

The following document contains information on Cypress products. The document has the series name, product name, and ordering part numbering with the prefix “MB”. However, Cypress will offer these products to new and existing customers with the series name, product name, and ordering part number with the prefix “CY”.

How to Check the Ordering Part Number

1. Go to www.cypress.com/pcn.
2. Enter the keyword (for example, ordering part number) in the **SEARCH PCNS** field and click **Apply**.
3. Click the corresponding title from the search results.
4. Download the Affected Parts List file, which has details of all changes

About Cypress

Cypress is the leader in advanced embedded system solutions for the world's most innovative automotive, industrial, smart home appliances, consumer electronics and medical products. Cypress' microcontrollers, analog ICs, wireless and USB-based connectivity solutions and reliable, high-performance memories help engineers design differentiated products and get them to market first. Cypress is committed to providing customers with the best support and development resources on the planet enabling them to disrupt markets by creating new product categories in record time. MB9B460L Series

32-Bit Arm[®] Cortex[®]-M4F FM4 Microcontroller

Devices in the MB9B460L Series are highly integrated 32-bit microcontrollers with high performance and competitive cost.

This series is based on the Arm[®] Cortex[®]-M4F Processor with on-chip Flash memory and SRAM. The series has peripheral functions such as Motor Control Timers, ADCs and Communication Interfaces (CAN, UART, CSIO, I²C, LIN).

The products that are described in this datasheet are placed into TYPE2-M4 product categories in the "FM4 Family Peripheral Manual Main Part (002-04856)".

Features

32-bit Arm[®] Cortex[®]-M4F Core

- Processor version: r0p1
- Up to 160 MHz Frequency Operation
- FPU built-in
- Support DSP instruction
- Memory Protection Unit (MPU): improves the reliability of an embedded system
- Integrated Nested Vectored Interrupt Controller (NVIC): 1 NMI (non-maskable interrupt) and 128 peripheral interrupts and 16 priority levels
- 24-bit System timer (Sys Tick): System timer for OS task management

On-Chip Memories

[Flash Memory]

These series are based on two independent on-chip Flash memories.

- MainFlash memory
 - Up to 512 Kbytes
 - Built-in Flash Accelerator System with 16 Kbytes trace buffer memory
 - The read access to Flash memory can be achieved without wait-cycle up to operation frequency of 72 MHz. Even at the operation frequency more than 72 MHz, an equivalent access to Flash memory can be obtained by Flash Accelerator System.
 - Security function for code protection
- WorkFlash memory
 - 32 Kbytes
 - Read cycle:
 - 6wait-cycle: the operation frequency more than 120 MHz, and up to 160 MHz
 - 4wait-cycle: the operation frequency more than 72 MHz, and up to 120 MHz
 - 2wait-cycle: the operation frequency more than 40 MHz, and up to 72 MHz
 - 0wait-cycle: the operation frequency up to 40 MHz
 - Security function is shared with code protection

[SRAM]

This is composed of three independent SRAMs (SRAM0, SRAM1, and SRAM2). SRAM0 is connected to I-code bus and D-code bus of Cortex-M4F core. SRAM1 and SRAM2 are connected to System bus of Cortex-M4F core.

- SRAM0: Up to 32 Kbytes
- SRAM1: Up to 16 Kbytes
- SRAM2: Up to 16 Kbytes

CAN Interface (1 Channel)

- Compatible with CAN Specification 2.0A/B
- Maximum transfer rate: 1 Mbps
- Built-in 32 message buffer

Multi-Function Serial Interface (Max 6 Channels)

- 64 bytes with FIFO (the FIFO step numbers are variable depending on the settings of the communication mode or bit length.)
- Operation mode is selectable from the followings for each channel.
 - UART
 - CSIO
 - LIN
 - I²C
- UART
 - Full-duplex double buffer
 - Selection with or without parity supported
 - Built-in dedicated baud rate generator
 - External clock available as a serial clock
 - Hardware Flow control : Automatically control the transmission by CTS/RTS (only ch.4)
 - Various error detect functions available (parity errors, framing errors, and overrun errors)
- CSIO
 - Full-duplex double buffer
 - Built-in dedicated baud rate generator
 - Overrun error detect function available
 - Serial chip select function (ch.6 only)
 - Supports high-speed SPI (ch.0 and ch.6 only)
 - Data length 5 to 16-bit

■ LIN

- LIN protocol Rev.2.1 supported
- Full-duplex double buffer
- Master/Slave mode supported
- LIN break field generation (can change to 13 to 16-bit length)
- LIN break delimiter generation (can change to 1 to 4-bit length)
- Various error detect functions available (parity errors, framing errors, and overrun errors)

■ I²C

- Standard mode (Max 100 kbps) / Fast-mode (Max 400 kbps) supported
- Fast mode Plus (Fm+) (Max 1000 kbps, only for ch.3=ch.A and ch.4=ch.B) supported

DMA Controller (8 Channels)

DMA Controller has an independent bus for CPU, so CPU and DMA Controller can process simultaneously.

- 8 independently configured and operated channels
- Transfer can be started by software or request from the built-in peripherals
- Transfer address area: 32-bit (4 Gbytes)
- Transfer mode: Block transfer/Burst transfer/Demand transfer
- Transfer data type: bytes/half-word/word
- Transfer block count: 1 to 16
- Number of transfers: 1 to 65536

DSTC (Descriptor System data Transfer Controller) (128 Channels)

The DSTC can transfer data at high-speed without going via the CPU. The DSTC adopts the Descriptor system and, following the specified contents of the Descriptor which has already been constructed on the memory, can access directly the memory /peripheral device and performs the data transfer operation.

It supports the software activation, the hardware activation and the chain activation functions.

A/D Converter (Max 15 Channels)
[12-bit A/D Converter]

- Successive Approximation type
- Built-in 2 units
- Conversion time: 0.5 μs @ 5 V
- Priority conversion available (priority at 2levels)
- Scanning conversion mode
- Built-in FIFO for conversion data storage (for SCAN conversion: 16steps, for Priority conversion: 4steps)

DA Converter (Max 2 Channels)

- R-2R type
- 12-bit resolution

Base Timer (Max 8 Channels)

Operation mode is selectable from the followings for each channel.

- 16-bit PWM timer
- 16-bit PPG timer
- 16-/32-bit reload timer
- 16-/32-bit PWC timer

General Purpose I/O Port

This series can use its pins as general purpose I/O ports when they are not used for external bus or peripherals. Moreover, the port relocate function is built in. It can set which I/O port the peripheral function can be allocated.

- Capable of pull-up control per pin
- Capable of reading pin level directly
- Built-in the port relocate function
- Up to 48 high-speed general-purpose I/O ports @ 64 pin Package
- Some pin is 5 V tolerant I/O.
See 4. Pin Description and 5. I/O Circuit Type for the corresponding pins.

Multi-Function Timer (Max 2 Units)

The Multi-function timer is composed of the following blocks.

Minimum resolution: 6.25 ns

- 16-bit free-run timer × 3 ch./unit
- Input capture × 4 ch./unit
- Output compare × 6 ch./unit
- A/D activation compare × 6 ch./unit
- Waveform generator × 3 ch./unit
- 16-bit PPG timer × 3 ch./unit

The following function can be used to achieve the motor control.

- PWM signal output function
- DC chopper waveform output function
- Dead time function
- Input capture function
- A/D convertor activate function
- DTIF (Motor emergency stop) interrupt function

Real-Time Clock (RTC)

The Real-time clock can count Year/Month/Day/Hour/Minute /Second/A day of the week from 00 to 99.

- Interrupt function with specifying date and time (Year/Month/Day/Hour/Minute) is available. This function is also available by specifying only Year, Month, Day, Hour or Minute.
- Timer interrupt function after set time or each set time.
- Capable of rewriting the time with continuing the time count.
- Leap year automatic count is available.

Quadrature Position/Revolution Counter (QPRC) (1 Channel)

The Quadrature Position/Revolution Counter (QPRC) is used to measure the position of the position encoder. Moreover, it is possible to use up/down counter.

- The detection edge of the three external event input pins AIN, BIN, and ZIN is configurable.
- 16-bit position counter
- 16-bit revolution counter
- Two 16-bit compare registers

Dual Timer (32-/16-bit Down Counter)

The Dual Timer consists of two programmable 32-/16-bit down counters. Operation mode is selectable from the followings for each channel.

- Free-running
- Periodic (=Reload)
- One-shot

Watch Counter

The Watch counter is used for wake up from the low-power consumption mode. It is possible to select the main clock, sub clock, built-in high-speed CR clock or built-in low-speed CR clock as the clock source.

Interval timer: up to 64 s (Max) @ Sub Clock: 32.768 kHz

External Interrupt Controller Unit

- External interrupt input pin: Max 16 pins
- Include one non-maskable interrupt (NMI)

Watchdog Timer (2 Channels)

A watchdog timer can generate interrupts or a reset when a time-out value is reached.

This series consists of two different watchdogs, a "Hardware" watchdog and a "Software" watchdog.

"Hardware" watchdog timer is clocked by low-speed internal CR oscillator. Therefore, "Hardware" watchdog is active in any power saving mode except STOP.

CRC (Cyclic Redundancy Check) Accelerator

The CRC accelerator helps a verify data transmission or storage integrity.

CCITT CRC16 and IEEE-802.3 CRC32 are supported.

- CCITT CRC16 Generator Polynomial: 0x1021
- IEEE-802.3 CRC32 Generator Polynomial: 0x04C11DB7

Clock and Reset

[Clocks]

Five clock sources (2 external oscillators, 2 internal CR oscillator, and Main PLL) that are dynamically selectable.

- Main clock: 4 MHz to 48 MHz
- Sub Clock: 32.768 kHz
- High-speed internal CR Clock: 4 MHz
- Low-speed internal CR Clock: 100 kHz
- Main PLL Clock

[Resets]

- Reset requests from INITX pin
- Power on reset
- Software reset
- Watchdog timers reset
- Low voltage detector reset
- Clock supervisor reset

Clock Super Visor (CSV)

Clocks generated by internal CR oscillators are used to supervise abnormality of the external clocks.

- External OSC clock failure (clock stop) is detected, reset is asserted.
- External OSC frequency anomaly is detected, interrupt or reset is asserted.

Low-Voltage Detector (LVD)

This Series include 2-stage monitoring of voltage on the VCC pins. When the voltage falls below the voltage has been set, Low-Voltage Detector generates an interrupt or reset.

- LVD1: error reporting via interrupt
- LVD2: auto-reset operation

Low-Power Consumption Mode

Six low-power consumption modes are supported.

- SLEEP
- TIMER
- RTC
- STOP
- Deep standby RTC (selectable from with/without RAM retention)
- Deep standby stop (selectable from with/without RAM retention)

VBAT

The consumption power during the RTC operation can be reduced by supplying the power supply independent from the RTC (calendar circuit)/32 kHz oscillation circuit. The following circuits can also be used.

- RTC
- 32 kHz oscillation circuit
- Power-on circuit
- Back up register: 32 bytes
- Port circuit

Debug

- Serial Wire JTAG Debug Port (SWJ-DP)

Unique ID

Unique value of the device (41-bit) is set.

Power Supply

Two Power Supplies (when 64 pin Package)

One Power Supply (when 48 pin Package)

- Wide range voltage:

VCC = 2.7 V to 5.5 V

- Power supply for VBAT (only 64 pin Package):

VBAT = 2.7 V to 5.5 V

3. Pin Assignment

LQD064/LQG064

Note:

- The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

VNC064

Note:

- The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

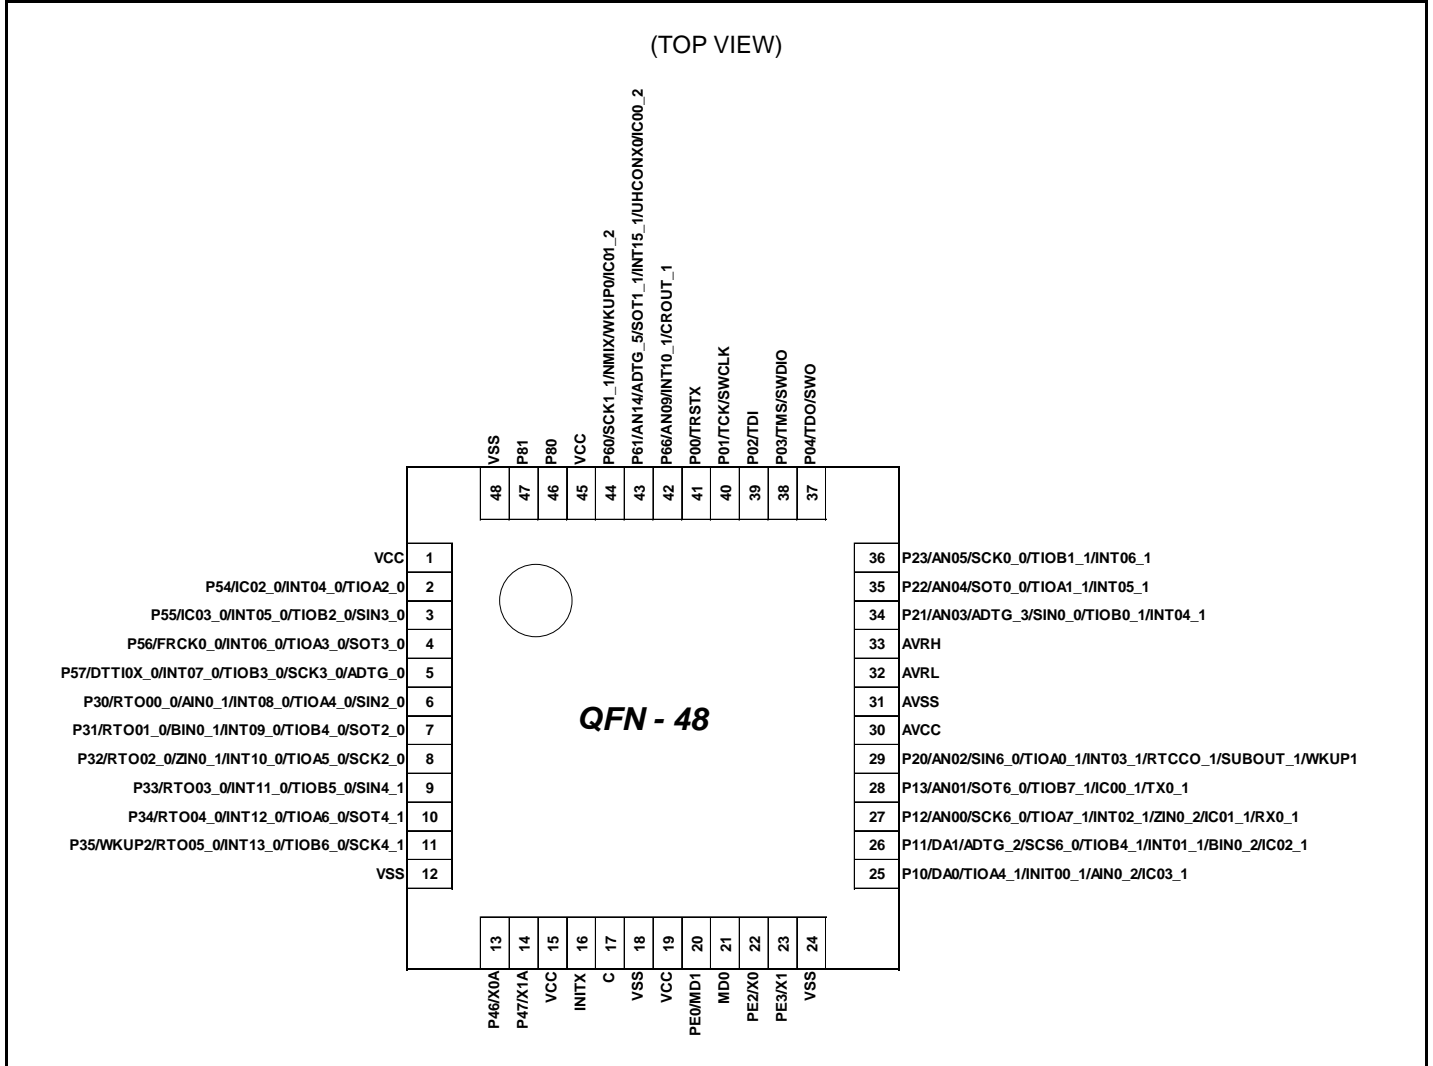

LQA048

Note:

- The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

VNA048

Note:

- The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

4. Pin Description

4.1 List of Pin Numbers

The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

4.2 List of Pin Functions

The number after the underscore ("_") in pin names such as XXX_1 and XXX_2 indicates the relocated port number. For these pins, there are multiple pins that provide the same function for the same channel. Use the extended port function register (EPFR) to select the pin.

Note:

- While this device contains a Test Access Port (TAP) based on the IEEE 1149.1-2001 JTAG standard, it is not fully compliant to all requirements of that standard. This device may contain a 32-bit device ID that is the same as the 32-bit device ID in other devices with different functionality. The TAP pins may also be configurable for purposes other than access to the TAP controller.

6. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

6.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

1. Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

2. Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device. Therefore, avoid this type of connection.

3. Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

Latch-Up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

1. Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.
2. Be sure that abnormal current flows do not occur during the power-on sequence.

Observance of Safety Regulations and Standards

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

Fail-Safe Design

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Precautions Related to Usage of Devices

Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

6.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress's recommended conditions. For detailed information about mount conditions, contact your sales representative.

Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and have established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

1. Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
2. Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
3. When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
4. Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125°C/24 h

Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

1. Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
2. Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
3. Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
4. Ground all fixtures and instruments, or protect with anti-static measures.
5. Avoid the use of Styrofoam or other highly static-prone materials for storage of completed board assemblies.

6.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

1. Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

2. Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

3. Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

4. Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

5. Smoke, Flame

CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

7. Handling Devices

Power Supply Pins

In products with multiple VCC and VSS pins, respective pins at the same potential are interconnected within the device in order to prevent malfunctions such as latch-up. However, all of these pins should be connected externally to the power supply or ground lines in order to reduce electromagnetic emission levels, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.

Moreover, connect the current supply source with each POWER pins and GND pins of this device at low impedance. It is also advisable that a ceramic capacitor of approximately 0.1 μF be connected as a bypass capacitor between VCC and VSS near this device.

Power Supply Pins

A malfunction may occur when the power supply voltage fluctuates rapidly even though the fluctuation is within the guaranteed operating range of the VCC power supply voltage. As a rule of voltage stabilization, suppress voltage fluctuation so that the fluctuation in VCC ripple (peak-to-peak value) at the commercial frequency (50 Hz/60 Hz) does not exceed 10% of the standard VCC value, and the transient fluctuation rate does not exceed 0.1 V/ μs at a momentary fluctuation such as switching the power supply.

Crystal Oscillator Circuit

Noise near the X0/X1 and X0A/X1A pins may cause the device to malfunction. Design the printed circuit board so that X0/X1, X0A/X1A pins, the crystal oscillator (or ceramic oscillator), and the bypass capacitor to ground are located as close to the device as possible.

It is strongly recommended that the PC board artwork be designed such that the X0/X1 and X0A/X1A pins are surrounded by ground plane as this is expected to produce stable operation.

Evaluate oscillation of your using crystal oscillator by your mount board.

Sub Crystal Oscillator

This series sub oscillator circuit is low gain to keep the low current consumption.

The crystal oscillator to fill the following conditions is recommended for sub crystal oscillator to stabilize the oscillation.

- Surface mount type
 - Size: More than 3.2 mm x 1.5 mm
 - Load capacitance: Approximately 6 pF to 7 pF
- Lead type
 - Load capacitance: Approximately 6 pF to 7 pF

Using an External Clock

When using an external clock as an input of the main clock, set X0/X1 to the external clock input, and input the clock to X0. X1 (PE3) can be used as a general-purpose I/O port.

Similarly, when using an external clock as an input of the sub clock, set X0A/X1A to the external clock input, and input the clock to X0A. X1A (P47) can be used as a general-purpose I/O port.

Handling when Using Multi-Function Serial Pin as I²C Pin

If it is using the multi-function serial pin as I²C pins, P-ch transistor of digital output is always disabled. However, I²C pins need to keep the electrical characteristic like other pins and not to connect to the external I²C bus system with power OFF.

C Pin

This series contains the regulator. Be sure to connect a smoothing capacitor (C_s) for the regulator between the C pin and the GND pin. Please use a ceramic capacitor or a capacitor of equivalent frequency characteristics as a smoothing capacitor. However, some laminated ceramic capacitors have the characteristics of capacitance variation due to thermal fluctuation (F characteristics and Y5V characteristics). Please select the capacitor that meets the specifications in the operating conditions to use by evaluating the temperature characteristics of a capacitor. A smoothing capacitor of about 4.7 μF would be recommended for this series.

Mode Pins (MD0)

Connect the MD pin (MD0) directly to VCC or VSS pins. Design the printed circuit board such that the pull-up/down resistance stays low, as well as the distance between the mode pins and VCC pins or VSS pins is as short as possible and the connection impedance is low, when the pins are pulled-up/down such as for switching the pin level and rewriting the Flash memory data. It is because of preventing the device erroneously switching to test mode due to noise.

Notes on Power-on

Turn power on/off in the following order or at the same time. The device operates normally after all power on.

In the case of 64pin package, VBAT only Power-on is possible when turns all power on and Hibernation control is setting and then except for VBAT turns power off. About Hibernation control, see Chapter 7-2: VBAT Domain (A) in FM4 Family Peripheral Manual (002-04856).

If not using the A/D converter and D/A converter, connect AVCC = VCC and AVSS = VSS.

| | |
|--------------|---------------------------------|
| Turning on: | VBAT → VCC VCC → AVCC → AVRH |
| Turning off: | AVRH → AVCC → VCC VCC → VBAT |

Serial Communication

There is a possibility to receive wrong data due to the noise or other causes on the serial communication.

Therefore, design a printed circuit board so as to avoid noise.

Consider the case of receiving wrong data due to noise, perform error detection such as by applying a checksum of data at the end. If an error is detected, retransmit the data.

Differences in Features among the Products with Different Memory Sizes and between Flash Products and MASK Products

The electric characteristics including power consumption, ESD, latch-up, noise characteristics, and oscillation characteristics among the products with different memory sizes and between Flash products and MASK products are different because chip layout and memory structures are different.

If you are switching to use a different product of the same series, please make sure to evaluate the electric characteristics.

Pull-Up Function of 5 V Tolerant I/O

Please do not input the signal more than VCC voltage at the time of pull-up function use of 5V tolerant I/O.

Handling when Using Debug Pins

When debug pins (TDO/TMS/TDI/TCK/TRSTX or SWO/SWDIO/SWCLK) are set to GPIO or other peripheral functions, only set them as output, do not set them as input.

11. Pin Status in Each CPU State

The terms used for pin status have the following meanings.

■ **INITX=0**

This is the period when the INITX pin is the L level.

■ **INITX=1**

This is the period when the INITX pin is the H level.

■ **SPL=0**

This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB_CTL) is set to 0.

■ **SPL=1**

This is the status that the standby pin level setting bit (SPL) in the standby mode control register (STB_CTL) is set to 1.

■ **Input enabled**

Indicates that the input function can be used.

■ **Internal input fixed at 0**

This is the status that the input function cannot be used. Internal input is fixed at L.

■ **Hi-Z**

Indicates that the pin drive transistor is disabled and the pin is put in the Hi-Z state.

■ **Setting disabled**

Indicates that the setting is disabled.

■ **Maintain previous state**

Maintains the state that was immediately prior to entering the current mode.
If a built-in peripheral function is operating, the output follows the peripheral function.
If the pin is being used as a port, that output is maintained.

■ **Analog input is enabled**

Indicates that the analog input is enabled.

■ **Trace output**

Indicates that the trace function can be used.

■ **GPIO selected**

In Deep standby mode, pins switch to the general-purpose I/O port.

■ **Setting prohibition**

Prohibition of a setting by specification limitation.

*1: These parameters are based on the condition that V_{SS} = AV_{SS} = 0.0 V.

*2: V_{CC} must not drop below V_{SS} - 0.5 V.

*3: V_{BAT} must not drop below V_{SS} - 0.5 V.

*4: Ensure that the voltage does not exceed V_{CC} + 0.5 V, for example, when the power is turned on.

*5: The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

*6: The average output current is defined as the average current value flowing through any one of the corresponding pins for a 100ms period.

*7: The total average output current is defined as the average current value flowing through all of corresponding pins for a period of 100 ms.

WARNING:

- Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

12.2 Recommended Operating Conditions

| Parameter | Symbol | Conditions | Value | | Unit | Remarks |
|-----------------------------|----------------------|----------------|--------|------------------|------|-----------------------------------|
| | | | Min | Max | | |
| Power supply voltage | V _{CC} | - | 2.7 *3 | 5.5 | V | |
| Power supply voltage (VBAT) | V _{BAT} | - | 2.7 | 5.5 | V | |
| Analog power supply voltage | AV _{CC} | - | 2.7 | 5.5 | V | AV _{CC} =V _{CC} |
| Analog reference voltage | AVRH | - | *1 | AV _{CC} | V | |
| Smoothing capacitor | C _S | - | 1 | 10 | μF | for built-in regulator *4 |
| Operating temperature | Junction temperature | T _J | - 40 | + 125 | °C | |
| | Ambient temperature | T _A | - 40 | *2 | °C | |

*1: The minimum value of Analog reference voltage depends on the value of compare clock cycle (T_{CK}).

See "5. 12-bit A/D Converter" for the details.

*2: The maximum temperature of the ambient temperature (T_A) can guarantee a range that does not exceed the junction temperature (T_J).

The calculation formula of the ambient temperature (T_A) is shown below.

$$T_A(\text{Max}) = T_J(\text{Max}) - P_d(\text{Max}) \times \theta_{ja}$$

P_d: Power dissipation (W)

θ_{ja}: Package thermal resistance (°C/W)

$$P_d(\text{Max}) = V_{CC} \times I_{CC}(\text{Max}) + \sum (I_{OL} \times V_{OL}) + \sum ((V_{CC} - V_{OH}) \times (-I_{OH}))$$

I_{OL}: L level output current

I_{OH}: H level output current

V_{OL}: L level output voltage

V_{OH}: H level output voltage

*3: In between less than the minimum power supply voltage and low voltage reset/interrupt detection voltage or more, instruction execution and low voltage detection function by built-in High-speed CR (including Main PLL is used) or built-in Low-speed CR is possible to operate only.

*4: See "C pin" in "Handling Devices" for the connection of the smoothing capacitor.

Package thermal resistance and maximum permissible power for each package are shown below.

The operation is guaranteed maximum permissible power or less for semiconductor devices.

Table for Package Thermal Resistance and Maximum Permissible Power

WARNING:

- The recommended operating conditions are required to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions. Any use of semiconductor devices will be under their recommended operating condition. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

Calculation Method of Power Dissipation (Pd)

The power dissipation is shown in the following formula.

$$P_d = V_{CC} \times I_{CC} + \sum (I_{OL} \times V_{OL}) + \sum ((V_{CC} - V_{OH}) \times (-I_{OH}))$$

- I_{OL} : "L" level output current
- I_{OH} : "H" level output current
- V_{OL} : "L" level output voltage
- V_{OH} : "H" level output voltage

I_{CC} is a current consumed in device.
It can be analyzed as follows.

$$I_{CC} = I_{CC}(\text{INT}) + \sum I_{CC}(\text{IO})$$

$I_{CC}(\text{INT})$: Current consumed in internal logic and memory, etc. through regulator

$\sum I_{CC}(\text{IO})$: Sum of current (I/O switching current) consumed in output pin

For $I_{CC}(\text{INT})$, it can be anticipated by "12.3.1 Current Rating" in "12.3 DC Characteristics" (This rating value does not include $I_{CC}(\text{IO})$ for a value at pin fixed).

For $I_{CC}(\text{IO})$, it depends on system used by customers.

The calculation formula is shown below.

$$I_{CC}(\text{IO}) = (C_{\text{INT}} + C_{\text{EXT}}) \times V_{CC} \times f_{\text{SW}}$$

- C_{INT} : Pin internal load capacitance
- C_{EXT} : External load capacitance of output pin
- f_{SW} : Pin switching frequency

| Parameter | Symbol | Conditions | Capacitance Value |
|-------------------------------|------------------|------------|-------------------|
| Pin internal load capacitance | C_{INT} | 4 mA type | 1.93 pF |
| | | 8 mA type | 3.45 pF |
| | | 12 mA type | 3.42 pF |

Calculate $I_{CC}(\text{Max})$ as follows when the power dissipation can be evaluated.

1. Measure current value $I_{CC}(\text{Typ})$ at normal temperature (+25°C).
2. Add maximum leak current value $I_{CC}(\text{leak_max})$ at operating on a value in (1).

$$I_{CC}(\text{Max}) = I_{CC}(\text{Typ}) + I_{CC}(\text{leak_max})$$

| Parameter | Symbol | Conditions | Current Value |
|-----------------------------------|----------------------------|----------------------------|---------------|
| Maximum leak current at operating | $I_{CC}(\text{leak_max})$ | $T_j = +125^\circ\text{C}$ | 28 mA |
| | | $T_j = +105^\circ\text{C}$ | 17 mA |
| | | $T_j = +85^\circ\text{C}$ | 13 mA |

| PLL multiplication rate | - | 50 | - | 75 | multiplier | |
| PLL macro oscillation clock frequency | f _{PLLO} | 190 | - | 320 | MHz | |
| Main PLL clock frequency* ² | f _{CLKPLL} | - | - | 160 | MHz | |

*1: Time from when the PLL starts operating until the oscillation stabilizes.

*2: For more information about Main PLL clock (CLKPLL), see CHAPTER 2-1: Clock in FM4 Family Peripheral Manual Main part (002-04856).

Note:

- Make sure to input to the main PLL source clock, the high-speed CR clock (CLKHC) that the frequency and temperature has been trimmed.

12.4.6 Reset Input Characteristics

 (V_{CC} = 2.7V to 5.5V, V_{SS} = 0V)

| Parameter | Symbol | Pin Name | Condition | Value | | Unit | Remarks |
|------------------|--------------------|----------|-----------|-------|-----|------|---------|
| | | | | Min | Max | | |
| Reset input time | t _{INITX} | INITX | - | 500 | - | ns | |

12.4.7 Power-on Reset Timing

 (V_{SS} = 0V, T_A = - 40°C to + 85°C)

| Parameter | Symbol | Pin Name | Conditions | Value | | | Unit | Remarks |
|-------------------------------------|------------------|----------|---------------------------------|-------|-----|------|-----------|---------|
| | | | | Min | Typ | Max | | |
| Power supply shut down time | t _{OFF} | VCC | - | 50 | - | - | ms | *1 |
| Power ramp rate | dV/dt | | V _{CC} : 0.2V to 2.70V | 1.3 | - | 1000 | mV/ μs | *2 |
| Time until releasing Power-on reset | t _{PRT} | | - | 0.33 | - | 0.60 | ms | |

*1: V_{CC} must be held below 0.2V for a minimum period of t_{OFF}. Improper initialization may occur if this condition is not met.

*2: This dV/dt characteristic is applied at the power-on of cold start (t_{OFF}>50ms).

Note:

- t_{OFF} must be satisfied. When t_{OFF} cannot be satisfied, assert external reset (INITX) at power-up and at any brownout event.

Glossary

- V_{DH}: detection voltage of Low-Voltage detection reset. See 12.7 Low-Voltage Detection Characteristics.

12.4.8 GPIO Output Characteristics

 (V_{CC} = 2.7V to 5.5V, V_{SS} = 0V)

| Parameter | Symbol | Pin Name | Conditions | Value | | Unit |
|------------------|---------------------|----------|-------------------------|-------|-----|------|

*1: The conversion time is the value of sampling time (T_s) + compare time (T_c).

The condition of the minimum conversion time is when the value of sampling time: 150 ns, the value of compare time: 350 ns ($AV_{CC} \geq 4.5 V$). Ensure that it satisfies the value of sampling time (T_s) and compare clock cycle (T_{cck}). For setting*⁴ of sampling time and compare clock cycle, see CHAPTER 1-1: A/D Converter in FM4 Family Peripheral Manual Analog macro part (002-04860). The register setting of the A/D Converter is reflected by the peripheral clock timing. The sampling and compare clock are set at Base clock (HCLK).

*2: A necessary sampling time changes by external impedance. Ensure that it set the sampling time to satisfy (Equation 1).

*3: The compare time (T_c) is the value of (Equation 2).

*4: The register setting of the A/D Converter is reflected by the timing of the APB bus clock. The sampling clock and compare clock are set in base clock (HCLK). About the APB bus number which the A/D Converter is connected to, see 8. Block Diagram in this data sheet.

(Equation 1) $T_s \geq (R_{AIN} + R_{ext}) \times C_{AIN} \times 9$

T_s : Sampling time

R_{AIN} : Input resistance of A/D = 1.2 k Ω at 4.5 V < AV_{CC} < 5.5 V
 Input resistance of A/D = 1.8 k Ω at 2.7 V < AV_{CC} < 4.5 V

C_{AIN} : Input capacity of A/D = 10 pF at 2.7 V < AV_{CC} < 5.5 V

R_{ext} : Output impedance of external circuit

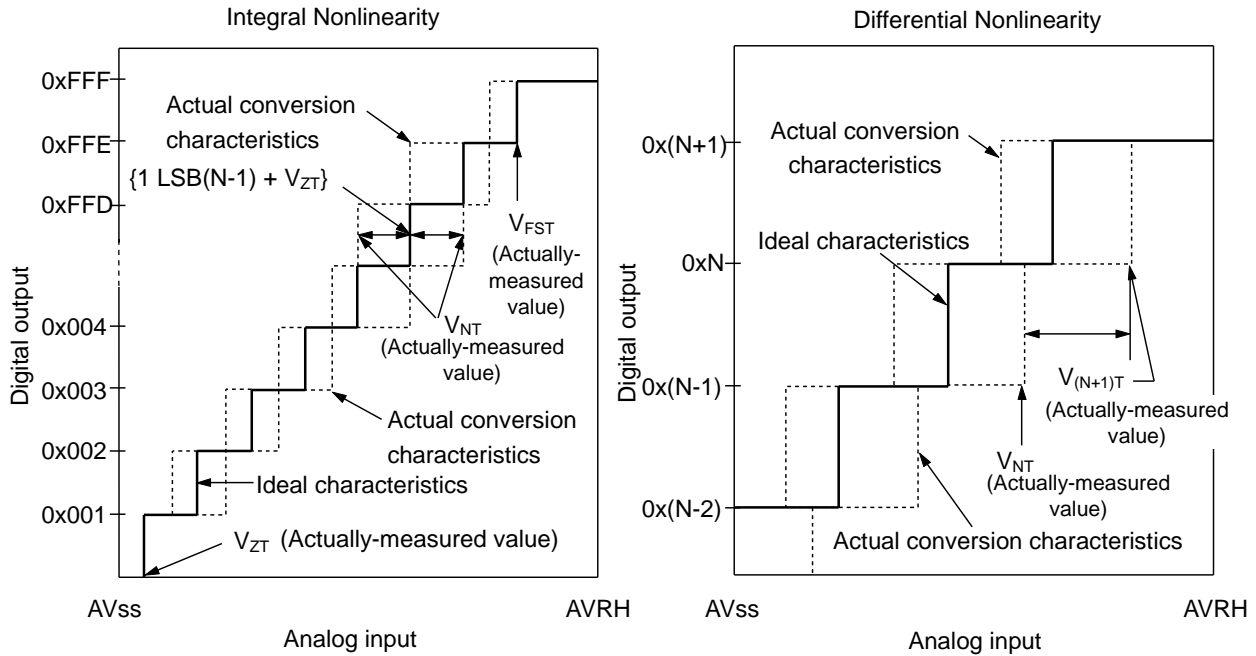

(Equation 2) $T_c = T_{cck} \times 14$

T_c : Compare time

T_{cck} : Compare clock cycle

Definition of 12-bit A/D Converter Terms

- Resolution: Analog variation that is recognized by an A/D converter.
- Integral Nonlinearity: Deviation of the line between the zero-transition point (0b000000000000 ↔ 0b000000000001) and the full-scale transition point (0b111111111110 ↔ 0b111111111111) from the actual conversion characteristics.
- Differential Nonlinearity: Deviation from the ideal value of the input voltage that is required to change the output code by 1 LSB.

$$\text{Integral Nonlinearity of digital output } N = \frac{V_{NT} - \{1\text{LSB} \times (N - 1) + V_{ZT}\}}{1\text{LSB}} \text{ [LSB]}$$

$$\text{Differential Nonlinearity of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1\text{LSB}} - 1 \text{ [LSB]}$$

$$1\text{LSB} = \frac{V_{FST} - V_{ZT}}{4094}$$

- N: A/D converter digital output value.
- V_{ZT}: Voltage at which the digital output changes from 0x000 to 0x001.
- V_{FST}: Voltage at which the digital output changes from 0xFFE to 0xFFF.
- V_{NT}: Voltage at which the digital output changes from 0x(N - 1) to 0xN.

12.10 Standby Recovery Time

12.10.1 Recovery Cause: Interrupt/WKUP

The time from recovery cause reception of the internal circuit to the program operation start is shown.

Recovery Count Time

($V_{CC} = 2.7V$ to $5.5V$, $V_{SS} = 0V$)

| Parameter | Symbol | Value | | Unit | Remarks |
|---|--------|--------|------|---------|--------------------------|
| | | Typ | Max* | | |
| Sleep mode | Ticnt | HCLKx1 | | μs | |
| High-speed CR Timer mode Main Timer mode PLL Timer mode | | 40 | 80 | μs | |
| Low-speed CR timer mode | | 450 | 900 | μs | |
| Sub timer mode | | 896 | 1136 | μs | |
| RTC mode stop mode (High-speed CR /Main/PLL run mode return) | | 316 | 581 | μs | |
| RTC mode stop mode (Low-speed CR/sub run mode return) | | 270 | 540 | μs | |
| Deep standby RTC mode Deep standby stop mode | | 365 | 667 | μs | without RAM retention |
| | | 365 | 667 | μs | with RAM retention |

*: The maximum value depends on the built-in CR accuracy.

Example of Standby Recovery Operation (when in External Interrupt Recovery*)

*: External interrupt is set to detecting fall edge.

Example of Standby Recovery Operation (when in Internal Resource Interrupt Recovery*)

*: Depending on the standby mode, interrupt from the internal resource is not included in the recovery cause.

Notes:

- The return factor is different in each Low-Power consumption modes. See CHAPTER 6: Low Power Consumption Mode and Operations of Standby Modes in FM4 Family Peripheral Manual Main part (002-04856).
- When interrupt recovers, the operation mode that CPU recovers depend on the state before the Low-Power consumption mode transition. See CHAPTER 6: Low Power Consumption Mode in FM4 Family Peripheral Manual Main part (002-04856).

12.10.2 Recovery Cause: Reset

The time from reset release to the program operation start is shown.

Recovery Count Time

($V_{CC} = 2.7V$ to $5.5V$, $V_{SS} = 0V$)

| Parameter | Symbol | Value | | Unit | Remarks |
|---|--------|-------|------|---------|-----------------------|
| | | Typ | Max* | | |
| Sleep mode | Trcnt | 155 | 266 | μs | |
| High-speed CR timer mode Main timer mode PLL timer mode | | 155 | 266 | μs | |
| Low-speed CR timer mode | | 315 | 567 | μs | |
| Sub timer mode | | 315 | 567 | μs | |
| RTC mode Stop mode | | 315 | 567 | μs | |
| Deep standby RTC mode Deep standby stop mode | | 336 | 667 | μs | without RAM retention |
| | | | | μs | with RAM retention |

*: The maximum value depends on the built-in CR accuracy.

Example of Standby Recovery Operation (when in INITX Recovery)

Example of Standby Recovery Operation (when in Internal Resource Reset Recovery*)

*: Depending on the standby mode, the reset issue from the internal resource is not included in the recovery cause.

Notes:

- The return factor is different in each Low-Power consumption modes. See CHAPTER 6: Low Power Consumption Mode and Operations of Standby Modes in FM4 Family Peripheral Manual Main part (002-04856).
- The time during the power-on reset/low-voltage detection reset is excluded to the recovery source. See 12.4.7. Power-on Reset Timing in 12.4.AC Characteristics in 12. Electrical Characteristics for the detail on the time during the power-on reset/low-voltage detection reset.
- When in recovery from reset, CPU changes to the high-speed CR run mode. When using the main clock or the PLL clock, it is necessary to add the main clock oscillation stabilization wait time or the main PLL clock stabilization wait time.
- The internal resource reset means the watchdog reset and the CSV reset.
