Description

The AP130 is a 300mA, fixed output voltage, low dropout linear regulator. The device includes pass element, error amplifier, band-gap, current-limit and thermal shutdown circuitry. The characteristics of low dropout voltage and less quiescent current make it good for some critical current application, for example, some battery powered devices. The typical quiescent current is approximately 50μA from zero to maximum load. Due to internal flexible design, results in extensively fixed output voltage versions and make it convenient to use for applications. Built-in current-limit and thermal-shutdown functions prevent any fault condition from IC damage.

- Notes:
- Dropout voltage is defined as the input to output differential voltage. Dropout is measured at constant junction temperature by using pulsed on time, and the criterion is V_{OUT} inside target value $\pm 2\%$. This test is skipped at the condition of $V_{IN} < 3\text{V}$.
 - Current limit is measured at constant junction temperature by using pulsed testing with a low ON time.
 - Regulation is measured at constant junction temperature by using pulsed testing with a low ON time.
 - Guaranteed by design.
 - Test condition for SC59/SC59R: Devices mounted on FR-4 PC board, 1stMRP, 2oz copper, single sided, calibrate at $T_J = 125^\circ\text{C}$, $T_A = 25^\circ\text{C}$, with minimum recommended pad layout.
 - Test condition for SOT23: Devices mounted on FR-4 PC board, 1stMRP, calibrate at $T_J = 85^\circ\text{C}$, $T_A = 29^\circ\text{C}$.
 - Test condition for SOT89-3L/SOT89R-3L: No Heat Sink, no air flow.

Typical Performance Characteristics

Functional Descriptions

A minimum of 10μF capacitor must be connected from OUT to ground to insure stability. Typically a large storage capacitor is connected from V_{IN} to ground to ensure that the input voltage does not sag below the minimum dropout voltage during the load transient response.
