

DDR I/DDR II Phase Lock Loop Zero Delay Buffer

ICS9P935

Description

DDR I/DDR II Zero Delay Clock Buffer

Output Features

- Low skew, low jitter PLL clock driver
- Max frequency supported = 400MHz (DDR II 800)
- I²C for functional and output control
- Feedback pins for input to output synchronization
- Spread Spectrum tolerant inputs
- Programmable skew through SMBus
- Frequency defect control through SMBus
- Individual output control programmable through SMBus

Key Specifications

- CYCLE - CYCLE jitter: <100ps
- OUTPUT - OUTPUT skew: <100ps
- DUTY CYCLE: 48% - 52%
- 28-pin SSOP package
- Available in RoHS compliant packaging
- Operates @ 2.5V or 1.8V

Absolute Max

Supply Voltage	-0.5V to 2.7V
Logic Inputs	GND -0.5 V to $V_{DD} + 0.5$ V
Ambient Operating Temperature	0°C to +70°C
Case Temperature	115°C
Storage Temperature	-65°C to +150°C

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Electrical Characteristics - Input/Supply/Common Output Parameters

Notes:

1. Unused inputs must be held high or low to prevent them from floating.
2. DC input signal voltage specifies the allowable DC execution of differential input.
3. Differential inputs signal voltages specifies the differential voltage [VTR-VCP] required for switching, where VTR is the true input level and VCP is the complementary input level.
4. Differential cross-point voltage is expected to track variations of V_{DD} and is the voltage at which the differential signal must be crossing.

Timing Requirements

Notes:

1. Refers to transition on noninverting output in PLL bypass mode.
2. While the pulse skew is almost constant over frequency, the duty cycle error increases at higher frequencies. This is due to the formula: duty cycle= t_{WH}/t_c , where the cycle (t_c) decreases as the frequency goes up.
3. Switching characteristics guaranteed for application frequency range.
4. Static phase offset shifted by design.

General I²C serial interface information for the ICS9P935

How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address D4_(H)
- ICS clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- ICS clock will **acknowledge**
- Controller (host) sends the data byte count = X
- ICS clock will **acknowledge**
- Controller (host) starts sending **Byte N through Byte N + X - 1**
(see Note 2)
- ICS clock will **acknowledge** each byte **one at a time**
- Controller (host) sends a Stop bit

How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the write address D4_(H)
- ICS clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- ICS clock will **acknowledge**
- Controller (host) will send a separate start bit.
- Controller (host) sends the read address D5_(H)
- ICS clock will **acknowledge**
- ICS clock will send the data byte count = X
- ICS clock sends **Byte N + X - 1**
- ICS clock sends **Byte 0 through byte X (if X_(H) was written to byte 8).**
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

Notes:

- The IDT clock generator is a slave/receiver, I²C component. It can read back the data stored in the latches for verification.
Read-Back will support SMBus block read protocol.
- The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
- The input is operating at 3.3V logic levels.
- The data byte format is 8 bit bytes.
- To simplify the clock generator I²C interface, the protocol is set to use only "**Block-Writes**" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, The data is loaded until a Stop sequence is issued.
- At power-on, all registers are set to a default condition, as shown.
