

### POWER MANAGEMENT

#### Description

The SC4508 is a low voltage current mode switching regulator controller that drives a P-channel power MOSFET with programmable switching frequency. It can be configured in either buck or buck boost (inverting) converters. The converters can be operated from 2.7V to 15V input voltage range. The typical operating supply current is 3mA and a shutdown pin allows the user to turn the controller off reducing it to less than 200 $\mu$ A. The output voltage can be adjusted by external resistor divider. The switching frequency is programmable up to 1.5MHz, allowing small inductor and capacitor values to minimize PCB space. The operating current level is programmable via an external sense resistor. Accessible reference voltage allows users to make output voltage as low as they want.

#### Features

- ◆ Wide input voltage range 2.7V to 15V
- ◆ Programmable output voltage
- ◆ Programmable switching frequency up to 1.5MHz
- ◆ Buck or buck boost(inverting) configuration
- ◆ Current mode control with slope compensation
- ◆ Very low quiescent current in shutdown mode
- ◆ Accessible reference voltage
- ◆ MLPQ-12 package

#### Applications

- ◆ Low power point of use converters
- ◆ Single or multiple output low power converters
- ◆ Positive and/or negative output voltage
- ◆ DSL cards
- ◆ Graphic cards
- ◆ I/O cards
- ◆ Negative bias supplies

#### Typical Application Circuits

**POWER MANAGEMENT**
**Absolute Maximum Rating**

Exceeding the specifications below may result in permanent damage to the device, or device malfunction. Operation outside of the parameters specified in the Electrical Characteristics section is not implied. Exposure to Absolute Maximum rated conditions for extended periods of time may affect device reliability.

Parameter	Symbol	Maximum	Units
VDD to GND		-0.3 to 16	V
SS/SHDN to GND		3.2	V
FB+, FB-, COMP, OSC to GND		5	V
VREF Current		1	mA
OUT Source or Sink		250	mA
Thermal Resistance, Junction to Ambient	$\theta_{JA}$	48	°C/W
Thermal Resistance, Junction to Case	$\theta_{JC}$	3	°C/W
Storage Temperature Range	$T_{STG}$	-60 to +150	°C
Junction Temperature Range	$T_J$	-40 to +150	°C
Peak IR Reflow Temperature 10 - 40s	$T_{PKG}$	260	°C

**Electrical Characteristics**

Unless specified:  $V_{DD} = 2.7V$  to  $15V$ ,  $T_A = T_J = -40^{\circ}C$  to  $125^{\circ}C$

Parameter	Test Conditions	Min	Typ	Max	Unit
<b>Power Supply</b>					
Input Voltage Range		2.7		15	V
Quiescent Current	SHDN = low		200	500	$\mu A$
Operating Current	SHDN = high, No load		3		mA
<b>Undervoltage Lockout</b>					
Start Threshold	$V_{DD}$ rising		2.5	2.55	V
UVLO Hysteresis			100		mV
<b>Oscillator</b>					
Frequency Range		100		1500	KHz
Frequency	$C_T = 300pF$	450	500	550	KHz
Charge Current			100		$\mu A$
<b>Error Amplifier</b>					
Feedback Input Voltage		0.75			V
Input Bias Current			100		nA
Transconductance			5		mS
Output Source or Sink Current		50	100		$\mu A$

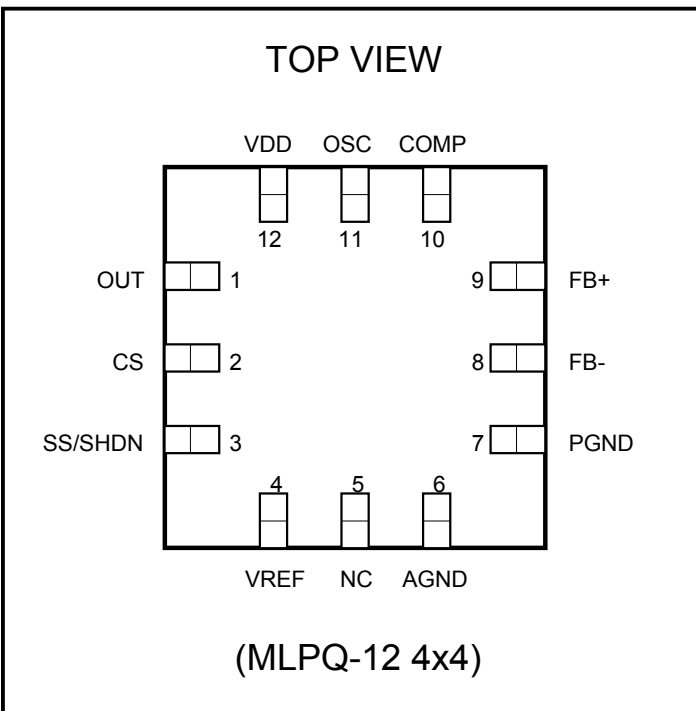

**POWER MANAGEMENT**
**Electrical Characteristics**

 Unless specified:  $V_{DD} = 2.7V$  to  $15V$ ,  $T_A = T_J = -40^{\circ}C$  to  $125^{\circ}C$ 

Parameter	Test Conditions	Min	Typ	Max	Unit
<b>PWM Comparator</b>					
Delay to Output			50		ns
<b>VREF Reference</b>					
Output Voltage		1.231	1.25	1.269	V
Output Current				1	mA
Line Regulation	$V_{DD} = 2.7$ to $15V$ , $I_{VREF} = 1mA$		4		mV
Load Regulation	$V_{DD} = 5V$ , $I_{VREF} = 0$ to $1mA$		4		mV
<b>Soft Start/Shutdown</b>					
Charge Current			20		$\mu A$
Discharge Current			12		mA
SHDN Logic Hight Voltage		2			V
SHDN Logic Low Voltage				0.25	V
<b>Current Limit</b>					
Cycle by Cycle Threshold	$V_{DD} = 5V$	90	110	130	mV
Shutdown Threshold			0.16		V
Delay to Output			50		nS
<b>Output</b>					
Gate Drive On-Resistance(H)	$V_{DD} = 5V$ , $I_{SOURCING} = 250mA$		20		Ohm
Gate Drive On-Resistance(L)	$V_{DD} = 5V$ , $I_{SINK} = 250mA$		20		Ohm
Rise Time	$C_{OUT} = 200pF$		20		nS
Fall Time	$C_{OUT} = 200pF$		20		nS

Note:

(1) This device is ESD sensitive. Use of standard ESD handling precautions is required.

**POWER MANAGEMENT**
**Pin Configuration**

**Ordering Information**

DEVICE	PACKAGE	Temp. Range (T <sub>j</sub> )
SC4508IMLTRT <sup>(2)</sup>	MLPQ-12 <sup>(1)</sup>	-40°C to 150°C

**Notes:**

(1) Only available in tape and reel packaging. A reel contains 3000 devices.

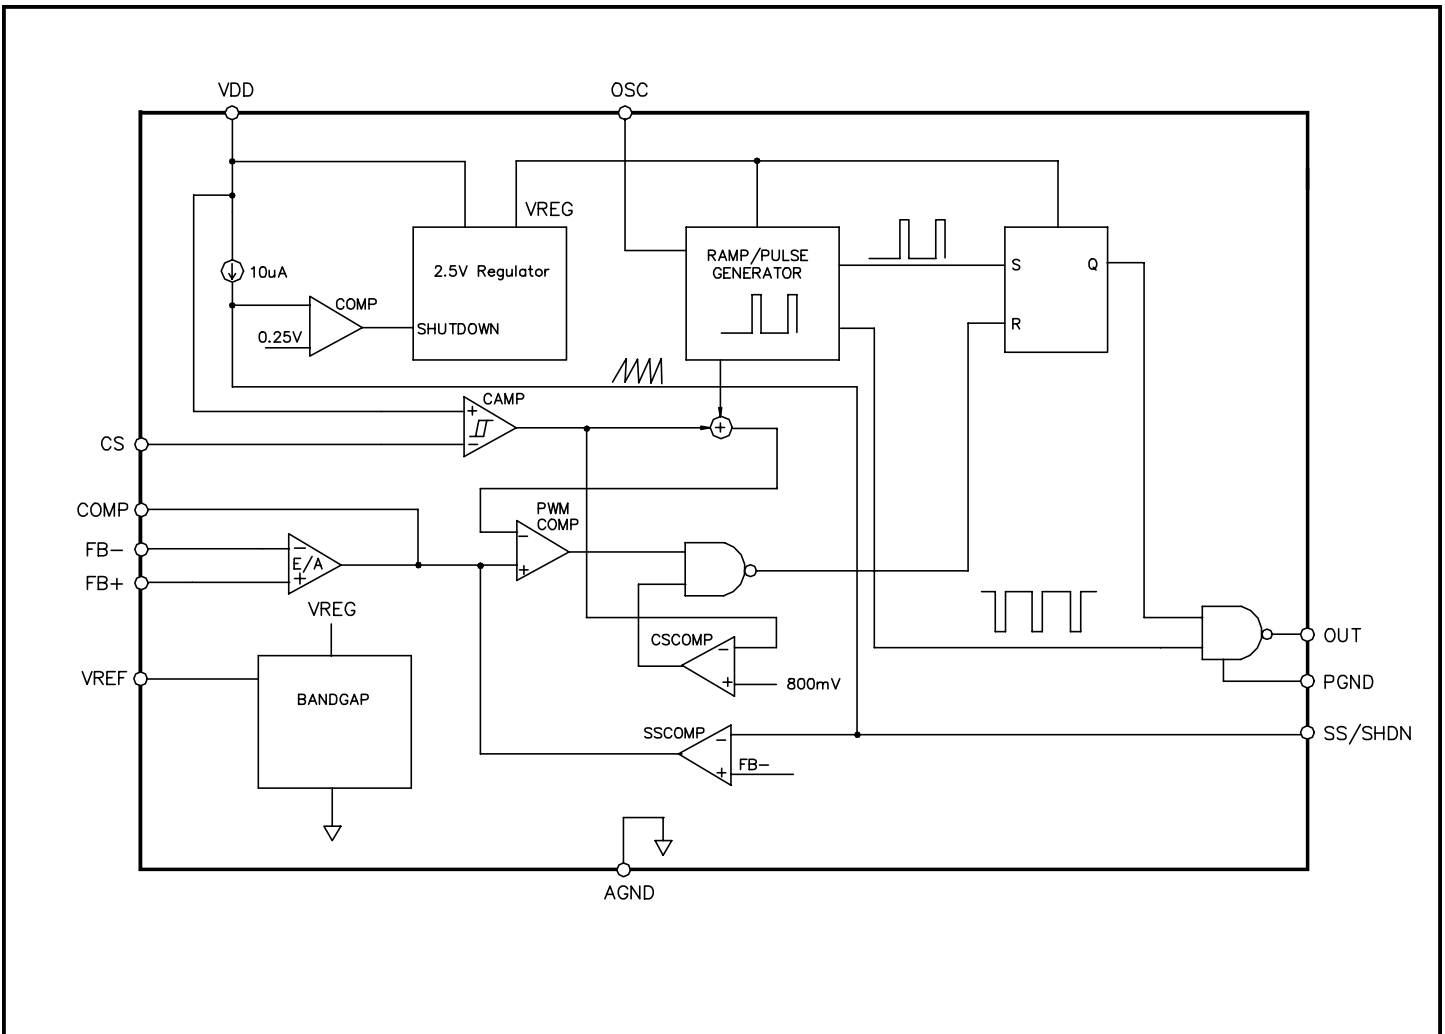

(2) Lead free product. This product is fully WEEE and RoHS compliant.

**Pin Descriptions**

Pin #	Pin Name	Pin Function
1	OUT	Gate driver output for external P-MOSFET. OUT swings from VDD to PGND.
2	CS	Current sense input pin. Connect a current sense resistor between VDD and CS.
3	SS/SHDN	Soft start pin. Connects an external capacitor between this pin and AGND. The ramp up time is defined by the capacitor. The device goes into shutdown when VSS/SHDN is pulled below 0.25V.
4	VREF	1.25V reference output. VREF can source up to 1mA. Bypass with a 0.1uF ceramic capacitor from VREF to AGND.
5	NC	No connection.
6	AGND	Analog ground.
7	PGND	Power ground.
8	FB-	Error amplifier inverting input.
9	FB+	Error amplifier non-inverting input.
10	COMP	Compensation pin for the internal transconductance error amplifier. Connect loop compensation network from COMP to AGND.
11	OSC	Oscillator frequency set input. Connect a ceramic capacitor from OSC to AGND to set the internal oscillator frequency from 100KHz to 1.5MHz. Use equation $f = \frac{100\mu A}{C \cdot 0.65}$ to set the oscillator frequency. C is the capacitor from OSC to AGND.
12	VDD	Supply voltage. Bypass a 1uF ceramic capacitor from VDD to PGND.
-	THERMAL PAD	Pad for heatsinking purposes. Connect to ground plane using multiple vias. Not connected internally.

**POWER MANAGEMENT**

**Block Diagram**

**Marking Information**

**POWER MANAGEMENT**
**Application Information**

The SC4508 is designed to control buck (step down) or buck-boost (inverting) converter with P-channel MOSFET as a switch using current mode, programmable switching frequency architecture. During steady state operation, the switch is turned on each cycle and turned off when the voltage across current sense resistor exceeds the voltage level at COMP pin set by voltage loop error amplifier. A fixed 0.5V artificial ramp is added internally to the sensed current signal for operations when duty-cycle is larger than 50%. In over load or output shortage condition, if the sensed current signal reaching typical 120mV, the switch is turned off immediately in the same cycle. If the sensed current signal further increases to typical 160mV, not only the switch is turned off but also the soft start capacitor is discharged by a internal MOSFET to ground then charging back to threshold 250mV during which the switch is held off. With the “hiccup” mode over current protection, the thermal stress is reduced in the faulty conditions.

**Current Sense and Current Limit**

The typical cycle-by-cycle current limit threshold in the current sense pin of the SC4508 is 120mV. The over current limit is assumed typical 120% of full load current. Then the current sense resistor can be calculated by the following equation:

$$R_s = \frac{120\text{mV}}{120\% \cdot I_L(\text{pk})}$$

$$I_L(\text{pk}) = I_o + \frac{1}{2} \frac{V_{IN} - V_o}{f_s \cdot L} \left( \frac{V_o + V_D}{V_{IN} + V_D} \right) \text{ for Buck}$$

$$I_L(\text{pk}) = I_o \frac{V_{IN} + |V_o| + V_D}{V_{IN}} + \frac{1}{2} \frac{V_{IN}}{f_s \cdot L} \left( \frac{|V_o| + V_D}{V_{IN} + |V_o| + V_D} \right)$$

for Buck – Boost

$I_o$  - full load current

$V_o$  - output voltage

$V_{IN}$  - input voltage

$V_D$  - diode forward voltage drop

$f_s$  - switching frequency

$L$  - inductor

**Inductor Selection**

A inductor is chosen based on the required output ripple current which is usually 20-30% of load current. The ripple current  $\Delta I$  decreases with higher inductance and increases with higher input voltage  $V_{IN}$  or output voltage  $V_o$ .

$$L = \frac{V_{IN} - V_o}{f_s \cdot \Delta I_L} \left( \frac{V_o + V_D}{V_{IN} + V_D} \right) \text{ for Buck}$$

$$L = \frac{V_{IN}}{f_s \cdot \Delta I_L} \left( \frac{|V_o| + V_D}{V_{IN} + |V_o| + V_D} \right) \text{ for Buck-Boost}$$

Specify the maximum inductor current larger than  $I_L(\text{pk})$  set by the current sense resistor  $R_s$  to avoid the inductor core saturation.

**Input Capacitor  $C_{IN}$  and Output Capacitor  $C_{OUT}$  Selection**

Both input and output capacitors need to be sized to handle the ripple current safely. Buck converters have high ripple current in the input side while buck-boost converters have high ripple current in the both input and output capacitors. Therefore, the RMS value of the current must be less than the high frequency ripple rating of the capacitors. In continuous mode operation,

$$I_{\text{RMS\_INPUT\_CAP}} \approx I_o \frac{\sqrt{V_o(V_{IN} - V_o)}}{V_{IN}} \text{ for Buck}$$

$$I_{\text{RMS\_CAP}} \approx I_o \sqrt{\frac{V_o + V_D}{V_{IN}}} \text{ for Buck-Boost input and output capacitors.}$$

The  $C_{OUT}$  is selected for Buck converter is by required output<sup>OUT</sup> ripple voltage and converter loop stability. The output ripple is determined by:

$$\Delta V_o \approx \Delta I_L \left( \text{ESR} + \frac{1}{8f_s C_{OUT}} \right)$$

where  $f$  is converted switching frequency,  $C_{OUT}$  is output capacitance and  $\Delta I_L$  is inductor ripple current.

**POWER MANAGEMENT**
**Application Information (Cont.)**

In Buck converter, the worst case input RMS ripple current occurs at 50% duty cycle, or at  $V_{IN} = 2V_{OUT}$ . Under this condition, the input capacitors RMS ripple current is about half of the load current.

**MOSFET Selection**

The selection criteria for the power MOSFET is its operating junction temperature not exceeding the maximum junction temperature. Therefore, from a specified ambient temperature, the maximum junction to ambient temperature rise has to be determined, which is related to the MOSFET power dissipation or power loss. The power loss includes conduction loss and switching loss. The conduction loss is given by:

$$P_{ON} = \left( \frac{V_O + V_D}{V_{IN} + V_D} \right) I_O^2 R_{DS(ON)} \text{ for Buck}$$

$$P_{ON} = \left( \frac{V_{IN} + |V_O| + V_D}{V_{IN}} \right) (|V_O| + V_D) I_O^2 R_{DS(ON)} \text{ for Buck-Boost}$$

**Freewheeling Diode Selection**

The Schottky diode is recommended as freewheeling diode in the both Buck and Buck-Boost applications. The diode conducts during the off-time. The diode voltage and current ratings are selected based upon the peak reverse voltage, the peak current and average power dissipation.

$$V_{D(REV)} = V_{IN}, I_{D(PEAK)} = I_O + \frac{\Delta I_L}{2}, I_{D(AVG)} = I_O \frac{V_{IN} - V_O}{V_{IN} + V_D} \text{ for Buck}$$

$$V_{D(REV)} = V_{IN} + |V_O|, I_{D(PEAK)} = I_O \left( \frac{V_{IN} + |V_O| + V_D}{V_{IN}} \right) + \frac{\Delta I_L}{2}, I_{D(AVG)} = I_O$$

for Buck – Boost

The most stressful condition for the diode occurs when the output is shorted. Under this condition, due to the  $V_{OUT} = 0$ , the diode conducts at close to 100% duty cycle. Therefore, attention should be paid to the thermal condition when laying out a board.

**LAYOUT GUIDELINES**

Careful attention to layout requirements are necessary for successful implementation of the SC4508 PWM controller. High switching currents are present in the application and their effect on ground plane voltage differentials must be understood and minimized.

1). The high power parts of the circuit should be laid out first. A ground plane should be used, the number and position of ground plane interruptions should be such as to not unnecessarily compromise ground plane integrity. Isolated or semi-isolated areas of the ground plane may be deliberately introduced to constrain ground currents to particular areas, for example, the input capacitor and output capacitor ground.

2). The loop formed by the Input Capacitor(s) ( $C_{in}$ ), the MOSFET and the Schottky diode or inductor must be kept as small as possible. This loop contains all the high current, fast transition switching. Connections should be as wide and as short as possible to minimize loop inductance

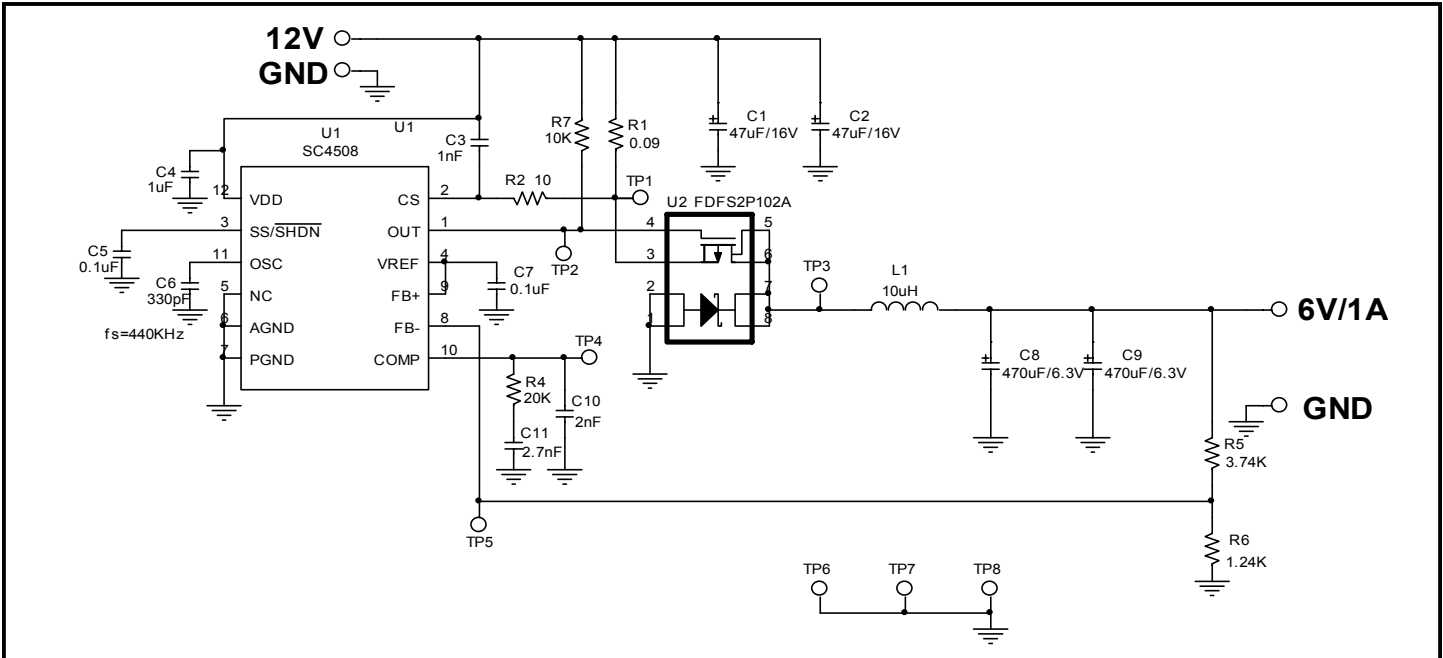

3). The connection between the junction of MOSFET, Schottky diode and the output inductor should be a wide trace or copper region. It should be as short as practical. Since this connection has fast voltage transitions, keeping this connection short will minimize EMI.

4) The Output Capacitor(s) ( $C_{out}$ ) should be located as close to the load as possible, fast transient load currents are supplied by  $C_{out}$  only, and connections between  $C_{out}$  and the load must be short, wide copper areas to minimize inductance and resistance.

5) A separate analog ground plane connects to the SC4508 AGND pin. All analog grounding path including decoupling capacitors, feedback resistors, compensation components, and current-limit setting resistors should be connected to this plane.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
