

AX8052F151

SoC Ultra-Low Power RF-Microcontroller for the 400 - 470 MHz and 800 - 940 MHz Bands

ON Semiconductor®

www.onsemi.com

OVERVIEW

The AX8052F151 is a single chip ultra-low-power RF-microcontroller SoC primarily for use in SRD bands. The on-chip transceiver consists of a fully integrated RF front-end with modulator, and demodulator. Base band data processing is implemented in an advanced and flexible communication controller that enables user friendly communication.

Features

SoC Ultra-low Power RF-microcontroller for Wireless Communication Applications

- QFN40 Package
- Supply Range 2.2 V – 3.6 V (1.8 V MCU)
- –40°C to 85°C
- Ultra-low Power Consumption:
 - ♦ CPU Active Mode 150 μ A/MHz
 - ♦ Sleep Mode with 256 Byte RAM Retention and Wake-up Timer running 900 nA
 - ♦ Sleep Mode 4 kByte RAM Retention and Wake-up Timer running 1.9 μ A
 - ♦ Sleep Mode 8 kByte RAM Retention and Wake-up Timer running 2.6 μ A
 - ♦ Radio RX-mode in Low Power Mode 17 mA
 - ♦ Radio TX-mode 22 mA at 10 dBm Output Power
 - ♦ Wake-on-Radio Mode 100 kbps, 1 s Duty Cycle 6 μ A

AX8052 Features

- Ultra-low Power MCU Core Compatible with Industry Standard 8052 Instruction Set
- Down to 500 nA Wake-up Current
- Single Cycle/Instruction for many Instructions
- 64 kByte In-system Programmable FLASH
- Code Protection Lock
- 8.25 kByte SRAM
- 3-wire (1 dedicated, 2 shared) In-circuit Debug Interface
- Three 16-bit Timers with $\Sigma\Delta$ Output Capability
- Two 16-bit Wakeup Timers
- Two Input Captures
- Two Output Compares with PWM Capability
- 10-bit 500 ksample/s Analog-to-Digital Converter

QFN40 7x5, 0.5P
CASE 485EG

ORDERING INFORMATION

| Device | Type | Qty |
|-------------------|-------------|-------|
| AX8052F151-2-TB05 | Tape & Reel | 500 |
| AX8052F151-2-TX30 | Tape & Reel | 3,000 |

- Temperature Sensor
- Two Analog Comparators
- Two UARTs
- One General Purpose Master/Slave SPI
- Two Channel DMA Controller
- Multi-megabit/s AES Encryption/Decryption Engine, supports AES-128, AES-192 and AES-256 with True Random Number Generator (TRNG)
NOTE: The AES Engine and the TRNG require Software Enabling and Support.
- Ultra-low Power 10 kHz/640 Hz Wakeup Oscillator, with Automatic Calibration against a Precise Clock
- Internal 20 MHz RC Oscillator, with Automatic Calibration against a Precise Clock for Flexible System Clocking
- Low Frequency Tuning Fork Crystal Oscillator for Accurate Low Power Time Keeping
- Brown-out and Power-on-Reset Detection

High-performance RF Transceiver compatible to AX5051

- 400 – 470 MHz and 800 – 940 MHz SRD Bands
- Wide Variety of Shaped Modulations Supported (ASK, PSK, MSK, FSK)
- Flexible Shaping for the Modulations
- Data Rates from 1 to 350 kbps (FSK, MSK) and 1 to 600 kbps ASK, 10 to 600 kbps PSK

AX8052F151

- Fully Integrated RF Frequency Synthesizer with Ultra-fast Settling Time for Low-power Consumption
- RF Carrier Frequency and FSK Deviation Programmable in 1Hz Steps
- Variable Channel Filtering from 40 kHz to 600 kHz
- 802.15.4 Compatible
- Few External Components
- Channel Hopping up to 2000 hops/s
- Sensitivity down to -116 dBm at 1.2 kbps
- Up to +16 dBm at 433 MHz Programmable Transmitter Power Amplifier for Long Range Operation
- Crystal Oscillator with Programmable Transconductance and Programmable Internal Tuning Capacitors for Low Cost Crystals
- Digital RSSI
- Automatic Frequency Control (AFC)
- Integrated RX/TX Switching
- Differential Antenna Pins
- Support of Synchronous and Asynchronous Communication Systems

Applications

400 – 470 MHz and 800 – 940 MHz Data Transmission and Reception in the Short Range Devices (SRD) Band

- Suited for Systems targeting Compliance to EN 300 220 V2.3.1 and FCC CFR Part 15
- Suited for Systems targeting Compliance with Wireless M-Bus Standard EN 13757-4:2005
- 802.15.4 Compatible
- Telemetric Applications, Sensor Readout
- Toys
- Wireless Audio
- Automatic Meter Reading
- Wireless Networks
- Access Control
- Remote Keyless Entry
- Garage Door Openers
- Home Automation
- Pointing Devices and Keyboards
- Active RFID

BLOCK DIAGRAM

Figure 1. Functional Block Diagram of the AX8052F151

AX8052F151

Table 1. PIN FUNCTION DESCRIPTIONS

| Symbol | Pin(s) | Type | Description |
|---------|--------|----------|--|
| GND | 1 | P | Ground |
| GND | 2 | P | Ground |
| VDDA | 3 | P | Power supply, must be supplied with regulated voltage VREG |
| GND | 4 | P | Ground |
| ANTP | 5 | A | Antenna input/output |
| ANTN | 6 | A | Antenna input/output |
| GND | 7 | P | Ground |
| VDDA | 8 | P | Power supply, must be supplied with regulated voltage VREG |
| TST1 | 9 | I | Connected to GND |
| TST | 10 | I | Connected to GND |
| VDD_IO | 11 | P | Unregulated power supply (battery input) |
| SYSCCLK | 12 | I/O/PU | System Clock Output |
| PC4 | 13 | I/O/PU | General Purpose IO |
| PC3 | 14 | I/O/PU | General Purpose IO |
| PC2 | 15 | I/O/PU | General Purpose IO |
| PC1 | 16 | I/O/PU | General Purpose IO |
| PC0 | 17 | I/O/PU | General Purpose IO |
| PB0 | 18 | I/O/PU | General Purpose IO |
| PB1 | 19 | I/O/PU | General Purpose IO |
| PB2 | 20 | I/O/PU | General Purpose IO |
| PB3 | 21 | I/O/PU | General Purpose IO |
| PB4 | 22 | I/O/PU | General Purpose IO |
| PB5 | 23 | I/O/PU | General Purpose IO |
| PB6 | 24 | I/O/PU | General Purpose IO, DBG_DATA |
| PB7 | 25 | I/O/PU | General Purpose IO, DBG_CLK |
| DBG_EN | 26 | I/PD | In-Circuit Debugger Enable |
| RESET_N | 27 | I/PU | Optional reset pin If this pin is not used it must be connected to VDD_IO |
| GND | 28 | P | Ground |
| VDD_IO | 29 | P | Unregulated power supply (battery input) |
| PA0 | 30 | I/O/A/PU | General Purpose IO |
| PA1 | 31 | I/O/A/PU | General Purpose IO |
| PA2 | 32 | I/O/A/PU | General Purpose IO |
| PA3 | 33 | I/O/A/PU | General Purpose IO |
| PA4 | 34 | I/O/A/PU | General Purpose IO |
| PA5 | 35 | I/O/A/PU | General Purpose IO |
| PA6 | 36 | I/O/A/PU | General Purpose IO |
| PA7 | 37 | I/O/A/PU | General Purpose IO |
| VREG | 38 | P | Regulated output voltage VDDA pins must be connected to this supply voltage A 1 μ F low ESR capacitor to GND must be connected to this pin |
| CLK16P | 39 | A | Crystal oscillator input/output (RF reference) |

Table 1. PIN FUNCTION DESCRIPTIONS

| Symbol | Pin(s) | Type | Description |
|--------|------------|------|--|
| CLK16N | 40 | A | Crystal oscillator input/output (RF reference) |
| GND | Center pad | P | Ground on center pad of QFN, must be connected |

A = analog input

I = digital input signal

O = digital output signal

PU = pull-up

I/O = digital input/output signal

N = not to be connected

P = power or ground

PD = pull-down

All digital inputs are Schmitt trigger inputs, digital input and output levels are LVCMOS/LVTTL compatible. Port A Pins (PA0 – PA7) must not be driven above VDD_IO, all other digital inputs are 5 V tolerant. Pull-ups are programmable for all GPIO pins.

Alternate Pin Functions

GPIO Pins are shared with dedicated Input/Output signals of on-chip peripherals. The following table lists the available functions on each GPIO pin.

Table 2. ALTERNATE PIN FUNCTIONS

| GPIO | Alternate Functions | | | |
|------|---------------------|---------|---------|---------|
| PA0 | T0OUT | IC1 | ADC0 | |
| PA1 | T0CLK | OC1 | ADC1 | |
| PA2 | OC0 | U1RX | ADC2 | COMP100 |
| PA3 | T1OUT | | ADC3 | LPXTALP |
| PA4 | T1CLK | COMPO0 | ADC4 | LPXTALN |
| PA5 | IC0 | U1TX | ADC5 | COMP110 |
| PA6 | T2OUT | ADCTRIG | ADC6 | COMP101 |
| PA7 | T2CLK | COMPO1 | ADC7 | COMP111 |
| PB0 | U1TX | IC1 | EXTIRQ0 | |
| PB1 | U1RX | OC1 | | |
| PB2 | IC0 | T2OUT | | |
| PB3 | OC0 | T2CLK | EXTIRQ1 | DSWAKE |
| PB4 | U0TX | T1CLK | | |
| PB5 | U0RX | T1OUT | | |
| PB6 | DBG_DATA | | | |
| PB7 | DBG_CLK | | | |
| PC0 | SSEL | T0OUT | EXTIRQ0 | |
| PC1 | SSCK | T0CLK | COMPO1 | |
| PC2 | SMOSI | U0TX | | |
| PC3 | SMISO | U0RX | COMPO0 | |
| PC4 | COMPO1 | ADCTRIG | EXTIRQ1 | |

AX8052F151

Pinout Drawing

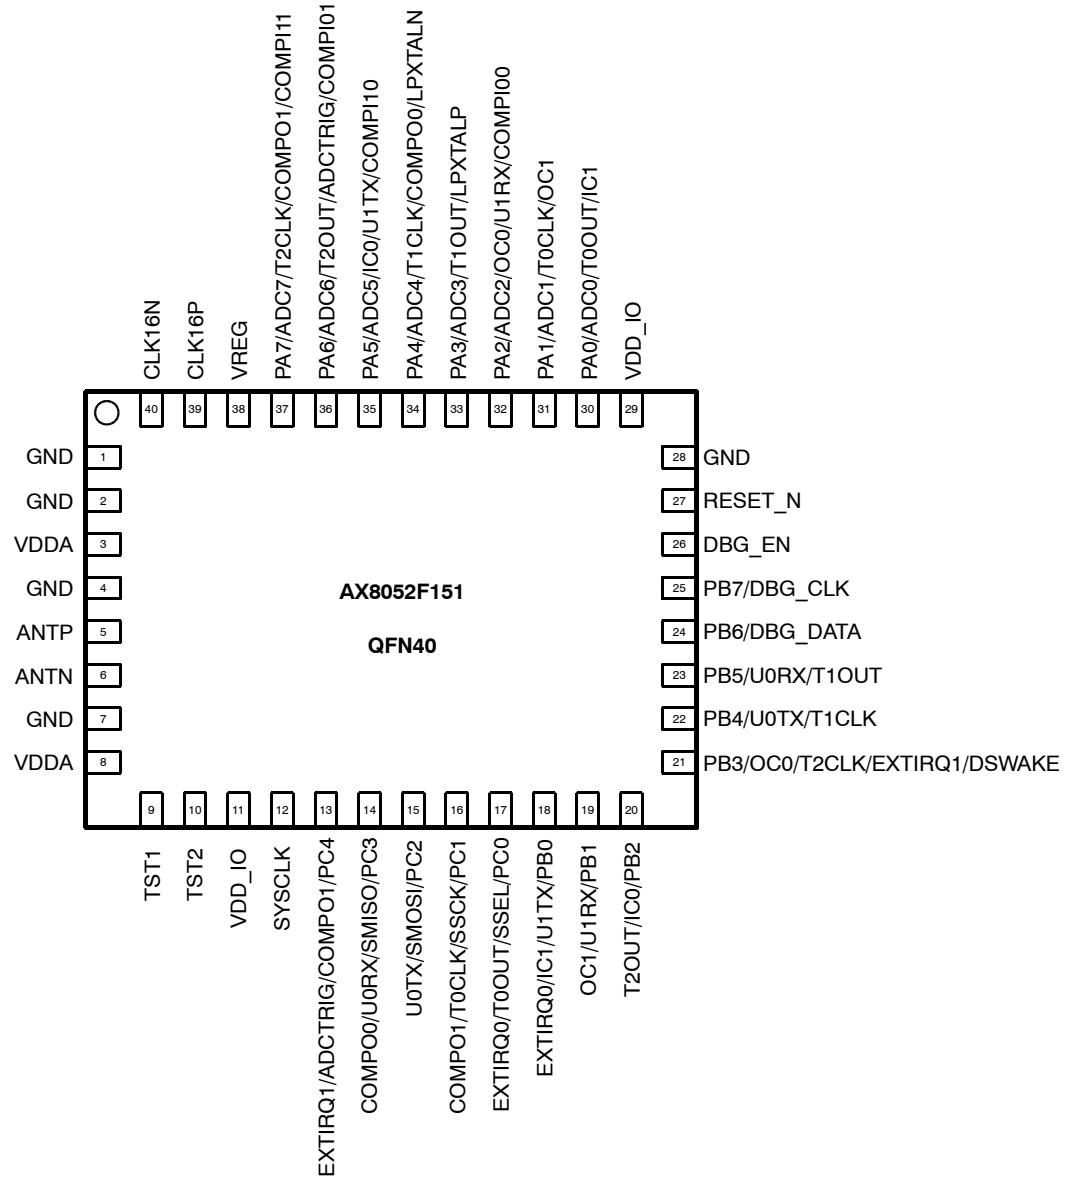

Figure 2. Pinout Drawing (Top View)

SPECIFICATIONS

Table 3. ABSOLUTE MAXIMUM RATINGS

| Symbol | Description | Condition | Min | Max | Units |
|------------------|--|-----------|-------|------|-------|
| VDD_IO | Supply voltage | | -0.5 | 5.5 | V |
| IDD | Supply current | | | 100 | mA |
| P _{tot} | Total power consumption | | | 800 | mW |
| P _i | Absolute maximum input power at receiver input | | | 15 | dBm |
| I _{I1} | DC current into any pin except ANTP, ANTN | | -10 | 10 | mA |
| I _{I2} | DC current into pins ANTP, ANTN | | -100 | 100 | mA |
| I _O | Output Current | | | 40 | mA |
| V _{ia} | Input voltage ANTP, ANTN pins | | -0.5 | 5.5 | V |
| | Input voltage digital pins | | -0.5 | 5.5 | V |
| V _{es} | Electrostatic handling | HBM | -2000 | 2000 | V |
| T _{amb} | Operating temperature | | -40 | 85 | °C |
| T _{stg} | Storage temperature | | -65 | 150 | °C |
| T _j | Junction Temperature | | | 150 | °C |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC Characteristics

Table 4. SUPPLIES

| Symbol | Description | Condition | Min | Typ | Max | Units |
|--------------------------|---|---|-----|-----|-----|-------|
| T _{AMB} | Operational ambient temperature | | -40 | 27 | 85 | °C |
| VDD_IO | I/O and voltage regulator supply voltage | RX operation or TX operation up to 4 dBm output power | 2.2 | 3.0 | 3.6 | V |
| | | TX operation up to 16 dBm output power | 2.4 | 3.0 | 3.6 | |
| | | Transceiver switched off | 1.8 | 3.0 | 3.6 | |
| VDD _{IO_R1} | I/O voltage ramp for reset activation; Note 1 | Ramp starts at VDD_IO ≤ 0.1 V | 0.1 | | | V/ms |
| VDD _{IO_R2} | I/O voltage ramp for reset activation; Note 1 | Ramp starts at 0.1 V < VDD_IO < 0.7 V | 3.3 | | | V/ms |
| VREG | Internally regulated analog supply voltage | Power-down mode AX5051_PWRMODE = 0x00 | | 1.7 | | V |
| | | All other power modes | 2.1 | 2.5 | 2.8 | V |
| I _{DEEPSLEEP} | Deep Sleep current | | | 500 | | nA |
| I _{SLEEP256PIN} | Sleep current, 256 Bytes RAM retained | Wakeup from dedicated pin | | 900 | | nA |
| I _{SLEEP256} | Sleep current, 256 Bytes RAM retained | Wakeup Timer running at 640 Hz | | 1.3 | | μA |
| I _{SLEEP4K} | Sleep current, 4.25 kBytes RAM retained | Wakeup Timer running at 640 Hz | | 1.9 | | μA |
| I _{SLEEP8K} | Sleep current, 8.25 kBytes RAM retained | Wakeup Timer running at 640 Hz | | 2.6 | | μA |
| I _{RX-HS} | Current consumption RX; High sensitivity mode: VCO_I = 001; REF_I = 011 | Bit rate 10 kbit/s | | 19 | | mA |
| I _{RX-LP} | Current consumption RX; Low power mode: VCO_I = 001; REF_I = 101 | Bit rate 10 kbit/s | | 17 | | mA |

1. If VDD_IO ramps cannot be guaranteed, an external reset circuit is recommended, see the AX8052 Application Note: Power On Reset.
2. The PA voltage is regulated to 2.5 V. For VDD_IO levels in the range of 2.2 V to 2.5 V the output power drops by typically 1 dBm.

Table 4. SUPPLIES

| Symbol | Description | Condition | Min | Typ | Max | Units |
|------------------------|--|--------------------------|-----|------|-----|------------|
| I _{TX} | Current consumption TX VCO_I = 001; REF_I = 011; LOCURST= 1 Note 2 | 868 MHz, 10 dBm | | 22 | | mA |
| | | 868 MHz, 0 dBm | | 13 | | |
| | | 868 MHz, 15 dBm | | 45 | | |
| | | 433 MHz, 10 dBm | | 22 | | |
| | | 433 MHz, 0 dBm | | 13 | | |
| | | 433 MHz, 15 dBm | | 45 | | |
| TX _{varvdd} | Variation of output power over voltage | VDD_IO > 2.5 V, Note 2 | | ±0.5 | | dB |
| TX _{vartemp} | Variation of output power over temperature | VDD_IO > 2.5 V, Note 2 | | ±0.5 | | dB |
| I _{MCU} | Microcontroller running power consumption | All peripherals disabled | | 150 | | μA/ MHz |
| I _{VSUP} | Voltage supervisor | Run and standby mode | | 85 | | μA |
| I _{XTALOSC} | Crystal oscillator current (RF reference oscillator) | 16 MHz | | 160 | | μA |
| I _{LFXTALOSC} | Low frequency crystal oscillator current | 32 kHz | | 700 | | nA |
| I _{RCOSC} | Internal oscillator current | 20 MHz | | 210 | | μA |
| I _{LPOSC} | Internal Low Power Oscillator current | 10 kHz | | 650 | | nA |
| | | 640 Hz | | 210 | | nA |
| I _{ADC} | ADC current | 311 kSample/s, DMA 5 MHz | | 1.1 | | mA |
| I _{WOR} | Typical wake-on-radio duty cycle current | 1 s, 100 kbps | | 6 | | μA |

1. If VDD_IO ramps cannot be guaranteed, an external reset circuit is recommended, see the AX8052 Application Note: Power On Reset.
2. The PA voltage is regulated to 2.5 V. For VDD_IO levels in the range of 2.2 V to 2.5 V the output power drops by typically 1 dBm.

Note on current consumption in TX mode

To achieve best output power the matching network has to be optimized for the desired output power and frequency. As a rule of thumb a good matching network produces about 50% efficiency with the AX8052F151 power amplifier although over 90% are theoretically possible. A typical matching network has between 1 dB and 2 dB loss (P_{loss}).

The current consumption can be calculated as

$$I_{TX}[mA] = \frac{1}{PA_{efficiency}} \times 10^{\frac{P_{out}[dBm] + P_{loss}[dB]}{10}} \div 2.5V + I_{offset}$$

I_{offset} is about 12 mA for the VCO at 400 – 470 MHz and 11 mA for 800 – 940 MHz. The following table shows calculated current consumptions versus output power for P_{loss} = 1 dB, PA_{efficiency} = 0.5 and I_{offset} = 11 mA at 868 MHz.

Table 5.

| Pout [dBm] | I [mA] |
|------------|--------|
| 0 | 13.0 |
| 1 | 13.2 |
| 2 | 13.6 |
| 3 | 14.0 |

| | |
|----|-------|
| 4 | 14.5 |
| 5 | 15.1 |
| 6 | 16.0 |
| 7 | 17.0 |
| 8 | 18.3 |
| 9 | 20.0 |
| 10 | 22.0 |
| 11 | 24.6 |
| 12 | 27.96 |
| 13 | 32.1 |
| 14 | 37.3 |
| 15 | 43.8 |

The AX8052F151 power amplifier runs from the regulated VDD supply and not directly from the battery. This has the advantage that the current and output power do not vary much over supply voltage and temperature from 2.55 V to 3.6 V supply voltage. Between 2.55 V and 2.2 V a drop of about 1 dB in output power occurs.

Table 6. LOGIC

| Symbol | Description | Condition | Min | Typ | Max | Units |
|------------------------|---|--------------------------|------|------|-----------|------------------|
| Digital Inputs | | | | | | |
| V_{T+} | Schmitt trigger low to high threshold point | $VDD_IO = 3.3\text{ V}$ | | 1.55 | | V |
| V_{T-} | Schmitt trigger high to low threshold point | | | 1.25 | | V |
| V_{IL} | Input voltage, low | | | | 0.8 | V |
| V_{IH} | Input voltage, high | | 2.0 | | | V |
| V_{IPA} | Input voltage range, Port A | | -0.5 | | VDD_IO | V |
| V_{IPBC} | Input voltage range, Ports B, C | | -0.5 | | 5.5 | V |
| I_L | Input leakage current | | -10 | | 10 | μA |
| R_{PU} | Programmable Pull-Up Resistance | | | 65 | | $\text{k}\Omega$ |
| Digital Outputs | | | | | | |
| I_{OH} | P[ABC]x Output Current, high | $V_{OH} = 2.4\text{ V}$ | 8 | | | mA |
| I_{OL} | P[ABC]x Output Current, low | $V_{OL} = 0.4\text{ V}$ | 8 | | | mA |
| I_{OH} | SYSCLK Output Current, high | $V_{OH} = 2.4\text{ V}$ | 8 | | | mA |
| I_{OL} | SYSCLK Output Current, low | $V_{OL} = 0.4\text{ V}$ | 8 | | | mA |
| I_{OZ} | Tri-state output leakage current | | -10 | | 10 | μA |

AC Characteristics

Table 7. CRYSTAL OSCILLATOR (RF REFERENCE OSCILLATOR)

| Symbol | Description | Condition | Min | Typ | Max | Units |
|----------------|---|------------------------------------|------|------|-----|------------|
| f_{XTAL} | Crystal frequency | Notes 1, 3 | 15.5 | 16 | 25 | MHz |
| $g_{m_{osc}}$ | Transconductance oscillator | AX5051_XTALOSCGM = 0000 | | 1 | | mS |
| | | AX5051_XTALOSCGM = 0001 | | 2 | | |
| | | AX5051_XTALOSCGM = 0010 default | | 3 | | |
| | | AX5051_XTALOSCGM = 0011 | | 4 | | |
| | | AX5051_XTALOSCGM = 0100 | | 5 | | |
| | | AX5051_XTALOSCGM = 0101 | | 6 | | |
| | | AX5051_XTALOSCGM = 0110 | | 6.5 | | |
| | | AX5051_XTALOSCGM = 0111 | | 7 | | |
| | | AX5051_XTALOSCGM = 1000 | | 7.5 | | |
| | | AX5051_XTALOSCGM = 1001 | | 8 | | |
| | | AX5051_XTALOSCGM = 1010 | | 8.5 | | |
| | | AX5051_XTALOSCGM = 1011 | | 9 | | |
| | | AX5051_XTALOSCGM = 1100 | | 9.5 | | |
| | | AX5051_XTALOSCGM = 1101 | | 10 | | |
| | | AX5051_XTALOSCGM = 1110 | | 10.5 | | |
| | | AX5051_XTALOSCGM = 1111 | | 11 | | |
| C_{osc} | Programmable tuning capacitors at pins CLK16N and CLK16P | AX5051_XTALCAP = 000000 default | | 2 | | pF |
| | | AX5051_XTALCAP = 111111 | | 33 | | |
| $C_{osc-lsb}$ | Programmable tuning capacitors, increment per LSB of AX5051_XTALCAP | | | 0.5 | | pF |
| f_{ext} | External clock input (TCXO) | Notes 2, 3 | 15.5 | 15 | 25 | MHz |
| $R_{IN_{osc}}$ | Input DC impedance | | 10 | | | k Ω |

1. Tolerances and start-up times depend on the crystal used. Depending on the RF frequency and channel spacing the IC must be calibrated to the exact crystal frequency using the readings of the register AX5051_TRKFREQ.
2. If an external clock is used, it should be input via an AC coupling at pin CLK16P with the oscillator powered up and AX5051_XTALCAP = 000000
3. Lower frequencies than 15.5 MHz or higher frequencies than 25 MHz can be used. However, not all typical RF frequencies can then be generated.

Table 8. RF FREQUENCY GENERATION SUBSYSTEM (SYNTHESIZER)

| Symbol | Description | Condition | Min | Typ | Max | Units |
|------------------------|---|--|-----|----------|-----|--------|
| f _{REF} | Reference frequency | Note 1 | | 16 24 | | MHz |
| f _{range_hi} | Frequency range | BANDSEL = 0 | 800 | | 940 | MHz |
| f _{range_low} | | BANDSEL = 1 | 400 | | 470 | |
| f _{RESO} | Frequency resolution | | 1 | | | Hz |
| BW ₁ | Synthesizer loop bandwidth VCO current: VCO_I = 001 | Loop filter configuration: FLT = 01 Charge pump current: PLLCPI = 010 | | 100 | | kHz |
| BW ₂ | | Loop filter configuration: FLT = 01 Charge pump current: PLLCPI = 001 | | 50 | | |
| BW ₃ | | Loop filter configuration: FLT = 11 Charge pump current: PLLCPI = 010 | | 200 | | |
| BW ₄ | | Loop filter configuration: FLT = 10 Charge pump current: PLLCPI = 010 | | 500 | | |
| T _{set1} | Synthesizer settling time for 1 MHz step as typically required for RX/TX switching VCO current: VCO_I = 001 | Loop filter configuration: FLT = 01 Charge pump current: PLLCPI = 010 | | 15 | | μs |
| T _{set2} | | Loop filter configuration: FLT = 01 Charge pump current: PLLCPI = 001 | | 30 | | |
| T _{set3} | | Loop filter configuration: FLT = 11 Charge pump current: PLLCPI = 010 | | 7 | | |
| T _{set4} | | Loop filter configuration: FLT = 10 Charge pump current: PLLCPI = 010 | | 3 | | |
| T _{start1} | Synthesizer start-up time if crystal oscillator and reference are running VCO current: VCO_I = 001 | Loop filter configuration: FLT = 01 Charge pump current: PLLCPI = 010 | | 25 | | μs |
| T _{start2} | | Loop filter configuration: FLT = 01 Charge pump current: PLLCPI = 001 | | 50 | | |

CIRCUIT DESCRIPTION

The AX8052F151 is a single chip ultra-low-power RF-microcontroller SoC primarily for use in SRD bands. The on-chip transceiver consists of a fully integrated RF front-end with modulator, and demodulator. Base band data processing is implemented in an advanced and flexible communication controller that enables user friendly communication.

The AX8052F151 contains a high speed microcontroller compatible to the industry standard 8052 instruction set. It contains 64 kBytes of FLASH and 8.25 kBytes of internal SRAM.

The AX8052F151 features 3 16-bit general purpose timers with $\Sigma\Delta$ capability, 2 output compare units for generating PWM signals, 2 input compare units to record timings of external signals, 2 16-bit wakeup timers, a watchdog timer, 2 UARTs, a Master/Slave SPI controller, a 10-bit 500 kSample/s A/D converter, 2 analog comparators, a temperature sensor, a 2 channel DMA controller, and a dedicated AES crypto controller. Debugging is aided by a dedicated hardware debug interface controller that connects using a 3-wire protocol (1 dedicated wire, 2 shared with GPIO) to the PC hosting the debug software.

While the radio carrier/LO synthesizer can only be clocked by the crystal oscillator (carrier stability requirements dictate a high stability reference clock in the MHz range), the microcontroller and its peripherals provide extremely flexible clocking options. The system clock that clocks the microcontroller, as well as peripheral clocks, can be selected from one of the following clock sources: the crystal oscillator, an internal high speed 20 MHz oscillator, an internal low speed 640 Hz/10 kHz oscillator, or the low frequency crystal oscillator. Prescalers offer additional flexibility with their programmable divide by a power of two capability. To improve the accuracy of the internal oscillators, both oscillators may be slaved to the crystal oscillator.

AX8052F151 can be operated from a 2.2 V to 3.6 V power supply over a temperature range of -40°C to 85°C , it consumes 11 – 45 mA for transmitting, depending on the output power, 19 – 20 mA for receiving in high sensitivity mode and 17 – 18 mA for receiving in low power mode.

The AX8052F151 features make it an ideal interface for integration into various battery powered SRD solutions such as ticketing or as transceiver for telemetric applications e.g. in sensors. As primary application, the transceiver is intended for UHF radio equipment in accordance with the European Telecommunication Standard Institute (ETSI) specification EN 300 220-1 and the US Federal Communications Commission (FCC) standard CFR47, part 15. The use of AX8052F151 in accordance to FCC Par 15.247, allows for improved range in the 915 MHz band. Additionally AX8052F151 is compatible with the low frequency standards of 802.15.4 (ZigBee) and suited for systems targeting compliance with Wireless M-Bus standard EN 13757-4:2005.

The AX8052F151 sends and receives data in frames. This standard operation mode is called Frame Mode. Pre and post ambles as well as checksums can be generated automatically.

AX8052F151 supports any data rate from 1 kbps to 350 kbps for FSK and MSK, from 1 kbps to 600 kbps for ASK and from 10 kbps to 600 kbps for PSK. To achieve optimum performance for specific data rates and modulation schemes several register settings to configure the AX8052F151 are necessary, they are outlined in the following, for details see the AX5051 Programming Manual.

Spreading and despreading is possible on all data rates and modulation schemes. The net transfer rate is reduced by a factor of 15 in this case. For ZigBee either 600 or 300 kbps modes have to be chosen.

The receiver supports multi-channel operation for all data rates and modulation schemes.

Microcontroller

The AX8052F151 microcontroller core executes the industry standard 8052 instruction set. Unlike the original 8052, many instructions are executed in a single cycle. The system clock and thus the instruction rate can be programmed freely from DC to 20 MHz.

Memory Architecture

The AX8052 Microcontroller features the highest bandwidth memory architecture of its class. Figure 4 shows the memory architecture. Three bus masters may initiate bus cycles:

- The AX8052 Microcontroller Core
- The Direct Memory Access (DMA) Engine
- The Advanced Encryption Standard (AES) Engine

Bus targets include:

- Two individual 4 kBytes RAM blocks located in X address space, which can be simultaneously accessed and individually shut down or retained during sleep mode
- A 256 Byte RAM located in internal address space, which is always retained during sleep mode
- A 64 kBytes FLASH memory located in code space.
- Special Function Registers (SFR) located in internal address space accessible using direct address mode instructions
- Additional Registers located in X address space (X Registers)

The upper half of the FLASH memory may also be accessed through the X address space. This simplifies and makes the software more efficient by reducing the need for generic pointers.

NOTE: Generic pointers include, in addition to the address, an address space tag.

AX8052F151

Figure 4. AX8052 Memory Architecture

SFR Registers are also accessible through X address space, enabling indirect access to SFR registers. This allows driver code for multiple identical peripherals (such as UARTs or Timers) to be shared.

The 4 word \times 16 bit fully associative cache and a pre-fetch controller hide the latency of the FLASH.

The AX8052 Memory Architecture is fully parallel. All bus masters may simultaneously access different bus targets during each system clock cycle. Each bus target includes an arbiter that resolves access conflicts. Each arbiter ensures that no bus master can be starved.

Both 4 kBytes RAM blocks may be individually retained or switched off during sleep mode. The 256 Byte RAM is always retained during sleep mode.

The AES engine accesses memory 16 bits at a time. It is therefore slightly faster to align its buffers on even addresses.

Memory Map

The AX8052, like the other industry standard 8052 compatible microcontrollers, uses a Harvard architecture. Multiple address spaces are used to access code and data. Figure 5 shows the AX8052 memory map.

AX8052F151

Figure 5. AX8052 Memory Map

The AX8052 uses P or Code Space to access its program. Code space may also be read using the MOVC instruction.

Smaller amounts of data can be placed in the Internal (see Note) or Data Space. A distinction is made in the upper half of the Data Space between direct accesses (MOV reg,addr; MOV addr,reg) and indirect accesses (MOV reg,@Ri; MOV @Ri,reg; PUSH; POP); Direct accesses are routed to the Special Function Registers, while indirect accesses are routed to the internal RAM.

NOTE: The origin of Internal versus External (X) Space is historical. External Space used to be outside of the chip on the original 8052 Microcontrollers.

Large amounts of data can be placed in the External or X Space. It can be accessed using the MOVX instructions. Special Function Registers, as well as additional Microcontroller Registers (XREG) and the Radio Registers (RREG) are also mapped into the X Space.

Detailed documentation of the Special Function Registers (SFR) and additional Microcontroller Registers can be found in the AX8052 Programming Manual.

The Radio Registers are documented in the AX5051 Programming Manual. Register Addresses given in the

AX5051 Programming Manual are relative to the beginning of RREG, i.e. 0x4000 must be added to these addresses. It is recommended that the provided AX8052F151.h header file is used; Radio Registers are prefixed with AX5051_ in the AX8052F151.h header file to avoid clashes of same-name Radio Registers with AX8052 registers.

Normally, accessing Radio Registers through the RREG address range is adequate. Since Radio Register accesses have a higher latency than other AX8052 registers, the AX8052 provides a method for non-blocking access to the Radio Registers. Accessing the RREG (nb) address range initiates a Radio Register access, but does not wait for its completion. The details of mechanism is documented in the Radio Interface section of the AX8052 Programming Manual.

The FLASH memory is organized as 64 pages of 1 kBytes each. Each page can be individually erased. The write word size is 16 Bits. The last 1 kByte page is dedicated to factory calibration data and should not be overwritten.

Power Management

The microcontroller power mode can be selected independently from the transceiver. The microcontroller supports the following power modes:

Table 17. POWER MANAGEMENT

| PCON register | Name | Description |
|---------------|-----------|---|
| 00 | RUNNING | The microcontroller and all peripherals are running. Current consumption depends on the system clock frequency and the enabled peripherals and their clock frequency. |
| 01 | STANDBY | The microcontroller is stopped. All register and memory contents are retained. All peripherals continue to function normally. Current consumption is determined by the enabled peripherals. STANDBY is exited when any of the enabled interrupts become active. |
| 10 | SLEEP | The microcontroller and its peripherals, except GPIO and the system controller, are shut down. Their register settings are lost. The internal RAM is retained. The external RAM is split into two 4 kByte blocks. Software can determine individually for both blocks whether contents of that block are to be retained or lost. SLEEP can be exited by any of the enabled GPIO or system controller interrupts. For most applications this will be a GPIO or wakeup timer interrupt. |
| 11 | DEEPSLEEP | The microcontroller, all peripherals and the transceiver are shut down. Only 4 bytes of scratch RAM are retained. DEEPSLEEP can only be exited by tying the PB3 pin low. |

Clocking

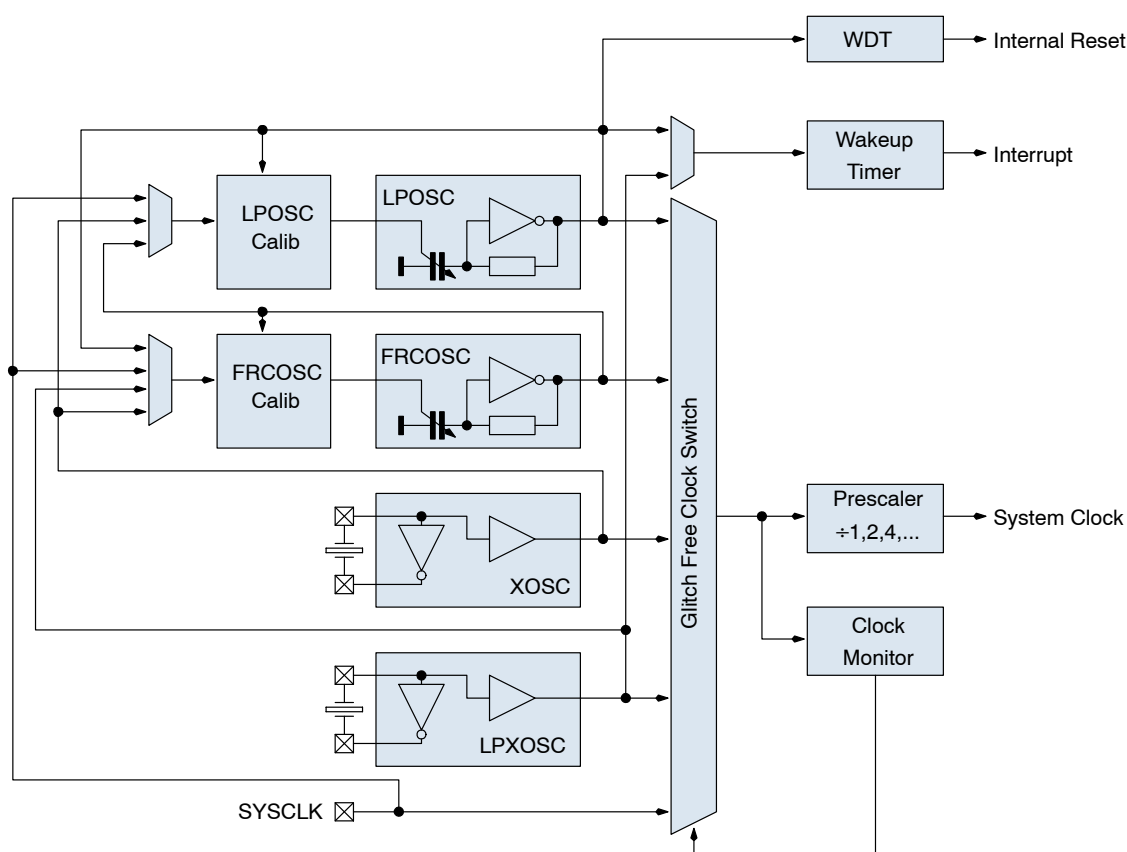

Figure 6. Clock System Diagram

The system clock can be derived from any of the following clock sources:

- The crystal oscillator (RF reference oscillator, typically 16 MHz, via SYSCLK)
- The low speed crystal oscillator (typical 32 kHz tuning fork)
- The internal high speed RC (20 MHz) oscillator
- The internal low power (640 Hz/10 kHz) oscillator

An additional pre-scaler allows the selected oscillator to be divided by a power of two. After reset, the microcontroller starts with the internal high speed RC oscillator selected and divided by two. I.e. at start-up, the microcontroller runs with 10 MHz \pm 10%. Clocks may be switched any time by writing to the CLKCON register. In order to prevent clock glitches, the switching takes approximately $2 \cdot (T_1 + T_2)$, where T_1 and T_2 are the periods

of the old and the new clock. Switching may take longer if the new oscillator first has to start up. Internal oscillators start up instantaneously, but crystal oscillators may take a considerable amount of time to start the oscillation. CLKSTAT can be read to determine the clock switching status.

A programmable clock monitor resets the CLKCON register when no system clock transitions are found during a programmable time interval, thus reverts to the internal RC oscillator.

Both internal oscillators can be slaved to one of the crystal oscillators to increase the accuracy of the oscillation frequency. While the reference oscillator runs, the internal oscillator is slaved to the reference frequency by a digital frequency locked loop. When the reference oscillator is switched off, the internal oscillator continues to run unslaved with the last frequency setting.

Reset and Interrupts

After reset, the microcontroller starts executing at address 0x0000. Several events can lead to resetting the microcontroller core:

- POR or hardware RESET_N pin activated and released
- Leaving SLEEP or DEEPSLEEP mode
- Watchdog Reset
- Software Reset

The reset cause can be determined by reading the PCON register.

The microcontroller supports 22 interrupt sources. Each interrupt can be individually enabled and can be programmed to have one of two possible priorities. The interrupt vectors are located at 0x0003, 0x000B,..., 0x00AB.

Debugging

A hardware debug unit considerably eases debugging compared to other 8052 microcontrollers. It allows to reliably stop the microcontroller at breakpoints even if the stack is smashed. The debug unit communicates with the host PC running the debugger using a 3 wire interface. One wire is dedicated (DBG_EN), while two wires are shared with GPIO pins (PB6, PB7). When DBG_EN is driven high, PB6 and PB7 convert to debug interface pins and the GPIO functionality is no longer available. A pin emulation feature however allows bits PINB[7:6] to be set and PORTB[7:6] and DIRB[7:6] to be read by the debugger software. This allows for example switches or LEDs connected to the PB6, PB7 pins to be emulated in the debugger software whenever the debugger is active.

In order to protect the intellectual property of the firmware developer, the debug interface can be locked using a developer-selectable 64-bit key. The debug interface is then disabled and can only be enabled with the knowledge of this 64-bit key. Therefore, unauthorized persons cannot read the firmware through the debug interface, but debugging is still possible for authorized persons. Secure erase can be initiated

without key knowledge; secure erase ensures that the main FLASH array is completely erased before erasing the key, reverting the chip into factory state.

The DebugLink peripheral looks like an UART to the microcontroller, and allows exchange of data between the microcontroller and the host PC without disrupting program execution.

Timer, Output Compare and Input Capture

The AX8052F151 features three general purpose 16-bit timers. Each timer can be clocked by the system clock, any of the available oscillators, or a dedicated input pin. The timers also feature a programmable clock inversion, a programmable prescaler that can divide by powers of two, and an optional clock synchronization logic that synchronizes the clock to the system clock. All three counters are identical and feature four different counting modes, as well as a $\Sigma\Delta$ mode that can be used to output an analog value on a dedicated digital pin only employing a simple RC lowpass filter.

Two output compare units work in conjunction with one of the timers to generate PWM signals.

Two input capture units work in conjunction with one of the timers to measure transitions on an input signal.

For software timekeeping, two additional 16-bit wakeup timers with 4 16-bit event registers are provided, generating an interrupt on match events.

UART

The AX8052F151 features two universal asynchronous receiver transmitters. They use one of the timers as baud rate generator. Word length can be programmed from 5 to 9 bits.

SPI Master/Slave Controller

The AX8052F151 features a master/slave SPI controller. Both 3 and 4 wire SPI variants are supported. In master mode, any of the on-chip oscillators or the system clock may be selected as clock source. An additional prescaler with divide by two capability provides additional clocking flexibility. Shift direction, as well as clock phase and inversion, are programmable.

ADC, Analog Comparators and Temperature Sensor

The AX8052F151 features a 10-bit, 500 kSample/s Analog to Digital converter. Figure 7 shows the block diagram of the ADC. The ADC supports both single ended and differential measurements. It uses an internal reference of 1 V. $\times 1$, $\times 10$ and $\times 0.1$ gain modes are provided. The ADC may digitize signals on PA0...PA7, as well as VDD_IO and an internal temperature sensor. The user can define four channels which are then converted sequentially and stored in four separate result registers. Each channel configuration consists of the multiplexer and the gain setting.

The AX8052F151 contains an on-chip temperature sensor. Built-in calibration logic allows the temperature sensor to be calibrated in °C, °F or any other user defined temperature scale.

The AX8052F151 also features two analog comparators. Each comparator can either compare two voltages on dedicated PA pins, or one voltage against the internal 1 V

reference. The comparator output can be routed to a dedicated digital output pin or can be read by software. The comparators are clocked with the system clock.

Figure 7. ADC Block Diagram

DMA Controller

The AX8052F151 features a dual channel DMA engine. Each DMA channel can either transfer data from XRAM to almost any peripheral on chip, or from almost any peripheral to XRAM. Both channels may also be cross-linked for memory-memory transfers. The DMA channels use buffer descriptors to find the buffers where data is to be retrieved or placed, thus enabling very flexible buffering strategies.

The DMA channels access XRAM in a cycle steal fashion. They access XRAM whenever XRAM is not used by the microcontroller. Their priority is lower than the microcontroller, thus interfering very little with the microcontroller. Additional logic prevents starvation of the DMA controller.

AES Engine

The AX8052F151 contains a dedicated engine for the government mandated Advanced Encryption Standard (AES). It features a dedicated DMA engine and reads input data as well as key stream data from the XRAM, and writes output data into a programmable buffer in the XRAM. The round number is programmable; the chip therefore supports AES-128, AES-192, and AES-256, as well as higher security proprietary variants. Keystream (key expansion) is performed in software, adding to the flexibility of the AES engine. ECB (electronic codebook), CFB (cipher feedback) and OFB (output feedback) modes are directly supported without software intervention.

Crystal Oscillator (RF Reference Oscillator)

The on-chip crystal oscillator allows the use of an inexpensive quartz crystal as the RF generation subsystem's timing reference. Although a wider range of crystal frequencies can be handled by the crystal oscillator circuit, it is recommended to use 16 MHz as reference frequency for ASK and PSK modulations independent of the data rate. For FSK it is recommended to use a 16 MHz crystal for data rates below 200 kbps and 24 MHz for data rates above 200 kbps.

The oscillator circuit is enabled by programming the AX5051_PWRMODE register. At power-up it is not enabled.

To adjust the circuit's characteristics to the quartz crystal being used, without using additional external components, both the transconductance and the tuning capacitance of the crystal oscillator can be programmed.

The transconductance is programmed via register bits XTALOSCGM[3:0] in register AX5051_XTALOSC.

The integrated programmable tuning capacitor bank makes it possible to connect the oscillator directly to pins CLK16N and CLK16P without the need for external capacitors. It is programmed using bits XTALCAP[5:0] in register AX5051_XTALCAP.

To synchronize the receiver frequency to a carrier signal, the oscillator frequency could be tuned using the capacitor bank however, the recommended method to implement frequency synchronization is to make use of the high resolution RF frequency generation sub-system together with the Automatic Frequency Control, both are described further down.

Alternatively a single ended reference (TCXO, CXO) may be used. The CMOS levels should be applied to CLK16P via an AC coupling with the crystal oscillator enabled.

SYSCLOCK Output

The SYSCLOCK pin outputs the RF reference clock signal divided by a programmable integer. Divisions from 1 to 2048 are possible. For divider ratios > 1 the duty cycle is 50%. Bits SYSCLOCK[3:0] in the AX5051_PINCFG1 register set the divider ratio. The SYSCLOCK output can be disabled.

Outputting a frequency that is identical to the IF frequency (default 1 MHz) on the SYSCLOCK pin is not recommended

during receive operation, since it requires extensive decoupling on the PCB to avoid interference.

Power-on-Reset (POR) and RESET_N Input

AX8052F151 has an integrated power-on-reset block which is edge sensitive to VDD_IO. For many common application cases no external reset circuitry is required. However, if VDD_IO ramps cannot be guaranteed, an external reset circuit is recommended. For detailed recommendations and requirements see the AX8052 Application Note: Power On Reset.

After POR or reset all registers are set to their default values.

The RESET_N pin contains a weak pull-up. However, it is strongly recommended to connect the RESET_N pin to VDD_IO if not used, for additional robustness.

The AX8052F151 can be reset by software as well. The microcontroller is reset by writing 1 to the SWRESET bit of the PCON register. The transmitter can be reset by first writing 1 and then 0 to the RST bit in the AX5051_PWRMODE register.

Ports

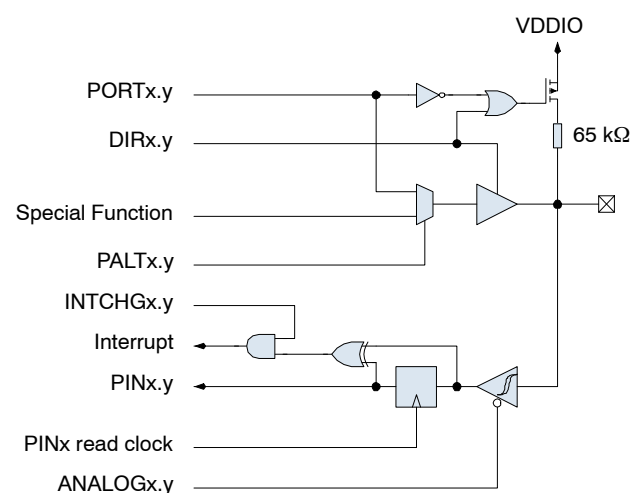

Figure 8. Port Pin Schematic

Figure 8 shows the GPIO logic. The DIR register bit determines whether the port pin acts as an output (1) or an input (0).

If configured as an output, the PALT register bit determines whether the port pin is connected to a peripheral output (1), or used as a GPIO pin (0). In the latter case, the PORT register bit determines the port pin drive value.

If configured as an input, the PORT register bit determines whether a pull-up resistor is enabled (1) or disabled (0). Inputs have Schmitt-trigger characteristic. Port A inputs may be disabled by setting the ANALOGA register bit; this prevents additional current consumption if the voltage level of the port pin is mid-way between logic low and logic high, when the pin is used as an analog input.

AX8052F151

Port A, B and C pins may interrupt the microcontroller if their level changes. The INTCHG register bit enables the interrupt. The PIN register bit reflects the value of the port

pin. Reading the PIN register also resets the interrupt if interrupt on change is enabled.

TRANSCIVER

The transceiver block is controllable through its registers, which are mapped into the X data space of the microcontroller. The transceiver block features its own 4 word × 10 bit FIFO. The microcontroller can either be interrupted at a programmable FIFO fill level, or one of the DMA channels can be instructed to transfer between XRAM and the transceiver FIFO.

RF Frequency Generation Subsystem

The RF frequency generation subsystem consists of a fully integrated synthesizer, which multiplies the reference frequency from the crystal oscillator to get the desired RF frequency. The advanced architecture of the synthesizer enables frequency resolutions of 1 Hz, as well as fast settling times of 5 – 50 μ s depending on the settings (see section AC Characteristics). Fast settling times mean fast start-up and fast RX/TX switching, enabling low-power system design.

For receive operation the RF frequency is fed to the mixer, for transmit operation to the power-amplifier.

The frequency must be programmed to the desired carrier frequency. The RF frequency shift by the IF frequency that is required for RX operation, is automatically set when the receiver is activated and does not need to be programmed by the user. The default IF frequency is 1 MHz. It can be programmed to other values. Changing the IF frequency and thus the center frequency of the digital channel filter can be used to adapt the blocking performance of the device to specific system requirements.

The synthesizer loop bandwidth can be programmed. This serves three purposes:

1. Start-up time optimization, start-up is faster for higher synthesizer loop bandwidths
2. TX spectrum optimization, phase-noise at 300 kHz to 1 MHz distance from the carrier improves with lower synthesizer loop bandwidths

3. Adaptation of the bandwidth to the data-rate. For transmission of FSK and MSK it is required that the synthesizer bandwidth must be in the order of the data-rate.

VCO

An on-chip VCO converts the control voltage generated by the charge pump and loop filter into an output frequency. This frequency is used for transmit as well as for receive operation. The frequency can be programmed in 1 Hz steps in the AX5051_FREQ registers. For operation in the 433 MHz band, the BANDSEL bit in the AX5051_PLLLOOP register must be programmed.

VCO Auto-Ranging

The AX8052F151 has an integrated auto-ranging function, which allows to set the correct VCO range for specific frequency generation subsystem settings automatically. Typically it has to be executed after power-up. The function is initiated by setting the RNG_START bit in the AX5051_PLLRANGING register. The bit is readable and a 0 indicates the end of the ranging process. The RNGERR bit indicates the correct execution of the auto-ranging.

Loop Filter and Charge Pump

The AX8052F151 internal loop filter configuration together with the charge pump current sets the synthesizer loop band width. The loop-filter has three configurations that can be programmed via the register bits FLT[1:0] in register AX5051_PLLLOOP, the charge pump current can be programmed using register bits PLLCPI[1:0] also in register AX5051_PLLLOOP. Synthesizer bandwidths are typically 50 – 500 kHz depending on the AX5051_PLLLOOP settings, for details see the section: AC Characteristics.

Registers

Table 18. REGISTERS

| Register | Bits | Purpose |
|-------------------------------------|-------------|---|
| AX5051_PLLLOOP | FLT[1:0] | Synthesizer loop filter bandwidth, recommended usage is to increase the bandwidth for faster settling time, bandwidth increases of factor 2 and 5 are possible. |
| | PLLCPI[2:0] | Synthesizer charge pump current, recommended usage is to decrease the bandwidth (and improve the phase-noise) for low data-rate transmissions. |
| | BANDSEL | Switches between 868 MHz / 915 MHz and 433 MHz bands |
| AX5051_FREQ | | Programming of the carrier frequency |
| AX5051_IFFREQHI, AX5051_IFFREQLO | | Programming of the IF frequency |
| AX5051_PLLRANGING | | Initiate VCO auto-ranging and check results |

RF Input and Output Stage (ANTP/ANTN)

The AX8052F151 uses fully differential antenna pins. RX/TX switching is handled internally. An external RX/TX switch is not required.

LNA

The LNA amplifies the differential RF signal from the antenna and buffers it to drive the I/Q mixer. An external matching network is used to adapt the antenna impedance to the IC impedance. A DC feed to the regulated supply voltage VREG must be provided at the antenna pins. For recommendations see section: Application Information.

I/Q Mixer

The RF signal from the LNA is mixed down to an IF of typically 1 MHz. I- and Q-IF signals are buffered for the analog IF filter.

PA

In TX mode the PA drives the signal generated by the frequency generation subsystem out to the differential antenna terminals. The output power of the PA is programmed via bits TXRNG[3:0] in the register AX5051_TXPWR. Output power as well as harmonic content will depend on the external impedance seen by the PA, recommendations are given in the applications section.

Analog IF Filter

The mixer is followed by a complex band-pass IF filter, which suppresses the down-mixed image while the wanted signal is amplified. The center frequency of the filter is 1 MHz, with a pass-band width of 1 MHz. The RF frequency generation subsystem must be programmed in such a way that for all possible modulation schemes the IF frequency spectrum fits into the pass-band of the analog filter.

Digital IF Channel Filter and Demodulator

The digital IF channel filter and the demodulator extract the data bit-stream from the incoming IF signal. They must be programmed to match the modulation scheme as well as the data rate. Inaccurate programming will lead to loss of sensitivity.

The channel filter offers bandwidths of 40 kHz up to 600 kHz.

For detailed instructions how to program the digital channel filter and the demodulator see the AX5051 Programming Manual, an overview of the registers involved is given in the following table. The register setups typically must be done once at power-up of the device.

Table 19. REGISTERS

| Register | Remarks |
|---|--|
| AX5051_CICDEC | This register programs the bandwidth of the digital channel filter. |
| AX5051_DATARATEHI, AX5051_DATARATELO | These registers specify the receiver bit rate, relative to the channel filter bandwidth. |
| AX5051_TMGGAINHI, AX5051_TMGGAINLO | These registers specify the aggressiveness of the receiver bit timing recovery. More aggressive settings allow the receiver to synchronize with shorter preambles, at the expense of more timing jitter and thus a higher bit error rate at a given signal-to-noise ratio. |
| AX5051_MODULATION | This register selects the modulation to be used by the transmitter and the receiver, i.e. whether ASK, PSK, FSK, MSK or QPSK should be used. |
| AX5051_PHASEGAIN, AX5051_FREQGAIN, AX5051_FREQGAIN2, AX5051_AMPLGAIN | These registers control the bandwidth of the phase, frequency offset and amplitude tracking loops. Recommended settings are provided in the AX5051 Programming Manual. |
| AX5051_AGCATTACK, AX5051_AGCDECAY | These registers control the AGC (automatic gain control) loop slopes, and thus the speed of gain adjustments. The faster the bit rate, the faster the AGC loop should be. Recommended settings are provided in the AX5051 Programming Manual. |
| AX5051_TXRATE | These registers control the bit rate of the transmitter. |
| AX5051_FSKDEV | These registers control the frequency deviation of the transmitter in FSK mode. The receiver does not explicitly need to know the frequency deviation, only the channel filter bandwidth has to be set wide enough for the complete modulation to pass. |

Encoder

The encoder is located between the Framing Unit, the Demodulator and the Modulator. It can optionally transform the bit-stream in the following ways:

- It can invert the bit stream.
- It can perform differential encoding. This means that a zero is transmitted as no change in the level, and a one is transmitted as a change in the level. Differential encoding is useful for PSK, because PSK transmissions

can be received either as transmitted or inverted, due to the uncertainty of the initial phase. Differential encoding / decoding removes this uncertainty.

- It can perform Manchester encoding. Manchester encoding ensures that the modulation has no DC content and enough transitions (changes from 0 to 1 and from 1 to 0) for the demodulator bit timing recovery to function correctly, but does so at a doubling of the data rate.

- It can perform Spectral Shaping. Spectral shaping removes DC content of the bit stream, ensures transitions for the demodulator bit timing recovery, and makes sure that the transmitted spectrum does not have discrete lines even if the transmitted data is cyclic. It does so without adding additional bits, i.e. without changing the data rate. Spectral Shaping uses a self synchronizing feedback shift register.

The encoder is programmed using the register AX5051_ENCODING, details and recommendations on usage are given in the AX5051 Programming Manual.

Framing and FIFO

Most radio systems today group data into packets. The framing unit is responsible for converting these packets into a bit-stream suitable for the modulator, and to extract packets from the continuous bit-stream arriving from the demodulator.

The Framing unit supports four different modes:

- HDLC
- Raw
- Raw with Preamble Match
- 802.15.4 Compliant

The microcontroller communicates with the framing unit through a 4 level \times 10 bit FIFO. The FIFO decouples microcontroller timing from the radio (modulator and demodulator) timing. The bottom 8 bits of the FIFO contain transmit or receive data. The top 2 bit are used to convey meta information in HDLC and 802.15.4 modes. They are

unused in Raw and Raw with Preamble Match modes. The meta information consists of packet begin / end information and the result of CRC checks.

The framing unit contains one FIFO. Its direction is switched depending on whether transmit or receive mode is selected.

The FIFO can be operated in polled or interrupt driven modes. In polled mode, the microcontroller must periodically read the FIFO status register or the FIFO count register to determine whether the FIFO needs servicing.

In interrupt mode EMPTY, NOT EMPTY, FULL, NOT FULL and programmable level interrupts are provided. Interrupts are acknowledged by removing the cause for the interrupt, i.e. by emptying or filling the FIFO.

To lower the interrupt load on the microcontroller, one of the DMA channels may be instructed to transfer data between the transceiver FIFO and the XRAM memory. This way, much larger buffers can be realized in XRAM, and interrupts need only be serviced if the larger XRAM buffers fill or empty.

HDLC Mode

NOTE: HDLC mode follows High-Level Data Link Control (HDLC, ISO 13239) protocol.

HDLC Mode is the main framing mode of the AX8052F151. In this mode, the AX8052F151 performs automatic packet delimiting, and optional packet correctness check by inserting and checking a cyclic redundancy check (CRC) field.

The packet structure is given in the following table.

Table 20.

| Flag | Address | Control | Information | FCS | Flag |
|-------|---------|-------------|---|-------------|-------|
| 8 bit | 8 bit | 8 or 16 bit | Variable length, 0 or more bits in multiples of 8 | 16 / 32 bit | 8 bit |

HDLC packets are delimited with flag sequences of content 0x7E.

In AX8052F151 the meaning of address and control is user defined. The Frame Check Sequence (FCS) can be programmed to be CRC-CCITT, CRC-16 or CRC-32.

The receiver checks the CRC, the result can be retrieved from the FIFO, the CRC is appended to the received data.

For details on implementing a HDLC communication see the AX5051 Programming Manual.

Raw Mode

In Raw mode, the AX8052F151 does not perform any packet delimiting or byte synchronization. It simply serializes transmit bytes and de-serializes the received bit-stream and groups it into bytes.

This mode is ideal for implementing legacy protocols in software.

Raw Mode with Preamble Match

Raw mode with preamble match is similar to raw mode. In this mode, however, the receiver does not receive anything until it detects a user programmable bit pattern (called the preamble) in the receive bit-stream. When it detects the preamble, it aligns the de-serialization to it.

The preamble can be between 4 and 32 bits long.

802.15.4 (ZigBee) DSSS

802.15.4 uses binary phase shift keying (PSK) with 300 kbit/s (868 MHz band) or 600 kbit/s (915 MHz band) on the radio. The usable bit rate is only a 15th of the radio bit rate, however. A spreading function in the transmitter expands the user bit rate by a factor of 15, to make the transmission more robust. The despreader function of the receiver undoes that.

In 802.15.4 mode, the AX8052F151 framing unit performs the spreading and despreading function according to the 802.15.4 specification. In receive mode, the framing unit will also automatically search for the 802.15.4

preamble, meaning that no interrupts will have to be serviced by the microcontroller until a packet start is detected.

The 802.15.4 is a universal DSSS mode, which can be used with any modulation or data rate as long as it does not violate the maximum data rate of the modulation being used. Therefore the maximum DSSS data rate is 16 kbps for FSK and 40 kbps for ASK and PSK.

RX AGC and RSSI

AX8052F151 features two receiver signal strength indicators (RSSI):

1. RSSI before the digital IF channel filter.

The gain of the receiver is adjusted in order to keep the analog IF filter output level inside the working range of the ADC and demodulator. The register AX5051_AGCCOUNTER contains the current value of the AGC and can be used as an

RSSI. The step size of this RSSI is 0.625 dB. The value can be used as soon as the RF frequency generation sub-system has been programmed.

2. RSSI behind the digital IF channel filter.

The demodulator also provides amplitude information in the AX5051_TRK_AMPLITUDE register. By combining both the AX5051_AGCCOUNTER and the AX5051_TRK_AMPLITUDE registers, a high resolution (better than 0.1 dB) RSSI value can be computed at the expense of a few arithmetic operations on the microcontroller. Formulas for this computation can be found in the AX5051 Programming Manual.

Modulator

Depending on the transmitter settings the modulator generates various inputs for the PA:

Table 21.

| Modulation | Bit = 0 | Bit = 1 | Main Lobe Bandwidth | Max. Bitrate |
|------------|------------------------------------|------------------------------------|-------------------------------------|--------------|
| ASK | PA off | PA on | BW = BITRATE | 600 kBit/s |
| FSK/MSK | $\Delta f = -f_{\text{deviation}}$ | $\Delta f = +f_{\text{deviation}}$ | $BW = (1 + h) \cdot \text{BITRATE}$ | 350 kBit/s |
| PSK | $\Delta \Phi = 0^\circ$ | $\Delta \Phi = 180^\circ$ | BW = BITRATE | 600 kBit/s |

h = modulation index. It is the ratio of the deviation compared to the bit-rate;
 $f_{\text{deviation}} = 0.5 \cdot h \cdot \text{BITRATE}$, AX8052F151 can demodulate signals with $h < 32$.

ASK = amplitude shift keying

FSK = frequency shift keying

MSK = minimum shift keying; MSK is a special case of FSK, where $h = 0.5$, and therefore $f_{\text{deviation}} = 0.25 \cdot \text{BITRATE}$; the advantage of MSK over FSK is that it can be demodulated more robustly.

PSK = phase shift keying

OQPSK = offset quadrature shift keying. The AX8052F151 supports OQPSK. However, unless compatibility to an existing system is required, MSK should be preferred.

All modulation schemes are binary.

Automatic Frequency Control (AFC)

The AX8052F151 has a frequency tracking register AX5051_TRKFREQ to synchronize the receiver frequency to a carrier signal. For AFC adjustment, the frequency offset can be computed with the following formula:

$$\Delta f = \frac{\text{TRKFREQ}}{2^{16}} \text{BITRATE} \times \text{FSKMUL}$$

FSKMUL is the FSK oversampling factor, it depends on the FSK bit rate and deviation used. To determine it for a specific case, see the AX5051 Programming Manual. For modulations other than FSK, FSKMUL = 1.

PWRMODE Register

The AX8052F151 transceiver features its own independent power management, independent from the microcontroller. While the microcontroller power mode is controlled through the PCON register, the AX5051_PWRMODE register controls which parts of the transceiver are operating.

Table 22. PWRMODE REGISTER

| AX5051_PWRMODE Register | Name | Description |
|-------------------------|-----------|--|
| 0000 | POWERDOWN | All digital and analog transceiver functions, except the register file, are disabled. VREG is reduced to conserve leakage power. The registers are still accessible. |
| 0100 | VREGON | All digital and analog transceiver functions, except the register file, are disabled. VREG, however is at its nominal value for operation, and all registers are accessible. |
| 0101 | STANDBY | The crystal oscillator is powered on; receiver and transmitter are off. |

Table 22. PWRMODE REGISTER

| AX5051_PWRMODE Register | Name | Description |
|-------------------------|---------|--|
| 1000 | SYNTHRX | The synthesizer is running on the receive frequency. Transmitter and receiver are still off. This mode is used to let the synthesizer settle on the correct frequency for receive. |
| 1001 | FULLRX | Synthesizer and receiver are running. |
| 1100 | SYNTHTX | The synthesizer is running on the transmit frequency. Transmitter and receiver are still off. This mode is used to let the synthesizer settle on the correct frequency for transmit. |
| 1101 | FULLTX | Synthesizer and transmitter are running. Do not switch into this mode before the synthesizer has completely settled on the transmit frequency (in SYNTHTX mode), otherwise spurious spectral transmissions will occur. |

Table 23. A TYPICAL AX5051_PWRMODE SEQUENCE FOR A TRANSMIT SESSION

| Step | PWRMODE | Remarks |
|------|-----------|--|
| 1 | POWERDOWN | |
| 2 | STANDBY | The settling time is dominated by the crystal used, typical value 3 ms. |
| 3 | SYNTHTX | The synthesizer settling time is 5 – 50 μ s depending on settings, see section AC Characteristics |
| 4 | FULLTX | Data transmission |
| 5 | SYNTHTX | This step must be programmed after FULLTX mode, or the device will not enter POWERDOWN or STANDBY mode. |
| 6 | POWERDOWN | |

Table 24. A TYPICAL AX5051_PWRMODE SEQUENCE FOR A RECEIVE SESSION

| Step | PWRMODE [3:0] | Remarks |
|------|---------------|---|
| 1 | POWERDOWN | |
| 2 | STANDBY | The settling time is dominated by the crystal used, typical value 3 ms. |
| 3 | SYNTHRX | The synthesizer settling time is 5 – 50 μ s depending on settings, see section AC Characteristics |
| 4 | FULLRX | Data reception |
| 5 | POWERDOWN | |

Voltage Regulator

The AX8052F151 transceiver uses its own dedicated on-chip voltage regulator to create a stable supply voltage for the transceiver circuitry at pin VREG from the primary supply VDD_IO. All VDDA pins of the device must be connected to VREG. The antenna pins ANTP and ANTEN must be DC biased to VREG. The I/O level of the digital pins is VDD_IO.

The voltage regulator requires a 1 μ F low ESR capacitor at pin VREG.

In power-down mode the voltage regulator typically outputs 1.7 V at VREG, if it is powered-up its output rises

to typically 2.5 V. At device power-up the regulator is in power-down mode.

The voltage regulator must be powered-up before receive or transmit operations can be initiated. This is handled automatically when programming the device modes via the AX5051_PWRMODE register.

Register VREG contains status bits that can be read to check if the regulated voltage is above 1.3 V or 2.3 V, sticky versions of the bits are provided that can be used to detect low power events (brown-out detection).

APPLICATION INFORMATION

Typical Application Diagrams

Connecting to Debug Adapter

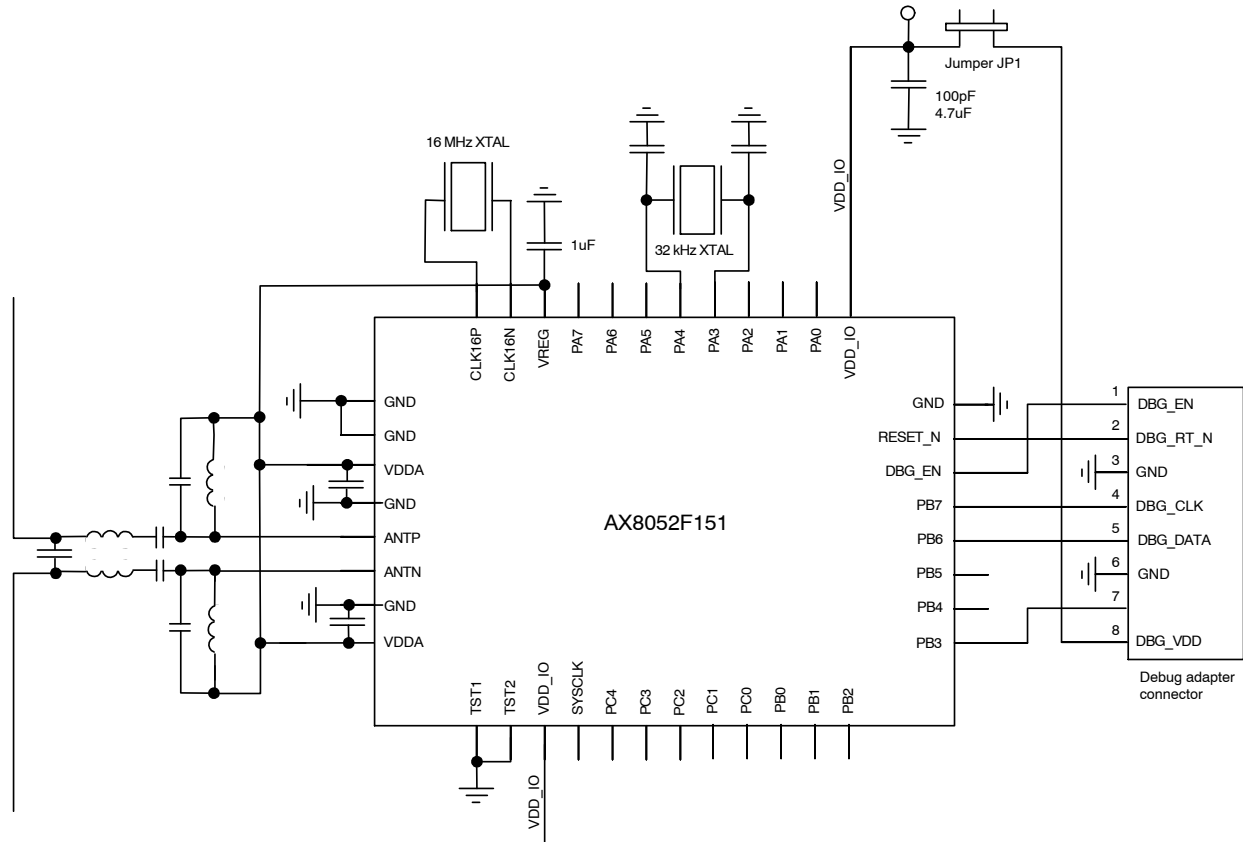

Figure 9. Typical Application Diagram with Connection to the Debug Adapter

Short Jumper JP1–1 if it is desired to supply the target board from the Debug Adapter (50 mA max). Connect the bottom exposed pad of the AX8052F151 to ground.

If the debugger is not running, PB6 and PB7 are not driven by the Debug Adapter. If the debugger is running, the PB6 and PB7 values that the software reads may be set using the Pin Emulation feature of the debugger.

PB3 is driven by the debugger only to bring the AX8052F151 out of Deep Sleep. It is high impedance otherwise.

The 32 kHz crystal is optional, the fast crystal at pins CLK16N and CLK16P is used as reference frequency for the RF RX/TX. Crystal load capacitances should be chosen according to the crystal's datasheet. At pins CLK16N and

CLK16P they the internal programmable capacitors may be used, at pins PA3 and PA4 capacitors must be connected externally.

It is mandatory to add 1 μ F (low ESR) between VREG and GND. Decoupling capacitors are not all drawn. It is recommended to add 100 nF decoupling capacitor for every VDDA and VDD_IO pin. In order to reduce noise on the antenna inputs it is recommended to add 27 pF on the VDD pins close to the antenna interface.

The AX8052F151 has an integrated voltage regulator for the analog supply voltages, which generates a stable supply voltage VREG from the voltage applied at VDD_IO. Use VREG to supply all the VDDA supply pins and also to DC power to the pins ANTTP and ANTEN.

Antenna Interface Circuitry

The ANTP and ANTEN pins provide RF input to the LNA when AX8052F151 is in receiving mode, and RF output from the PA when AX8052F151 is in transmitting mode. A small antenna can be connected with an optional translation network. The network must provide DC power to the PA and LNA. A biasing to VREG is necessary.

Beside biasing and impedance matching, the proposed networks also provide low pass filtering to limit spurious emission.

QFN40 Recommended Pad Layout

1. PCB land and solder masking recommendations are shown in Figure 12.

- A = Clearance from PCB thermal pad to solder mask opening, 0.0635 mm minimum
 B = Clearance from edge of PCB thermal pad to PCB land, 0.2 mm minimum
 C = Clearance from PCB land edge to solder mask opening to be as tight as possible to ensure that some solder mask remains between PCB pads.
 D = PCB land length = QFN solder pad length + 0.1 mm
 E = PCB land width = QFN solder pad width + 0.1 mm

Figure 12. PCB Land and Solder Mask Recommendations

2. Thermal vias should be used on the PCB thermal pad (middle ground pad) to improve thermal conductivity from the device to a copper ground plane area on the reverse side of the printed circuit board. The number of vias depends on the package thermal requirements, as determined by thermal simulation or actual testing.
3. Increasing the number of vias through the printed circuit board will improve the thermal conductivity to the reverse side ground plane and external heat sink. In general, adding more metal through the PC board under the IC will improve operational heat transfer, but will require careful attention to uniform heating of the board during assembly.

Assembly Process

Stencil Design & Solder Paste Application

1. Stainless steel stencils are recommended for solder paste application.
2. A stencil thickness of 0.125 – 0.150 mm (5 – 6 mils) is recommended for screening.

3. For the PCB thermal pad, solder paste should be printed on the PCB by designing a stencil with an array of smaller openings that sum to 50% of the QFN exposed pad area. Solder paste should be applied through an array of squares (or circles) as shown in Figure 13.
4. The aperture opening for the signal pads should be between 50–80% of the QFN pad area as shown in Figure 14.
5. Optionally, for better solder paste release, the aperture walls should be trapezoidal and the corners rounded.
6. The fine pitch of the IC leads requires accurate alignment of the stencil and the printed circuit board. The stencil and printed circuit assembly should be aligned to within + 1 mil prior to application of the solder paste.
7. No-clean flux is recommended since flux from underneath the thermal pad will be difficult to clean if water-soluble flux is used.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
