13.33 Timing of Overshooting

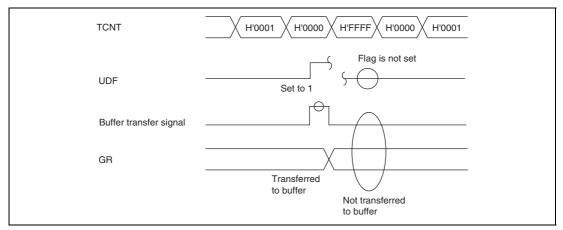

Figure 13.34 Timing of Undershooting

When the counter is incremented or decremented, the IMFA flag of channel 0 is set to 1, and when the register is underflowed, the UDF flag of channel 0 is set to 1. After buffer operation has been designated for BR, BR is transferred to GR when the counter is incremented by compare match A0 or when TCNT_1 is underflowed. If the ϕ or ϕ /2 clock is selected by TPSC2 to TPSC0 bits, the OVF flag is not set to 1 at the timing that the counter value changes from H'FFFF to H'0000. If the ϕ /4 or ϕ /8 clock is selected by TPSC2 to TPSC0 bits, the OVF flag is set to 1.

3. Setting GR Value in Complementary PWM Mode: To set the general register (GR) or modify GR during operation in complementary PWM mode, refer to the following notes.

A. Initial value

- a. When other than TPSC2 = TPSC1 = TPSC0 = 0, the GRA_0 value must be equal to H'FFFC or less. When TPSC2 = TPSC1 = TPSC0 = 0, the GRA_0 value can be set to H'FFFF or less.
- b. H'0000 to T 1 (T: Initial value of TCNT0) must not be set for the initial value.
- c. $GRA_0 (T 1)$ or more must not be set for the initial value.
- d. When using buffer operation, the same values must be set in the buffer registers and corresponding general registers.

B. Modifying the setting value

- a. Writing to GR directly must be performed while the TCNT_1 and TCNT_0 values should satisfy the following expression: $H'0000 \le TCNT_1 < previous GR$ value, and previous GR value $< TCNT_0 \le GRA_0$. Otherwise, a waveform is not output correctly. For details on outputting a waveform with a duty cycle of 0% and 100%, see C., Outputting a waveform with a duty cycle of 0% and 100%.
- b. Do not write the following values to GR directly. When writing the values, a waveform is not output correctly.

$$H'0000 \le GR \le T-1$$
 and $GRA_0 - (T-1) \le GR < GRA_0$ when $TPSC2 = TPSC1 = TPSC0 = 0$

$$H'0000 < GR \le T-1$$
 and $GRA_0 - (T-1) \le GR < GRA_0 + 1$ when $TPSC2 = TPSC1 = TPSC0 = 0$

- c. Do not change settings of GRA_0 during operation.
- C. Outputting a waveform with a duty cycle of 0% and 100%
 - a. Buffer operation is not used and TPSC2 = TPSC1 = TPSC0 = 0
 Write H'0000 or a value equal to or more than the GRA_0 value to GR directly at the timing shown below.
 - To output a 0%-duty cycle waveform, write a value equal to or more than the GRA_0 value while H'0000 ≤ TCNT 1 < previous GR value
 - To output a 100%-duty cycle waveform, write H'0000 while previous GR value
 TCNT_0 ≤ GRA_0

- To change duty cycles while a waveform with a duty cycle of 0% or 100% is being output, make sure the following procedure.
- To change duty cycles while a 0%-duty cycle waveform is being output, write to GR while H'0000 ≤ TCNT_1 < previous GR value
- To change duty cycles while a 100%-duty cycle waveform is being output, write to GR while previous GR value< TCNT_0 ≤ GRA_0
 - Note that changing from a 0%-duty cycle waveform to a 100%-duty cycle waveform and vice versa is not possible.
- b. Buffer operation is used and TPSC2 = TPSC1 = TPSC0 = 0
 Write H'0000 or a value equal to or more than the GRA_0 value to the buffer register.
- To output a 0%-duty cycle waveform, write a value equal to or more than the GRA_0 value to the buffer register
- To output a 100%-duty cycle waveform, write H'0000 to the buffer register For details on buffer operation, see section 13.4.8, Buffer Operation.
- c. Buffer operation is not used and other than TPSC2 = TPSC1 = TPSC0 = 0
 Write a value which satisfies GRA_0 + 1 < GR < H'FFFF to GR directly at the timing shown below.
- To output a 0%-duty cycle waveform, write the value while H'0000 ≤ TCNT_1 < previous GR value
- To output a 100%-duty cycle waveform, write the value while previous GR value
 TCNT 0 ≤ GRA 0
 - To change duty cycles while a waveform with a duty cycle of 0% and 100% is being output, the following procedure must be followed.
- To change duty cycles while a 0%-duty cycle waveform is being output, write to GR while H'0000 ≤ TCNT_1 < previous GR value
- To change duty cycles while a 100%-duty cycle waveform is being output, write to GR while previous GR value< TCNT_0 ≤ GRA_0
 Note that changing from a 0%-duty cycle waveform to a 100%-duty cycle waveform
- Note that changing from a 0%-duty cycle waveform to a 100%-duty cycle waveform and vice versa is not possible.
- d. Buffer operation is used and other than TPSC2 = TPSC1 = TPSC0 = 0

 Write a value which satisfies GRA_0 + 1 < GR < H'FFFF to the buffer register. A waveform with a duty cycle of 0% can be output. However, a waveform with a duty cycle of 100% cannot be output using the buffer operation. Also, the buffer operation cannot be used to change duty cycles while a waveform with a duty cycle of 100% is being output. For details on buffer operation, see section 13.4.8, Buffer Operation.

13.4.8 Buffer Operation

Buffer operation differs depending on whether GR has been designated for an input capture register or an output compare register, or in reset synchronous PWM mode or complementary PWM mode.

Table 13.8 shows the register combinations used in buffer operation.

Table 13.8 Register Combinations in Buffer Operation

| General Register | Buffer Register |
|------------------|-----------------|
| GRA | GRC |
| GRB | GRD |

1. When GR is an output compare register

When a compare match occurs, the value in the buffer register of the corresponding channel is transferred to the general register.

This operation is illustrated in figure 13.35.

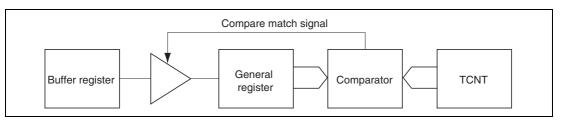

Figure 13.35 Compare Match Buffer Operation

2. When GR is an input capture register

When an input capture occurs, the value in TCNT is transferred to the general register and the value previously stored in the general register is transferred to the buffer register.

This operation is illustrated in figure 13.36.

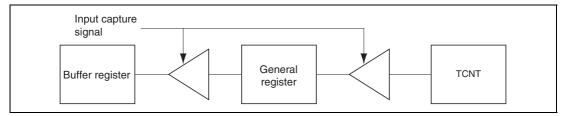

Figure 13.36 Input Capture Buffer Operation

3. Complementary PWM Mode

When the counter switches from counting up to counting down or vice versa, the value of the buffer register is transferred to the general register. Here, the value of the buffer register is transferred to the general register in the following timing:

- A. When TCNT_0 and GRA_0 are compared and their contents match
- B. When TCNT 1 underflows

4. Reset Synchronous PWM Mode

The value of the buffer register is transferred from compare match A0 to the general register.

5. Example of Buffer Operation Setting Procedure

Figure 13.37 shows an example of the buffer operation setting procedure.

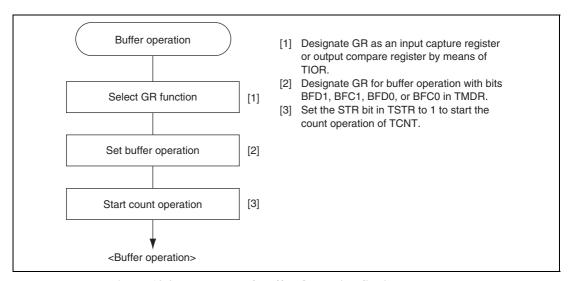

Figure 13.37 Example of Buffer Operation Setting Procedure

6. Examples of Buffer Operation

Figure 13.38 shows an operation example in which GRA has been designated as an output compare register, and buffer operation has been designated for GRA and GRC.

This is an example of TCNT operating as a periodic counter cleared by compare match B.

Pins FTIOA and FTIOB are set for toggle output by compare match A and B.

As buffer operation has been set, when compare match A occurs, the FTIOA pin performs toggle outputs and the value in buffer register is simultaneously transferred to the general register. This operation is repeated each time that compare match A occurs.

The timing to transfer data is shown in figure 13.39.

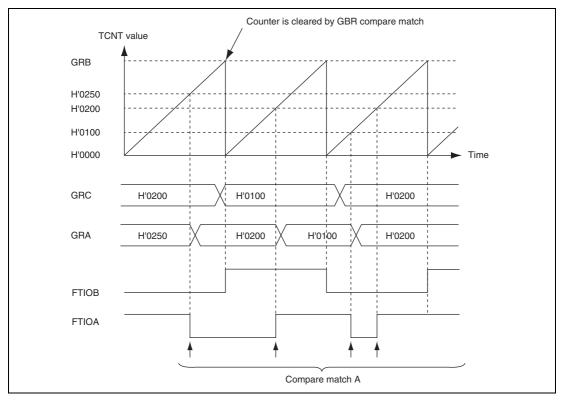

Figure 13.38 Example of Buffer Operation (1) (Buffer Operation for Output Compare Register)

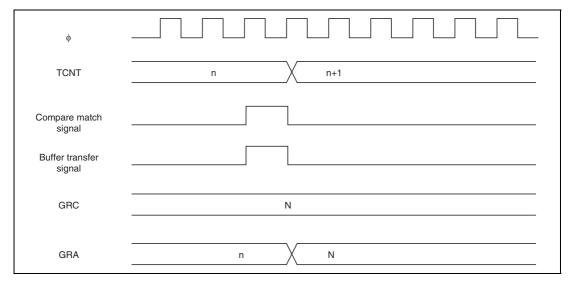

Figure 13.39 Example of Compare Match Timing for Buffer Operation

Figure 13.40 shows an operation example in which GRA has been designated as an input capture register, and buffer operation has been designated for GRA and GRC.

Counter clearing by input capture B has been set for TCNT, and falling edges have been selected as the FIOCB pin input capture input edge. And both rising and falling edges have been selected as the FIOCA pin input capture input edge.

As buffer operation has been set, when the TCNT value is stored in GRA upon the occurrence of input capture A, the value previously stored in GRA is simultaneously transferred to GRC. The transfer timing is shown in figure 13.41.

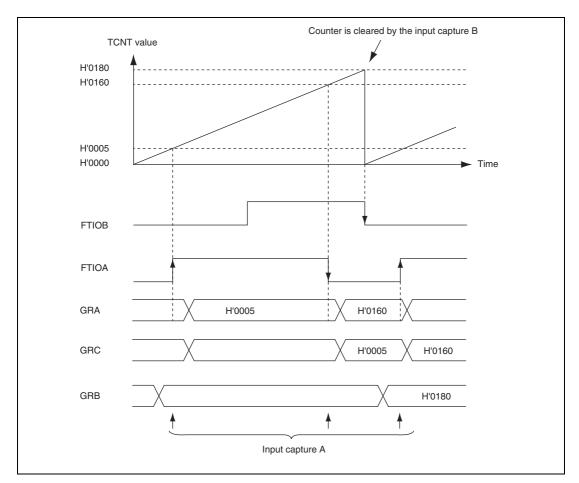

Figure 13.40 Example of Buffer Operation (2) (Buffer Operation for Input Capture Register)

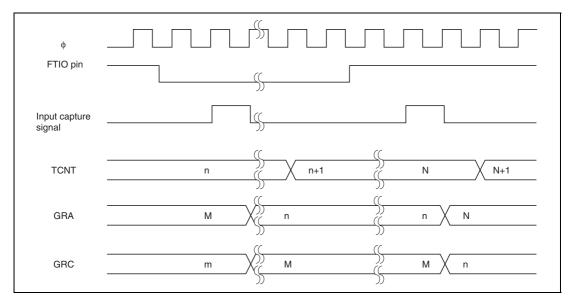

Figure 13.41 Input Capture Timing of Buffer Operation

Figures 13.42 and 13.43 show the operation examples when buffer operation has been designated for GRB_0 and GRD_0 in complementary PWM mode. These are examples when a PWM waveform of 0% duty is created by using the buffer operation and performing GRD_0 \geq GRA_0. Data is transferred from GRD_0 to GRB_0 according to the settings of CMD_0 and CMD_1 when TCNT_0 and GRA_0 are compared and their contents match or when TCNT_1 underflows. However, when GRD_0 \geq GRA_0, data is transferred from GRD_0 to GRB_0 when TCNT_1 underflows regardless of the setting of CMD_0 and CMD_1. When GRD_0 = H'0000, data is transferred from GRD_0 to GRB_0 when TCNT_0 and GRA_0 are compared and their contents match regardless of the settings of CMD_0 and CMD_1.

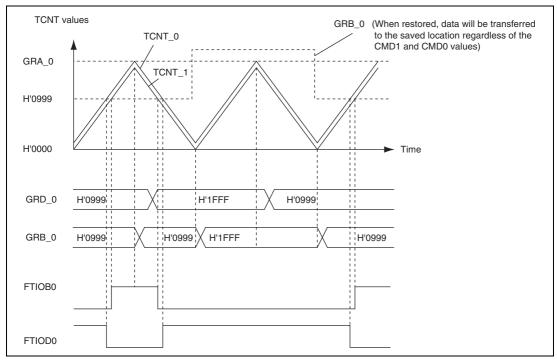

Figure 13.42 Buffer Operation (3) (Buffer Operation in Complementary PWM Mode CMD1 = CMD0 = 1)

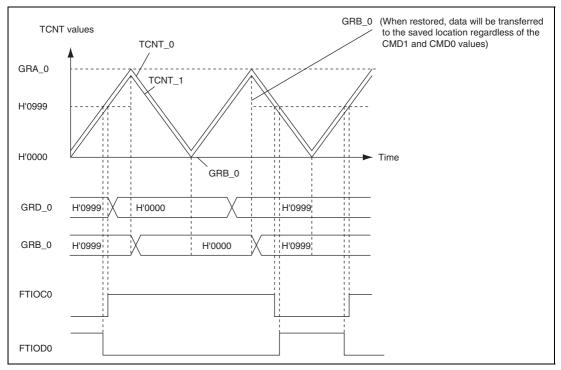

Figure 13.43 Buffer Operation (4) (Buffer Operation in Complementary PWM Mode CMD1 = CMD0 = 1)

13.4.9 Timer Z Output Timing

The outputs of channels 0 and 1 can be disabled or inverted by the settings of TOER and TOCR and the external level.

1. Output Disable/Enable Timing of Timer Z by TOER: Setting the master enable bit in TOER to 1 disables the output of timer Z. By setting the PCR and PDR of the corresponding I/O port beforehand, any value can be output. Figure 13.44 shows the timing to enable or disable the output of timer Z by TOER.

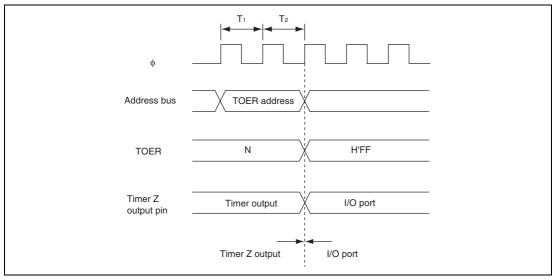

Figure 13.44 Example of Output Disable Timing of Timer Z by Writing to TOER

2. Output Disable Timing of Timer Z by External Trigger: When P54/WKP4 is set as a WKP4 input pin, and low level is input to WKP4, the master enable bit in TOER is set to 1 and the output of timer Z will be disabled.

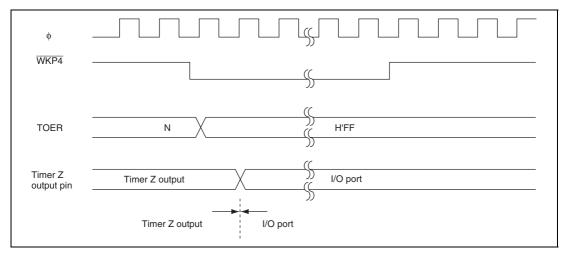

Figure 13.45 Example of Output Disable Timing of Timer Z by External Trigger

3. Output Inverse Timing by TFCR: The output level can be inverted by inverting the OLS1 and OLS0 bits in TFCR in reset synchronous PWM mode or complementary PWM mode. Figure 13.46 shows the timing.

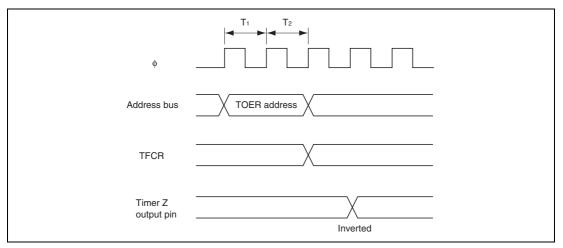

Figure 13.46 Example of Output Inverse Timing of Timer Z by Writing to TFCR

4. Output Inverse Timing by POCR: The output level can be inverted by inverting the POLD, POLC, and POLB bits in POCR in PWM mode. Figure 13.47 shows the timing.

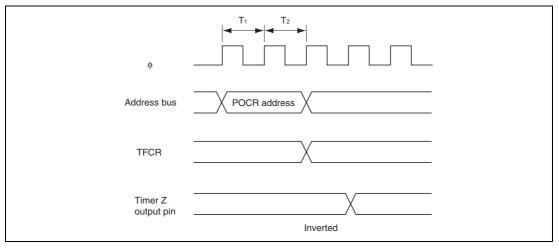

Figure 13.47 Example of Output Inverse Timing of Timer Z by Writing to POCR

13.5 Interrupts

There are three kinds of timer Z interrupt sources; input capture/compare match, overflow, and underflow. An interrupt is requested when the corresponding interrupt request flag is set to 1 while the corresponding interrupt enable bit is set to 1.

13.5.1 Status Flag Set Timing

1. IMF Flag Set Timing: The IMF flag is set to 1 by the compare match signal that is generated when the GR matches with the TCNT. The compare match signal is generated at the last state of matching (timing to update the counter value when the GR and TCNT match). Therefore, when the TCNT and GR matches, the compare match signal will not be generated until the TCNT input clock is generated. Figure 13.48 shows the timing to set the IMF flag.

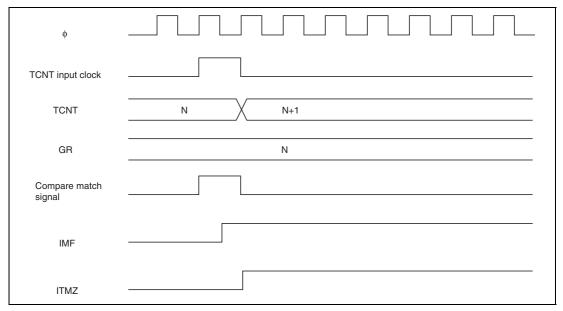

Figure 13.48 IMF Flag Set Timing when Compare Match Occurs

2. IMF Flag Set Timing at Input Capture: When an input capture signal is generated, the IMF flag is set to 1 and the value of TCNT is simultaneously transferred to corresponding GR. Figure 13.49 shows the timing.

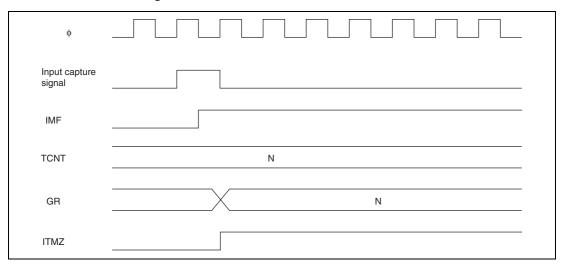

Figure 13.49 IMF Flag Set Timing at Input Capture

3. Overflow Flag (OVF) Set Timing: The overflow flag is set to 1 when the TCNT overflows. Figure 13.50 shows the timing.

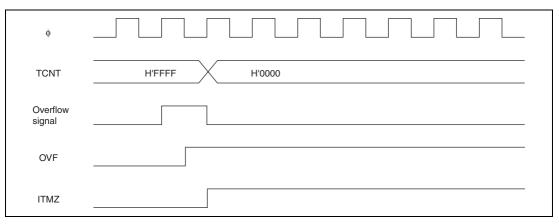

Figure 13.50 OVF Flag Set Timing

13.5.2 Status Flag Clearing Timing

The status flag can be cleared by writing 0 after reading 1 from the CPU. Figure 13.51 shows the timing in this case.

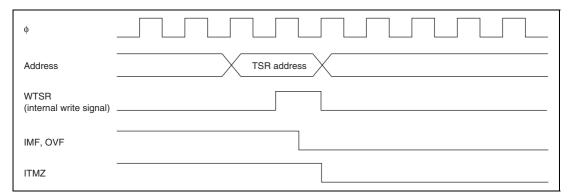

Figure 13.51 Status Flag Clearing Timing

13.6 Usage Notes

1. Contention between TCNT Write and Clear Operations: If a counter clear signal is generated in the T₂ state of a TCNT write cycle, TCNT clearing has priority and the TCNT write is not performed. Figure 13.52 shows the timing in this case.

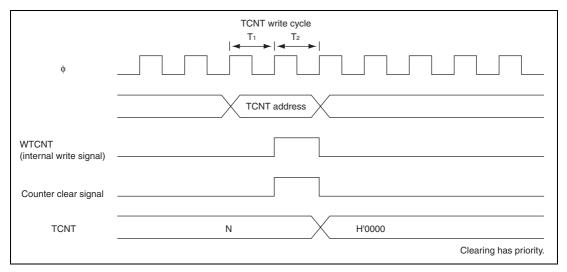

Figure 13.52 Contention between TCNT Write and Clear Operations

2. Contention between TCNT Write and Increment Operations: If increment is done in T₂ state of a TCNT write cycle, TCNT writing has priority. Figure 13.53 shows the timing in this case.

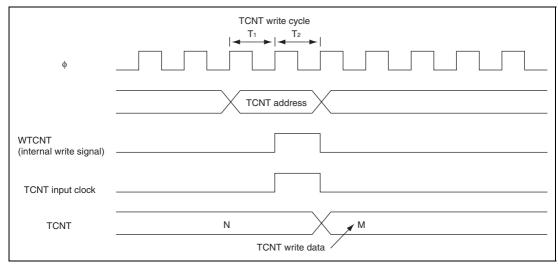

Figure 13.53 Contention between TCNT Write and Increment Operations

3. Contention between GR Write and Compare Match: If a compare match occurs in the T₂ state of a GR write cycle, GR write has priority and the compare match signal is disabled. Figure 13.54 shows the timing in this case.

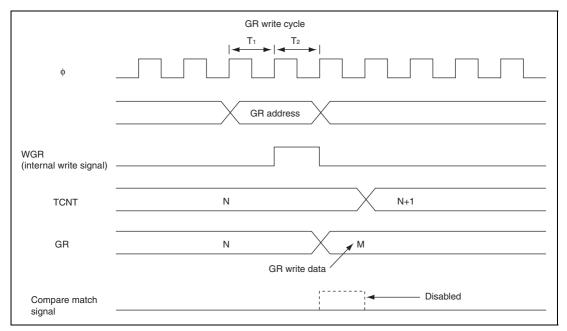

Figure 13.54 Contention between GR Write and Compare Match

4. Contention between TCNT Write and Overflow/Underflow: If overflow/underflow occurs in the T₂ state of a TCNT write cycle, TCNT write has priority without an increment operation. At this time, the OVF flag is set to 1. Figure 13.55 shows the timing in this case.

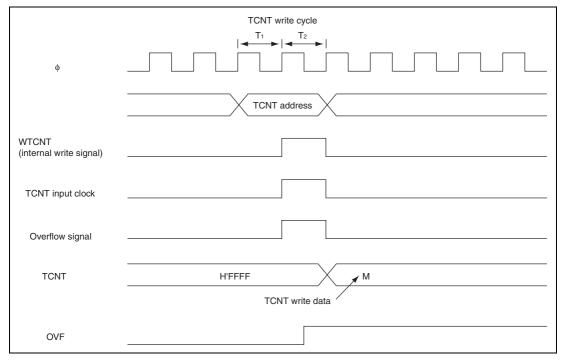

Figure 13.55 Contention between TCNT Write and Overflow

5. Contention between GR Read and Input Capture: If an input capture signal is generated in the T₁ state of a GR read cycle, the data that is read will be transferred before input capture transfer. Figure 13.56 shows the timing in this case.

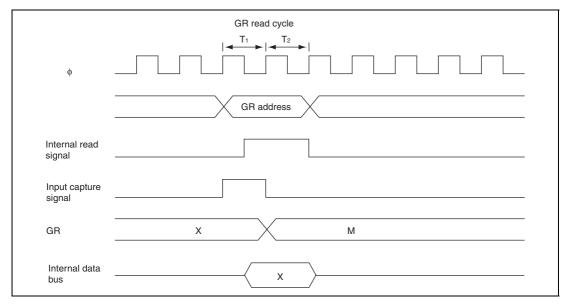

Figure 13.56 Contention between GR Read and Input Capture

6. Contention between Count Clearing and Increment Operations by Input Capture: If an input capture and increment signals are simultaneously generated, count clearing by the input capture operation has priority without an increment operation. The TCNT contents before clearing counter are transferred to GR. Figure 13.57 shows the timing in this case.

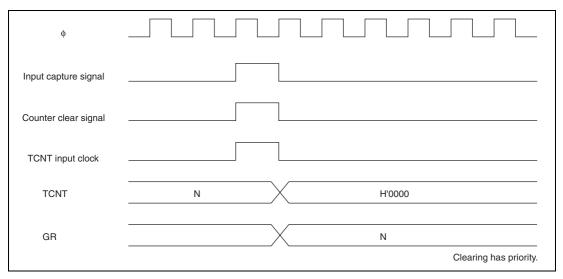

Figure 13.57 Contention between Count Clearing and Increment Operations by Input Capture

7. Contention between GR Write and Input Capture: If an input capture signal is generated in the T₂ state of a GR write cycle, the input capture operation has priority and the write to GR is not performed. Figure 13.58 shows the timing in this case.

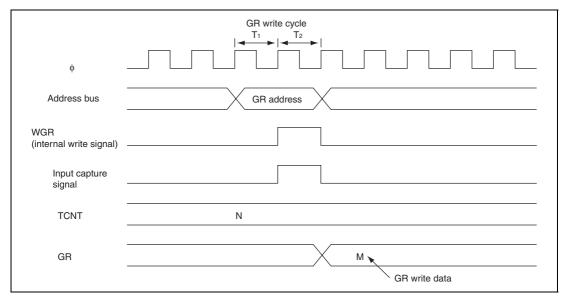

Figure 13.58 Contention between GR Write and Input Capture

- 8. Notes on Setting Reset Synchronous PWM Mode/Complementary PWM Mode: When bits CMD1 and CMD0 in TFCR are set, note the following:
 - A. Write bits CMD1 and CMD0 while TCNT_1 and TCNT_0 are halted.
 - B. Changing the settings of reset synchronous PWM mode to complementary PWM mode or vice versa is disabled. Set reset synchronous PWM mode or complementary PWM mode after the normal operation (bits CMD1 and CMD0 are cleared to 0) has been set.

9. Note on Writing to the TOA0 to TOD0 Bits and the TOA1 to TOD1 Bits in TOCR: The TOA0 to TOD0 bits and the TOA1 to TOD1 bits in TOCR decide the value of the FTIO pin, which is output until the first compare match occurs. Once a compare match occurs and this compare match changes the values of FTIOA0 to FTIOD0 and FTIOA1 to FTIOD1 output, the values of the FTIOA0 to FTIOD0 and FTIOA1 to FTIOD1 pin output and the values read from the TOA0 to TOD0 and TOA1 to TOD1 bits may differ. Moreover, when the writing to TOCR and the generation of the compare match A0 to D0 and A1 to D1 occur at the same timing, the writing to TOCR has the priority. Thus, output change due to the compare match is not reflected to the FTIOA0 to FTIOD0 and FTIOA1 to FTIOD1 pins. Therefore, when bit manipulation instruction is used to write to TOCR, the values of the FTIOA0 to FTIOD0 and FTIOA1 to FTIOD1 pin output may result in an unexpected result. When TOCR is to be written to while compare match is operating, stop the counter once before accessing to TOCR, read the port 6 state to reflect the values of FTIOA0 to FTIOD0 and FTIOA1 to FTIOD1 output, to TOA0 to TOD0 and TOA1 to TOD1, and then restart the counter. Figure 13.59 shows an example when the compare match and the bit manipulation instruction to

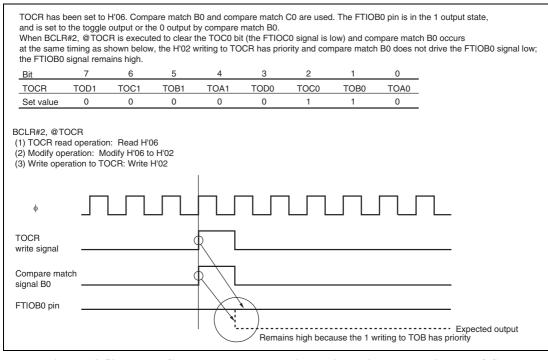

Figure 13.59 When Compare Match and Bit Manipulation Instruction to TOCR
Occur at the Same Timing

TOCR occur at the same timing.

Section 14 Watchdog Timer

The watchdog timer is an 8-bit timer that can generate an internal reset signal for this LSI if a system crash prevents the CPU from writing to the timer counter, thus allowing it to overflow.

The block diagram of the watchdog timer is shown in figure 14.1.

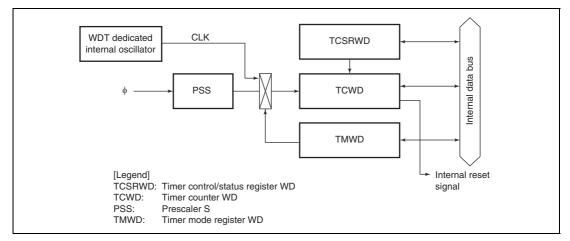

Figure 14.1 Block Diagram of Watchdog Timer

14.1 Features

- Selectable from nine counter input clocks.
 Eight clock sources (φ/64, φ/128, φ/256, φ/512, φ/1024, φ/2048, φ/4096, and φ/8192) or the WDT dedicated internal oscillator can be selected as the timer-counter clock. When the WDT dedicated internal oscillator is selected, it can operate as the watchdog timer in any operating mode.
- Reset signal generated on counter overflow
 An overflow period of 1 to 256 times the selected clock can be set.
- The watchdog timer is enabled in the initial state.
 It starts operating after the reset state is canceled.

14.2 Register Descriptions

The watchdog timer has the following registers.

- Timer control/status register WD (TCSRWD)
- Timer counter WD (TCWD)
- Timer mode register WD (TMWD)

14.2.1 Timer Control/Status Register WD (TCSRWD)

TCSRWD performs the TCSRWD and TCWD write control. TCSRWD also controls the watchdog timer operation and indicates the operating state. TCSRWD must be rewritten by using the MOV instruction. The bit manipulation instruction cannot be used to change the setting value.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 7 | B6WI | 1 | R/W | Bit 6 Write Inhibit |
| | | | | The TCWE bit can be written only when the write value of the B6WI bit is 0. |
| | | | | This bit is always read as 1. |
| 6 | TCWE | 0 | R/W | Timer Counter WD Write Enable |
| | | | | TCWD can be written when the TCWE bit is set to 1. |
| | | | | When writing data to this bit, the value for bit 7 must be 0. |
| 5 | B4WI | 1 | R/W | Bit 4 Write Inhibit |
| | | | | The TCSRWE bit can be written only when the write value of the B4WI bit is 0. This bit is always read as 1. |
| 4 | TCSRWE | 0 | R/W | Timer Control/Status Register WD Write Enable |
| | | | | The WDON and WRST bits can be written when the TCSRWE bit is set to 1. |
| | | | | When writing data to this bit, the value for bit 5 must be 0. |
| 3 | B2WI | 1 | R/W | Bit 2 Write Inhibit |
| | | | | This bit can be written to the WDON bit only when the write value of the B2WI bit is 0. |
| | | | | This bit is always read as 1. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|------|--|
| 2 | WDON | 1 | R/W | Watchdog Timer On |
| _ | WEGIV | • | 1000 | TCWD starts counting up when the WDON bit is set to 1 and halts when the WDON bit is cleared to 0. The watchdog timer is enabled in the initial state. When the watchdog timer is not used, clear the WDON bit to 0. |
| | | | | [Setting conditions] |
| | | | | Reset |
| | | | | When 1 is written to the WDON bit and 0 is written to the B2WI bit while the TCSRWE bit = 1 |
| | | | | [Clearing condition] |
| | | | | When 0 is written to the WDON bit and 0 is written to the B2WI bit while the TCSRWE bit = 1 |
| 1 | B0WI | 1 | R/W | Bit 0 Write Inhibit |
| | | | | This bit can be written to the WRST bit only when the write value of the B0WI bit is 0. This bit is always read as 1. |
| 0 | WRST | 0 | R/W | Watchdog Timer Reset |
| | | | | [Setting condition] |
| | | | | When TCWD overflows and an internal reset signal is generated |
| | | | | [Clearing conditions] |
| | | | | Reset by the RES pin |
| | | | | When 0 is written to the WRST bit and 0 is written to the BOWI bit while the TCSRWE bit = 1 |

14.2.2 Timer Counter WD (TCWD)

TCWD is an 8-bit readable/writable up-counter. When TCWD overflows from H'FF to H'00, the internal reset signal is generated and the WRST bit in TCSRWD is set to 1. TCWD is initialized to H'00.

14.2.3 Timer Mode Register WD (TMWD)

TMWD selects the input clock.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 7 to 4 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 3 | CKS3 | 1 | R/W | Clock Select 3 to 0 |
| 2 | CKS2 | 1 | R/W | Select the clock to be input to TCWD. |
| 1 | CKS1 | 1 | R/W | 1000: Internal clock: counts on φ/64 |
| 0 | CKS0 | 1 | R/W | 1001: Internal clock: counts on φ/128 |
| | | | | 1010: Internal clock: counts on φ/256 |
| | | | | 1011: Internal clock: counts on φ/512 |
| | | | | 1100: Internal clock: counts on φ/1024 |
| | | | | 1101: Internal clock: counts on φ/2048 |
| | | | | 1110: Internal clock: counts on φ/4096 |
| | | | | 1111: Internal clock: counts on φ8192 |
| | | | | 0XXX: WDT dedicated internal oscillator |
| | | | | For the overflow periods of the WDT dedicated internal oscillator, see section 22, Electrical Characteristics. |

[Legend]X: Don't care.

14.3 Operation

The watchdog timer is provided with an 8-bit counter. After the reset state is released, TCWD starts counting up. When the TCWD count value overflows HFF, an internal reset signal is generated. The internal reset signal is output for a period of 256 ϕ_{osc} clock cycles. As TCWD is a writable counter, it starts counting from the value set in TCWD. An overflow period in the range of 1 to 256 input clock cycles can therefore be set, according to the TCWD set value. When the watchdog timer is not used, stop TCWD counting by writing 0 to B2WI and WDON simultaneously while the TCSRWE bit in TCSRWD is set to 1. (To stop the watchdog timer, two write accesses to TCSRWD are required.)

Figure 14.2 shows an example of watchdog timer operation.

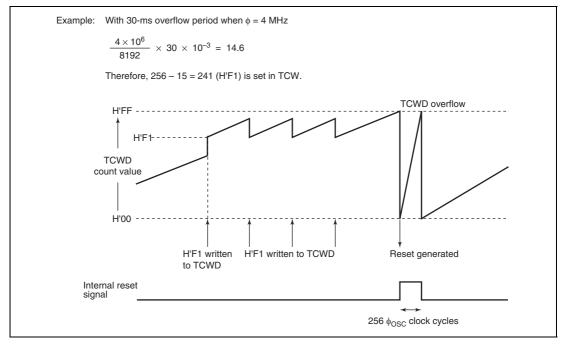

Figure 14.2 Watchdog Timer Operation Example

Section 15 14-Bit PWM

The 14-bit PWM is a pulse division type PWM that can be used for electronic tuner control, etc. Figure 15.1 shows a block diagram of the 14-bit PWM.

15.1 **Features**

- Choice of two conversion periods A conversion period of 32768/\phi with a minimum modulation width of 2/\phi, or a conversion period of 16384/φ with a minimum modulation width of 1/φ, can be selected.
- Pulse division method for less ripple

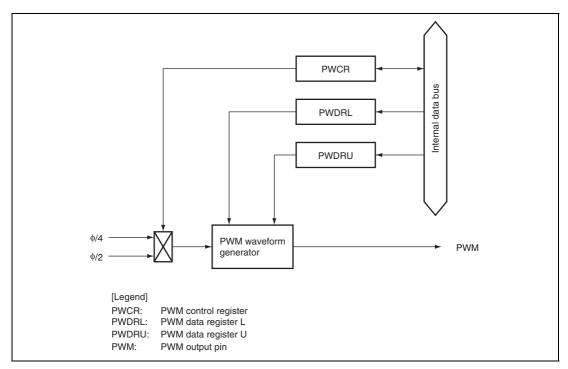

Figure 15.1 Block Diagram of 14-Bit PWM

15.2 Input/Output Pin

Table 15.1 shows the 14-bit PWM pin configuration.

Table 15.1 Pin Configuration

| Name | Abbreviation | I/O | Function |
|-------------------------------|--------------|--------|-----------------------------------|
| 14-bit PWM square-wave output | PWM | Output | 14-bit PWM square-wave output pin |

15.3 Register Descriptions

The 14-bit PWM has the following registers.

- PWM control register (PWCR)
- PWM data register U (PWDRU)
- PWM data register L (PWDRL)

15.3.1 PWM Control Register (PWCR)

PWCR selects the conversion period.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 7 to 1 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1, and cannot be modified. |
| 0 | PWCR0 | 0 | R/W | Clock Select |
| | | | | 0: The input clock is $\phi/2$ ($t\phi = 2/\phi$) |
| | | | | — The conversion period is 16384/ ϕ , with a minimum modulation width of 1/ ϕ |
| | | | | 1: The input clock is $\phi/4$ ($t\phi = 4/\phi$) |
| | | | | The conversion period is 32768/φ, with a minimum modulation width of 2/φ |

[Legend]

to: Period of PWM clock input

15.3.2 PWM Data Registers U and L (PWDRU, PWDRL)

PWDRU and PWDRL indicate high level width in one PWM waveform cycle. PWDRU and PWDRL are 14-bit write-only registers, with the upper 6 bits assigned to PWDRU and the lower 8 bits to PWDRL. When read, all bits are always read as 1.

Both PWDRU and PWDRL are accessible only in bytes. Note that the operation is not guaranteed if word access is performed. When 14-bit data is written in PWDRU and PWDRL, the contents are latched in the PWM waveform generator and the PWM waveform generation data is updated. When writing the 14-bit data, the order is as follows: PWDRL to PWDRU.

PWDRU and PWDRL are initialized to H'C000.

15.4 Operation

When using the 14-bit PWM, set the registers in this sequence:

- 1. Set the PWM bit in the port mode register 1 (PMR1) to set the P11/PWM pin to function as a PWM output pin.
- 2. Set the PWCR0 bit in PWCR to select a conversion period of either.
- 3. Set the output waveform data in PWDRU and PWDRL. Be sure to write byte data first to PWDRL and then to PWDRU. When the data is written in PWDRU, the contents of these registers are latched in the PWM waveform generator, and the PWM waveform generation data is updated in synchronization with internal signals.

One conversion period consists of 64 pulses, as shown in figure 15.2. The total high-level width during this period (T_H) corresponds to the data in PWDRU and PWDRL. This relation can be expressed as follows:

$$T_{H} = (data \ value \ in \ PWDRU \ and \ PWDRL + 64) \times t\phi/2$$

where t ϕ is the period of PWM clock input: $2/\phi$ (bit PWCR0 = 0) or $4/\phi$ (bit PWCR0 = 1). If the data value in PWDRU and PWDRL is from H'FFC0 to H'FFFF, the PWM output stays high. When the data value is H'C000, T_H is calculated as follows:

$$T_{H} = 64 \times t\phi/2 = 32 t\phi$$

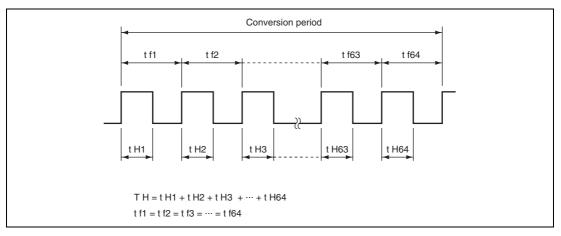

Figure 15.2 Waveform Output by 14-Bit PWM

Section 16 Serial Communication Interface 3 (SCI3)

This LSI includes a serial communication interface 3 (SCI3), which has independent two channels. The SCI3 can handle both asynchronous and clock synchronous serial communication. In asynchronous mode, serial data communication can be carried out using standard asynchronous communication chips such as a Universal Asynchronous Receiver/Transmitter (UART) or an Asynchronous Communication Interface Adapter (ACIA). A function is also provided for serial communication between processors (multiprocessor communication function).

Table 16.1 shows the SCI3 channel configuration and figure 16.1 shows a block diagram of the SCI3. Since pin functions are identical for each of the two channels (SCI3 and SCI3_2), separate explanations are not given in this section.

16.1 Features

- Choice of asynchronous or clock synchronous serial communication mode
- Full-duplex communication capability

The transmitter and receiver are mutually independent, enabling transmission and reception to be executed simultaneously.

Double-buffering is used in both the transmitter and the receiver, enabling continuous transmission and continuous reception of serial data.

- On-chip baud rate generator allows any bit rate to be selected
- External clock or on-chip baud rate generator can be selected as a transfer clock source.
- Six interrupt sources
 Transmit-end, transmit-data-empty, receive-data-full, overrun error, framing error, and parity error.

Asynchronous mode

- Data length: 7 or 8 bits
- Stop bit length: 1 or 2 bits
- Parity: Even, odd, or none
- Receive error detection: Parity, overrun, and framing errors
- Break detection: Break can be detected by reading the RxD pin level directly in the case of a framing error

Clock synchronous mode

• Data length: 8 bits

• Receive error detection: Overrun errors

Table 16.1 Channel Configuration

| Channel | Abbreviation | Pin | Register | Register Address |
|-----------|--------------|--------------------------|----------|------------------|
| Channel 1 | SCI3* | SCK3 RXD TXD | SMR | H'FFA8 |
| | | | BRR | H'FFA9 |
| | | | SCR3 | H'FFAA |
| | | | TDR | H'FFAB |

| SCI3 transmit data output | TXD | Output | SCI3 transmit data output |

16.3 Register Descriptions

The SCI3 has the following registers for each channel.

- Receive shift register (RSR)
- Receive data register (RDR)
- Transmit shift register (TSR)
- Transmit data register (TDR)
- Serial mode register (SMR)
- Serial control register 3 (SCR3)
- Serial status register (SSR)
- Bit rate register (BRR)

16.3.1 Receive Shift Register (RSR)

RSR is a shift register that is used to receive serial data input from the RxD pin and convert it into parallel data. When one frame of data has been received, it is transferred to RDR automatically. RSR cannot be directly accessed by the CPU.

16.3.2 Receive Data Register (RDR)

RDR is an 8-bit register that stores received data. When the SCI3 has received one frame of serial data, it transfers the received serial data from RSR to RDR, where it is stored. After this, RSR is receive-enabled. As RSR and RDR function as a double buffer in this way, continuous receive operations are possible. After confirming that the RDRF bit in SSR is set to 1, read RDR only once. RDR cannot be written to by the CPU. RDR is initialized to H'00.

16.3.3 Transmit Shift Register (TSR)

TSR is a shift register that transmits serial data. To perform serial data transmission, the SCI3 first transfers transmit data from TDR to TSR automatically, then sends the data that starts from the LSB to the TXD pin. TSR cannot be directly accessed by the CPU.

16.3.4 Transmit Data Register (TDR)

TDR is an 8-bit register that stores data for transmission. When the SCI3 detects that TSR is empty, it transfers the transmit data written in TDR to TSR and starts transmission. The double-buffered structure of TDR and TSR enables continuous serial transmission. If the next transmit data has already been written to TDR during transmission of one-frame data, the SCI3 transfers the written data to TSR to continue transmission. To achieve reliable serial transmission, write transmit data to TDR only once after confirming that the TDRE bit in SSR is set to 1. TDR is initialized to H'FF.

16.3.5 Serial Mode Register (SMR)

SMR is used to set the SCI3's serial transfer format and select the baud rate generator clock source.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 7 | COM | 0 | R/W | Communication Mode |
| | | | | 0: Asynchronous mode |
| | | | | 1: Clock synchronous mode |
| 6 | CHR | 0 | R/W | Character Length (enabled only in asynchronous mode) |
| | | | | 0: Selects 8 bits as the data length. |
| | | | | 1: Selects 7 bits as the data length. |
| 5 | PE | 0 | R/W | Parity Enable (enabled only in asynchronous mode) |
| | | | | When this bit is set to 1, the parity bit is added to transmit data before transmission, and the parity bit is checked in reception. |
| 4 | PM | 0 | R/W | Parity Mode (enabled only when the PE bit is 1 in asynchronous mode) |
| | | | | 0: Selects even parity. |
| | | | | 1: Selects odd parity. |

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 3 | STOP | 0 | R/W | Stop Bit Length (enabled only in asynchronous mode) |
| | | | | Selects the stop bit length in transmission. |
| | | | | 0: 1 stop bit |
| | | | | 1: 2 stop bits |
| | | | | For reception, only the first stop bit is checked, regardless of the value in the bit. If the second stop bit is 0, it is treated as the start bit of the next transmit character. |
| 2 | MP | 0 | R/W | Multiprocessor Mode |
| | | | | When this bit is set to 1, the multiprocessor communication function is enabled. The PE bit and PM bit settings are invalid in multiprocessor mode. In clock synchronous mode, clear this bit to 0. |
| 1 | CKS1 | 0 | R/W | Clock Select 0 and 1 |
| 0 | CKS0 | 0 | R/W | These bits select the clock source for the baud rate generator. |
| | | | | 00: φ clock (n = 0) |
| | | | | 01: |
| | | | | 10: |
| | | | | 11: φ/64 clock (n = 3) |
| | | | | For the relationship between the bit rate register setting and the baud rate, see section 16.3.8, Bit Rate Register (BRR). n is the decimal representation of the value of n in BRR (see section 16.3.8, Bit Rate Register (BRR)). |

16.3.6 Serial Control Register 3 (SCR3)

SCR3 is a register that enables or disables SCI3 transfer operations and interrupt requests, and is also used to select the transfer clock source. For details on interrupt requests, refer to section 16.7, Interrupts.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|------|---|
| 7 | TIE | 0 | R/W | Transmit Interrupt Enable |
| , | 110 | Ü | 1000 | When this bit is set to 1, the TXI interrupt request is |
| | | | | enabled. |
| 6 | RIE | 0 | R/W | Receive Interrupt Enable |
| | | | | When this bit is set to 1, RXI and ERI interrupt requests are enabled. |
| 5 | TE | 0 | R/W | Transmit Enable |
| | | | | When this bit s set to 1, transmission is enabled. |
| 4 | RE | 0 | R/W | Receive Enable |
| | | | | When this bit is set to 1, reception is enabled. |
| 3 | MPIE | 0 | R/W | Multiprocessor Interrupt Enable (enabled only when the MP bit in SMR is 1 in asynchronous mode) |
| | | | | When this bit is set to 1, receive data in which the multiprocessor bit is 0 is skipped, and setting of the RDRF, FER, and OER status flags in SSR is disabled. On receiving data in which the multiprocessor bit is 1, this bit is automatically cleared and normal reception is resumed. For details, refer to section 16.6, Multiprocessor Communication Function. |
| 2 | TEIE | 0 | R/W | Transmit End Interrupt Enable |
| | | | | When this bit is set to 1, TEI interrupt request is enabled. |

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 1 | CKE1 | 0 | R/W | Clock Enable 0 and 1 |
| 0 | CKE0 | 0 | R/W | Selects the clock source. |
| | | | | Asynchronous mode |
| | | | | 00: On-chip baud rate generator |
| | | | | 01: On-chip baud rate generator |
| | | | | Outputs a clock of the same frequency as the bit rate from the SCK3 pin. |
| | | | | 10: External clock |
| | | | | Inputs a clock with a frequency 16 times the bit rate from the SCK3 pin. |
| | | | | 11:Reserved |
| | | | | Clock synchronous mode |
| | | | | 00: On-chip clock (SCK3 pin functions as clock output) |
| | | | | 01: Reserved |
| | | | | 10: External clock (SCK3 pin functions as clock input) |
| | | | | 11: Reserved |

16.3.7 Serial Status Register (SSR)

SSR is a register containing status flags of the SCI3 and multiprocessor bits for transfer. 1 cannot be written to flags TDRE, RDRF, OER, PER, and FER; they can only be cleared.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 7 | TDRE | 1 | R/W | Transmit Data Register Empty |
| | | | | Indicates whether TDR contains transmit data. |
| | | | | [Setting conditions] |
| | | | | When the TE bit in SCR3 is 0 |
| | | | | When data is transferred from TDR to TSR |
| | | | | [Clearing conditions] |
| | | | | • When 0 is written to TDRE after reading TDRE = 1 |
| | | | | When the transmit data is written to TDR |
| 6 | RDRF | 0 | R/W | Receive Data Register Full |
| | | | | Indicates that the received data is stored in RDR. |
| | | | | [Setting condition] |
| | | | | When serial reception ends normally and receive data is transferred from RSR to RDR |
| | | | | [Clearing conditions] |
| | | | | • When 0 is written to RDRF after reading RDRF = 1 |
| | | | | When data is read from RDR |
| 5 | OER | 0 | R/W | Overrun Error |
| | | | | [Setting condition] |
| | | | | When an overrun error occurs in reception |
| | | | | [Clearing condition] |
| | | | | • When 0 is written to OER after reading OER = 1 |
| 4 | FER | 0 | R/W | Framing Error |
| | | | | [Setting condition] |
| | | | | When a framing error occurs in reception |
| | | | | [Clearing condition] |
| | | | | When 0 is written to FER after reading FER = 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|----------|---|
| 3 | PER | 0 | R/W | Parity Error |
| | | | | [Setting condition] |
| | | | | When a parity error is detected during reception |
| | | | | [Clearing condition] |
| | | | | When 0 is written to PER after reading PER = 1 |
| 2 | TEND | 1 | R | Transmit End |
| | | | | [Setting conditions] |
| | | | | When the TE bit in SCR3 is 0 |
| | | | | • When TDRE = 1 at transmission of the last bit of a 1- |
| | | | | frame serial transmit character |
| | | | | [Clearing conditions] |
| | | | | • When 0 is written to TDRE after reading TDRE = 1 |
| | | | | When the transmit data is written to TDR |
| 1 | MPBR | 0 | R | Multiprocessor Bit Receive |
| | | | | MPBR stores the multiprocessor bit in the receive character data. When the RE bit in SCR3 is cleared to 0, its state is retained. |
| 0 | MPBT | 0 | R/W | Multiprocessor Bit Transfer |
| 0 | IVII DI | J | 1 1/ V V | • |
| | | | | MPBT stores the multiprocessor bit to be added to the transmit character data. |

16.3.8 Bit Rate Register (BRR)

BRR is an 8-bit register that adjusts the bit rate. The initial value of BRR is HTF. Table 16.3 shows the relationship between the N setting in BRR and the n setting in bits CKS1 and CKS0 of SMR in asynchronous mode. Table 16.4 shows the maximum bit rate for each frequency in asynchronous mode. The values shown in both tables 16.3 and 16.4 are values in active (high-speed) mode. Table 16.5 shows the relationship between the N setting in BRR and the n setting in bits CKS1 and CKS0 of SMR in clock synchronous mode. The values shown in table 16.5 are values in active (high-speed) mode. The N setting in BRR and error for other operating frequencies and bit rates can be obtained by the following formulas:

[Asynchronous Mode]

$$N = \frac{\phi}{64 \times 2^{2n-1} \times B} \times 10^6 - 1$$

Error (%) =
$$\left\{ \frac{\phi \times 10^6}{(N+1) \times B \times 64 \times 2^{2n-1}} - 1 \right\} \times 100$$

[Clock Synchronous Mode]

$$N = \frac{\phi}{8 \times 2^{2n-1} \times B} \times 10^6 - 1$$

[Legend]

B: Bit rate (bit/s)

N: BRR setting for band rate generator $(0 \le N \le 255)$

φ: Operating frequency (MHz)

n: CSK1 and CSK0 settings in SMR $(0 \le n \le 3)$

16.4 Operation in Asynchronous Mode

Figure 16.2 shows the general format for asynchronous serial communication. One character (or frame) consists of a start bit (low level), followed by data (in LSB-first order), a parity bit (high or low level), and finally stop bits (high level). Inside the SCI3, the transmitter and receiver are independent units, enabling full-duplex. Both the transmitter and the receiver also have a double-buffered structure, so data can be read or written during transmission or reception, enabling continuous data transfer.

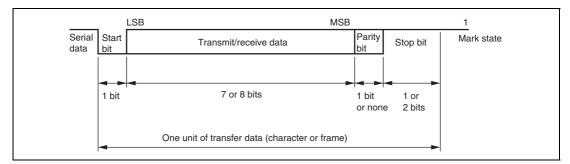

Figure 16.2 Data Format in Asynchronous Communication

16.4.1 Clock

Either an internal clock generated by the on-chip baud rate generator or an external clock input at the SCK3 pin can be selected as the SCI3's serial clock, according to the setting of the COM bit in SMR and the CKE0 and CKE1 bits in SCR3. When an external clock is input at the SCK3 pin, the clock frequency should be 16 times the bit rate used.

When the SCI3 is operated on an internal clock, the clock can be output from the SCK3 pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is such that the rising edge of the clock is in the middle of the transmit data, as shown in figure 16.3.

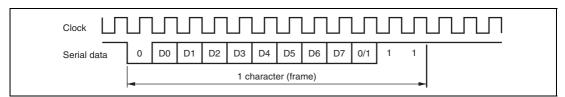

Figure 16.3 Relationship between Output Clock and Transfer Data Phase (Asynchronous Mode) (Example with 8-Bit Data, Parity, Two Stop Bits)

16.4.2 SCI3 Initialization

Before transmitting and receiving data, you should first clear the TE and RE bits in SCR3 to 0, then initialize the SCI3 as described below. When the operating mode, or transfer format, is changed for example, the TE and RE bits must be cleared to 0 before making the change using the following procedure. When the TE bit is cleared to 0, the TDRE flag is set to 1. Note that clearing the RE bit to 0 does not initialize the contents of the RDRF, PER, FER, and OER flags, or the contents of RDR. When the external clock is used in asynchronous mode, the clock must be supplied even during initialization.

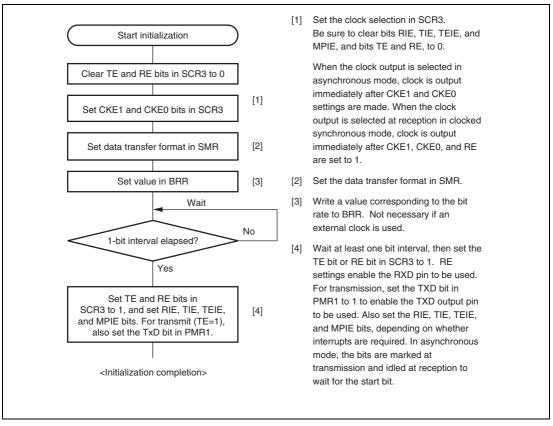

Figure 16.4 Sample SCI3 Initialization Flowchart

16.4.3 Data Transmission

Figure 16.5 shows an example of operation for transmission in asynchronous mode. In transmission, the SCI3 operates as described below.

- 1. The SCI3 monitors the TDRE flag in SSR. If the flag is cleared to 0, the SCI3 recognizes that data has been written to TDR, and transfers the data from TDR to TSR.
- 2. After transferring data from TDR to TSR, the SCI3 sets the TDRE flag to 1 and starts transmission. If the TIE bit is set to 1 at this time, a TXI interrupt request is generated. Continuous transmission is possible because the TXI interrupt routine writes next transmit data to TDR before transmission of the current transmit data has been completed.
- 3. The SCI3 checks the TDRE flag at the timing for sending the stop bit.
- 4. If the TDRE flag is 0, the data is transferred from TDR to TSR, the stop bit is sent, and then serial transmission of the next frame is started.
- 5. If the TDRE flag is 1, the TEND flag in SSR is set to 1, the stop bit is sent, and then the "mark state" is entered, in which 1 is output. If the TEIE bit in SCR3 is set to 1 at this time, a TEI interrupt request is generated.
- 6. Figure 16.6 shows a sample flowchart for transmission in asynchronous mode.

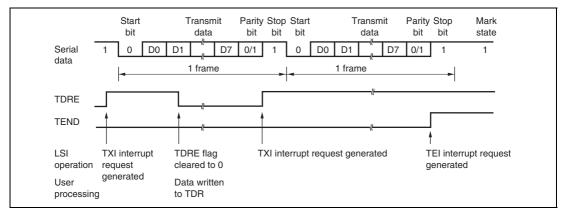

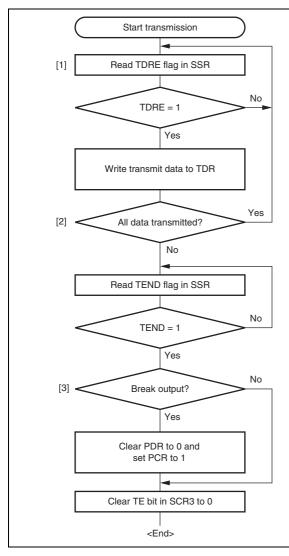

Figure 16.5 Example of SCI3 Transmission in Asynchronous Mode (8-Bit Data, Parity, One Stop Bit)

- [1] Read SSR and check that the TDRE flag is set to 1, then write transmit data to TDR. When data is written to TDR, the TDRE flag is automatically cleared to 0.
- [2] To continue serial transmission, read 1 from the TDRE flag to confirm that writing is possible, then write data to TDR. When data is written to TDR, the TDRE flag is automatically cleared to 0.
- [3] To output a break in serial transmission, after setting PCR to 1 and PDR to 0, clear TxD in PMR1 to 0, then clear the TE bit in SCR3 to 0.

Figure~16.6~~Sample~Serial~Transmission~Data~Flowchart~(Asynchronous~Mode)

16.4.4 Serial Data Reception

Figure 16.7 shows an example of operation for reception in asynchronous mode. In serial reception, the SCI3 operates as described below.

- 1. The SCI3 monitors the communication line. If a start bit is detected, the SCI3 performs internal synchronization, receives receive data in RSR, and checks the parity bit and stop bit.
- 2. If an overrun error occurs (when reception of the next data is completed while the RDRF flag is still set to 1), the OER bit in SSR is set to 1. If the RIE bit in SCR3 is set to 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR.
- 3. If a parity error is detected, the PER bit in SSR is set to 1 and receive data is transferred to RDR. If the RIE bit in SCR3 is set to 1 at this time, an ERI interrupt request is generated.
- 4. If a framing error is detected (when the stop bit is 0), the FER bit in SSR is set to 1 and receive data is transferred to RDR. If the RIE bit in SCR3 is set to 1 at this time, an ERI interrupt request is generated.
- 5. If reception is completed successfully, the RDRF bit in SSR is set to 1, and receive data is transferred to RDR. If the RIE bit in SCR3 is set to 1 at this time, an RXI interrupt request is generated. Continuous reception is possible because the RXI interrupt routine reads the receive data transferred to RDR before reception of the next receive data has been completed.

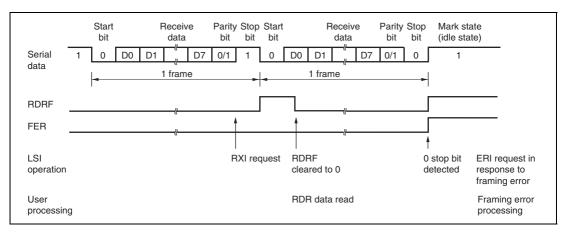

Figure 16.7 Example of SCI3 Reception in Asynchronous Mode (8-Bit Data, Parity, One Stop Bit)

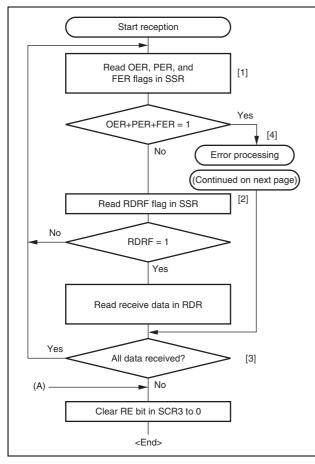

Table 16.6 shows the states of the SSR status flags and receive data handling when a receive error is detected. If a receive error is detected, the RDRF flag retains its state before receiving data. Reception cannot be resumed while a receive error flag is set to 1. Accordingly, clear the OER, FER, PER, and RDRF bits to 0 before resuming reception. Figure 16.8 shows a sample flow chart for serial data reception.

Table 16.6 SSR Status Flags and Receive Data Handling

SSR Status Flag

| RDRF* | OER | FER | PER | Receive Data | Receive Error Type |
|-------|-----|-----|-----|--------------------|--|
| 1 | 1 | 0 | 0 | Lost | Overrun error |
| 0 | 0 | 1 | 0 | Transferred to RDR | Framing error |
| 0 | 0 | 0 | 1 | Transferred to RDR | Parity error |
| 1 | 1 | 1 | 0 | Lost | Overrun error + framing error |
| 1 | 1 | 0 | 1 | Lost | Overrun error + parity error |
| 0 | 0 | 1 | 1 | Transferred to RDR | Framing error + parity error |
| 1 | 1 | 1 | 1 | Lost | Overrun error + framing error + parity error |

Note: * The RDRF flag retains the state it had before data reception.

- [1] Read the OER, PER, and FER flags in SSR to identify the error. If a receive error occurs, performs the appropriate error processing.
- [2] Read SSR and check that RDRF = 1, then read the receive data in RDR.
 The RDRF flag is cleared automatically.
- [3] To continue serial reception, before the stop bit for the current frame is received, read the RDRF flag and read RDR.
- The RDRF flag is cleared automatically.

 [4] If a receive error occurs, read the OER, PER, and FER flags in SSR to identify the error. After performing the appropriate error processing, ensure that the OER, PER, and FER flags are all cleared to 0. Reception cannot be resumed if any of these flags are set to 1. In the case of a framing error, a break can be detected by reading the value of the input port corresponding to the RxD pin.

Figure 16.8 Sample Serial Reception Data Flowchart (Asynchronous Mode) (1)

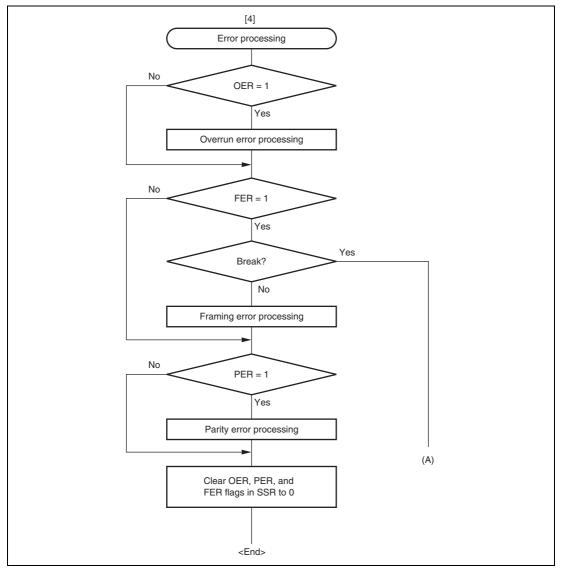

Figure 16.8 Sample Serial Reception Data Flowchart (Asynchronous Mode) (2)

16.5 Operation in Clock Synchronous Mode

Figure 16.9 shows the general format for clock synchronous communication. In clock synchronous mode, data is transmitted or received synchronous with clock pulses. A single character in the transmit data consists of the 8-bit data starting from the LSB. In clock synchronous serial communication, data on the transmission line is output from one falling edge of the synchronization clock to the next. In clock synchronous mode, the SCI3 receives data in synchronous with the rising edge of the synchronization clock. After 8-bit data is output, the transmission line holds the MSB state. In clock synchronous mode, no parity or multiprocessor bit is added. Inside the SCI3, the transmitter and receiver are independent units, enabling full-duplex communication through the use of a common clock. Both the transmitter and the receiver also have a double-buffered structure, so data can be read or written during transmission or reception, enabling continuous data transfer.

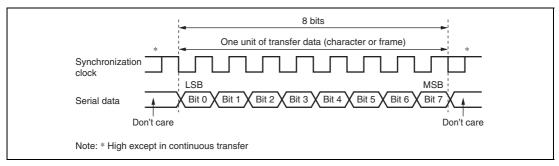

Figure 16.9 Data Format in Clock Synchronous Communication

16.5.1 Clock

Either an internal clock generated by the on-chip baud rate generator or an external synchronization clock input at the SCK3 pin can be selected, according to the setting of the COM bit in SMR and CKE0 and CKE1 bits in SCR3. When the SCI3 is operated on an internal clock, the synchronization clock is output from the SCK3 pin. Eight synchronization clock pulses are output in the transfer of one character, and when no transfer is performed the clock is fixed high.

16.5.2 SCI3 Initialization

Before transmitting and receiving data, the SCI3 should be initialized as described in a sample flowchart in figure 16.4.

16.5.3 Serial Data Transmission

Figure 16.10 shows an example of SCI3 operation for transmission in clock synchronous mode. In serial transmission, the SCI3 operates as described below.

- 1. The SCI3 monitors the TDRE flag in SSR, and if the flag is 0, the SCI3 recognizes that data has been written to TDR, and transfers the data from TDR to TSR.
- 2. The SCI3 sets the TDRE flag to 1 and starts transmission. If the TIE bit in SCR3 is set to 1 at this time, a transmit data empty interrupt (TXI) is generated.
- 3. 8-bit data is sent from the TxD pin synchronized with the output clock when output clock mode has been specified, and synchronized with the input clock when use of an external clock has been specified. Serial data is transmitted sequentially from the LSB (bit 0), from the TxD pin.
- 4. The SCI3 checks the TDRE flag at the timing for sending the MSB (bit 7).
- 5. If the TDRE flag is cleared to 0, data is transferred from TDR to TSR, and serial transmission of the next frame is started.
- 6. If the TDRE flag is set to 1, the TEND flag in SSR is set to 1, and the TDRE flag maintains the output state of the last bit. If the TEIE bit in SCR3 is set to 1 at this time, a TEI interrupt request is generated.
- 7. The SCK3 pin is fixed high at the end of transmission.

Figure 16.11 shows a sample flow chart for serial data transmission. Even if the TDRE flag is cleared to 0, transmission will not start while a receive error flag (OER, FER, or PER) is set to 1. Make sure that the receive error flags are cleared to 0 before starting transmission.

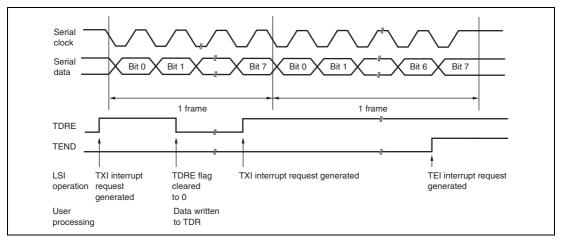

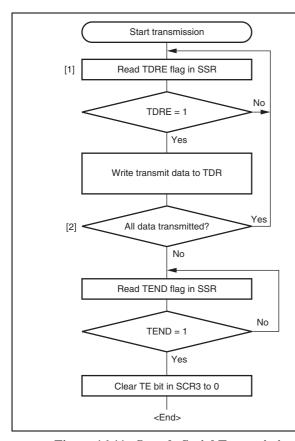

Figure 16.10 Example of SCI3 Transmission in Clock Synchronous Mode

- [1] Read SSR and check that the TDRE flag is set to 1, then write transmit data to TDR. When data is written to TDR, the TDRE flag is automatically cleared to 0 and clocks are output to start the data transmission.
- [2] To continue serial transmission, be sure to read 1 from the TDRE flag to confirm that writing is possible, then write data to TDR. When data is written to TDR, the TDRE flag is automatically cleared to 0.

Figure 16.11 Sample Serial Transmission Flowchart (Clock Synchronous Mode)

16.5.4 Serial Data Reception (Clock Synchronous Mode)

Figure 16.12 shows an example of SCI3 operation for reception in clock synchronous mode. In serial reception, the SCI3 operates as described below.

- 1. The SCI3 performs internal initialization synchronous with a synchronization clock input or output, starts receiving data.
- 2. The SCI3 stores the receive data in RSR.
- 3. If an overrun error occurs (when reception of the next data is completed while the RDRF flag in SSR is still set to 1), the OER bit in SSR is set to 1. If the RIE bit in SCR3 is set to 1 at this time, an ERI interrupt request is generated, receive data is not transferred to RDR, and the RDRF flag remains to be set to 1.
- 4. If reception is completed successfully, the RDRF bit in SSR is set to 1, and receive data is transferred to RDR. If the RIE bit in SCR3 is set to 1 at this time, an RXI interrupt request is generated.

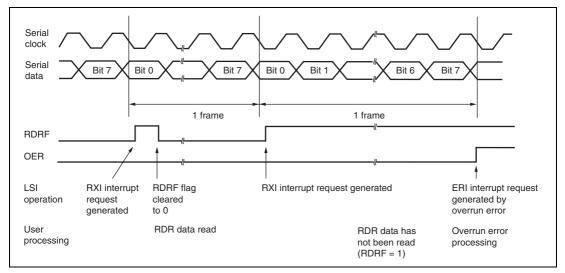

Figure 16.12 Example of SCI3 Reception in Clock Synchronous Mode

Reception cannot be resumed while a receive error flag is set to 1. Accordingly, clear the OER, FER, PER, and RDRF bits to 0 before resuming reception. Figure 16.13 shows a sample flow chart for serial data reception.

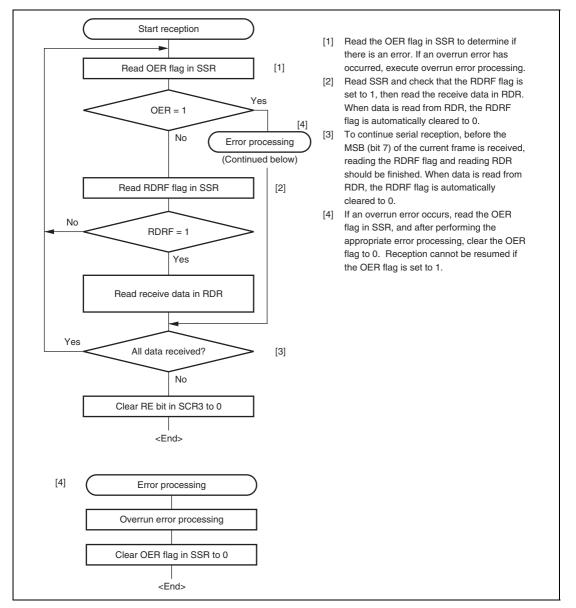

Figure 16.13 Sample Serial Reception Flowchart (Clock Synchronous Mode)

16.5.5 Simultaneous Serial Data Transmission and Reception

Figure 16.14 shows a sample flowchart for simultaneous serial transmit and receive operations. The following procedure should be used for simultaneous serial data transmit and receive operations. To switch from transmit mode to simultaneous transmit and receive mode, after checking that the SCI3 has finished transmission and the TDRE and TEND flags are set to 1, clear TE to 0. Then simultaneously set TE and RE to 1 with a single instruction. To switch from receive mode to simultaneous transmit and receive mode, after checking that the SCI3 has finished reception, clear RE to 0. Then after checking that the RDRF and receive error flags (OER, FER, and PER) are cleared to 0, simultaneously set TE and RE to 1 with a single instruction.

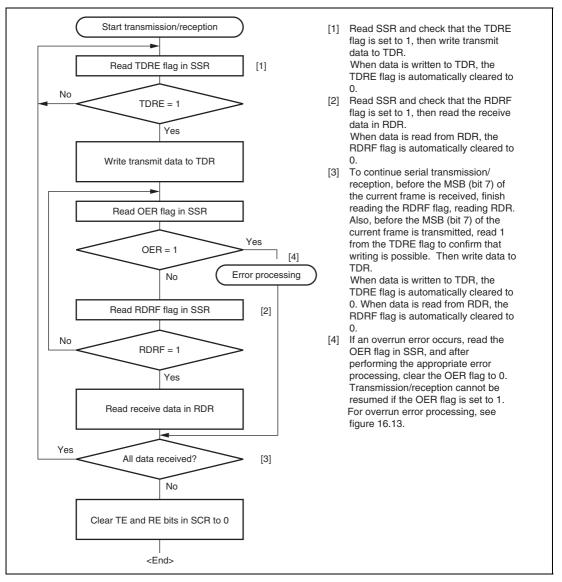

Figure 16.14 Sample Flowchart of Simultaneous Serial Transmit and Receive Operations (Clock Synchronous Mode)

16.6 Multiprocessor Communication Function

Use of the multiprocessor communication function enables data transfer between a number of processors sharing communication lines by asynchronous serial communication using the multiprocessor format, in which a multiprocessor bit is added to the transfer data. When multiprocessor communication is performed, each receiving station is addressed by a unique ID code. The serial communication cycle consists of two component cycles; an ID transmission cycle that specifies the receiving station, and a data transmission cycle. The multiprocessor bit is used to differentiate between the ID transmission cycle and the data transmission cycle. If the multiprocessor bit is 1, the cycle is an ID transmission cycle; if the multiprocessor bit is 0, the cycle is a data transmission cycle. Figure 16.15 shows an example of inter-processor communication using the multiprocessor format. The transmitting station first sends the ID code of the receiving station with which it wants to perform serial communication as data with a 1 multiprocessor bit added. When data with a 1 multiprocessor bit is received, the receiving station compares that data with its own ID. The station whose ID matches then receives the data sent next. Stations whose IDs do not match continue to skip data until data with a 1 multiprocessor bit is again received.

The SCI3 uses the MPIE bit in SCR3 to implement this function. When the MPIE bit is set to 1, transfer of receive data from RSR to RDR, error flag detection, and setting the SSR status flags, RDRF, FER, and OER, to 1, are inhibited until data with a 1 multiprocessor bit is received. On reception of a receive character with a 1 multiprocessor bit, the MPBR bit in SSR is set to 1 and the MPIE bit is automatically cleared, thus normal reception is resumed. If the RIE bit in SCR3 is set to 1 at this time, an RXI interrupt is generated.

When the multiprocessor format is selected, the parity bit setting is rendered invalid. All other bit settings are the same as those in normal asynchronous mode. The clock used for multiprocessor communication is the same as that in normal asynchronous mode.

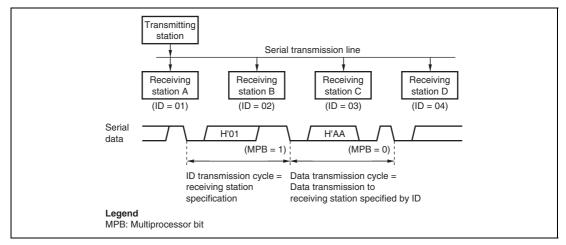

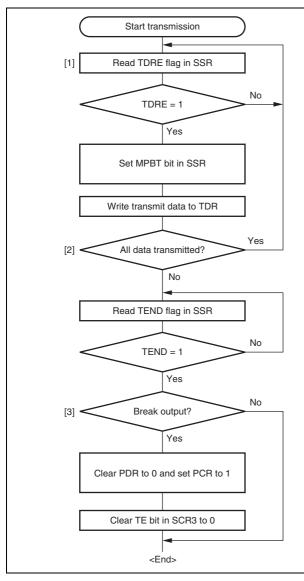

Figure 16.15 Example of Inter-Processor Communication Using Multiprocessor Format (Transmission of Data H'AA to Receiving Station A)

16.6.1 Multiprocessor Serial Data Transmission

Figure 16.16 shows a sample flowchart for multiprocessor serial data transmission. For an ID transmission cycle, set the MPBT bit in SSR to 1 before transmission. For a data transmission cycle, clear the MPBT bit in SSR to 0 before transmission. All other SCI3 operations are the same as those in asynchronous mode.

- [1] Read SSR and check that the TDRE flag is set to 1, set the MPBT bit in SSR to 0 or 1, then write transmit data to TDR. When data is written to TDR, the TDRE flag is automatically cleared to 0.
- [2] To continue serial transmission, be sure to read 1 from the TDRE flag to confirm that writing is possible, then write data to TDR. When data is written to TDR, the TDRE flag is automatically cleared to 0.
- [3] To output a break in serial transmission, set the port PCR to 1, clear PDR to 0, then clear the TE bit in SCR3 to 0.

Figure 16.16 Sample Multiprocessor Serial Transmission Flowchart

16.6.2 Multiprocessor Serial Data Reception

Figure 16.17 shows a sample flowchart for multiprocessor serial data reception. If the MPIE bit in SCR3 is set to 1, data is skipped until data with a 1 multiprocessor bit is sent. On receiving data with a 1 multiprocessor bit, the receive data is transferred to RDR. An RXI interrupt request is generated at this time. All other SCI3 operations are the same as those in asynchronous mode. Figure 16.18 shows an example of SCI3 operation for multiprocessor format reception.

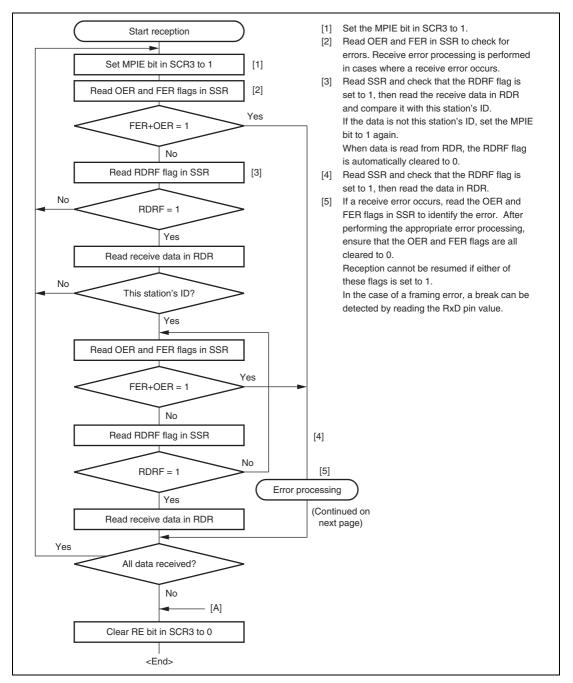

Figure 16.17 Sample Multiprocessor Serial Reception Flowchart (1)

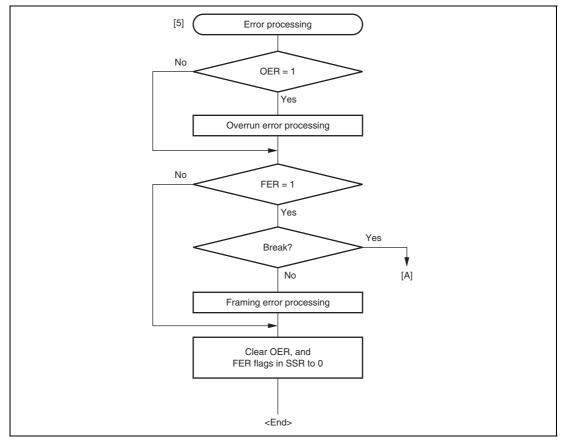

Figure 16.17 Sample Multiprocessor Serial Reception Flowchart (2)

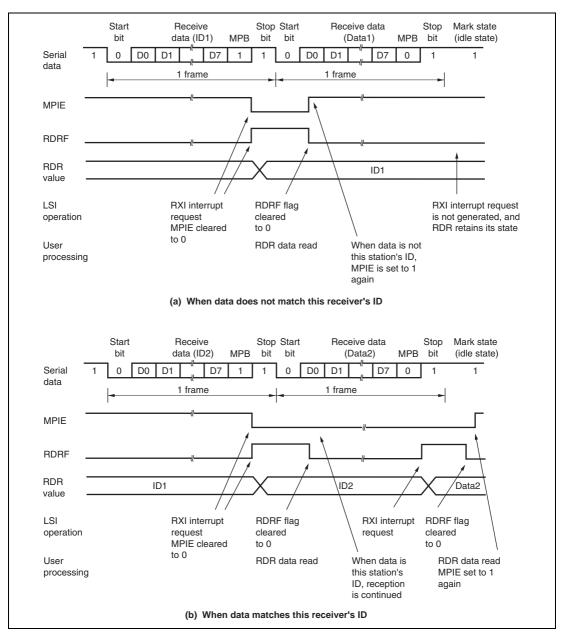

Figure 16.18 Example of SCI3 Reception Using Multiprocessor Format (Example with 8-Bit Data, Multiprocessor Bit, One Stop Bit)

16.7 Interrupts

SCI3 creates the following six interrupt requests: transmission end, transmit data empty, receive data full, and receive errors (overrun error, framing error, and parity error). Table 16.7 shows the interrupt sources.

Table 16.7 SCI3 Interrupt Requests

| Interrupt Requests | Abbreviation | Interrupt Sources |
|---------------------|--------------|----------------------------------|
| Receive Data Full | RXI | Setting RDRF in SSR |
| Transmit Data Empty | TXI | Setting TDRE in SSR |
| Transmission End | TEI | Setting TEND in SSR |
| Receive Error | ERI | Setting OER, FER, and PER in SSR |

The initial value of the TDRE flag in SSR is 1. Thus, when the TIE bit in SCR3 is set to 1 before transferring the transmit data to TDR, a TXI interrupt request is generated even if the transmit data is not ready. The initial value of the TEND flag in SSR is 1. Thus, when the TEIE bit in SCR3 is set to 1 before transferring the transmit data to TDR, a TEI interrupt request is generated even if the transmit data has not been sent. It is possible to make use of the most of these interrupt requests efficiently by transferring the transmit data to TDR in the interrupt routine. To prevent the generation of these interrupt requests (TXI and TEI), set the enable bits (TIE and TEIE) that correspond to these interrupt requests to 1, after transferring the transmit data to TDR.

REJ09B0216-0300

16.8 Usage Notes

16.8.1 Break Detection and Processing

When framing error detection is performed, a break can be detected by reading the RxD pin value directly. In a break, the input from the RxD pin becomes all 0s, setting the FER flag, and possibly the PER flag. Note that as the SCI3 continues the receive operation after receiving a break, even if the FER flag is cleared to 0, it will be set to 1 again.

16.8.2 Mark State and Break Sending

When the TXD or TXD2 bit in PMR1 is 1, the TxD pin is used as an I/O port whose direction (input or output) and level are determined by PCR and PDR. This can be used to set the TxD pin to mark state (high level) or send a break during serial data transmission. To maintain the communication line at mark state until TE is set to 1, set both PCR and PDR to 1, and then set the TXD bit to 1. At this point, the TxD pin becomes an I/O port, and 1 is output from the TxD pin. To send a break during serial transmission, first set PCR to 1 and clear PDR to 0, and then set the TXD bit to 1. At this point, the TxD pin becomes an I/O port regardless of the current transmission state, and 0 is output from the TxD pin.

16.8.3 Receive Error Flags and Transmit Operations (Clock Synchronous Mode Only)

Transmission cannot be started when a receive error flag (OER, PER, or FER) is set to 1, even if the TDRE flag is cleared to 0. Be sure to clear the receive error flags to 0 before starting transmission. Note also that receive error flags cannot be cleared to 0 even if the RE bit is cleared to 0.

16.8.4 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI3 operates on a basic clock with a frequency of 16 times the transfer rate. In reception, the SCI3 samples the falling edge of the start bit using the basic clock, and performs internal synchronization. Receive data is latched internally at the rising edge of the 8th pulse of the basic clock as shown in figure 16.19. Thus, the reception margin in asynchronous mode is given by formula (1) below.

$$M = \left\{ (0.5 - \frac{1}{2N}) - \frac{D - 0.5}{N} - (L - 0.5) F \right\} \times 100(\%)$$

... Formula (1)

[Legend]

N: Ratio of bit rate to clock (N = 16)

D: Clock duty (D = 0.5 to 1.0)

L: Frame length (L = 9 to 12)

F: Absolute value of clock rate deviation

Assuming values of F (absolute value of clock rate deviation) = 0 and D (clock duty) = 0.5 in formula (1), the reception margin can be given by the formula.

$$M = \{0.5 - 1/(2 \times 16)\} \times 100 \ [\%] = 46.875\%$$

However, this is only the computed value, and a margin of 20% to 30% should be allowed for in system design.

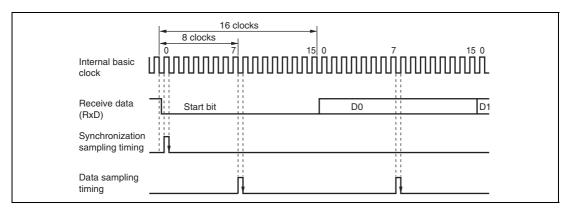

Figure 16.19 Receive Data Sampling Timing in Asynchronous Mode

Section 17 I²C Bus Interface 2 (IIC2)

The I²C bus interface 2 conforms to and provides a subset of the Philips I²C bus (inter-IC bus) interface functions. The register configuration that controls the I²C bus differs partly from the Philips configuration, however.

Figure 17.1 shows a block diagram of the I²C bus interface 2.

Figure 17.2 shows an example of I/O pin connections to external circuits.

17.1 Features

- Selection of I²C format or clock synchronous serial format
- Continuous transmission/reception
 Since the shift register, transmit data register, and receive data register are independent from each other, the continuous transmission/reception can be performed.

I²C bus format

- Start and stop conditions generated automatically in master mode
- Selection of acknowledge output levels when receiving
- Automatic loading of acknowledge bit when transmitting
- Bit synchronization/wait function
 - In master mode, the state of SCL is monitored per bit, and the timing is synchronized automatically.
 - If transmission/reception is not yet possible, set the SCL to low until preparations are completed.
- Six interrupt sources
 - Transmit data empty (including slave-address match), transmit end, receive data full (including slave-address match), arbitration lost, NACK detection, and stop condition detection
- Direct bus drive
 - Two pins, SCL and SDA pins, function as NMOS open-drain outputs when the bus drive function is selected.

Clock synchronous format

• Four interrupt sources

Transmit-data-empty, transmit-end, receive-data-full, and overrun error

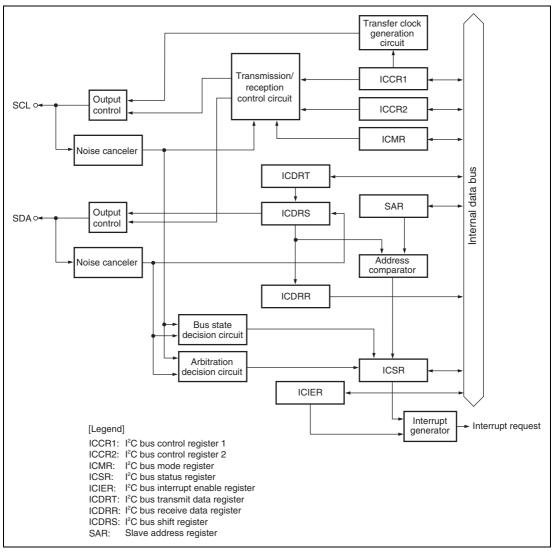

Figure 17.1 Block Diagram of I²C Bus Interface 2

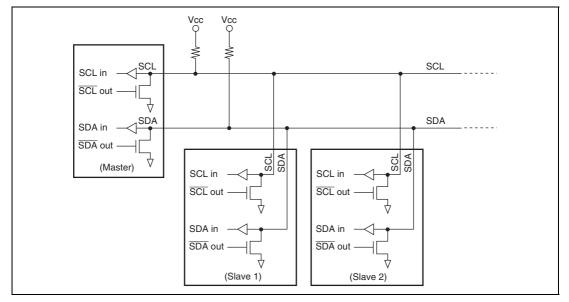

Figure 17.2 External Circuit Connections of I/O Pins

17.2 Input/Output Pins

Table 17.1 summarizes the input/output pins used by the I²C bus interface 2.

Table 17.1 I²C Bus Interface Pins

| Name | Abbreviation | 1/0 | Function |
|--------------|--------------|-----|-------------------------------|
| Serial clock | SCL | I/O | IIC serial clock input/output |
| Serial data | SDA | I/O | IIC serial data input/output |

17.3 Register Descriptions

The I²C bus interface 2 has the following registers:

- I²C bus control register 1 (ICCR1)
- I²C bus control register 2 (ICCR2)
- I²C bus mode register (ICMR)
- I²C bus interrupt enable register (ICIER)
- I²C bus status register (ICSR)
- I²C bus slave address register (SAR)
- I²C bus transmit data register (ICDRT)
- I²C bus receive data register (ICDRR)
- I²C bus shift register (ICDRS)

17.3.1 I²C Bus Control Register 1 (ICCR1)

ICCR1 enables or disables the I²C bus interface 2, controls transmission or reception, and selects master or slave mode, transmission or reception, and transfer clock frequency in master mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 7 | ICE | 0 | R/W | I ² C Bus Interface Enable |
| | | | | 0: This module is halted. (SCL and SDA pins are set to port function.) |
| | | | | 1: This bit is enabled for transfer operations. (SCL and SDA pins are bus drive state.) |
| 6 | RCVD | 0 | R/W | Reception Disable |
| | | | | This bit enables or disables the next operation when TRS is 0 and ICDRR is read. |
| | | | | 0: Enables next reception |
| | | | | 1: Disables next reception |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 5 | MST | 0 | R/W | Master/Slave Select |
| 4 | TRS | 0 | R/W | Transmit/Receive Select |
| | | | | In master mode with the I ² C bus format, when arbitration is lost, MST and TRS are both reset by hardware, causing a transition to slave receive mode. Modification of the TRS bit should be made between transfer frames. |
| | | | | After data receive has been started in slave receive mode, when the first seven bits of the receive data agree with the slave address that is set to SAR and the eighth bit is 1, TRS is automatically set to 1. If an overrun error occurs in master mode with the clock synchronous serial format, MST is cleared to 0 and slave receive mode is entered. |
| | | | | Operating modes are described below according to MST and TRS combination. When clock synchronous serial format is selected and MST is 1, clock is output. |
| | | | | 00: Slave receive mode |
| | | | | 01: Slave transmit mode |
| | | | | 10: Master receive mode |
| | | | | 11: Master transmit mode |
| 3 | CKS3 | 0 | R/W | Transfer Clock Select 3 to 0 |
| 2 | CKS2 | 0 | R/W | These bits should be set according to the necessary |
| 1 | CKS1 | 0 | R/W | transfer rate (see table 17.2) in master mode. In slave |
| 0 | CKS0 | 0 | R/W | mode, these bits are used for reservation of the setup time in transmit mode. The time is 10 $t_{\rm cyc}$ when CKS3 and 20 $t_{\rm cyc}$ when CKS3 = 1. |

Table 17.2 Transfer Rate

| Bit 3 | Bit 2 | Bit 1 | Bit 0 | | | | Transfer Ra | te | |
|-------|-------|-------|-------|-------|-----------|-----------|-------------|------------|------------|
| CKS3 | CKS2 | CKS1 | CKS0 | Clock | φ = 5 MHz | φ = 8 MHz | φ = 10 MHz | φ = 16 MHz | φ = 20 MHz |
| 0 | 0 | 0 | 0 | φ/28 | 179 kHz | 286 kHz | 357 kHz | 571 kHz | 714 kHz |
| | | | 1 | φ/40 | 125 kHz | 200 kHz | 250 kHz | 400 kHz | 500 kHz |
| | | 1 | 0 | φ/48 | 104 kHz | 167 kHz | 208 kHz | 333 kHz | 417 kHz |
| | | | 1 | φ/64 | 78.1 kHz | 125 kHz | 156 kHz | 250 kHz | 313 kHz |
| | 1 | 0 | 0 | φ/80 | 62.5 kHz | 100 kHz | 125 kHz | 200 kHz | 250 kHz |
| | | | 1 | ф/100 | 50.0 kHz | 80.0 kHz | 100 kHz | 160 kHz | 200 kHz |
| | | 1 | 0 | φ/112 | 44.6 kHz | 71.4 kHz | 89.3 kHz | 143 kHz | 179 kHz |
| | | | 1 | ф/128 | 39.1 kHz | 62.5 kHz | 78.1 kHz | 125 kHz | 156 kHz |
| 1 | 0 | 0 | 0 | φ/56 | 89.3 kHz | 143 kHz | 179 kHz | 286 kHz | 357 kHz |
| | | | 1 | φ/80 | 62.5 kHz | 100 kHz | 125 kHz | 200 kHz | 250 kHz |
| | | 1 | 0 | φ/96 | 52.1 kHz | 83.3 kHz | 104 kHz | 167 kHz | 208 kHz |
| | | | 1 | ф/128 | 39.1 kHz | 62.5 kHz | 78.1 kHz | 125 kHz | 156 kHz |
| | 1 | 0 | 0 | ф/160 | 31.3 kHz | 50.0 kHz | 62.5 kHz | 100 kHz | 125 kHz |
| | | | 1 | φ/200 | 25.0 kHz | 40.0 kHz | 50.0 kHz | 80.0 kHz | 100 kHz |
| | | 1 | 0 | φ/224 | 22.3 kHz | 35.7 kHz | 44.6 kHz | 71.4 kHz | 89.3 kHz |
| | | | 1 | φ/256 | 19.5 kHz | 31.3 kHz | 39.1 kHz | 62.5 kHz | 78.1 kHz |

17.3.2 I²C Bus Control Register 2 (ICCR2)

ICCR1 issues start/stop conditions, manipulates the SDA pin, monitors the SCL pin, and controls reset in the control part of the I^2 C bus interface 2.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 7 | BBSY | 0 | R/W | Bus Busy |
| | | | | This bit enables to confirm whether the I ² C bus is occupied or released and to issue start/stop conditions in master mode. With the clock synchronous serial format, this bit has no meaning. With the I ² C bus format, this bit is set to 1 when the SDA level changes from high to low under the condition of SCL = high, assuming that the start condition has been issued. This bit is cleared to 0 when the SDA level changes from low to high under the condition of SCL = high, assuming that the stop condition has been issued. Write 1 to BBSY and 0 to SCP to issue a start condition. Follow this procedure when also retransmitting a start condition. Write 0 in BBSY and 0 in SCP to issue a stop condition. To issue start/stop conditions, use the MOV instruction. |
| 6 | SCP | 1 | W | Start/Stop Issue Condition Disable |
| | | | | The SCP bit controls the issue of start/stop conditions in master mode. |
| | | | | To issue a start condition, write 1 in BBSY and 0 in SCP. A retransmit start condition is issued in the same way. To issue a stop condition, write 0 in BBSY and 0 in SCP. This bit is always read as 1. If 1 is written, the data is not stored. |
| 5 | SDAO | 1 | R/W | SDA Output Value Control |
| | | | | This bit is used with SDAOP when modifying output level of SDA. This bit should not be manipulated during transfer. |
| | | | | 0: When reading, SDA pin outputs low. |
| | | | | When writing, SDA pin is changed to output low. |
| | | | | 1: When reading, SDA pin outputs high. |
| | | | | When writing, SDA pin is changed to output Hi-Z (outputs high by external pull-up resistance). |

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 4 | SDAOP | 1 | R/W | SDAO Write Protect |
| | | | | This bit controls change of output level of the SDA pin by modifying the SDAO bit. To change the output level, clear SDAO and SDAOP to 0 or set SDAO to 1 and clear SDAOP to 0 by the MOV instruction. This bit is always read as 1. |
| 3 | SCLO | 1 | R | This bit monitors SCL output level. When SCLO is 1, SCL pin outputs high. When SCLO is 0, SCL pin outputs low. |
| 2 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1, and cannot be modified. |
| 1 | IICRST | 0 | R/W | IIC Control Part Reset |
| | | | | This bit resets the control part except for I ² C registers. If this bit is set to 1 when hang-up occurs because of communication failure during I ² C operation, I ² C control part can be reset without setting ports and initializing registers. |
| 0 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1, and cannot be modified. |

17.3.3 I²C Bus Mode Register (ICMR)

ICMR selects whether the MSB or LSB is transferred first, performs master mode wait control, and selects the transfer bit count.

| | | Initial | | |
|-----|----------|---------|-----|---|
| Bit | Bit Name | Value | R/W | Description |
| 7 | MLS | 0 | R/W | MSB-First/LSB-First Select |
| | | | | 0: MSB-first |
| | | | | 1: LSB-first |
| | | | | Set this bit to 0 when the I ² C bus format is used. |

| Bit | Bit Name | Initial Value | R/W | Description |
|------|----------|------------------|-----|---|
| 6 | WAIT | 0 | R/W | Wait Insertion Bit |
| | | | | In master mode with the I ² C bus format, this bit selects whether to insert a wait after data transfer except the acknowledge bit. When WAIT is set to 1, after the fall of the clock for the final data bit, low period is extended for two transfer clocks. If WAIT is cleared to 0, data and acknowledge bits are transferred consecutively with no wait inserted. |
| | | | | The setting of this bit is invalid in slave mode with the l ² C bus format or with the clock synchronous serial format. |
| 5, 4 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1, and cannot be modified. |
| 3 | BCWP | 1 | R/W | BC Write Protect |
| | | | | This bit controls the BC2 to BC0 modifications. When modifying BC2 to BC0, this bit should be cleared to 0 and use the MOV instruction. In clock synchronous serial mode, BC should not be modified. |
| | | | | 0: When writing, values of BC2 to BC0 are set. |
| | | | | 1: When reading, 1 is always read. |
| | | | | When writing, settings of BC2 to BC0 are invalid. |

| Bit | Bit Name | Initial Value | R/W | Description | |
|-----|----------|------------------|-----|--|--|
| 2 | BC2 | 0 | R/W | Bit Counter 2 to 0 | |
| _ | | - | | 2.1 0 0 0 10 0 | |
| 1 | BC1 | 0 | R/W | - | e number of bits to be transferred |
| 0 | BC0 | 0 | R/W | next. When read, the remaining number of transfer indicated. With the I ² C bus format, the data is transf with one addition acknowledge bit. Bit BC2 to BC0 settings should be made during an interval betweer transfer frames. If bits BC2 to BC0 are set to a valu other than 000, the setting should be made while th pin is low. The value returns to 000 at the end of a c transfer, including the acknowledge bit. With the closynchronous serial format, these bits should not be modified. | C bus format, the data is transferred knowledge bit. Bit BC2 to BC0 hade during an interval between its BC2 to BC0 are set to a value setting should be made while the SCL returns to 000 at the end of a data e acknowledge bit. With the clock |
| | | | | I ² C Bus Format | Clock Synchronous Serial Format |
| | | | | 000: 9 bits | 000: 8 bits |
| | | | | 001: 2 bits | 001: 1 bits |
| | | | | 010: 3 bits | 010: 2 bits |
| | | | | 011: 4 bits | 011: 3 bits |
| | | | | 100: 5 bits | 100: 4 bits |
| | | | | 101: 6 bits | 101: 5 bits |
| | | | | 110: 7 bits | 110: 6 bits |
| | | | | 111: 8 bits | 111: 7 bits |

17.3.4 I²C Bus Interrupt Enable Register (ICIER)

ICIER enables or disables interrupt sources and acknowledge bits, sets acknowledge bits to be transferred, and confirms acknowledge bits to be received.

| | | Initial | | |
|-----|----------|---------|-----|--|
| Bit | Bit Name | Value | R/W | Description |
| 7 | TIE | 0 | R/W | Transmit Interrupt Enable |
| | | | | When the TDRE bit in ICSR is set to 1, this bit enables or disables the transmit data empty interrupt (TXI). |
| | | | | 0: Transmit data empty interrupt request (TXI) is disabled. |
| | | | | 1: Transmit data empty interrupt request (TXI) is enabled. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 6 | TEIE | 0 | R/W | Transmit End Interrupt Enable |
| | | | | This bit enables or disables the transmit end interrupt (TEI) at the rising of the ninth clock while the TDRE bit in ICSR is 1. TEI can be canceled by clearing the TEND bit or the TEIE bit to 0. |
| | | | | 0: Transmit end interrupt request (TEI) is disabled. |
| | | | | 1: Transmit end interrupt request (TEI) is enabled. |
| 5 | RIE | 0 | R/W | Receive Interrupt Enable |
| | | | | This bit enables or disables the receive data full interrupt request (RXI) and the overrun error interrupt request (ERI) with the clock synchronous format, when a receive data is transferred from ICDRS to ICDRR and the RDRF bit in ICSR is set to 1. RXI can be canceled by clearing the RDRF or RIE bit to 0. |
| | | | | Receive data full interrupt request (RXI) and overrun error interrupt request (ERI) with the clock synchronous format are disabled. |
| | | | | Receive data full interrupt request (RXI) and overrun error interrupt request (ERI) with the clock synchronous format are enabled. |
| 4 | NAKIE | 0 | R/W | NACK Receive Interrupt Enable |
| | | | | This bit enables or disables the NACK receive interrupt request (NAKI) and the overrun error (setting of the OVE bit in ICSR) interrupt request (ERI) with the clock synchronous format, when the NACKF and AL bits in ICSR are set to 1. NAKI can be canceled by clearing the NACKF, OVE, or NAKIE bit to 0. |
| | | | | 0: NACK receive interrupt request (NAKI) is disabled. |
| | | | | 1: NACK receive interrupt request (NAKI) is enabled. |
| 3 | STIE | 0 | R/W | Stop Condition Detection Interrupt Enable |
| | | | | Stop condition detection interrupt request (STPI) is disabled. |
| | | | | Stop condition detection interrupt request (STPI) is enabled. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 2 | ACKE | 0 | R/W | Acknowledge Bit Judgment Select |
| | | | | The value of the receive acknowledge bit is ignored, and continuous transfer is performed. |
| | | | | 1: If the receive acknowledge bit is 1, continuous transfer is halted. |
| 1 | ACKBR | 0 | R | Receive Acknowledge |
| | | | | In transmit mode, this bit stores the acknowledge data that are returned by the receive device. This bit cannot be modified. |
| | | | | 0: Receive acknowledge = 0 |
| | | | | 1: Receive acknowledge = 1 |
| 0 | ACKBT | 0 | R/W | Transmit Acknowledge |
| | | | | In receive mode, this bit specifies the bit to be sent at the acknowledge timing. |
| | | | | 0: 0 is sent at the acknowledge timing. |
| | | | | 1: 1 is sent at the acknowledge timing. |

17.3.5 I²C Bus Status Register (ICSR)

ICSR performs confirmation of interrupt request flags and status.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|--|
| 7 | TDRE | 0 | R/W | Transmit Data Register Empty |
| | | | | [Setting conditions] |
| | | | | When data is transferred from ICDRT to ICDRS and ICDRT becomes empty |
| | | | | When TRS is set |
| | | | | When a start condition (including re-transfer) has been issued |
| | | | | When transmit mode is entered from receive mode in slave mode |
| | | | | [Clearing conditions] |
| | | | | • When 0 is written in TDRE after reading TDRE = 1 |
| | | | | When data is written to ICDRT with an instruction |

| Bit | Bit Name | Initial Value | R/W | Description | |
|-----|----------|------------------|-----|--|--|
| 6 | TEND | 0 | R/W | Transmit End | |
| | | | | [Setting conditions] | |
| | | | | When the ninth clock of SCL rises with the I²C bus format while the TDRE flag is 1 | |
| | | | | When the final bit of transmit frame is sent with the clock synchronous serial format | |
| | | | | [Clearing conditions] | |
| | | | | When 0 is written in TEND after reading TEND = 1 | |
| | | | | When data is written to ICDRT with an instruction | |
| 5 | RDRF | 0 | R/W | Receive Data Register Full | |
| | | | | [Setting condition] | |
| | | | | When a receive data is transferred from ICDRS to ICDRR | |
| | | | | [Clearing conditions] | |
| | | | | • When 0 is written in RDRF after reading RDRF = 1 | |
| | | | | When ICDRR is read with an instruction | |
| 4 | NACKF | 0 | R/W | No Acknowledge Detection Flag | |
| | | | | [Setting condition] | |
| | | | | When no acknowledge is detected from the receive device in transmission while the ACKE bit in ICIER is | |
| | | | | [Clearing condition] | |
| | | | | • When 0 is written in NACKF after reading NACKF = 1 | |

| Bit | Bit Name | Initial Value | R/W | Description | | |
|-----|----------|------------------|-----|--|--|--|
| 3 | STOP | 0 | R/W | Stop Condition Detection Flag | | |
| | | | | [Setting conditions] | | |
| | | | | In master mode, when a stop condition is detected after frame transfer | | |
| | | | | • In slave mode, when a stop condition is detected after the following events: | | |
| | | | | A general call is invoked | | |
| | | | | A start condition is detected | | |
| | | | | The first byte in the slave address matches the address set in the SAR | | |
| | | | | [Clearing condition] | | |
| | | | | • When 0 is written in STOP after reading STOP = 1 | | |
| 2 | AL/OVE | 0 | R/W | Arbitration Lost Flag/Overrun Error Flag | | |
| | | | | This flag indicates that arbitration was lost in master mode with the I ² C bus format and that the final bit has been received while RDRF = 1 with the clock synchronous format. | | |
| | | | | When two or more master devices attempt to seize the bus at nearly the same time, if the I ² C bus interface detects data differing from the data it sent, it sets AL to 1 to indicate that the bus has been taken by another master. | | |
| | | | | [Setting conditions] | | |
| | | | | If the internal SDA and SDA pin disagree at the rise of SCL in master transmit mode | | |
| | | | | When the SDA pin outputs high in master mode while a start condition is detected | | |
| | | | | When the final bit is received with the clock synchronous format while RDRF = 1 | | |
| | | | | [Clearing condition] | | |
| | | | | • When 0 is written in AL/OVE after reading AL/OVE=1 | | |

| | | Initial | | | | |
|-----|----------|---------|-----|---|--|--|
| Bit | Bit Name | Value | R/W | Description | | |
| 1 | AAS | 0 | R/W | Slave Address Recognition Flag | | |
| | | | | In slave receive mode, this flag is set to 1 if the first frame following a start condition matches bits SVA6 to SVA0 in SAR. | | |
| | | | | [Setting conditions] | | |
| | | | | When the slave address is detected in slave receive mode | | |
| | | | | When the general call address is detected in slave receive mode. | | |
| | | | | [Clearing condition] | | |
| | | | | When 0 is written in AAS after reading AAS=1 | | |
| 0 | ADZ | 0 | R/W | General Call Address Recognition Flag | | |
| | | | | This bit is valid in I ² C bus format slave receive mode. | | |
| | | | | [Setting condition] | | |
| | | | | When the general call address is detected in slave | | |
| | | | | receive mode | | |
| | | | | [Clearing condition] | | |
| | | | | When 0 is written in ADZ after reading ADZ=1 | | |

17.3.6 Slave Address Register (SAR)

SAR selects the communication format and sets the slave address. When the chip is in slave mode with the I²C bus format, if the upper 7 bits of SAR match the upper 7 bits of the first frame received after a start condition, the chip operates as the slave device.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|-----------------|------------------|-----|--|
| 7 to 1 | SVA6 to SVA0 | All 0 | R/W | Slave Address 6 to 0 |
| | | | | These bits set a unique address in bits SVA6 to SVA0, differing form the addresses of other slave devices connected to the I ² C bus. |
| 0 | FS | 0 | R/W | Format Select |
| | | | | 0: I ² C bus format is selected. |
| | | | | 1: Clock synchronous serial format is selected. |

17.3.7 I²C Bus Transmit Data Register (ICDRT)

ICDRT is an 8-bit readable/writable register that stores the transmit data. When ICDRT detects the space in the shift register (ICDRS), it transfers the transmit data which is written in ICDRT to ICDRS and starts transferring data. If the next transfer data is written to ICDRT during transferring data of ICDRS, continuous transfer is possible. If the MLS bit of ICMR is set to 1 and when the data is written to ICDRT, the MSB/LSB inverted data is read. The initial value of ICDRT is H'FF.

17.3.8 I²C Bus Receive Data Register (ICDRR)

ICDRR is an 8-bit register that stores the receive data. When data of one byte is received, ICDRR transfers the receive data from ICDRS to ICDRR and the next data can be received. ICDRR is a receive-only register, therefore the CPU cannot write to this register. The initial value of ICDRR is H'FF.

17.3.9 I²C Bus Shift Register (ICDRS)

ICDRS is a register that is used to transfer/receive data. In transmission, data is transferred from ICDRT to ICDRS and the data is sent from the SDA pin. In reception, data is transferred from ICDRS to ICDRR after data of one byte is received. This register cannot be read directly from the CPU.

17.4 Operation

The I²C bus interface can communicate either in I²C bus mode or clock synchronous serial mode by setting FS in SAR.

17.4.1 I²C Bus Format

Figure 17.3 shows the I²C bus formats. Figure 17.4 shows the I²C bus timing. The first frame following a start condition always consists of 8 bits.

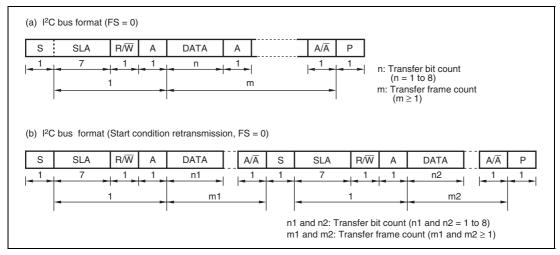

Figure 17.3 I²C Bus Formats

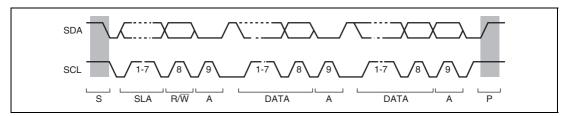

Figure 17.4 I²C Bus Timing

[Legend]

A:

S: Start condition. The master device drives SDA from high to low while SCL is high.

SLA: Slave address

R/W: Indicates the direction of data transfer: from the slave device to the master device when R/\overline{W} is 1, or from the master device to the slave device when R/\overline{W} is 0.

Acknowledge. The receive device drives SDA to low.

DATA: Transfer data

P: Stop condition. The master device drives SDA from low to high while SCL is high.

17.4.2 **Master Transmit Operation**

In master transmit mode, the master device outputs the transmit clock and transmit data, and the slave device returns an acknowledge signal. For master transmit mode operation timing, refer to figures 17.5 and 17.6. The transmission procedure and operations in master transmit mode are described below.

- Set the ICE bit in ICCR1 to 1. Set the MLS and WAIT bits in ICMR and the CKS3 to CKS0. bits in ICCR1 to 1. (Initial setting)
- 2. Read the BBSY flag in ICCR2 to confirm that the bus is free. Set the MST and TRS bits in ICCR1 to select master transmit mode. Then, write 1 to BBSY and 0 to SCP using MOV instruction. (Start condition issued) This generates the start condition.
- 3. After confirming that TDRE in ICSR has been set, write the transmit data (the first byte data show the slave address and R/W) to ICDRT. At this time, TDRE is automatically cleared to 0, and data is transferred from ICDRT to ICDRS. TDRE is set again.
- 4. When transmission of one byte data is completed while TDRE is 1, TEND in ICSR is set to 1 at the rise of the 9th transmit clock pulse. Read the ACKBR bit in ICIER, and confirm that the slave device has been selected. Then, write second byte data to ICDRT. When ACKBR is 1, the slave device has not been acknowledged, so issue the stop condition. To issue the stop condition, write 0 to BBSY and SCP using MOV instruction. SCL is fixed low until the transmit data is prepared or the stop condition is issued.
- 5. The transmit data after the second byte is written to ICDRT every time TDRE is set.
- 6. Write the number of bytes to be transmitted to ICDRT. Wait until TEND is set (the end of last byte data transmission) while TDRE is 1, or wait for NACK (NACKF in ICSR = 1) from the receive device while ACKE in ICIER is 1. Then, issue the stop condition to clear TEND or NACKF.
- 7. When the STOP bit in ICSR is set to 1, the operation returns to the slave receive mode.

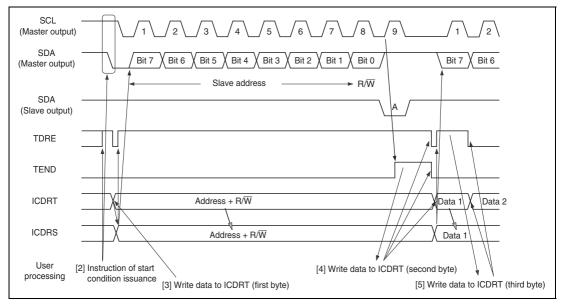

Figure 17.5 Master Transmit Mode Operation Timing (1)

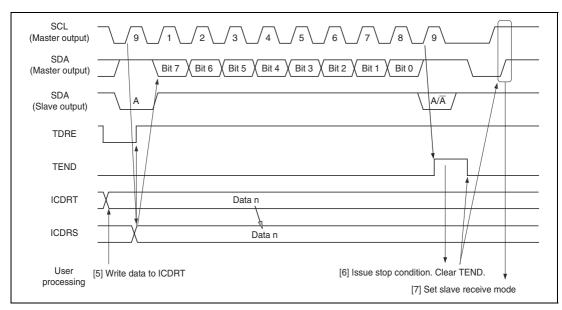

Figure 17.6 Master Transmit Mode Operation Timing (2)

17.4.3 Master Receive Operation

In master receive mode, the master device outputs the receive clock, receives data from the slave device, and returns an acknowledge signal. For master receive mode operation timing, refer to figures 17.7 and 17.8. The reception procedure and operations in master receive mode are shown below.

- 1. Clear the TEND bit in ICSR to 0, then clear the TRS bit in ICCR1 to 0 to switch from master transmit mode to master receive mode. Then, clear the TDRE bit to 0.
- 2. When ICDRR is read (dummy data read), reception is started, and the receive clock is output, and data received, in synchronization with the internal clock. The master device outputs the level specified by ACKBT in ICIER to SDA, at the 9th receive clock pulse.
- 3. After the reception of first frame data is completed, the RDRF bit in ICST is set to 1 at the rise of 9th receive clock pulse. At this time, the receive data is read by reading ICDRR, and RDRF is cleared to 0.
- 4. The continuous reception is performed by reading ICDRR every time RDRF is set. If 8th receive clock pulse falls after reading ICDRR by the other processing while RDRF is 1, SCL is fixed low until ICDRR is read.
- 5. If next frame is the last receive data, set the RCVD bit in ICCR1 to 1 before reading ICDRR. This enables the issuance of the stop condition after the next reception.
- 6. When the RDRF bit is set to 1 at rise of the 9th receive clock pulse, issue the stage condition.
- 7. When the STOP bit in ICSR is set to 1, read ICDRR. Then clear the RCVD bit to 0.
- 8. The operation returns to the slave receive mode.

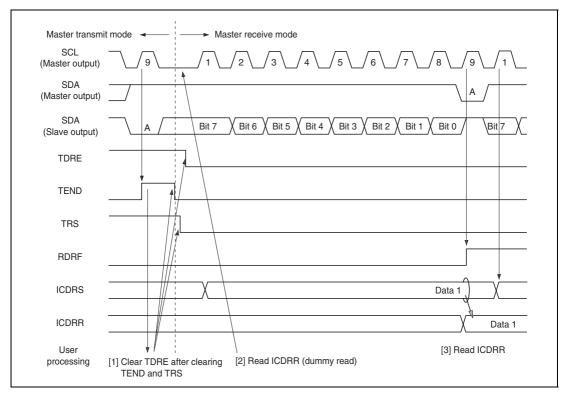

Figure 17.7 Master Receive Mode Operation Timing (1)

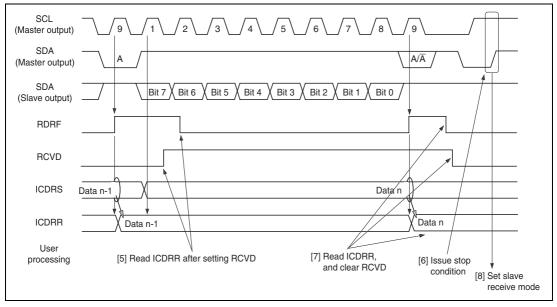

Figure 17.8 Master Receive Mode Operation Timing (2)

17.4.4 Slave Transmit Operation

In slave transmit mode, the slave device outputs the transmit data, while the master device outputs the receive clock and returns an acknowledge signal. For slave transmit mode operation timing, refer to figures 17.9 and 17.10.

The transmission procedure and operations in slave transmit mode are described below.

- Set the ICE bit in ICCR1 to 1. Set the MLS and WAIT bits in ICMR and the CKS3 to CKS0 bits in ICCR1 to 1. (Initial setting) Set the MST and TRS bits in ICCR1 to select slave receive mode, and wait until the slave address matches.
- 2. When the slave address matches in the first frame following detection of the start condition, the slave device outputs the level specified by ACKBT in ICIER to SDA, at the rise of the 9th clock pulse. At this time, if the 8th bit data (R/W) is 1, the TRS and ICSR bits in ICCR1 are set to 1, and the mode changes to slave transmit mode automatically. The continuous transmission is performed by writing transmit data to ICDRT every time TDRE is set.
- 3. If TDRE is set after writing last transmit data to ICDRT, wait until TEND in ICSR is set to 1, with TDRE = 1. When TEND is set, clear TEND.
- 4. Clear TRS for the end processing, and read ICDRR (dummy read). SCL is free.
- 5. Clear TDRE.

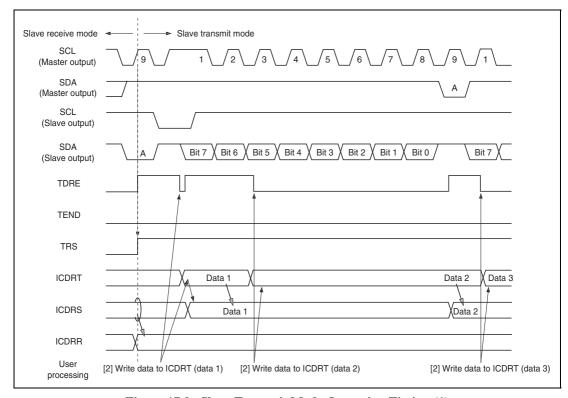

Figure 17.9 Slave Transmit Mode Operation Timing (1)

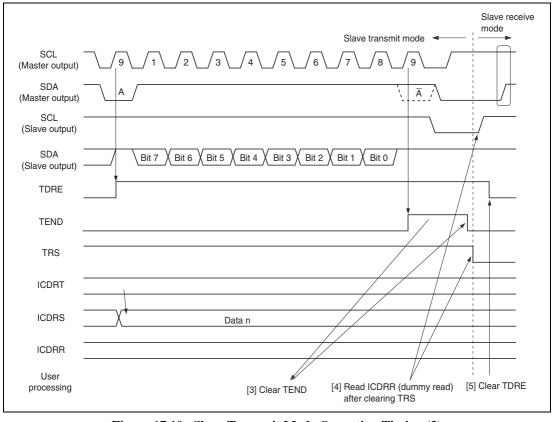

Figure 17.10 Slave Transmit Mode Operation Timing (2)

17.4.5 Slave Receive Operation

In slave receive mode, the master device outputs the transmit clock and transmit data, and the slave device returns an acknowledge signal. For slave receive mode operation timing, refer to figures 17.11 and 17.12. The reception procedure and operations in slave receive mode are described below.

- Set the ICE bit in ICCR1 to 1. Set the MLS and WAIT bits in ICMR and the CKS3 to CKS0 bits in ICCR1 to 1. (Initial setting) Set the MST and TRS bits in ICCR1 to select slave receive mode, and wait until the slave address matches.
- 2. When the slave address matches in the first frame following detection of the start condition, the slave device outputs the level specified by ACKBT in ICIER to SDA, at the rise of the 9th clock pulse. At the same time, RDRF in ICSR is set to read ICDRR (dummy read). (Since the read data show the slave address and R/W, it is not used.)

- 3. Read ICDRR every time RDRF is set. If 8th receive clock pulse falls while RDRF is 1, SCL is fixed low until ICDRR is read. The change of the acknowledge before reading ICDRR, to be returned to the master device, is reflected to the next transmit frame.
- 4. The last byte data is read by reading ICDRR.

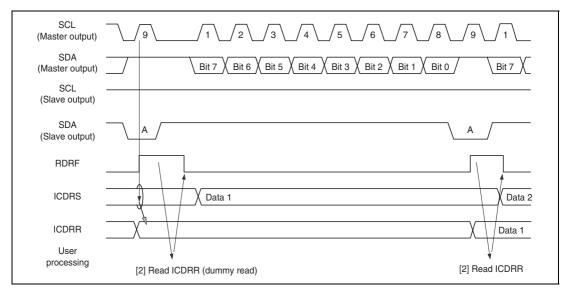

Figure 17.11 Slave Receive Mode Operation Timing (1)

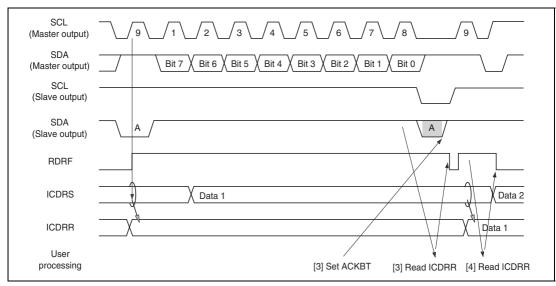

Figure 17.12 Slave Receive Mode Operation Timing (2)

17.4.6 Clock Synchronous Serial Format

This module can be operated with the clock synchronous serial format, by setting the FS bit in SAR to 1. When the MST bit in ICCR1 is 1, the transfer clock output from SCL is selected. When MST is 0, the external clock input is selected.

Data Transfer Format

Figure 17.13 shows the clock synchronous serial transfer format.

The transfer data is output from the rise to the fall of the SCL clock, and the data at the rising edge of the SCL clock is guaranteed. The MLS bit in ICMR sets the order of data transfer, in either the MSB first or LSB first. The output level of SDA can be changed during the transfer wait, by the SDAO bit in ICCR2.

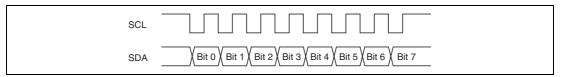

Figure 17.13 Clock Synchronous Serial Transfer Format

Transmit Operation

In transmit mode, transmit data is output from SDA, in synchronization with the fall of the transfer clock. The transfer clock is output when MST in ICCR1 is 1, and is input when MST is 0. For transmit mode operation timing, refer to figure 17.14. The transmission procedure and operations in transmit mode are described below.

- 1. Set the ICE bit in ICCR1 to 1. Set the MST and CKS3 to CKS0 bits in ICCR1 to 1. (Initial setting)
- 2. Set the TRS bit in ICCR1 to select the transmit mode. Then, TDRE in ICSR is set.
- 3. Confirm that TDRE has been set. Then, write the transmit data to ICDRT. The data is transferred from ICDRT to ICDRS, and TDRE is set automatically. The continuous transmission is performed by writing data to ICDRT every time TDRE is set. When changing from transmit mode to receive mode, clear TRS while TDRE is 1.

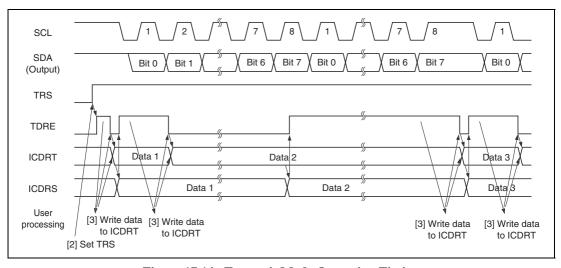

Figure 17.14 Transmit Mode Operation Timing

Receive Operation

In receive mode, data is latched at the rise of the transfer clock. The transfer clock is output when MST in ICCR1 is 1, and is input when MST is 0. For receive mode operation timing, refer to figure 17.15. The reception procedure and operations in receive mode are described below.

- 1. Set the ICE bit in ICCR1 to 1. Set the MST and CKS3 to CKS0 bits in ICCR1 to 1. (Initial setting)
- 2. When the transfer clock is output, set MST to 1 to start outputting the receive clock.
- 3. When the receive operation is completed, data is transferred from ICDRS to ICDRR and RDRF in ICSR is set. When MST = 1, the next byte can be received, so the clock is continually output. The continuous reception is performed by reading ICDRR every time RDRF is set. When the 8th clock is risen while RDRF is 1, the overrun is detected and AL/OVE in ICSR is set. At this time, the previous reception data is retained in ICDRR.
- 4. To stop receiving when MST = 1, set RCVD in ICCR1 to 1, then read ICDRR. Then, SCL is fixed high after receiving the next byte data.

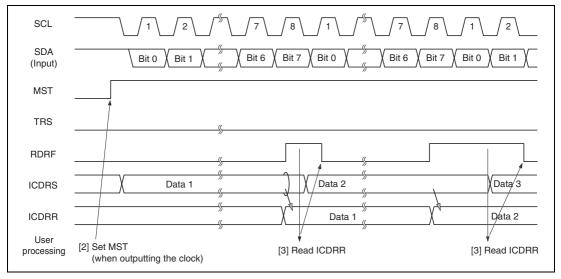

Figure 17.15 Receive Mode Operation Timing

17.4.7 Noise Filter

The signal levels on the SCL and SDA pins are internally latched via the noise filter. Figure 17.16 shows a block diagram of the noise filter circuit.

The noise filter consists of two cascaded latches and a match detector. The SCL (or SDA) input signal is sampled on the system clock. When both outputs of the latches match, its level is output to other blocks by the match detector. If they do not match, the previous value is held.

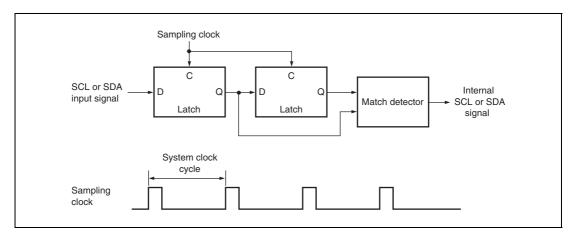

Figure 17.16 Block Diagram of Noise Filter

17.4.8 Example of Use

Flowcharts in respective modes that use the I²C bus interface are shown in figures 17.17 to 17.20.

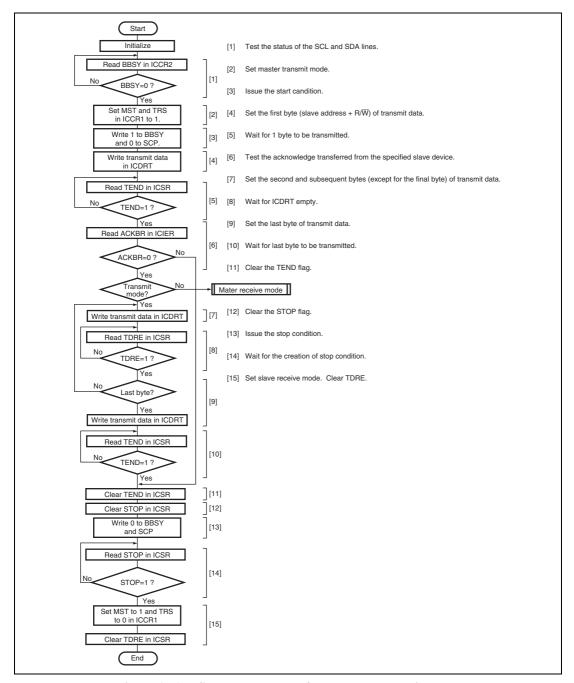

Figure 17.17 Sample Flowchart for Master Transmit Mode

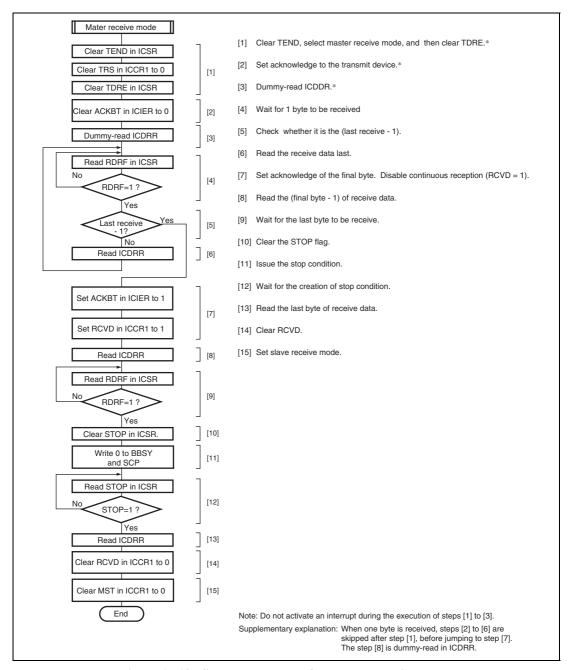

Figure 17.18 Sample Flowchart for Master Receive Mode

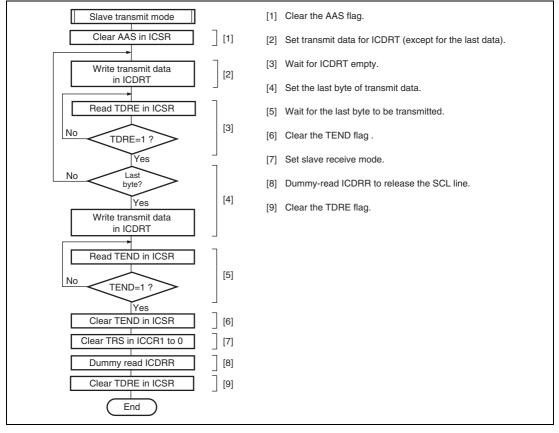

Figure 17.19 Sample Flowchart for Slave Transmit Mode

REJ09B0216-0300

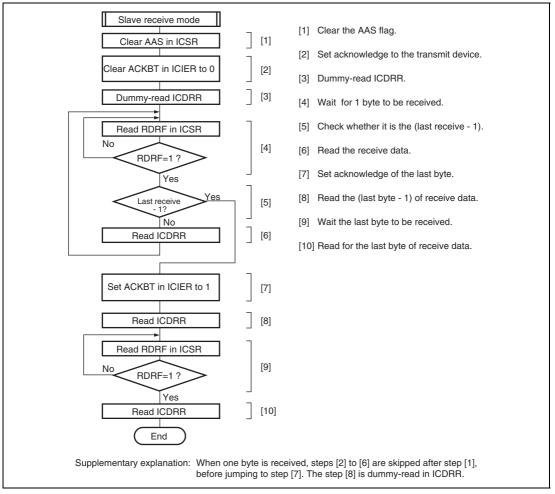

Figure 17.20 Sample Flowchart for Slave Receive Mode

17.5 Interrupt Request

There are six interrupt requests in this module; transmit data empty, transmit end, receive data full, NACK receive, STOP recognition, and arbitration lost/overrun error. Table 17.3 shows the contents of each interrupt request.

Table 17.3 Interrupt Requests

| Interrupt Request | Abbreviation | Interrupt Condition | I ² C Mode | Clock Synchronous Mode |
|-----------------------------------|--------------|---------------------|-----------------------|---------------------------|
| Transmit Data Empty | TXI | (TDRE=1) • (TIE=1) | 0 | 0 |
| Transmit End | TEI | (TEND=1) ⋅ (TEIE=1) | 0 | 0 |
| Receive Data Full | RXI | (RDRF=1) • (RIE=1) | 0 | 0 |
| STOP Recognition | STPI | (STOP=1) • (STIE=1) | 0 | × |
| NACK Receive | NAKI | ((| 0 | X |
| Arbitration Lost/Overrun Error | _ | (NAKIE=1) | 0 | 0 |

When interrupt conditions described in table 17.3 are 1 and the I bit in CCR is 0, the CPU executes an interrupt exception processing. Interrupt sources should be cleared in the exception processing. TDRE and TEND are automatically cleared to 0 by writing the transmit data to ICDRT. RDRF are automatically cleared to 0 by reading ICDRR. TDRE is set to 1 again at the same time when transmit data is written to ICDRT. When TDRE is cleared to 0, then an excessive data of one byte may be transmitted.

17.6 Bit Synchronous Circuit

In master mode, this module has a possibility that high level period may be short in the two states described below.

- When SCL is driven to low by the slave device
- When the rising speed of SCL is lowered by the load of the SCL line (load capacitance or pull-up resistance)

Therefore, it monitors SCL and communicates by bit with synchronization.

Figure 17.21 shows the timing of the bit synchronous circuit and table 17.4 shows the time when SCL output changes from low to Hi-Z then SCL is monitored.

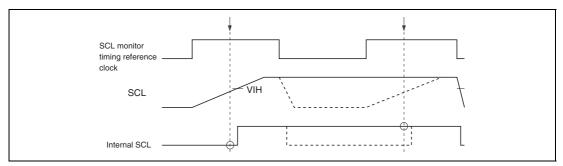

Figure 17.21 The Timing of the Bit Synchronous Circuit

Table 17.4 Time for Monitoring SCL

| CKS3 | CKS2 | Time for Monitoring SCL |
|------|------|-------------------------|
| 0 | 0 | 7.5 tcyc |
| | 1 | 19.5 tcyc |
| 1 | 0 | 17.5 tcyc |
| | 1 | 41.5 tcyc |

17.7 Usage Notes

17.7.1 Issue (Retransmission) of Start/Stop Conditions

In master mode, when the start/stop conditions are issued (retransmitted) at the specific timing under the following condition 1 or 2, such conditions may not be output successfully. To avoid this, issue (retransmit) the start/stop conditions after the fall of the ninth clock is confirmed. Check the SCLO bit in the I²C control register 2 (IICR2) to confirm the fall of the ninth clock.

- 1. When the rising of SCL falls behind the time specified in section 17.6, Bit Synchronous Circuit, by the load of the SCL bus (load capacitance or pull-up resistance)
- 2. When the bit synchronous circuit is activated by extending the low period of eighth and ninth clocks, that is driven by the slave device

17.7.2 WAIT Setting in I²C Bus Mode Register (ICMR)

If the WAIT bit is set to 1, and the SCL signal is driven low for two or more transfer clocks by the slave device at the eighth and ninth clocks, the high period of ninth clock may be shortened. To avoid this, set the WAIT bit in ICMR to 0.

17.7.3 Restriction in Use of Multi-Master

(1) Restriction on Setting Transfer Rate

In multi-master usage when I^2C transfer rate setting of this LSI is lower than those of the other masters, unexpected length of SCL may occasionally be output. To avoid this, the specified value must be greater than or equal to the value produced by multiplying the fastest transfer rate among the other masters by 1/1.8. For example, when the transfer rate of the fastest bus master among the other bus masters is 400 kbps, the transfer rate of the I^2C of this LSI must be set to at least 223 kbps (= 400/1.8).

(2) Restriction on Use of Bit Manipulation Instructions to Set MST and TRS

When master transmission is selected by consecutively manipulating the MST and TRS bits in multi-master usage, an arbitration loss during execution of the bit-manipulation instruction for TRS leads to the contradictory situation where AL in ICSR is 1 in master transmit mode (MST = 1, TRS = 1).

Ways to avoid this effect are listed below.

- Use the MOV instruction to set MST and TRS in multi-master usage.
- When arbitration is lost, confirm that MST = 0 and TRS = 0. If the setting of MST = 0 and TRS = 0 is not confirmed, set MST = 0 and TRS = 0 again.

17.7.4 Continuous Data Reception in Master Receive Mode

In master receive mode, when SCL is fixed low on the falling edge of the 8th clock while the RDRF bit is set to 1 and ICDRR is read around the falling edge of the 8th clock, the clock is only fixed low in the 8th clock of the next round of data reception. The SCL is then released from its fixed state without reading ICDRR and the 9th clock is output. As a result, some receive data is lost.

Ways to avoid this phenomenon are listed below.

- Read ICDRR in master receive mode before the rising edge of the 8th clock.
- Set RCVD to 1 in master receive mode and perform communication in units of one byte.

Section 18 A/D Converter

This LSI includes a successive approximation type 10-bit A/D converter that allows up to eight analog input channels to be selected. The block diagram of the A/D converter is shown in figure 18.1.

18.1 **Features**

- 10-bit resolution
- Eight input channels
- Conversion time: at least 3.5 µs per channel (at 20-MHz operation)
- Two operating modes
 - Single mode: Single-channel A/D conversion
 - Scan mode: Continuous A/D conversion on 1 to 4 channels
- Four data registers
 - Conversion results are held in a data register for each channel
- Sample-and-hold function
- Two conversion start methods
 - Software
 - External trigger signal
- Interrupt request
 - An A/D conversion end interrupt request (ADI) can be generated

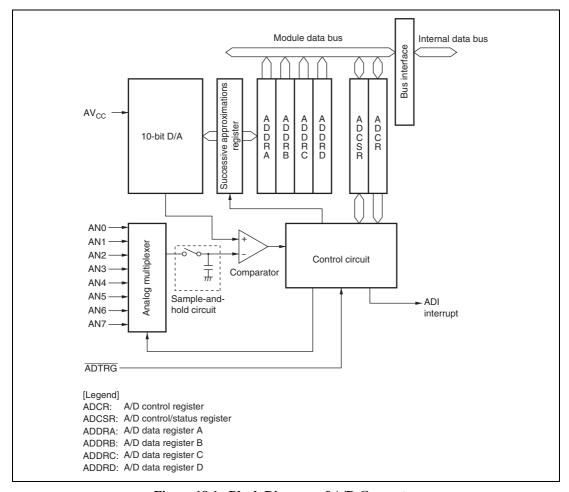

Figure 18.1 Block Diagram of A/D Converter

18.2 Input/Output Pins

Table 18.1 summarizes the input pins used by the A/D converter. The 8 analog input pins are divided into two groups; analog input pins 0 to 3 (AN0 to AN3) comprising group 0, analog input pins 4 to 7 (AN4 to AN7) comprising group 1. The AVcc pin is the power supply pin for the analog block in the A/D converter.

Table 18.1 Pin Configuration

| Pin Name | Abbreviation | I/O | Function |
|--------------------------------|------------------|-------|--|
| Analog power supply pin | AV _{cc} | Input | Analog block power supply |
| Analog input pin 0 | AN0 | Input | Group 0 analog input |
| Analog input pin 1 | AN1 | Input | |
| Analog input pin 2 | AN2 | Input | <u> </u> |
| Analog input pin 3 | AN3 | Input | <u> </u> |
| Analog input pin 4 | AN4 | Input | Group 1 analog input |
| Analog input pin 5 | AN5 | Input | <u> </u> |
| Analog input pin 6 | AN6 | Input | |
| Analog input pin 7 | AN7 | Input | <u> </u> |
| A/D external trigger input pin | ADTRG | Input | External trigger input for starting A/D conversion |

18.3 Register Descriptions

The A/D converter has the following registers.

- A/D data register A (ADDRA)
- A/D data register B (ADDRB)
- A/D data register C (ADDRC)
- A/D data register D (ADDRD)
- A/D control/status register (ADCSR)
- A/D control register (ADCR)

18.3.1 A/D Data Registers A to D (ADDRA to ADDRD)

There are four 16-bit read-only ADDR registers; ADDRA to ADDRD, used to store the results of A/D conversion. The ADDR registers, which store a conversion result for each analog input channel, are shown in table 18.2.

The converted 10-bit data is stored in bits 15 to 6. The lower 6 bits are always read as 0.

The data bus width between the CPU and the A/D converter is 8 bits. The upper byte can be read directly from the CPU, however the lower byte should be read via a temporary register. The temporary register contents are transferred from the ADDR when the upper byte data is read. When reading ADDR, read the upper byte first then the lower one, or read in word units. The ADDR is initialized to H'0000.

Table 18.2 Analog Input Channels and Corresponding ADDR Registers

Analog Input Channel

| Group 0 | Group 1 | A/D Data Register to Be Stored Results of A/D Conversion |
|---------|---------|--|
| AN0 | AN4 | ADDRA |
| AN1 | AN5 | ADDRB |
| AN2 | AN6 | ADDRC |
| AN3 | AN7 | ADDRD |

18.3.2 A/D Control/Status Register (ADCSR)

ADCSR consists of the control bits and conversion end status bits of the A/D converter.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 7 | ADF | 0 | R/W | A/D End Flag |
| | | | | [Setting conditions] |
| | | | | When A/D conversion ends in single mode |
| | | | | When A/D conversion ends once on all the channels selected in scan mode |
| | | | | [Clearing condition] |
| | | | | When 0 is written after reading ADF = 1 |
| 6 | ADIE | 0 | R/W | A/D Interrupt Enable |
| | | | | A/D conversion end interrupt request (ADI) is enabled by ADF when this bit is set to 1 |
| 5 | ADST | 0 | R/W | A/D Start |
| | | | | Setting this bit to 1 starts A/D conversion. In single mode, this bit is cleared to 0 automatically when conversion on the specified channel is complete. In scan mode, conversion continues sequentially on the specified channels until this bit is cleared to 0 by software, a reset, or a transition to standby mode. |
| 4 | SCAN | 0 | R/W | Scan Mode |
| | | | | Selects single mode or scan mode as the A/D conversion operating mode. |
| | | | | 0: Single mode |
| | | | | 1: Scan mode |
| 3 | CKS | 0 | R/W | Clock Select |
| | | | | Selects the A/D conversions time. |
| | | | | 0: Conversion time = 134 states (max.) |
| | | | | 1: Conversion time = 70 states (max.) |
| | | | | Clear the ADST bit to 0 before switching the conversion time. |

| Bit | Bit Name | Initial Value | R/W | Description | |
|-----|----------|------------------|-----|---------------------------|------------------|
| 2 | CH2 | 0 | R/W | Channel Select 2 to 0 | |
| 1 | CH1 | 0 | R/W | Select analog input chann | nels. |
| 0 | CH0 | 0 | R/W | When SCAN = 0 | When SCAN = 1 |
| | | | | 000: AN0 | 000: AN0 |
| | | | | 001: AN1 | 001: AN0 and AN1 |
| | | | | 010: AN2 | 010: AN0 to AN2 |
| | | | | 011: AN3 | 011: AN0 to AN3 |
| | | | | 100: AN4 | 100: AN4 |
| | | | | 101: AN5 | 101: AN4 and AN5 |
| | | | | 110: AN6 | 110: AN4 to AN6 |
| | | | | 111: AN7 | 111: AN4 to AN7 |

18.3.3 A/D Control Register (ADCR)

ADCR enables A/D conversion started by an external trigger signal.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|--|
| 7 | TRGE | 0 | R/W | Trigger Enable |
| | | | | A/D conversion is started at the falling edge and the rising edge of the external trigger signal (\overline{ADTRG}) when this bit is set to 1. |
| | | | | The selection between the falling edge and rising edge of the external trigger pin (ADTRG) conforms to the WPEG5 bit in the interrupt edge select register 2 (IEGR2) |
| 6 to 1 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1. |
| 0 | _ | 0 | R/W | Reserved |
| | | | | Do not set this bit to 1, though the bit is readable/writable. |

18.4 Operation

The A/D converter operates by successive approximation with 10-bit resolution. It has two operating modes; single mode and scan mode. When changing the operating mode or analog input channel, in order to prevent incorrect operation, first clear the bit ADST in ADCSR to 0. The ADST bit can be set at the same time as the operating mode or analog input channel is changed.

18.4.1 Single Mode

In single mode, A/D conversion is performed once for the analog input of the specified single channel as follows:

- 1. A/D conversion is started when the ADST bit in ADCSR is set to 1, according to software or external trigger input.
- 2. When A/D conversion is completed, the result is transferred to the corresponding A/D data register of the channel.
- 3. On completion of conversion, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
- 4. The ADST bit remains set to 1 during A/D conversion. When A/D conversion ends, the ADST bit is automatically cleared to 0 and the A/D converter enters the wait state.

18.4.2 Scan Mode

In scan mode, A/D conversion is performed sequentially for the analog input of the specified channels (four channels maximum) as follows:

- 1. When the ADST bit in ADCSR is set to 1 by software or external trigger input, A/D conversion starts on the first channel in the group (AN0 when CH2 = 0, AN4 when CH2 = 1).
- 2. When A/D conversion for each channel is completed, the result is sequentially transferred to the A/D data register corresponding to each channel.
- 3. When conversion of all the selected channels is completed, the ADF flag in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt requested is generated. A/D conversion starts again on the first channel in the group.
- 4. The ADST bit is not automatically cleared to 0. Steps [2] and [3] are repeated as long as the ADST bit remains set to 1. When the ADST bit is cleared to 0, A/D conversion stops.

18.4.3 Input Sampling and A/D Conversion Time

The A/D converter has a built-in sample-and-hold circuit. The A/D converter samples the analog input when the A/D conversion start delay time (t_D) has passed after the ADST bit is set to 1, then starts conversion. Figure 18.2 shows the A/D conversion timing. Table 18.3 shows the A/D conversion time.

As indicated in figure 18.2, the A/D conversion time includes t_D and the input sampling time. The length of t_D varies depending on the timing of the write access to ADCSR. The total conversion time therefore varies within the ranges indicated in table 18.3.

In scan mode, the values given in table 18.3 apply to the first conversion time. In the second and subsequent conversions, the conversion time is 128 states (fixed) when CKS = 0 and 66 states (fixed) when CKS = 1.

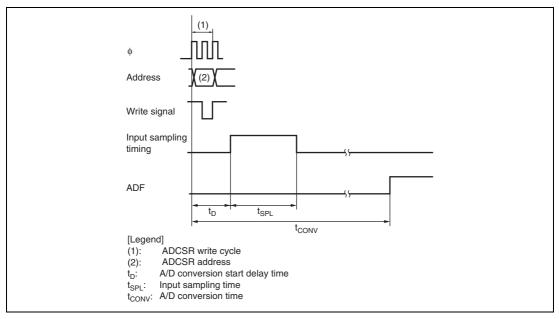

Figure 18.2 A/D Conversion Timing

Table 18.3 A/D Conversion Time (Single Mode)

| | | | CKS = | 0 | | CKS = | 1 |
|---------------------------------|-------------------|------|-------|------|------|-------|------|
| Item | Symbol | Min. | Тур. | Max. | Min. | Тур. | Max. |
| A/D conversion start delay time | t _D | 6 | _ | 9 | 4 | _ | 5 |
| Input sampling time | t _{SPL} | _ | 31 | | | 15 | |
| A/D conversion time | t _{conv} | 131 | _ | 134 | 69 | _ | 70 |

Note: All values represent the number of states.

18.4.4 External Trigger Input Timing

A/D conversion can also be started by an external trigger input. When the TRGE bit in ADCR is set to 1, external trigger input is enabled at the \overline{ADTRG} pin. A falling edge at the \overline{ADTRG} input pin sets the ADST bit in ADCSR to 1, starting A/D conversion. Other operations, in both single and scan modes, are the same as when the bit ADST has been set to 1 by software. Figure 18.3 shows the timing.

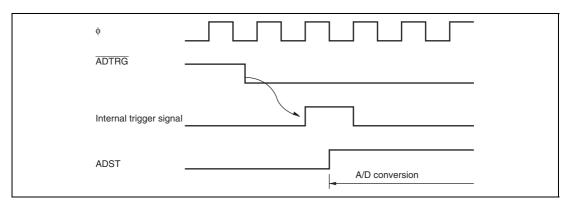

Figure 18.3 External Trigger Input Timing

18.5 A/D Conversion Accuracy Definitions

This LSI's A/D conversion accuracy definitions are given below.

Resolution

The number of A/D converter digital output codes

Quantization error

The deviation inherent in the A/D converter, given by 1/2 LSB (see figure 18.4).

Offset error

The deviation of the analog input voltage value from the ideal A/D conversion characteristic when the digital output changes from the minimum voltage value 0000000000 to 0000000001 (see figure 18.5).

Full-scale error

The deviation of the analog input voltage value from the ideal A/D conversion characteristic when the digital output changes from 11111111110 to 1111111111 (see figure 18.5).

• Nonlinearity error

The deviation from the ideal A/D conversion characteristic as the voltage changes from zero to full scale. This does not include the offset error, full-scale error, or quantization error.

Absolute accuracy

The deviation between the digital value and the analog input value. Includes offset error, full-scale error, quantization error, and nonlinearity error.

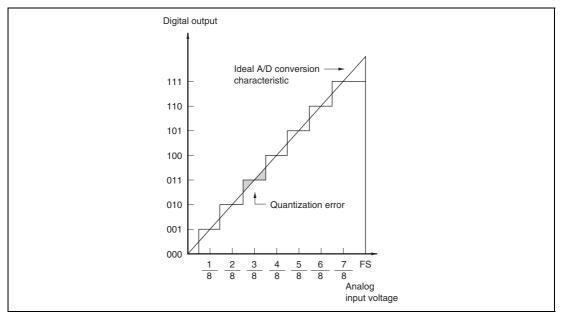

Figure 18.4 A/D Conversion Accuracy Definitions (1)

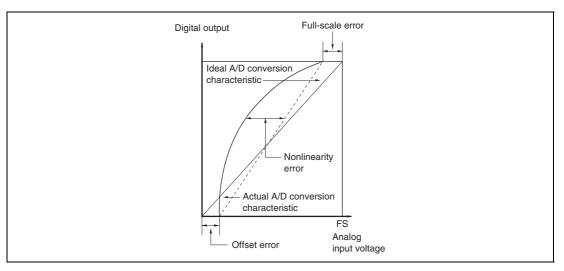

Figure 18.5 A/D Conversion Accuracy Definitions (2)

18.6 Usage Notes

18.6.1 Permissible Signal Source Impedance

This LSI's analog input is designed such that conversion accuracy is guaranteed for an input signal for which the signal source impedance is $5~k\Omega$ or less. This specification is provided to enable the A/D converter's sample-and-hold circuit input capacitance to be charged within the sampling time; if the sensor output impedance exceeds $5~k\Omega$, charging may be insufficient and it may not be possible to guarantee A/D conversion accuracy. However, for A/D conversion in single mode with a large capacitance provided externally, the input load will essentially comprise only the internal input resistance of $10~k\Omega$, and the signal source impedance is ignored. However, as a low-pass filter effect is obtained in this case, it may not be possible to follow an analog signal with a large differential coefficient (e.g., $5~mV/\mu s$ or greater) (see figure 18.6). When converting a high-speed analog signal or converting in scan mode, a low-impedance buffer should be inserted.

18.6.2 Influences on Absolute Accuracy

Adding capacitance results in coupling with GND, and therefore noise in GND may adversely affect absolute accuracy. Be sure to make the connection to an electrically stable GND.

Care is also required to ensure that filter circuits do not interfere with digital signals or act as antennas on the mounting board.

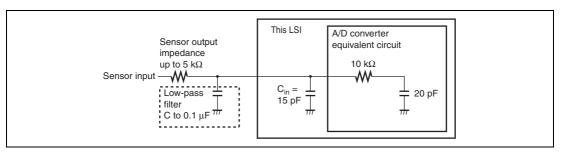

Figure 18.6 Analog Input Circuit Example

Section 19 Band-Gap Circuit, Power-On Reset, and Low-Voltage Detection Circuits

This LSI can include a band-gap circuit (BGR, band-gap regulator), a power-on reset circuit and low-voltage detection circuit.

BGR supplies a reference voltage to the on-chip oscillator and low-voltage detection circuit. Figure 19.1 shows the block diagram of how BGR is allocated.

The low-voltage detection (LVD) circuit consists of two circuits: LVDI (interrupt by low voltage detection) and LVDR (reset by low voltage detection) circuits.

This circuit is used to prevent abnormal operation (program runaway) from occurring due to the power supply voltage fall and to recreate the state before the power supply voltage fall when the power supply voltage rises again.

Even if the power supply voltage falls, the unstable state when the power supply voltage falls below the guaranteed operating voltage can be removed by entering standby mode when exceeding the guaranteed operating voltage and during normal operation. Thus, system stability can be improved. If the power supply voltage falls more, the reset state is automatically entered. If the power supply voltage rises again, the reset state is held for a specified period, then active mode is automatically entered.

Figure 19.2 is a block diagram of the power-on reset circuit and the low-voltage detection circuit.

19.1 Features

BGR circuit

Supplies stable reference voltage covering the entire operating voltage range and the operating temperature range.

Power-on reset circuit

Uses an external capacitor to generate an internal reset signal when power is first supplied.

• Low-voltage detection circuit

LVDR: Monitors the power-supply voltage, and generates an internal reset signal when the voltage falls below a given value.

LVDI: Monitors the power-supply voltage, and generates an interrupt when the voltage falls below or rises above respective given values.

Two detection levels for reset generation voltage are available: when only the LVDR circuit is used, or when the LVDI and LVDR circuits are both used.

Reset source decision

The source of a reset can be decided by reading the reset source decision register in the reset exception handler.

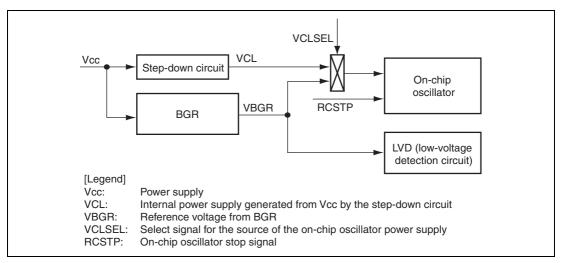

Figure 19.1 Block Diagram around BGR

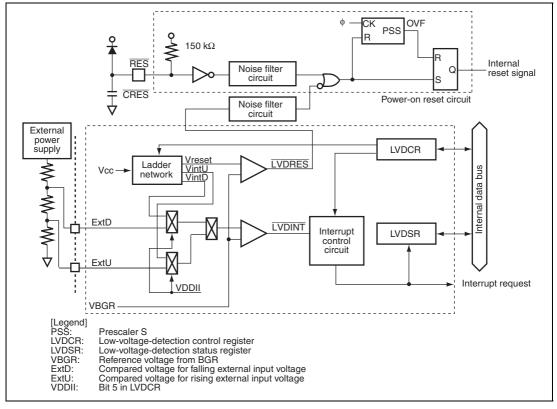

Figure 19.2 Block Diagram of Power-On Reset Circuit and Low-Voltage Detection Circuit

19.2 Register Descriptions

The low-voltage detection circuit has the following registers.

- Low-voltage-detection control register (LVDCR)
- Low-voltage-detection status register (LVDSR)
- Reset source decision register (LVDRF)

19.2.1 Low-Voltage-Detection Control Register (LVDCR)

LVDCR selects the compared voltage of the LVDI circuit, sets the detection levels for the LVDR circuit, enables or disables the LVDR circuit, and enables or disables generation of an interrupt when the power-supply voltage rises above or falls below the respective levels.

Table 19.1 shows the relationship between the LVDCR settings and functions to be selected. LVDCR should be set according to table 19.1.

| Bit | Bit Name | Initial Value | R/W | Description |
|------|----------|------------------|-----|--|
| 7, 6 | _ | All 1 | _ | Reserved |
| | | | | These bits are always read as 1 and cannot be modified. |
| 5 | VDDII | 1*1 | R/W | LVDR External Compared Voltage Input Inhibit |
| | | | | 0: Use external voltage as LVDI compared voltage |
| | | | | 1: Use internal voltage as LVDI compared voltage |
| 4 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1 and cannot be modified. |
| 3 | LVDSEL*2 | 1 | R/W | LVDR Detection Level Select |
| | | | | 0: Reset detection voltage is 2.3 V (Typ.) |
| | | | | 1: Reset detection voltage is 3.6 V (Typ.) |
| | | | | When the falling or rising voltage detection interrupt is used, the reset detection voltage of 2.3 V (Typ.) should be used. When only a reset detection interrupt is used, reset detection voltage of 3.6 V (Typ.) should be used. |
| 2 | _ | 1 | _ | Reserved |
| | | | | This bit is always read as 1 and cannot be modified. |

Select Functions

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|------------------|-----|---|
| 1 | LVDDE | 0 | R/W | Voltage-Fall-Interrupt Enable |
| | | | | 0: Interrupt on the power-supply voltage falling disabled |
| | | | | 1: Interrupt on the power-supply voltage falling enabled |
| 0 | LVDUE | 0 | R/W | Voltage-Rise-Interrupt Enable |
| | | | | 0: Interrupt on the power-supply voltage rising disabled |
| | | | | 1: Interrupt on the power-supply voltage rising enabled |

Notes: 1. Not initialized by an LVDR but initialized by a power-on reset or a watchdog timer reset.

2. For 3.3-V-specification models, this bit 3 of this register is a reserved bit (initial value is 0) and the reset detection voltage is 2.3 V (typ.).

Table 19.1 LVDCR Settings and Select Functions

I VDCR Settings

| | LVDCR | Settings | | Select Fullctions | | | |
|-------|--------|----------|-------|-------------------|------|---|---|
| VDDII | LVDSEL | LVDDE | LVDUE | Power-On Reset | LVDR | Low-Voltage- Detection Fall Interrupt | Low-Voltage- Detection Rise Interrupt |
| * | 1 | 0 | 0 | V | V | _ | |
| * | 0 | 1 | 0 | V | V | V | _ |
| * | 0 | 1 | 1 | V | V | V | |

Note: * Set these bits if necessary.

19.2.2 Low-Voltage-Detection Status Register (LVDSR)

LVDSR indicates whether the power-supply voltage falls below or rises above the respective given values.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|-------------|------------------|------|--|
| 7 to 2 | Dit Name | All 1 | 1000 | Reserved |
| 7 10 2 | _ | All I | _ | |

19.2.3 Reset Source Decision Register (LVDRF)

LVDSR indicates sources of resets.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|------------------|-----|---|
| 7 to 2 | _ | _ | _ | Reserved |
| | | | | The read value is undefined and these bits cannot be modified. |
| 1 | PRST | *1 | R/W | POR/LVDR Detection |
| | | | | [Setting conditions] |
| | | | | When a power-on reset has occurred |
| | | | | When an LVDR has occurred |
| | | | | [Clearing condition] |
| | | | | When writing 0 |
| 0 | WRST | *2 | R/W | WDT Reset Detection |
| | | | | [Setting condition] |
| | | | | When a reset by the WDT has occurred |
| | | | | [Clearing conditions] |
| | | | | When a power-on reset has occurred |
| | | | | When an LVDR has occurred |
| | | | | When an reset signal input on the external pin has asserted |
| | | | | When writing 0 |

Notes: 1. The initial value depends on the condition when the PRST bit is set or cleared.

2. The initial value depends on the condition when the WRST bit is set or cleared.

19.3 Operations

19.3.1 Power-On Reset Circuit

Figure 19.3 shows the timing of the operation of the power-on reset circuit. As the power-supply voltage rises, the capacitor which is externally connected to the \overline{RES} pin is gradually charged via the internal pull-up resistor (Typ. 150 k Ω). While the \overline{RES} signal is driven low, the prescaler S and the entire chip retains the reset state. When the level on the \overline{RES} signal reaches the specified value, the prescaler S is released from its reset state and it starts counting. The OVF signal is generated to release the internal reset signal after the prescaler S has counted 131,072 cycles of the φ clock. The noise filter circuit which removes noise with less than 400 ns (Typ.) is included to prevent the incorrect operation of this LSI caused by noise on the \overline{RES} signal.

To achieve stable operation of this LSI, the power supply needs to rise to its full level and settles within the specified time. The maximum time required for the power supply to rise and settle (t_{pwon}) is determined by the oscillation frequency (f_{osc}) and capacitance which is connected to \overline{RES} pin $(C_{\overline{RES}})$. Where t_{pwon} is assumed to be the time required to reach 90 % of the full level of the power supply, the power supply circuit should be designed to satisfy the following formula.

$$\begin{split} t_{\text{\tiny PWON}} \ (\text{ms}) & \leq 90 \times C_{\overline{\text{\tiny RES}}} \ (\mu\text{F}) + 162/f_{\text{\tiny OSC}} \ (\text{MHz}) \\ & (t_{\text{\tiny PWON}} \leq 3000 \ \text{ms}, \ C_{\overline{\text{\tiny RES}}} \geq 0.22 \ \mu\text{F}, \ \text{and} \ f_{_{OSC}} = 10 \ \text{in} \ 2\text{-MHz} \ \text{to} \ 10\text{-MHz} \ \text{operation}) \end{split}$$

Note that the power supply voltage (Vcc) must fall below Vpor = 100 mV to remove charge on the \overline{RES} pin. After that, it can be risen. To remove charge on the \overline{RES} pin, it is recommended that the diode should be placed to Vcc. If the power supply voltage (Vcc) rises from the point above Vpor, a power-on reset may not occur.

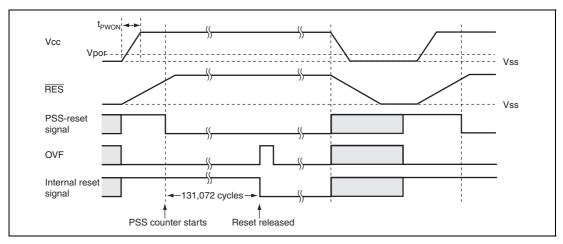

Figure 19.3 Operational Timing of Power-On Reset Circuit

19.3.2 Low-Voltage Detection Circuit

LVDR (Reset by Low Voltage Detection) Circuit:

Figure 19.4 shows the timing of the operation of the LVDR circuit. The LVDR circuit is kept enabled during the LSI's operation.

When the power-supply voltage falls below the Vreset voltage (the value selected by the LVDSEL bit: Typ. = 2.3 V or 3.6 V), the LVDR circuit clears the $\overline{\text{LVDRES}}$ signal to 0, and resets prescaler S. The low-voltage detection reset state remains in place until a power-on reset is generated. When the power-supply voltage rises above the Vreset voltage (Typ. = 3.6 V) regardless of LVDSEL bit setting) again, the LVDR circuit sets the $\overline{\text{LVDRES}}$ signal to 1 and prescaler S starts counting. When 131,072 clock (ϕ) cycles have been counted, the internal reset signal is released. In this case, the LVDSEL bit in LVDCR is initialized (the Vreset voltage: Typ. = 3.6 V) though the VDDII bit is not initialized.

If the power supply voltage (Vcc) falls below Vpor = 100 mV, a power-on reset occurs.

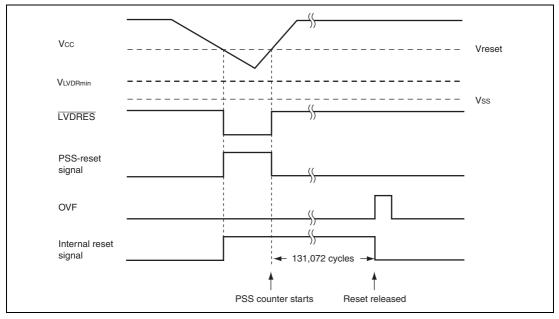

Figure 19.4 Operating Timing of LVDR Circuit

Low Voltage Detection Interrupt (LVDI) Circuit (When Internally Generated Voltage is used for Detection):

Figure 19.5 shows the timing of the operation of the LVDI circuit.

The LVDI circuit is enabled after a power-on reset, however, the interrupt request is disabled. To enable the LVDI, the LVDDF bit and LVDUF bit in LVDSR must be cleared to 0 and then the LVDDE bit or LVDUE bit in LVDCR must be set to 1. After that, the output settings of ports must be made.

When the power-supply voltage falls below Vint (D) (Typ. = 3.7 V) voltage, the LVDI circuit clears the $\overline{\text{LVDINT}}$ signal to 0 and sets the LVDDF bit to 1. If the LVDDE bit is 1 at this time, an IRQ0 interrupt request is generated. In this case, the necessary data must be saved in the external EEPROM and a transition to standby mode or subsleep mode must be made. Until this processing is completed, the power supply voltage must be higher than the lower limit of the guaranteed operating voltage.

When the power-supply voltage does not fall below the Vreset1 (Typ. = 2.3 V) voltage and rises above the Vint (U) (Typ. = 4.0 V) voltage, the LVDI circuit sets the $\overline{\text{LVDINT}}$ signal to 1. If the LVDUE bit is 1 at this time, the LVDUF bit in LVDSR is set to 1 and an IRQ0 interrupt request is simultaneously generated.

If the power supply voltage (Vcc) falls below the Vreset1 (Typ. = 2.3 V) voltage, this LSI enters low voltage detection reset operation (when LVDRE = 1).

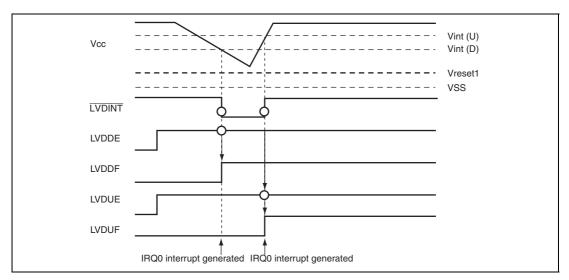

Figure 19.5 Operational Timing of LVDI Circuit

Low Voltage Detection Interrupt (LVDI) Circuit (When Voltages Input via ExtU and ExtD Pins are used for Detection):

Figure 19.6 shows the timing of the LVDI circuit. The LVDI circuit is enabled after a power-on reset, however, the interrupt request is disabled. To enable the LVDI, the LVDDF and LVDUF bits in LVDSR must be cleared to 0 and the LVDDE or LVDUE bit in LVDCR must be set to 1. When using external compared voltage, write 0 to the VDDII bit in LVDCR, and wait for 50 μ s (t_{LVDON}) given by a software timer until the detection circuit has settled. Then clear the LVDDF and LVDUF bits to 0 and set the LVDDE or LVDUE bit to 1. After that, the output settings of ports must be made. The initial value of the external compared voltages input on the ExtU and ExtD pins must be higher than the Vexd voltage.

When the external comparison voltage of ExtD pin falls below the Vexd (D) (Typ. = 1.15 V) voltage, the LVDI clears the $\overline{\text{LVDINT}}$ signal to 0 and sets the LVDDF bit in LVDSR to 1. If the LVDDE bit is 1 at this time, an IRQ0 interrupt request is generated. In this case, the necessary data must be saved in the external EEPROM, and a transition to standby mode or subsleep mode must be made. Until this processing is completed, the power supply voltage must be higher than the lower limit of the guaranteed operating voltage.

When the power-supply voltage does not fall below the Vreset1 (Typ. = 2.3 V) voltage and the input voltage of the ExtU pin rises above Vexd (Typ. = 1.15 V) voltage, the LVDI circuit sets the $\overline{\text{LVDINT}}$ signal to 1. If the LVDUE bit is 1 at this time, the LVDUF bit in LVDSR is set to 1 and an IRQ0 interrupt request is generated.

If the power supply voltage falls below the Vreset1 (Typ. = 2.3 V) voltage, this LSI enters low-voltage detection reset operation. When the voltages input on the ExtU and ExtD pins are used as the compared voltage, ensure to use the LVDR (reset detection voltage: Typ. = 2.3 V) circuit.

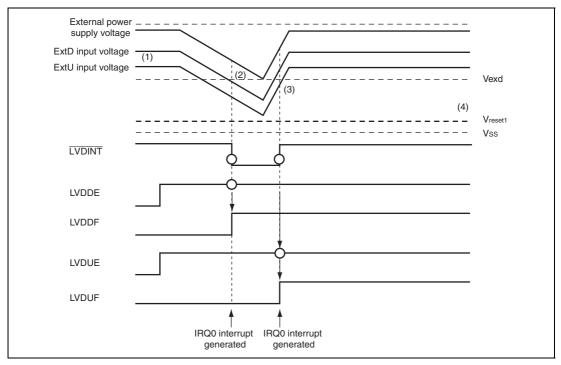

Figure 19.6 Operational Timing of LVDI Circuit (When Compared Voltage is Input through ExtU and ExtD Pins)

19.3.3 Deciding Reset Source

The source of a reset can be decided by reading the reset source decision register (LVDRF) in the reset exception handler (see table 19.2). After that, writing 0 to the bit can clear the flag and can be ready to decide the next reset source.

Figure 19.7 shows a timing of setting the bits in the register.

Table 19.2 Deciding Reset Source

LVDRF

| PRST | WRST | Reset Source |
|------|------|--|
| 1 | 0 | Power-on reset or LVDR occurred |
| 0 | 0 | Reset signal input on external reset pin |
| 0 | 1 | WDT reset occurred |

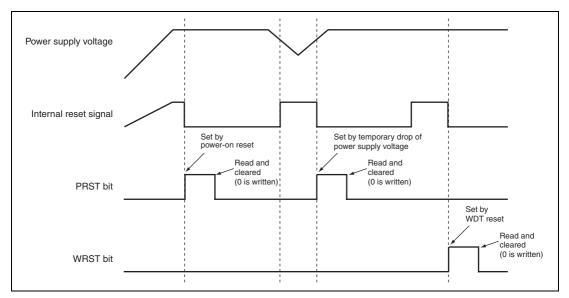

Figure 19.7 Timing of Setting Bits in Reset Source Decision Register

Section 20 Power Supply Circuit

This LSI incorporates an internal power supply step-down circuit. Use of this circuit enables the internal power supply to be fixed at a constant level of approximately 3.0 V, independently of the voltage of the power supply connected to the external V_{cc} pin. As a result, the current consumed when an external power supply is used at 3.0 V or above can be held down to virtually the same low level as when used at approximately 3.0 V.

20.1 Power Supply Connection of 5.0-V-Specification Microcontrollers

Connect the external power supply to the V_{cc} pin, and connect a capacitor of approximately 0.1 μ F between V_{CL} and V_{ss}, as shown in figure 20.1. The internal step-down circuit is made effective simply by adding this external circuit. In the external circuit interface, the external power supply voltage connected to V_{cc} and the GND potential connected to V_{ss} are the reference levels. For example, for port input/output levels, the V_{cc} level is the reference for the high level, and the V_{ss} level is that for the low level. The A/D converter analog power supply is not affected by the internal step-down circuit.

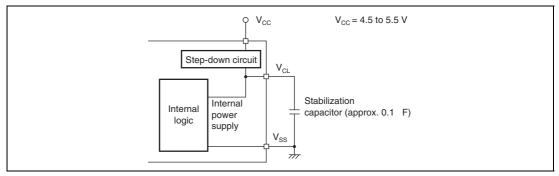

Figure 20.1 Power Supply Connection of 5.0-V-Specification Microcontrollers

20.2 Power Supply Connection of 3.3-V-Specification Microcontrollers

Connect the external power supply to the $V_{\scriptscriptstyle CL}$ and $V_{\scriptscriptstyle SS}$ pins as shown in figure 20.2. The power supply voltage must be within a range of 3.0 to 3.6 V. Otherwise, correct operation is not guaranteed.

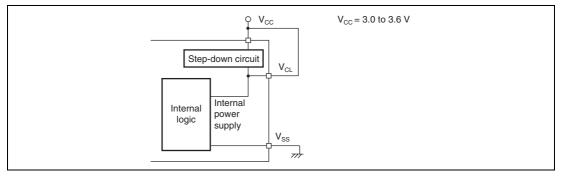

Figure 20.2 Power Supply Connection of 3.3-V-Specification Microcontrollers

Section 21 List of Registers

The register list gives information on the on-chip I/O register addresses, how the register bits are configured, and the register states in each operating mode. The information is given as shown below.

- 1. Register addresses (address order)
- The register addresses listed in the table are the address values (16 bits) in the 64-Kbyte address space. The value of the sixteen higher-order bits of address values (24 bits) in the 16-Mbyte address space is H'FF.
- Registers are listed from the lower allocation addresses.
- The symbol in the register-name column represents a reserved address or range of reserved addresses.
 - Do not attempt to access reserved addresses.
- When the register address is 16-bit wide, the address of the upper byte is given in the list.
- Registers are classified by functional modules.
- The data bus width is indicated.
- The number of access states is indicated.
- 2. Register bits
- Bit configurations of the registers are described in the same order as the register addresses.
- Reserved bits are indicated by in the bit name column.
- When registers consist of 16 bits, bits are described from the MSB side.
- 3. Register states in each operating mode
- Register states are described in the same order as the register addresses.
- The register states described here are for the basic operating modes. If there is a specific reset for an on-chip peripheral module, refer to the section on that on-chip peripheral module.

21.1 Register Addresses (Address Order)

The data-bus width column indicates the number of bits. The access-state column shows the number of states of the selected basic clock that is required for access to the register.

Note: Access to undefined or reserved addresses should not take place. Correct operation of the access itself or later operations is not guaranteed when such a register is accessed.

Notes: 1. WDT: Watchdog timer

2. Only provided for microcontrollers that supports advanced mode.

21.2 Register Bits

The addresses and bit names of the registers in the on-chip peripheral modules are listed below. The 16-bit register is indicated in two rows, 8 bits for each row.

| Register Name | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Module Name |
|------------------|---------|---------|---------|---------|---------|---------|---------|---------|----------------|
| _ | _ | _ | _ | _ | _ | _ | _ | _ | _ |
| TCR_0 | CCLR2 | CCLR1 | CCLR0 | CKEG1 | CKEG0 | TPSC2 | TPSC1 | TPSC0 | Timer Z |
| TIORA_0 | _ | IOB2 | IOB1 | IOB0 | _ | IOA2 | IOA1 | IOA0 | - |

Notes: 1. The LVDSEL bit is only provided for the 5.0-V specification products.

- 2. WDT: Watchdog timer
- 3. The BARE register is only provided for microcontrollers that support advanced mode.
- 4. The bit configuration of EBR1 differs according to products. For the bit configuration of each product, see the list below.
- H8/36079G, H8/36079L

Notes: — is not initialized

- 1. WDT: Watchdog timer
- 2. The BARE register is only provided for microcontrollers that support advanced mode.

Section 22 Electrical Characteristics

22.1 Absolute Maximum Ratings

Table 22.1 Absolute Maximum Ratings

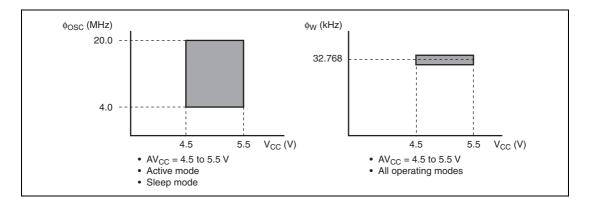

| Item | | Symbol | Value | Unit | Note |
|----------------|------------------------------------|------------------|--|------|------|
| Power supply v | oltage | V _{cc} | -0.3 to +7.0 | V | * |
| Analog power s | upply voltage | AV _{cc} | -0.3 to +7.0 | V | |
| Input voltage | Ports other than ports B and X1 | V _{IN} | -0.3 to $V_{\rm cc}$ +0.3 | V | |
| | Port B | _ | -0.3 to AV _{cc} +0.3 | V | _ |
| | X1 | _ | -0.3 to 4.3 | ٧ | _ |
| Operating temp | erature | T _{opr} | Regular specifications: -20 to +75 | °C | |
| | | | Wide-range specifications: -40 to +85 | °C | _ |
| Storage temper | ature | T _{stg} | -55 to +125 | °C | |

Notes: * Permanent damage may result if maximum ratings are exceeded. Normal operation should be under the conditions specified in Electrical Characteristics. Exceeding these values can result in incorrect operation and reduced reliability.

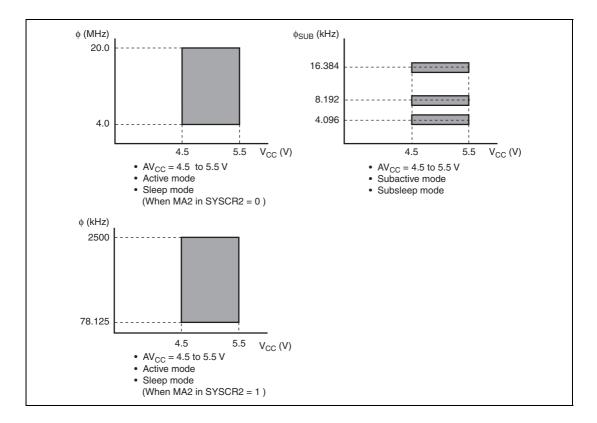

22.2 Electrical Characteristics (F-ZTATTM 5.0-V Version)

22.2.1 Power Supply Voltage and Operating Ranges

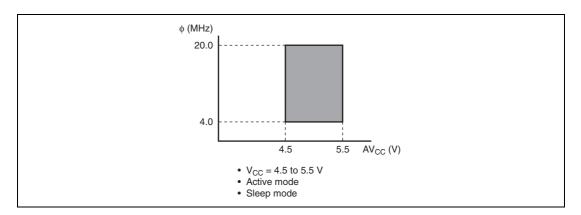

(1) Power Supply Voltage and Oscillation Frequency Range

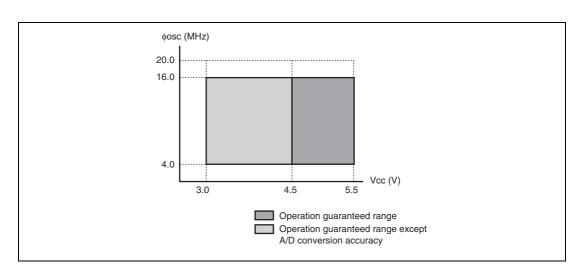

(2) Power Supply Voltage and Operating Frequency Range

(3) Analog Power Supply Voltage and A/D Converter Accuracy Guaranteed Range

(4) Range of Power Supply Voltage and Oscillation Frequency when Low-Voltage Detection Circuit is Used

22.2.2 DC Characteristics

Table 22.2 DC Characteristics (1)

 V_{cc} = 4.5 to 5.5 V, V_{ss} = 0.0 V, T_a = -20 to +75°C/-40 to +85°C, unless otherwise indicated.

| | | | | | Value | s | | |

| | | | Test | | Value | s | |
|---------|------------------------------------|--------|-----------|------|-------|------|-------|
| Item | | Symbol | Condition | Min. | Тур. | Max. | Unit |
| Erasing | Wait time after setting SWE bit*1 | х | | 1 | _ | _ | μs |
| | Wait time after setting ESU bit*1 | у | | 100 | _ | _ | μs |
| | Wait time after setting E bit*1*6 | Z | | 10 | _ | 100 | ms |
| | Wait time after clearing E bit*1 | α | | 10 | _ | _ | μs |
| | Wait time after clearing ESU bit*1 | β | | 10 | _ | _ | μs |
| | Wait time after setting EV bit*1 | γ | | 20 | _ | _ | μs |
| | Wait time after dummy write*1 | 3 | | 2 | _ | _ | μs |
| | Wait time after clearing EV bit*1 | η | | 4 | _ | _ | μs |
| | Wait time after clearing SWE bit*1 | θ | | 100 | _ | _ | μs |
| | Maximum erase count *1*6*7 | N | | _ | _ | 120 | Times |

Notes: 1. Make the time settings in accordance with the program/erase algorithms.

- 2. The programming time for 128 bytes. (Indicates the total time for which the P bit in flash memory control register 1 (FLMCR1) is set. The program-verify time is not included.)
- 3. The time required to erase one block. (Indicates the time for which the E bit in flash memory control register 1 (FLMCR1) is set. The erase-verify time is not included.)
- 4. Programming time maximum value $(t_p(max.))$ = wait time after P bit setting $(z) \times maximum programming count (N)$
- 5. Set the maximum programming count (N) according to the actual set values of z1, z2, and z3 so that it does not exceed the programming time maximum value (t_p(max.)). The wait time after setting P bit (z1, z2) should be changed as follows according to the value of the programming count (n).

Programming count (n)

$$1 \le n \le 6$$
 $z1 = 30 \mu s$
 $7 \le n \le 1000$ $z2 = 200 \mu s$

- 6. Erase time maximum value $(t_E(max.))$ = wait time after E bit setting $(z) \times maximum$ erase count (N)
- 7. Set the maximum erase count (N) according to the actual set value of (z) so that it does not exceed the erase time maximum value (t_E(max.)).

22.2.7 Power-Supply-Voltage Detection Circuit Characteristics

Table 22.9 Power-Supply-Voltage Detection Circuit Characteristics

 $V_{ss} = 0.0 \text{ V}$, $T_a = -20 \text{ to } +75^{\circ}\text{C}/-40 \text{ to } +85^{\circ}\text{C}$, unless otherwise indicated.

| | | Test | | Value | s | |
|--|---------------|------------|------|-------|------|------|
| Item | Symbol | Condition | Min. | Тур. | Max. | Unit |
| Power-supply falling detection voltage | Vint (D) | LVDSEL = 0 | 3.4 | 3.7 | _ | V |
| Power-supply rising detection voltage | Vint (U) | LVDSEL = 0 | _ | 4.0 | 4.4 | V |
| Reset detection voltage 1*1 | Vreset1 | LVDSEL = 0 | _ | 2.3 | 2.6 | V |
| Reset detection voltage 2*2 | Vreset2 | LVDSEL = 1 | 3.3 | 3.6 | 3.9 | V |
| Lower-limit voltage of LVDR operation | $V_{LVDRmin}$ | | 1.0 | _ | _ | V |

Notes: 1. This voltage should be used when the falling and rising voltage detection function is used.

2. Select the low-voltage reset 2 when only the low-voltage detection reset is used.

22.2.8 LVDI External Input Voltage Detection Circuit Characteristics

Table 22.10 LVDI External Input Voltage Detection Circuit Characteristics

 $Vcc = 4.5 \text{ to } 5.5 \text{ V}, \text{ AVcc} = 4.5 \text{ to } 5.5 \text{ V}, \text{ V}_{ss} = 0.0 \text{ V}, \text{ T}_{a} = -20 \text{ to } +75^{\circ}\text{C/}-40 \text{ to } +85^{\circ}\text{C}$

| | | Test | Values | | | |
|-----------------------------------|-------------|---------------|--------|------|---|------|
| Item | Symbol | Condition | Min. | Тур. | Max. | Unit |
| ExtD/ExtU input detection voltage | Vexd | | 1.0 | 1.15 | 1.30 | V |
| ExtD/ExtU input voltage range | VextD/VextU | VextD > VextU | -0.3 | — | Lower voltage of AV _w + 0.3 or V _w + 0.3 | V |

22.2.9 Power-On Reset Circuit Characteristics

Table 22.11 Power-On Reset Circuit Characteristics

 $V_{ss} = 0.0 \text{ V}$, $T_a = -20 \text{ to } +75^{\circ}\text{C}/-40 \text{ to } +85^{\circ}\text{C}$, unless otherwise indicated.

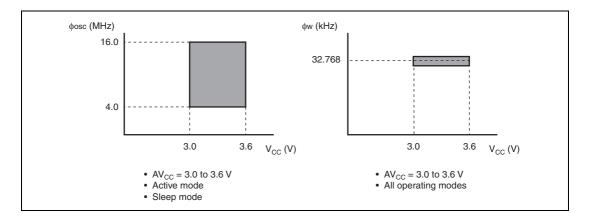

| | | Test | | | | |
|-------------------------------|------------------|-----------|------|------|-----|------|
| Item | Symbol | Condition | Min. | Тур. | Max | Unit |
| Pull-up resistance of RES pin | R _{RES} | | 100 | 150 | _ | kΩ |
| Power-on reset start voltage* | V _{por} | | _ | _ | 100 | mV |

Note: * The power-supply voltage (Vcc) must fall below Vpor = 100 mV and then rise after charge of the RES pin is removed completely. In order to remove charge of the RES pin, it is recommended that the diode be placed in the Vcc side. If the power-supply voltage (Vcc) rises from the point over 100 mV, a power-on reset may not occur.

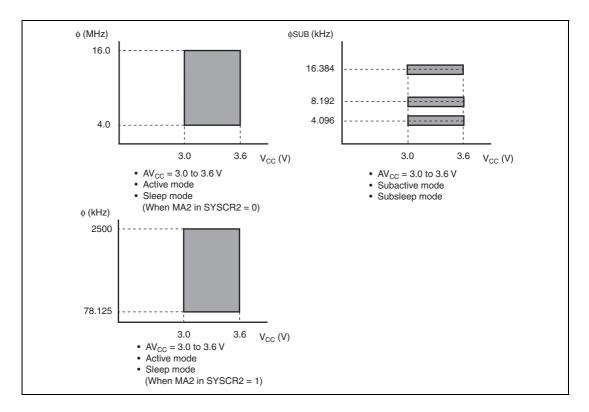

22.3 Electrical Characteristics (F-ZTATTM 3.3-V Version)

22.3.1 Power Supply Voltage and Operating Ranges

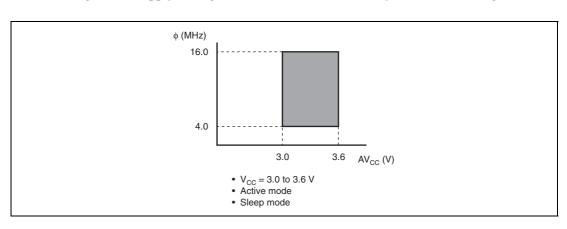

(1) Power Supply Voltage and Oscillation Frequency Range

(2) Power Supply Voltage and Operating Frequency Range

(3) Analog Power Supply Voltage and A/D Converter Accuracy Guaranteed Range

22.3.2 DC Characteristics

Table 22.12 DC Characteristics (1)

 V_{cc} = 3.0 to 3.6 V, V_{ss} = 0.0 V, T_a = -20 to +75°C/-40 to +85°C, unless otherwise indicated.

| | | | | Values | | | | |

| | Wait time after clearing SWE bit*1 | θ | | 100 | _ | _ | μs |
| | Maximum erase count *1*6*7 | N | | _ | _ | 120 | Times |

Notes: 1. Make the time settings in accordance with the program/erase algorithms.

- 2. The programming time for 128 bytes. (Indicates the total time for which the P bit in flash memory control register 1 (FLMCR1) is set. The program-verify time is not included.)
- 3. The time required to erase one block. (Indicates the time for which the E bit in flash memory control register 1 (FLMCR1) is set. The erase-verify time is not included.)
- 4. Programming time maximum value $(t_p(max.))$ = wait time after P bit setting $(z) \times maximum programming count (N)$
- 5. Set the maximum programming count (N) according to the actual set values of z1, z2, and z3 so that it does not exceed the programming time maximum value (tp(max.)). The wait time after setting P bit (z1, z2) should be changed as follows according to the value of the programming count (n).

Programming count (n)

$$1 \le n \le 6$$
 $z1 = 30 \ \mu s$ $7 \le n \le 1000$ $z2 = 200 \ \mu s$

- 6. Erase time maximum value ($t_E(max.)$) = wait time after E bit setting (z) × maximum erase count (N)
- 7. Set the maximum erase count (N) according to the actual set value of (z) so that it does not exceed the erase time maximum value ($t_E(max.)$).

22.3.7 Power-Supply-Voltage Detection Circuit Characteristics

Table 22.19 Power-Supply-Voltage Detection Circuit Characteristics

 $V_{ss} = 0.0 \text{ V}$, $T_a = -20 \text{ to } +75^{\circ}\text{C}/-40 \text{ to } +85^{\circ}\text{C}$, unless otherwise indicated.

| | | | Value | s | |
|--|-------------------------|------|-------|------|------|
| Item | Symbol | Min. | Тур. | Max. | Unit |
| Power-supply falling detection voltage | Vint (D) | 2.8 | 2.9 | 3.05 | V |
| Power-supply rising detection voltage | Vint (U) | 2.9 | 3.0 | 3.15 | V |
| Reset detection voltage 1* | Vreset1 | _ | 2.3 | 2.6 | V |
| Lower-limit voltage of LVDR operation | ${\sf V}_{\sf LVDRmin}$ | 1.0 | _ | _ | V |

Note: * This voltage should be used when the falling and rising voltage detection function is used.

22.3.8 LVDI External Input Voltage Detection Circuit Characteristics

Table 22.20 LVDI External Input Voltage Detection Circuit Characteristics

 $Vcc = 3.0 \text{ to } 3.6 \text{ V}, \text{ AVcc} = 3.0 \text{ to } 3.6 \text{ V}, \text{ V}_{ss} = 0.0 \text{ V}, \text{ T}_{a} = -20 \text{ to } +75^{\circ}\text{C}/-40 \text{ to } +85^{\circ}\text{C}$

| | | Test | | _ | | |
|-----------------------------------|-------------|---------------|------|------|--|------|
| Item | Symbol | Condition | Min. | Тур. | Max. | Unit |
| ExtD/ExtU input detection voltage | Vexd | | 0.95 | 1.15 | 1.35 | ٧ |
| ExtD/ExtU input voltage range | VextD/VextU | VextD > VextU | -0.3 | _ | Lower voltage of AV _∞ + 0.3 or V _∞ + 0.3 | V |

22.3.9 Power-On Reset Circuit Characteristics

Table 22.21 Power-On Reset Circuit Characteristics

 $V_{ss} = 0.0 \text{ V}$, $T_a = -20 \text{ to } +75^{\circ}\text{C}/-40 \text{ to } +85^{\circ}\text{C}$, unless otherwise indicated.

| | | Test | | Value | s | |
|-------------------------------|------------------|-----------|------|-------|-----|------|
| Item | Symbol | Condition | Min. | Тур. | Max | Unit |
| Pull-up resistance of RES pin | R _{RES} | | 100 | 150 | _ | kΩ |
| Power-on reset start voltage* | V _{por} | | _ | _ | 100 | mV |

Note: * The power-supply voltage (Vcc) must fall below Vpor = 100 mV and then rise after charge of the RES pin is removed completely. In order to remove charge of the RES pin, it is recommended that the diode be placed in the Vcc side. If the power-supply voltage (Vcc) rises from the point over 100 mV, a power-on reset may not occur.

Appendix A Instruction Set

A.1 Instruction List

Condition Code

| Symbol | Description |
|---------------|---|
| Rd | General destination register |
| Rs | General source register |
| Rn | General register |
| ERd | General destination register (address register or 32-bit register) |
| ERs | General source register (address register or 32-bit register) |
| ERn | General register (32-bit register) |
| (EAd) | Destination operand |
| (EAs) | Source operand |
| PC | Program counter |
| SP | Stack pointer |
| CCR | Condition-code register |
| N | N (negative) flag in CCR |
| Z | Z (zero) flag in CCR |
| V | V (overflow) flag in CCR |
| С | C (carry) flag in CCR |
| disp | Displacement |
| \rightarrow | Transfer from the operand on the left to the operand on the right, or transition from the state on the left to the state on the right |
| + | Addition of the operands on both sides |
| _ | Subtraction of the operand on the right from the operand on the left |
| × | Multiplication of the operands on both sides |
| ÷ | Division of the operand on the left by the operand on the right |
| ٨ | Logical AND of the operands on both sides |
| V | Logical OR of the operands on both sides |
| \oplus | Logical exclusive OR of the operands on both sides |
| 7 | NOT (logical complement) |
| (), <> | Contents of operand |

Note: General registers include 8-bit registers (R0H to R7H and R0L to R7L) and 16-bit registers (R0 to R7 and E0 to E7).

Condition Code Notation (cont)

| Symbol | Description |
|--------------|--|
| \(\) | Changed according to execution result |
| * | Undetermined (no guaranteed value) |
| 0 | Cleared to 0 |
| 1 | Set to 1 |
| _ | Not affected by execution of the instruction |
| Δ | Varies depending on conditions, described in notes |

- Notes: 1. The number of states in cases where the instruction code and its operands are located in on-chip memory is shown here. For other cases see appendix A.3, Number of Execution States.
 - 2. n is the value set in register R4L or R4.
 - (1) Set to 1 when a carry or borrow occurs at bit 11; otherwise cleared to 0.
 - (2) Set to 1 when a carry or borrow occurs at bit 27; otherwise cleared to 0.
 - (3) Retains its previous value when the result is zero; otherwise cleared to 0.
 - (4) Set to 1 when the adjustment produces a carry; otherwise retains its previous value.
 - (5) The number of states required for execution of an instruction that transfers data in synchronization with the E clock is variable.
 - (6) Set to 1 when the divisor is negative; otherwise cleared to 0.
 - (7) Set to 1 when the divisor is zero; otherwise cleared to 0.
 - (8) Set to 1 when the quotient is negative; otherwise cleared to 0.

A.3 Number of Execution States

The status of execution for each instruction of the H8/300H CPU and the method of calculating the number of states required for instruction execution are shown below. Table A.4 shows the number of cycles of each type occurring in each instruction, such as instruction fetch and data read/write. Table A.3 shows the number of states required for each cycle. The total number of states required for execution of an instruction can be calculated by the following expression:

Execution states =
$$I \times S_1 + J \times S_2 + K \times S_K + L \times S_L + M \times S_M + N \times S_N$$

Examples: When instruction is fetched from on-chip ROM, and an on-chip RAM is accessed.

BSET #0, @FF00

From table A.4:

$$I = L = 2$$
, $J = K = M = N = 0$

From table A.3:

$$S_{I} = 2$$
, $S_{L} = 2$

Number of states required for execution = $2 \times 2 + 2 \times 2 = 8$

When instruction is fetched from on-chip ROM, branch address is read from on-chip ROM, and on-chip RAM is used for stack area.

JSR @@ 30

From table A.4:

$$I = 2$$
, $J = K = 1$, $L = M = N = 0$

From table A.3:

$$S_I = S_J = S_K = 2$$

Number of states required for execution = $2 \times 2 + 1 \times 2 + 1 \times 2 = 8$

Table A.3 Number of Cycles in Each Instruction

| Execution Status | | Ad | ccess Location |
|---------------------|----------------|----------------|---------------------------|
| (Instruction Cycle) | | On-Chip Memory | On-Chip Peripheral Module |
| Instruction fetch | Sı | 2 | _ |
| Branch address read | S _J | _ | |
| Stack operation | S _K | _ | |
| Byte data access | S _L | _ | 2 or 3* |
| Word data access | S _M | _ | 2 or 3* |
| Internal operation | S _N | | 1 |

Note: * Depends on which on-chip peripheral module is accessed. See section 21.1, Register Addresses (Address Order).

Table A.4 Number of Cycles in Each Instruction

Notes: 1. Operating voltage range: 4.5 to 5.5 V (5.0-V models), 3.0 to 3.6 V (3.3-V models)

- 2. Operating temperature range: Regular specifications: -20 to +75 $^{\circ}$ C, wide-range specifications: -40 to +85 $^{\circ}$ C
- 3. The table includes products that are yet to be released. For details, please contact one of our sales representatives.

H8/36079 Group, H8/36077 Group Hardware Manual

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов:
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001:
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
