Automotive Power

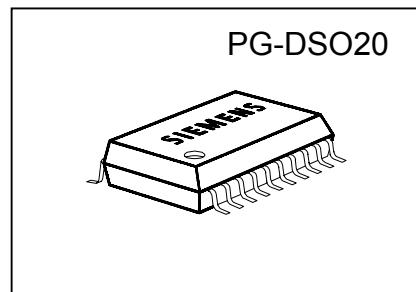

Smart Four Channel Highside Power Switch

Features

- Overload protection
- Current limitation
- Short-circuit protection
- Thermal shutdown
- Overvoltage protection (including load dump)
- Fast demagnetization of inductive loads
- Reverse battery protection¹⁾
- Undervoltage and overvoltage shutdown with auto-restart and hysteresis
- Open drain diagnostic output
- Open load detection in ON-state
- CMOS compatible input
- Loss of ground and loss of V_{bb} protection
- Electrostatic discharge (ESD) protection

Product Summary

Overvoltage Protection	V _{bb(AZ)}	43	V
Operating voltage	V _{bb(on)}	5.0 ... 34	V
active channels:	one	two parallel	four parallel
On-state resistance R _{ON}	200	100	50 mΩ
Nominal load current I _{L(NOM)}	1.9	2.8	4.4 A
Current limitation I _{L(SCR)}	4	4	4 A

Application

- μC compatible power switch with diagnostic feedback for 12 V and 24 V DC grounded loads
- All types of resistive, inductive and capacitive loads
- Replaces electromechanical relays and discrete circuits

- AEC qualified
- Green product (RoHS compliant)

General Description

N channel vertical power FET with charge pump, ground referenced CMOS compatible input and diagnostic feedback, monolithically integrated in Smart SIPMOS® technology.

Providing embedded protective functions.

2) Supply voltages higher than $V_{bb(AZ)}$ require an external current limit for the GND and status pins, e.g. with a 150Ω resistor in the GND connection and a $15 \text{ k}\Omega$ resistor in series with the status pin. A resistor for input protection is integrated.

3) R_I = internal resistance of the load dump test pulse generator

4) $V_{Load dump}$ is setup without the DUT connected to the generator per ISO 7637-1 and DIN 40839

5) Device on $50\text{mm} \times 50\text{mm} \times 1.5\text{mm}$ epoxy PCB FR4 with 6cm^2 (one layer, $70\mu\text{m}$ thick) copper area for V_{bb} connection. PCB is vertical without blown air. See page 15

6) Soldering point: upper side of solder edge of device pin 15. See page 15

⁹⁾ Add I_{ST} , if $I_{ST} > 0$

¹⁰⁾ Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

¹¹⁾ If channels are connected in parallel, output clamp is usually accomplished by the channel with the lowest $V_{ON(CL)}$

¹²⁾ Requires a $150\ \Omega$ resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 3 and circuit page 8).

H = "High" Level Status signal valid after the time delay shown in the timing diagrams

Parallel switching of channel 1 and 2 (also channel 3 and 4) is easily possible by connecting the inputs and outputs in parallel (see truth table). If switching channel 1 to 4 in parallel, the status outputs ST1/2 and ST3/4 have to be configured as a 'Wired OR' function with a single pull-up resistor.

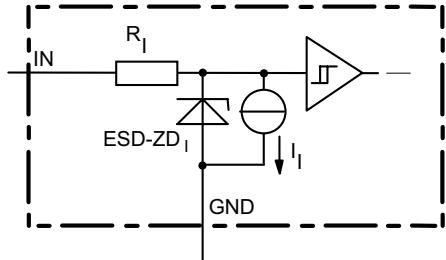

Terms

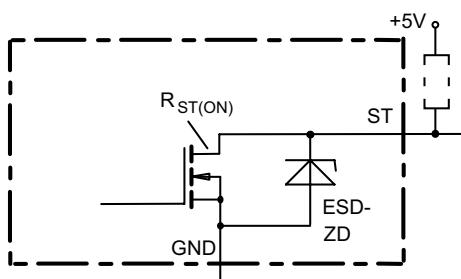

Leadframe (V_{bb}) is connected to pin 1,10,11,12,15,16,19,20

External R_{GND} optional; two resistors R_{GND1/2}, R_{GND3/4} = 150 Ω or a single resistor R_{GND} = 75 Ω for reverse battery protection up to the max. operating voltage.

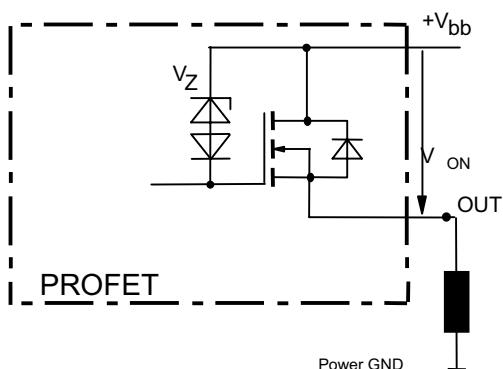

- 15) With additional external pull up resistor
- 16) An external short of output to V_{bb} in the off state causes an internal current from output to ground. If R_{GND} is used, an offset voltage at the GND and ST pins will occur and the V_{ST low} signal may be errorious.
- 17) Low resistance to V_{bb} may be detected by no-load-detection

Input circuit (ESD protection), IN1...4

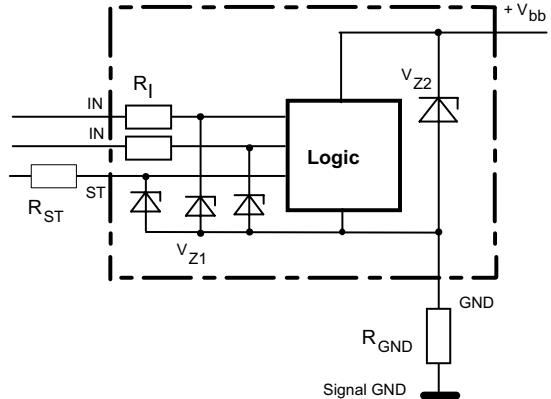

ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

Status output, ST1/2 or ST3/4

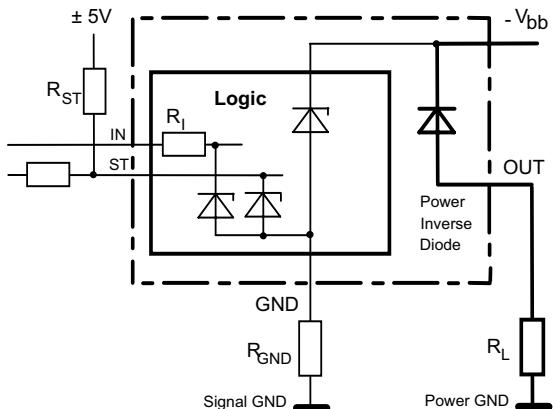

ESD-Zener diode: 6.1 V typ., max 5.0 mA;
 $R_{ST(ON)} < 380 \Omega$ at 1.6 mA, ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

Inductive and overvoltage output clamp, OUT1...4

V_{ON} clamped to $V_{ON(CL)} = 47$ V typ.

Overvoltage protection of logic part
GND1/2 or GND3/4

$V_{Z1} = 6.1$ V typ., $V_{Z2} = 47$ V typ., $R_I = 3.5$ k Ω typ.,
 $R_{GND} = 150 \Omega$

Reverse battery protection

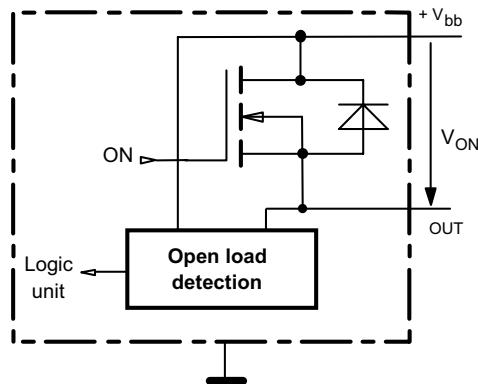

$R_{GND} = 150 \Omega$, $R_I = 3.5$ k Ω typ,

Temperature protection is not active during inverse current operation.

Open-load detection, OUT1...4

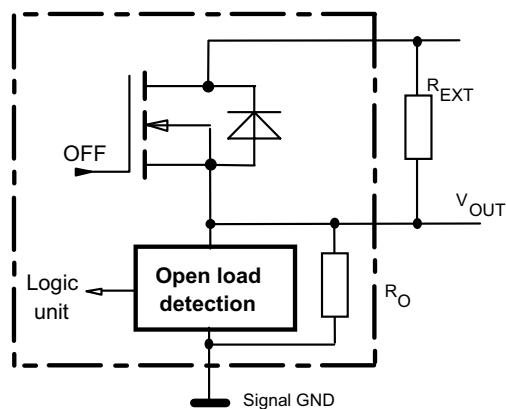

ON-state diagnostic condition:

$$V_{ON} < R_{ON} \cdot I_{L(OL)}; \text{IN high}$$

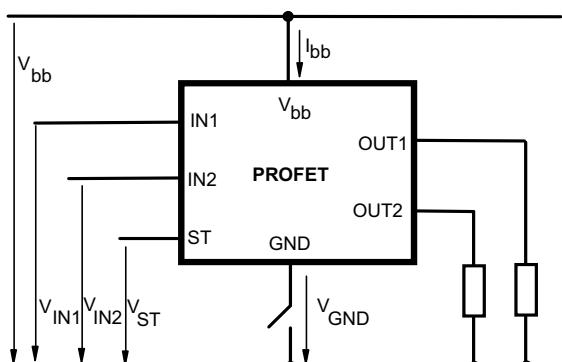

OFF-state diagnostic condition:

$$V_{OUT} > 3 \text{ V typ.; IN low}$$

GND disconnect

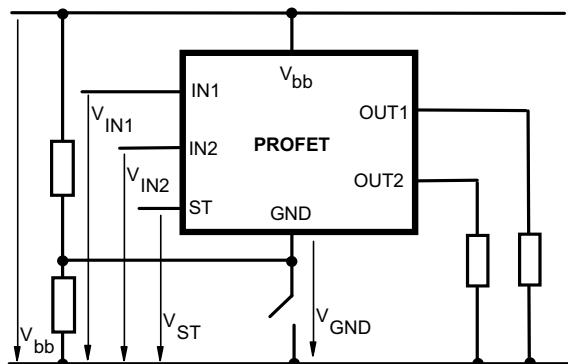

(channel 1/2 or 3/4)

Any kind of load. In case of IN=high is $V_{OUT} \approx V_{IN} - V_{IN(T+)}$. Due to $V_{GND} > 0$, no V_{ST} = low signal available.

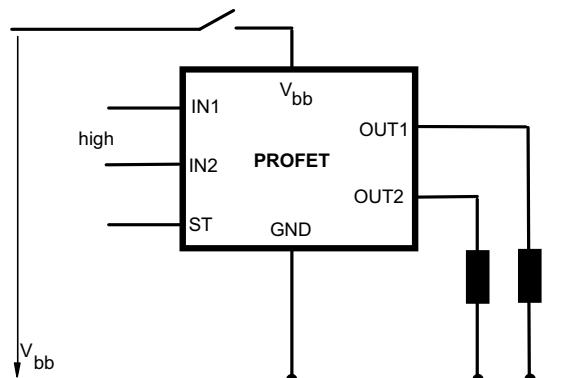

GND disconnect with GND pull up

(channel 1/2 or 3/4)

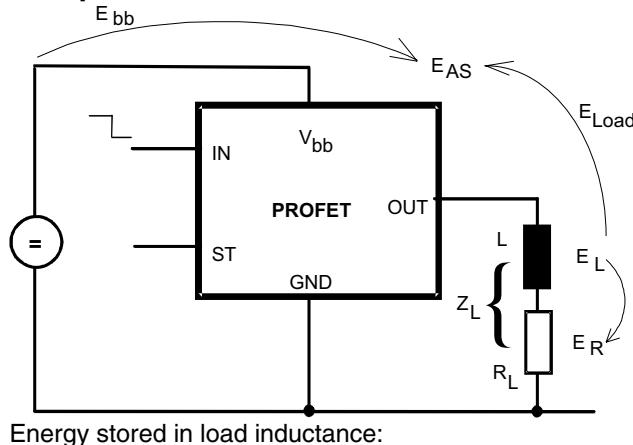

Any kind of load. If $V_{GND} > V_{IN} - V_{IN(T+)}$ device stays off. Due to $V_{GND} > 0$, no V_{ST} = low signal available.

Vbb disconnect with energized inductive load

For an inductive load current up to the limit defined by E_{AS} (max. ratings see page 3 and diagram on page 10) each switch is protected against loss of V_{bb} .

Consider at your PCB layout that in the case of V_{bb} disconnection with energized inductive load the whole load current flows through the GND connection.

Inductive load switch-off energy dissipation

While demagnetizing load inductance, the energy dissipated in PROFET is

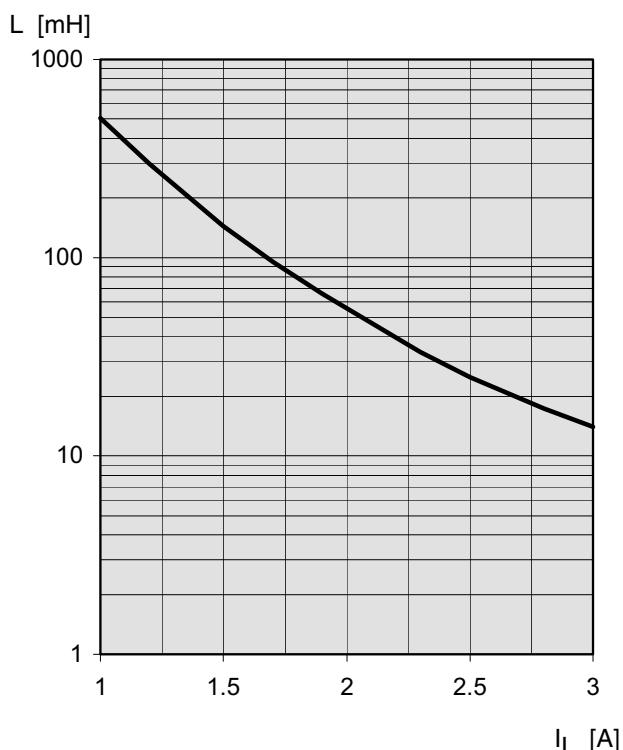

$$E_{AS} = E_{bb} + E_L - E_R = V_{ON(CL)} \cdot i_L(t) \, dt,$$

with an approximate solution for $R_L > 0 \Omega$:

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} (V_{bb} + |V_{OUT(CL)}|) \ln \left(1 + \frac{|I_L \cdot R_L|}{|V_{OUT(CL)}|} \right)$$

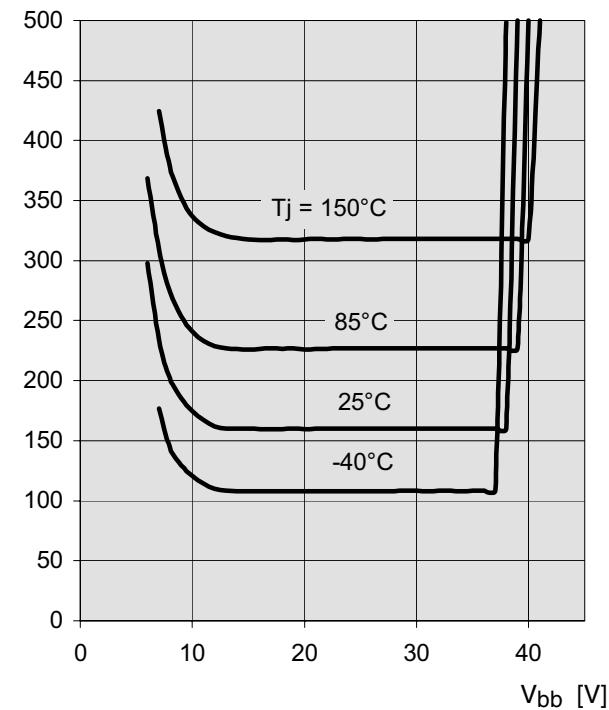

Maximum allowable load inductance for a single switch off (one channel)⁵

$$L = f(I_L); T_{j,start} = 150^\circ\text{C}, V_{bb} = 12\text{ V}, R_L = 0 \Omega$$

Typ. on-state resistance

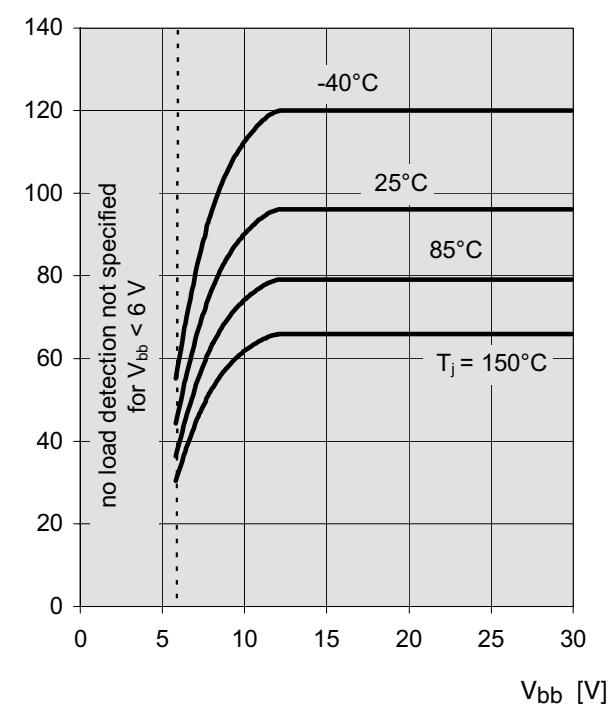

$$R_{ON} = f(V_{bb}, T_j); I_L = 1.8 \text{ A}, IN = \text{high}$$

R_{ON} [mOhm]

Typ. open load detection current

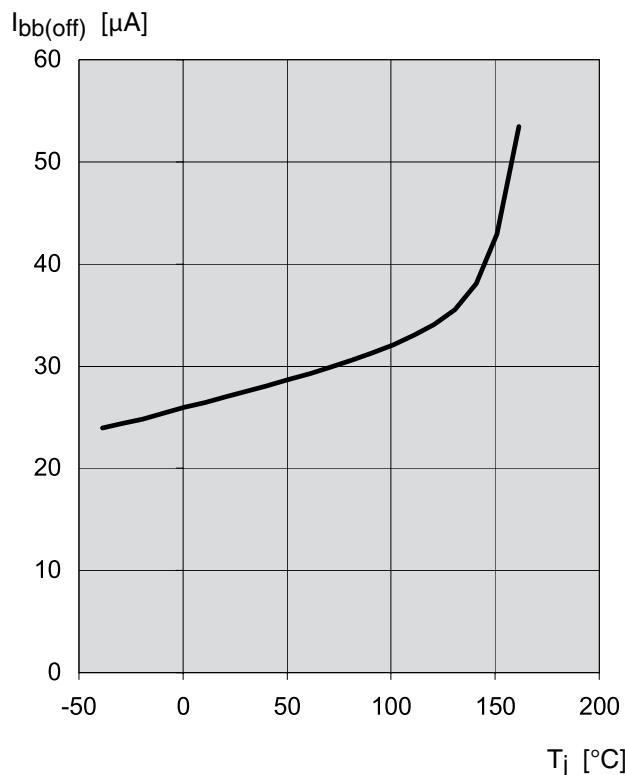

$$I_{L(OL)} = f(V_{bb}, T_j); IN = \text{high}$$

$I_{L(OL)}$ [mA]

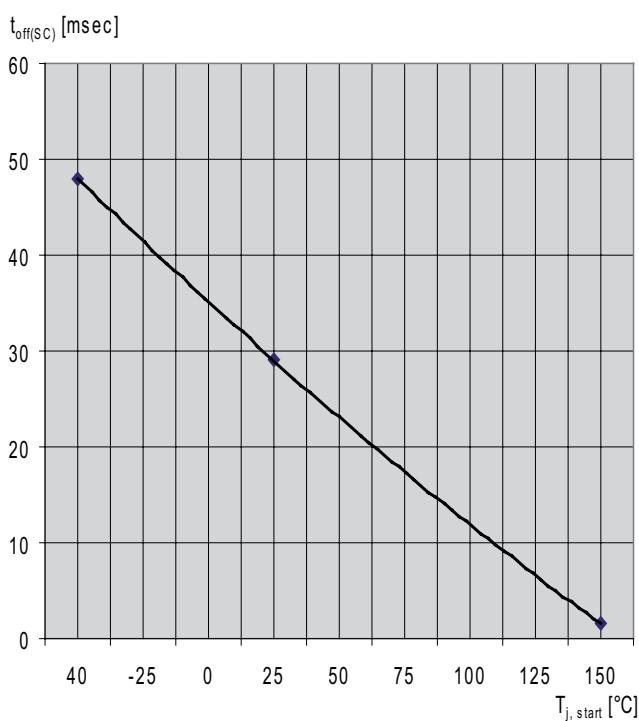

Typ. standby current

$I_{bb(off)} = f(T_j)$; $V_{bb} = 9 \dots 34$ V, IN1...4 = low

Typ. initial short circuit shutdown time

$t_{off(SC)} = f(T_{j,start})$; $V_{bb} = 12$ V

Timing diagrams

Timing diagrams are shown for chip 1 (channel 1/2). For chip 2 (channel 3/4) the diagrams are valid too. The channels 1 and 2, respectively 3 and 4, are symmetric and consequently the diagrams are valid for each channel as well as for permuted channels

Package Outlines

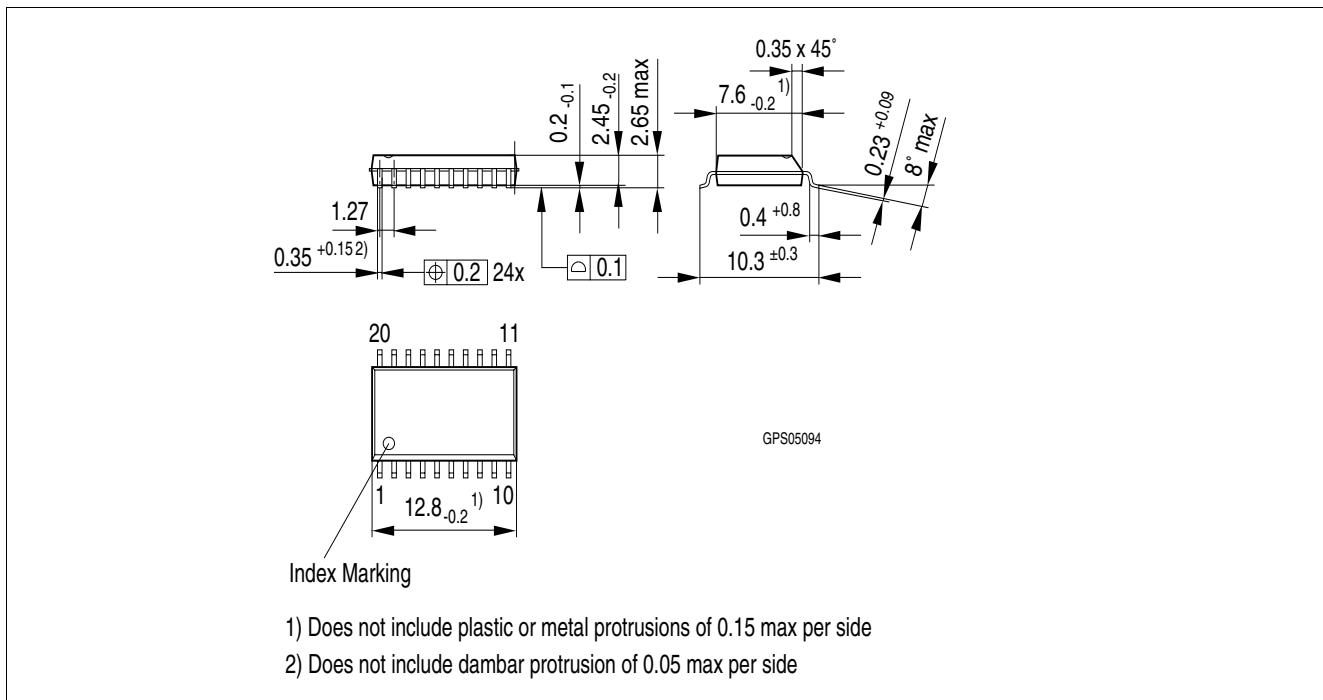

Figure 1 PG-DSO-20-31 (Plastic Dual Small Outline Package) (RoHS-compliant)

Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

Please specify the package needed (e.g. green package) when placing an order

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помошь в подборе аналогов, поставка прототипов;
