## Data Sheet

## FEATURES

## Ultralow supply current

Full power mode: $\mathbf{5 0 0} \mu \mathrm{A}$
Sleep mode: $74 \mu \mathrm{~A}$
Shutdown mode: $2.9 \mu \mathrm{~A}$
Dynamic power scaling
Turn-on time from shutdown mode: $1.5 \mu \mathrm{~s}$
Turn-on time from sleep mode: $0.45 \mu \mathrm{~s}$
High speed performance with dc precision
Input offset voltage: $\mathbf{1 2 5} \mu \mathrm{V}$ maximum
Input offset voltage drift: $1.5 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ maximum
-3 dB bandwidth: 105 MHz
Slew rate: $160 \mathrm{~V} / \mu \mathrm{s}$
Low noise and distortion
$5.9 \mathrm{nV} / \sqrt{ } \mathrm{Hz}$ input voltage noise with $8 \mathrm{~Hz} 1 / f$ corner
$-102 \mathrm{dBc} /-126 \mathrm{dBc}$ HD2/HD3 at 100 kHz
Wide supply range: 2.7 V to 10 V
Small package: 8-lead SOT-23

## APPLICATIONS

Portable and battery-powered instruments and systems
High channel density data acquisition systems
Precision analog-to-digital converter (ADC) drivers
Voltage reference buffers
Portable point of sales terminals
Active RFID readers

## GENERAL DESCRIPTION

The ADA4806-1 is a high speed, voltage feedback, rail-to-rail output, single operational amplifier with three power modes: full power mode, sleep mode, and shutdown mode. In full power mode, this amplifier provides a wide bandwidth of 105 MHz at a gain of +1 , a fast slew rate $160 \mathrm{~V} / \mu \mathrm{s}$, and excellent dc precision with a low input offset voltage of $125 \mu \mathrm{~V}$ (maximum) and an input offset voltage drift of $1.5 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ (maximum), while con-suming only $500 \mu \mathrm{~A}$ of quiescent current. Despite being a low power amplifier, the ADA4806-1 provides excellent overall performance, making it ideal for low power, high resolution data conversion systems.

For data conversion applications where minimizing power dissipation is paramount, the ADA4806-1 offers a method to reduce power by dynamically scaling the quiescent power of the ADC driver with the sampling rate of the system by switching the amplifier to a lower power mode between samples.

## TYPICAL APPLICATIONS CIRCUIT

Figure 1. Driving the AD7980 with the ADA4806-1
Sleep mode reduces the amplifier quiescent current to $74 \mu \mathrm{~A}$ and provides a fast turn-on time of only $0.45 \mu \mathrm{~s}$, enabling the use of dynamic power scaling for sample rates approaching 2 MSPS. For additional power savings at lower samples rates, the shutdown mode further reduces the quiescent current to only $2.9 \mu \mathrm{~A}$.
The ADA4806-1 operates over a wide range of supply voltages and is fully specified at supplies of $3 \mathrm{~V}, 5 \mathrm{~V}$ and $\pm 5 \mathrm{~V}$. This amplifier is available in a compact, 8-lead SOT-23 package and is rated to operate over the industrial temperature range of $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.

Figure 2. Quiescent Power Dissipation vs. ADC Sample Rate, Using Dynamic Power Scaling for the Two Low Power Modes

Table 1. Complementary ADCs to the ADA4806-1

| Product | ADC Power (mW) | Throughput <br> (MSPS) | Resolution <br> (Bits) | SNR <br> (dB) |
| :--- | :--- | :--- | :--- | :--- |
| AD7980 | 4.0 | 1 | 16 | $90.5^{1}$ |
| AD7982 | 7.0 | 1 | 18 | 98 |
| AD7984 | 10.5 | 1.33 | 18 | 98.5 |

${ }^{1}$ This SNR value is for the A Grade version of the AD7980.

## ABSOLUTE MAXIMUM RATINGS

Table 5.

| Parameter | Rating |
| :--- | :--- |
| Supply Voltage | 11 V |
| Power Dissipation | See Figure 3 |
| Common-Mode Input Voltage | $-\mathrm{V}_{\mathrm{S}}-0.7 \mathrm{~V}$ to $+\mathrm{V}_{\mathrm{s}}+0.7 \mathrm{~V}$ |
| Differential Input Voltage | $\pm 1 \mathrm{~V}$ |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Lead Temperature (Soldering, 10 sec ) | $300^{\circ} \mathrm{C}$ |
| Junction Temperature | $150^{\circ} \mathrm{C}$ |

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## THERMAL RESISTANCE

$\theta_{\mathrm{JA}}$ is specified for the worst case conditions, that is, $\theta_{\mathrm{JA}}$ is specified for a device soldered in a circuit board for surface-mount packages. Table 6 lists the $\theta_{\text {JA }}$ for the ADA4806-1.

Table 6. Thermal Resistance

| Package Type | $\theta_{\mathrm{JA}}$ | Unit |
| :--- | :--- | :--- |
| 8-Lead SOT-23 | 209.1 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

## MAXIMUM POWER DISSIPATION

The maximum safe power dissipation for the ADA4806-1 is limited by the associated rise in junction temperature $\left(\mathrm{T}_{\mathrm{J}}\right)$ on the die. At approximately $150^{\circ} \mathrm{C}$, which is the glass transition temperature, the properties of the plastic change. Even temporarily exceeding this temperature limit may change the stresses that the package exerts on the die, permanently shifting the parametric performance of the ADA4806-1. Exceeding a junction temperature of $175^{\circ} \mathrm{C}$ for an extended period of time can result in changes in silicon devices, potentially causing degradation or loss of functionality.
The power dissipated in the package $\left(\mathrm{P}_{\mathrm{D}}\right)$ is the sum of the quiescent power dissipation and the power dissipated in the die due to the ADA4806-1 output load drive.

The quiescent power dissipation is the voltage between the supply pins ( $\mathrm{V}_{\mathrm{s}}$ ) multiplied by the quiescent current ( Is ).

$$
P_{D}=\text { Quiescent Power }+(\text { Total Drive Power }- \text { Load Power })
$$

$$
P_{D}=\left(V_{S} \times I_{S}\right)+\left(\frac{V_{S}}{2} \times \frac{V_{O U T}}{R_{L}}\right)-\frac{V_{O U T}^{2}}{R_{L}}
$$

RMS output voltages must be considered. If $R_{L}$ is referenced to $-\mathrm{V}_{\mathrm{s}}$, as in single-supply operation, the total drive power is $\mathrm{V}_{\mathrm{s}} \times$ Iout. If the rms signal levels are indeterminate, consider the worst case, when $V_{\text {out }}=V_{S} / 4$ for $R_{L}$ to midsupply.

$$
P_{D}=\left(V_{S} \times I_{S}\right)+\frac{\left(V_{S} / 4\right)^{2}}{R_{L}}
$$

In single-supply operation with $\mathrm{R}_{\mathrm{L}}$ referenced to $-\mathrm{V}_{\mathrm{S}}$, the worst case is $V_{\text {out }}=\mathrm{V}_{\mathrm{S}} / 2$.
Airflow increases heat dissipation, effectively reducing $\theta_{J A}$. Additionally, more metal directly in contact with the package leads and exposed pad from metal traces, through holes, ground, and power planes reduces $\theta_{\mathrm{JA}}$.

Figure 3 shows the maximum safe power dissipation in the package vs. the ambient temperature on a JEDEC standard, 4-layer board. $\theta_{J A}$ values are approximations.

Figure 3. Maximum Power Dissipation vs. Ambient Temperature for a 4-Layer Board

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## THEORY OF OPERATION

## AMPLIFIER DESCRIPTION

The ADA4806-1 has a bandwidth of 105 MHz and a slew rate of $160 \mathrm{~V} / \mu \mathrm{s}$. It has an input referred voltage noise of only $5.9 \mathrm{nV} / \sqrt{ } \mathrm{Hz}$. The ADA4806-1 operates over a supply voltage range of 2.7 V to 10 V and consumes only $500 \mu \mathrm{~A}$ of supply current at $\mathrm{V}_{s}=5 \mathrm{~V}$. The low end of the supply range allows $-10 \%$ variation of a 3 V supply. The amplifier is unity-gain stable, and the input structure results in an extremely low input $1 / \mathrm{f}$ noise. The ADA4806-1 uses a slew enhancement architecture, as shown in Figure 52. The slew enhancement circuit detects the absolute difference between the two inputs. It then modulates the tail current, $\mathrm{I}_{\text {Tail }}$, of the input stage to boost the slew rate. The architecture allows a higher slew rate and fast settling time with low quiescent current while maintaining low noise.

Figure 52. Slew Enhancement Circuit

## INPUT PROTECTION

The ADA4806-1 is fully protected from ESD events, withstanding human body model ESD events of $\pm 3.5 \mathrm{kV}$ and charged device model events of $\pm 1.25 \mathrm{kV}$ with no measured performance degradation. The precision input is protected with an ESD network between the power supplies and diode clamps across the input device pair, as shown in Figure 53.

Figure 53. Input Stage and Protection Diodes

For differential voltages above approximately 1.2 V at room temperature, and 0.8 V at $125^{\circ} \mathrm{C}$, the diode clamps begin to conduct. If large differential voltages must be sustained across the input terminals, the current through the input clamps must be limited to less than 10 mA . Series input resistors that are sized appropriately for the expected differential overvoltage provide the needed protection.
The ESD clamps begin to conduct for input voltages that are more than 0.7 V above the positive supply and input voltages more than 0.7 V below the negative supply. If an overvoltage condition is expected, the input current must be limited to less than 10 mA .

## SHUTDOWN/SLEEP MODE OPERATION

Figure 54 shows the ADA4806-1 shutdown circuitry. To maintain very low supply current in shutdown mode, no internal pull-up resistor is supplied; therefore, the $\overline{\text { SHUTDOWN }}$ pin must be driven high or low externally and must not be left floating. Pulling the $\overline{\text { SHUTDOWN }}$ pin to $\geq 1 \mathrm{~V}$ below midsupply turns the device off, reducing the supply current to $2.9 \mu \mathrm{~A}$ for a 5 V supply. When the amplifier is powered down, its output enters a high impedance state. The output impedance decreases as frequency increases. In shutdown mode, a forward isolation of -62 dB can be achieved at 100 kHz (see Figure 21).
A second circuit similar to Figure 54 is used for sleep mode operation. Pulling the $\overline{\operatorname{SLEEP}}$ pin low places the amplifier in a low power state, drawing only $74 \mu \mathrm{~A}$ from a 5 V supply. Leaving the amplifier biased on at a very low level greatly reduces the turnon time from sleep to full power mode, thus enabling dynamic power scaling of the ADA4806-1 at higher sample rates.
The ADA4806-1 is not characterized for operation in sleep mode.

Figure 54. Shutdown/Sleep Equivalent Circuit
The $\overline{\text { SHUTDOWN }}$ pin and the $\overline{\text { SLEEP }}$ pin are protected by ESD clamps, as shown in Figure 54. Voltages beyond the power supplies cause these diodes to conduct. To protect the $\overline{\text { SHUTDOWN }}$ and $\overline{\text { SLEEP }}_{\text {pins, ensure that the the the to the the }}$ exceed 0.7 V above the positive supply or 0.7 V below the negative supply. If an overvoltage condition is expected, the input current must be limited to less than 10 mA with a series resistor.

Table 8 summarizes the threshold voltages for the $\overline{\text { SHUTDOWN }}$ and $\overline{\text { SLEEP }}$ pins for various supplies. Table 9 shows the truth table for the $\overline{\text { SHUTDOWN }}$ and $\overline{\text { SLEEP }}$ pins.

Table 8. Threshold Voltages for Enabled Mode and Shutdown/Sleep Modes

| Mode | $\mathbf{+ 3} \mathbf{V}$ | $\mathbf{+ 5} \mathbf{V}$ | $\mathbf{+ 5} \mathbf{V}$ | $\mathbf{+ 7} \mathbf{V} / \mathbf{- 2} \mathbf{V}$ |
| :--- | :--- | :--- | :--- | :--- |
| Enabled | $>+1.1 \mathrm{~V}$ | $>+1.9 \mathrm{~V}$ | $>-0.9 \mathrm{~V}$ | $>+1.6 \mathrm{~V}$ |

| High | Low | Low power mode |
| High | High | Full power mode |

## NOISE CONSIDERATIONS

Figure 55 shows the primary noise contributors for the typical gain configurations. The total output noise ( $\mathrm{v}_{\mathrm{n}_{-} \text {out }}$ ) is the root sum square of all the noise contributions.

Figure 55. Noise Sources in Typical Connection

The output noise spectral density is calculated by

$$
\begin{aligned}
& v_{n_{-} \text {OUT }}= \\
& \sqrt{4 k T R_{F}+\left(1+\frac{R_{F}}{R_{G}}\right)^{2}\left[4 k T R s+i_{n+}{ }^{2} R_{S}{ }^{2}+v_{n}{ }^{2}\right]+\left(\frac{R_{F}}{R_{G}}\right)^{2} 4 k T R_{G}+i_{n-}{ }^{2} R_{F}{ }^{2}}
\end{aligned}
$$

where:
$k$ is Boltzmann's constant.
$T$ is the absolute temperature in degrees Kelvin.
$R_{F}$ and $R_{G}$ are the feedback network resistances, as shown in
Figure 55.
$R_{s}$ is the source resistance, as shown in Figure 55.
$i_{n+}$ and $i_{n-}$ represent the amplifier input current noise spectral density in $\mathrm{pA} / \sqrt{ } \mathrm{Hz}$.
$v_{n}$ is the amplifier input voltage noise spectral density in $\mathrm{nV} / \sqrt{\mathrm{Hz}}$.

Source resistance noise, amplifier input voltage noise ( $\mathrm{v}_{\mathrm{n}}$ ), and the voltage noise from the amplifier input current noise ( $\mathrm{i}_{\mathrm{n}+} \times \mathrm{R}_{\mathrm{s}}$ ) are all subject to the noise gain term $\left(1+\mathrm{R}_{\mathrm{F}} / \mathrm{R}_{\mathrm{G}}\right)$.
Figure 56 shows the total referred to input (RTI) noise due to the amplifier vs. the source resistance. Note that with a $5.9 \mathrm{nV} / \sqrt{ } \mathrm{Hz}$ input voltage noise and $0.6 \mathrm{pA} / \sqrt{ } \mathrm{Hz}$ input current noise, the noise contributions of the amplifier are relatively small for source resistances from approximately $2.6 \mathrm{k} \Omega$ to $47 \mathrm{k} \Omega$.

The Analog Devices, Inc., silicon germanium (SiGe) bipolar process makes it possible to achieve a low noise of $5.9 \mathrm{nV} / \sqrt{ } \mathrm{Hz}$ for the ADA4806-1. This noise is much improved compared to similar low power amplifiers with a supply current in the range of hundreds of microamperes.

Figure 56. RTI Noise vs. Source Resistance

## APPLICATIONS INFORMATION

## SLEW ENHANCEMENT

The ADA4806-1 has an internal slew enhancement circuit that increases the slew rate as the feedback error voltage increases. This circuit allows the amplifier to settle a large step response faster, as shown in Figure 57. This is useful in ADC applications where multiple input signals are multiplexed. The impact of the slew enhancement can also be seen in the large signal frequency response, where larger input signals cause a slight increase in peaking, as shown in Figure 58.

Figure 57. Step Response with Selected Output Steps

Figure 58. Peaking in Frequency Responses as Signal Level Changes, $G=+1$

## EFFECT OF FEEDBACK RESISTOR ON FREQUENCY RESPONSE

The amplifier input capacitance and feedback resistor form a pole that, for larger value feedback resistors, can reduce phase margin and contribute to peaking in the frequency response. Figure 59 shows the peaking for selected feedback resistors ( $\mathrm{R}_{\mathrm{F}}$ ) when the amplifier is configured in a gain of +2 . Figure 59 also shows how peaking can be mitigated with the addition of a small value capacitor placed across the feedback resistor of the amplifier.

Figure 59. Peaking in Frequency Response at Selected $R_{F}$ Values

## COMPENSATING PEAKING IN LARGE SIGNAL FREQUENCY RESPONSE

At high frequency, the slew enhancement circuit can contribute to peaking in the large signal frequency response. Figure 59 shows the effect of a feedback capacitor on the small signal response, whereas Figure 60 shows that the same technique is effective for reducing peaking in the large signal response.

Figure 60. Peaking Mitigation in Large Signal Frequency Response

## DRIVING LOW POWER, HIGH RESOLUTION SUCCESSIVE APPROXIMATION REGISTER (SAR) ADCs

The ADA4806-1 is ideal for driving low power, high resolution SAR ADCs. The $5.9 \mathrm{nV} / \sqrt{ } \mathrm{Hz}$ input voltage noise and rail-to-rail output stage of the ADA4806-1 help minimize distortion at large output levels. With its low power of $500 \mu \mathrm{~A}$, the amplifier consumes power that is compatible with low power SAR ADCs, which are usually in the microwatt ( $\mu \mathrm{W}$ ) to low milliwatt ( mW ) range. Furthermore, the ADA4806-1 supports a single-supply configuration; the input common-mode range extends to 0.1 V below the negative supply, and 1 V below the positive supply.

Figure 61 shows a typical 16-bit, single-supply application. The ADA4806-1 drives the AD7980, a 16-bit, 1 MSPS, SAR ADC in a low power configuration. The AD7980 operates on a 2.5 V supply and supports an input from 0 V to $\mathrm{V}_{\text {ref. }}$. In this case, the ADR435 provides a 5 V reference. The ADA4806-1 is used both as a driver for the AD7980 and as a reference buffer for the ADR435.

The low-pass filter formed by R3 and C1 reduces the noise to the input of the ADC (see Figure 61). In lower frequency applications, the designer can reduce the corner frequency of the filter to remove additional noise.

Figure 61. Driving the AD7980 with the ADA4806-1
In this configuration, the ADA4806-1 consume 7.2 mW of quiescent power. The measured signal-to-noise ratio (SNR), THD, and signal-to-noise-and-distortion ratio (SINAD) of the whole system for a 10 kHz signal are $89.4 \mathrm{~dB}, 104 \mathrm{dBc}$, and 89.3 dB , respectively. This translates to an effective number of bits (ENOB) of 14.5 at 10 kHz , which is compatible with the AD7980 performance. Table 10 shows the performance of this setup at selected input frequencies.

## DYNAMIC POWER SCALING

One of the merits of a SAR ADC, like the AD7980, is that its power scales with the sampling rate. This power scaling makes SAR ADCs very power efficient, especially when running at a low sampling frequency. However, the ADC driver used with the SAR ADC traditionally consumes constant power regardless of the sampling frequency.

Figure 62 illustrates a method by which the quiescent power of the ADC driver can be dynamically scaled with the sampling rate of the system. By providing properly timed signals to the convert input (CNV) pin of the ADC and the $\overline{\text { SHUTDOWN }}$ and $\overline{\text { SLEEP }}$ pins of the ADA4806-1, both devices can be run at optimum efficiency.

Figure 62. ADA4806-1/AD7980 Power Management Circuitry
Figure 63 illustrates the relative signal timing for power scaling the ADA4806-1 and the AD7980. To prevent any degradation in the performance of the ADC, the ADA4806-1 must have a fully settled output into the ADC before the activation of the CNV pin. The amplifier on-time ( $\mathrm{t}_{\text {AMP, os }}$ ) is the time the amplifier is enabled prior to the rising edge of the CNV signal; this time depends on whether the $\overline{\text { SHUTDOWN }}$ pin or $\overline{\text { SLEEP }}$ pin is being driven. In the example shown in Figure 64, $\mathrm{t}_{\text {AMp, ON }}$ is $3 \mu \mathrm{~s}$ for the $\overline{\text { SHUTDOWN }}$ pin and $0.5 \mu \mathrm{~s}$ for the $\overline{\text { SLEEP }}$ pin. After a conversion, the SHUTDOWN pin and/or the SLEEP pin of the ADA4806-1 are pulled low when the ADC input is inactive in between samples. While in shutdown mode, the ADA4806-1 output impedance is high.

Table 10. System Performance at Selected Input Frequencies for Driving the AD7980 Single-Ended

| Input Frequency (kHz) | ADC Driver |  | Reference Buffer |  | Results |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Supply (V) | Gain | Supply (V) | Gain | SNR (dB) | THD (dBc) | SINAD (dB) | ENOB |
|  | 7.5 | 1 | 7.5 | 1 | 89.8 | 103 | 89.6 | 14.6 |
| 10 | 7.5 | 1 | 7.5 | 1 | 89.4 | 104 | 89.3 | 14.5 |
| 20 | 7.5 | 1 | 7.5 | 1 | 89.9 | 103 | 89.7 | 14.6 |
| 50 | 7.5 | 1 | 7.5 | 1 | 88.5 | 99 | 88.1 | 14.3 |
| 100 | 7.5 | 1 | 7.5 | 1 | 86.3 | 93.7 | 85.6 | 13.9 |

## ADA4806-1

Figure 63. Timing Waveforms

Figure 64 shows the quiescent power of the ADA4806-1, operating from a single +6 V supply, without power scaling and while power scaling via the $\overline{\text { SHUTDOWN }}$ pin and the $\overline{\text { SLEEP }}$ pin. Without power scaling, the ADA4806-1 consumes constant power regardless of the sampling frequency, as shown in Equation 1.

$$
\begin{equation*}
P_{Q}=I_{Q} \times V_{S} \tag{1}
\end{equation*}
$$

With power scaling, the quiescent power becomes proportional to the ratio between the amplifier on time, $\mathrm{t}_{\mathrm{AMP}, \mathrm{oN}}$, and the sampling time, t :

$$
\begin{equation*}
P_{Q}=\left(I_{Q_{-} \text {on }} \times V_{S} \times \frac{t_{A M P, O N}}{t_{S}}\right)+\left(I_{Q_{-} \text {off }} \times V_{S} \times \frac{t_{S}-t_{A M P, O N}}{t_{S}}\right) \tag{2}
\end{equation*}
$$

Thus, by dynamically switching the ADA4806-1 between shutdown/sleep and full power modes between consecutive samples, the quiescent power of the driver scales with the sampling rate.
Note that $\mathrm{t}_{\mathrm{AMP}, \text { on }}$ in Figure 64 is $3 \mu$ for the $\overline{\text { SHUTDOWN }}$ pin and $0.5 \mu \mathrm{~s}$ for the $\overline{\text { SLEEP }}_{\text {pin }}$.

Figure 64. Quiescent Power Consumption of the ADA4806-1 vs. ADC Sample Rate, Using Dynamic Power Scaling

## SINGLE-ENDED TO DIFFERENTIAL CONVERSION

Most high resolution ADCs have differential inputs to reduce common-mode noise and harmonic distortion. Therefore, it is necessary to use an amplifier to convert a single-ended signal into a differential signal to drive the ADCs.

There are two common ways the user can convert a single-ended signal into a differential signal: either use a differential amplifier, or configure two amplifiers as shown in Figure 65. The use of a differential amplifier yields better performance, whereas the 2 -op-amp solution results in lower system cost. The ADA4806-1 solves this dilemma of choosing between the two methods by combining the advantages of both. Its low harmonic distortion, low offset voltage, and low bias current mean that it can produce a differential output that is well matched with the performance of the high resolution ADCs.

Figure 65 shows how the ADA4806-1 converts a single-ended signal into a differential output. The first amplifier is configured in a gain of +1 with its output then inverted to produce the complementary signal. The differential output then drives the AD7982, an 18-bit, 1 MSPS SAR ADC. To further reduce noise, the user can reduce the values of R1 and R2. However, note that this increases the power consumption. The low-pass filter of the ADC driver limits the noise to the ADC .

The measured SNR, THD, and SINAD of the whole system for a 10 kHz signal are $93 \mathrm{~dB}, 113 \mathrm{dBc}$, and 93 dB , respectively. This translates to an ENOB of 15.1 at 10 kHz , which is compatible with the performance of the AD7982. Table 11 shows the performance of this setup at selected input frequencies.
Table 11. System Performance at Selected Input Frequencies for Driving the AD7982 Differentially

| Input Frequency $\mathbf{( k H z})$ | Results |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | SNR <br> $\mathbf{( d B})$ | THD <br> $\mathbf{( d B C})$ | SINAD <br> $(\mathbf{d B})$ | ENOB |
|  | 93 | 104 | 93 | 15.1 |
| 10 | 93 | 113 | 93 | 15.1 |
| 20 | 93 | 110 | 93 | 15.1 |
| 50 | 92 | 102 | 91 | 14.8 |
| 100 | 89 | 96 | 88 | 14.3 |

## LAYOUT CONSIDERATIONS

To ensure optimal performance, careful and deliberate attention must be paid to the board layout, signal routing, power supply bypassing, and grounding.

## Ground Plane

It is important to avoid ground in the areas under and around the input and output of the ADA4806-1. Stray capacitance between the ground plane and the input and output pads of a device is detrimental to high speed amplifier performance. Stray capacitance at the inverting input, together with the amplifier input capacitance, lowers the phase margin and can cause instability. Stray capacitance at the output creates a pole in the feedback loop, which can reduce phase margin and cause the circuit to become unstable.

## Power Supply Bypassing

Power supply bypassing is a critical aspect in the performance of the ADA4806-1. A parallel connection of capacitors from each power supply pin to ground works best. Smaller value ceramic capacitors offer better high frequency response, whereas larger value ceramic capacitors offer better low frequency performance.
Paralleling different values and sizes of capacitors helps to ensure that the power supply pins are provided with a low ac impedance across a wide band of frequencies. This is important for minimizing the coupling of noise into the amplifier-especially when the amplifier PSRR begins to roll off-because the bypass capacitors can help lessen the degradation in PSRR performance.
Place the smallest value capacitor on the same side of the board as the amplifier and as close as possible to the amplifier power supply pins. Connect the ground end of the capacitor directly to the ground plane.

It is recommended that a $0.1 \mu \mathrm{~F}$ ceramic capacitor with a 0508 case size be used. The 0508 case size offers low series inductance and excellent high frequency performance. Place a $10 \mu \mathrm{~F}$ electrolytic capacitor in parallel with the $0.1 \mu \mathrm{~F}$ capacitor. Depending on the circuit parameters, some enhancement to performance can be realized by adding additional capacitors. Each circuit is different and must be analyzed individually for optimal performance.

${ }^{1} \mathrm{Z}=$ RoHS Compliant Part.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
