**Description**

The IDT71V25761 are high-speed SRAMs organized as 128K x 36. The IDT71V25761 SRAMs contain write, data, address and control registers. Internal logic allows the SRAM to generate a self-timed write based upon a decision which can be left until the end of the write cycle.

The burst mode feature offers the highest level of performance to the system designer, as the IDT71V25761 can provide four cycles of data for a single address presented to the SRAM. An internal burst address counter accepts the first cycle address from the processor, initiating the access sequence. The first cycle of output data will be pipelined for one cycle before it is available on the next rising clock edge. If burst mode operation is selected (ADV=LOW), the subsequent three cycles of output data will be available to the user on the next three rising clock edges. The order of these three addresses are defined by the internal burst counter and the LBO input pin.

The IDT71V25761 SRAMs utilize IDT's latest high-performance CMOS process and are packaged in a JEDEC standard 14mm x 20mm 100-pin thin plastic quad flatpack (TQFP) as well as a 119 ball grid array (BGA) and 165 fine pitch ball grid array (FBGA).

## Pin Definitions<sup>(1)</sup>

Symbol	Pin Function	I/O	Active	Description
A0-A17	Address Inputs	I	N/A	Synchronous Address inputs. The address register is triggered by a combination of the rising edge of CLK and $\overline{ADSC}$ Low or $\overline{ADSP}$ Low and $\overline{CE}$ Low.
$\overline{ADSC}$	Address Status (Cache Controller)	I	LOW	Synchronous Address Status from Cache Controller. $\overline{ADSC}$ is an active LOW input that is used to load the address registers with new addresses.
$\overline{ADSP}$	Address Status (Processor)	I	LOW	Synchronous Address Status from Processor. $\overline{ADSP}$ is an active LOW input that is used to load the address registers with new addresses. $\overline{ADSP}$ is gated by $\overline{CE}$ .
$\overline{ADV}$	Burst Address Advance	I	LOW	Synchronous Address Advance. $\overline{ADV}$ is an active LOW input that is used to advance the internal burst counter, controlling burst access after the initial address is loaded. When the input is HIGH the burst counter is not incremented; that is, there is no address advance.
$\overline{BWE}$	Byte Write Enable	I	LOW	Synchronous byte write enable gates the byte write inputs $\overline{BW1}$ - $\overline{BW4}$ . If $\overline{BWE}$ is LOW at the rising edge of CLK then $\overline{BWx}$ inputs are passed to the next stage in the circuit. If $\overline{BWE}$ is HIGH then the byte write inputs are blocked and only $\overline{GW}$ can initiate a write cycle.
$\overline{BW1}$ - $\overline{BW4}$	Individual Byte Write Enables	I	LOW	Synchronous byte write enables. $\overline{BW1}$ controls I/O0-7, I/Op1, $\overline{BW2}$ controls I/O8-15, I/Op2, etc. Any active byte write causes all outputs to be disabled.
$\overline{CE}$	Chip Enable	I	LOW	Synchronous chip enable. $\overline{CE}$ is used with CS0 and $\overline{CS1}$ to enable the IDT71V25761/781. $\overline{CE}$ also gates $\overline{ADSP}$ .
CLK	Clock	I	N/A	This is the clock input. All timing references for the device are made with respect to this input.
CS0	Chip Select 0	I	HIGH	Synchronous active HIGH chip select. CS0 is used with $\overline{CE}$ and $\overline{CS1}$ to enable the chip.
$\overline{CS1}$	Chip Select 1	I	LOW	Synchronous active LOW chip select. $\overline{CS1}$ is used with $\overline{CE}$ and CS0 to enable the chip.
$\overline{GW}$	Global Write Enable	I	LOW	Synchronous global write enable. This input will write all four 9-bit data bytes when LOW on the rising edge of CLK. $\overline{GW}$ supersedes individual byte write enables.
I/O0-I/O31 I/Op1-I/Op4	Data Input/Output	I/O	N/A	Synchronous data input/output (I/O) pins. Both the data input path and data output path are registered and triggered by the rising edge of CLK.
$\overline{LBO}$	Linear Burst Order	I	LOW	Asynchronous burst order selection input. When $\overline{LBO}$ is HIGH, the interleaved burst sequence is selected. When $\overline{LBO}$ is LOW the Linear burst sequence is selected. $\overline{LBO}$ is a static input and must not change state while the device is operating.
$\overline{OE}$	Output Enable	I	LOW	Asynchronous output enable. When $\overline{OE}$ is LOW the data output drivers are enabled on the I/O pins if the chip is also selected. When $\overline{OE}$ is HIGH the I/O pins are in a high-impedance state.
TMS	Test ModeSelect	I	N/A	Gives input command for TAP controller. Sampled on rising edge of TDK. This pin has an internal pullup.
TDI	Test Data Input	I	N/A	Serial input of registers placed between TDI and TDO. Sampled on rising edge of TCK. This pin has an internal pullup.
TCK	Test Clock	I	N/A	Clock input of TAP controller. Each TAP event is clocked. Test inputs are captured on rising edge of TCK, while test outputs are driven from the falling edge of TCK. This pin has an internal pullup.
TDO	Test DataOutput	O	N/A	Serial output of registers placed between TDI and TDO. This output is active depending on the state of the TAP controller.
$\overline{TRST}$	JTAG Reset (Optional)	I	LOW	Optional Asynchronous JTAG reset. Can be used to reset the TAP controller, but not required. JTAG reset occurs automatically at power up and also resets using TMS and TCK per IEEE 1149.1. If not used $\overline{TRST}$ can be left floating. This pin has an internal pullup. Only available in BGA package.
ZZ	Sleep Mode	I	HIGH	Asynchronous sleep mode input. ZZ HIGH will gate the CLK internally and power down the IDT71V25761/781 to its lowest power consumption level. Data retention is guaranteed in Sleep Mode. This pin has an internal pull down.
VDD	Power Supply	N/A	N/A	3.3V core power supply.
VDDO	Power Supply	N/A	N/A	2.5V I/O Supply.
VSS	Ground	N/A	N/A	Ground.
NC	No Connect	N/A	N/A	NC pins are not electrically connected to the device.

## Timing Waveform of Pipeline Read Cycle<sup>(1,2)</sup>

5297.dnw 08

**NOTES:**

1.  $O1(Ax)$  represents the first output from the external address  $Ax$ .  $O1(Ay)$  represents the first output from the external address  $Ay$ ;  $O2(Ay)$  represents the next output data in the burst sequence of the base address  $Ay$ , etc. where  $A0$  and  $A1$  are advancing for the four word burst in the sequence defined by the state of the LBO input.
2. ZZ input is LOW and LBO is Don't Care for this cycle.
3. CS0 timing transitions are identical but inverted to the  $\overline{CE}$  and  $\overline{CS1}$  signals. For example, when  $\overline{CE}$  and  $\overline{CS1}$  are LOW on this waveform, CS0 is HIGH.

### Timing Waveform of Combined Pipelined Read and Write Cycles<sup>(1,2,3)</sup>

5297 drw 09

**NOTES:**

1. Device is selected through entire cycle:  $\overline{CE}$  and  $\overline{CS1}$  are LOW,  $\overline{CS0}$  is HIGH.
2. ZZ input is LOW and LBO is Don't Care for this cycle.
3. O1 (Ax) represents the first output from the external address Ax. I1 (Ay) represents the first input from the external address Ay. O1 (Az) represents the first output from the external address Az; O2 (Az) represents the next output data in the burst sequence of the base address Az, etc. where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input.

In the case of input **I2(Ay)** this data is valid for two cycles because **ADV** is high and has suspended the burst.
3. CS0 timing transitions are identical but inverted to the **CE** and **CS1** signals. For example, when **CE** and **CS1** are LOW on this waveform, **CS0** is HIGH.

### Timing Waveform of Write Cycle No. 2 — Byte Controlled<sup>(1,2,3)</sup>

5297 drw 11

**NOTES:**

1. Z $\bar{Z}$  input is LOW,  $\overline{G\bar{W}}$  is HIGH and  $\overline{L\bar{B}O}$  is Don't Care for this cycle.
2. O4 (Aw) represents the final output data in the burst sequence of the base address Aw. I1 (Ax) represents the first input from the external address Ax. I1 (Ay) represents the first input from the external address Ay. I2 (Ay) represent the next input data in the burst sequence of the base address Ay, etc. where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the  $\overline{L\bar{B}O}$  input. In the case of input I2 (Ay) this data is valid for two cycles because  $\overline{ADV}$  is high and has suspended the burst.
3. CS0 timing transitions are identical but inverted to the  $\overline{CE}$  and  $\overline{CS1}$  signals. For example, when  $\overline{CE}$  and  $\overline{CS1}$  are LOW on this waveform, CS0 is HIGH.

Timing Waveform of Sleep (ZZ) and Power-Down Modes<sup>(1,2,3)</sup>

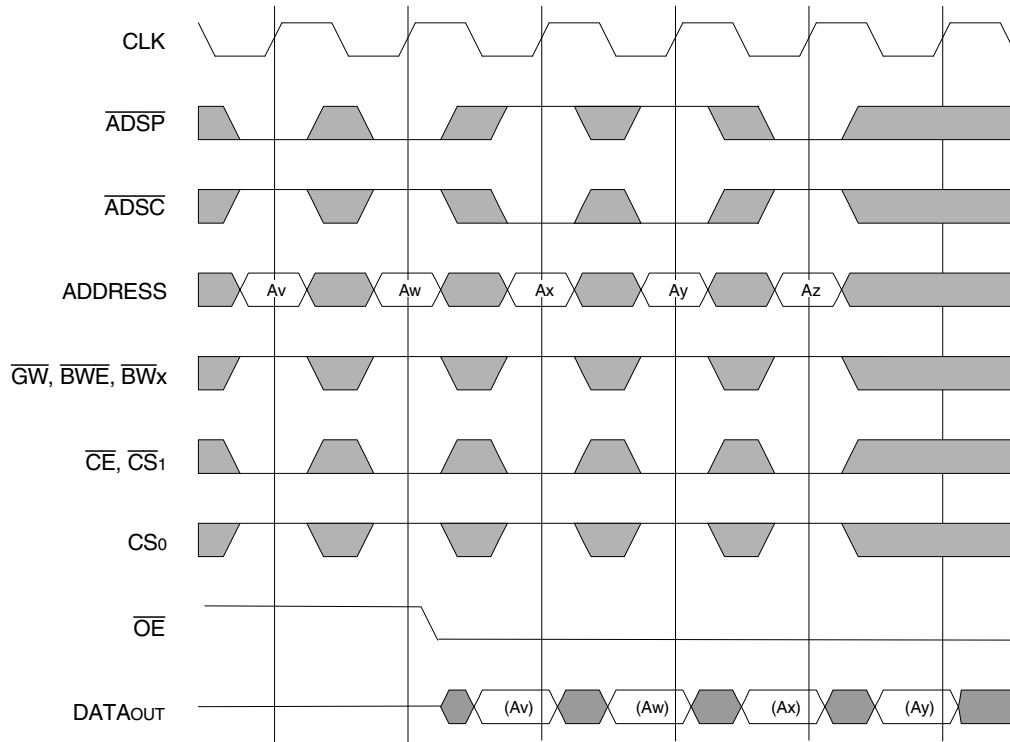

5297 drw 12

NOTES:

1. Device must power up in deselected Mode.
2. LBO is Don't Care for this cycle.
3. It is not necessary to retain the state of the input registers throughout the Power-down cycle.
4. CS0 timing transitions are identical but inverted to the CE and CS1 signals. For example, when CE and CS1 are LOW on this waveform, CS0 is HIGH.

## Non-Burst Read Cycle Timing Waveform

### NOTES:

1. ZZ input is LOW,  $\overline{ADV}$  is HIGH and  $\overline{LBO}$  is Don't Care for this cycle.
2. (Ax) represents the data for address Ax, etc.
3. For read cycles,  $\overline{ADSP}$  and  $\overline{ADSC}$  function identically and are therefore interchangeable.

5297 drw 14

## Non-Burst Write Cycle Timing Waveform

### NOTES:

1. ZZ input is LOW,  $\overline{ADV}$  and  $\overline{OE}$  are HIGH, and  $\overline{LBO}$  is Don't Care for this cycle.
2. (Ax) represents the data for address Ax, etc.
3. Although only  $\overline{GW}$  writes are shown, the functionality of  $\overline{BWE}$  and  $\overline{BWx}$  together is the same as  $\overline{GW}$ .
4. For write cycles,  $\overline{ADSP}$  and  $\overline{ADSC}$  have different limitations.

5297 drw 15

## JTAG Interface Specification (SA Version only)

**NOTES:**

1. Device inputs = All device inputs except TDI, TMS and  $\overline{TRST}$ .
2. Device outputs = All device outputs except TDO.
3. During power up,  $\overline{TRST}$  could be driven low or not be used since the JTAG circuit resets automatically.  $\overline{TRST}$  is an optional JTAG reset.
