SL28610

Low Power Clock Generator for Intel® Ultra Mobile Platform

Features

- **Supports intel's Moorestown and Menlow clocking requirements**
- **Compliant to Intel® CK610**
- **Low power push-pull type differential output buffers**
- **Integrated voltage regulator**
- **Integrated resistors on differential clocks**
- **Differential CPU clocks with selectable frequency**
- **100MHz Differential PCIe clocks**
- **100MHz LCD Video Clock**
- **96MHz Differential DOT clock**
- **Buffered Reference Clock 14.318MHz**
- **14.318 MHz Crystal Input or Clock Input**
- **Low-voltage frequency select input**
- **I^2C support with readback capabilities**
- **Triangular Spread Spectrum profile for maximum electromagnetic interference (EMI) reduction**
- **Industrial Temperature -40°C to 85°C**
- **48-pin QFN package**

Frequency Select Pin (FSB and FSC)

Apply the appropriate logic levels to FSB and FSC inputs before CKPWRGD assertion to achieve host clock frequency selection. When the clock chip sampled LOW on CKPWRGD and indicates that VTT voltage is stable then FSB and FSC input values are sampled. This process employs a one-shot functionality and once the CKPWRGD sampled a valid LOW, all other FSB, FSC, and CKPWRGD transitions are ignored except in test mode.

Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers are individually enabled or disabled. The registers associated with the Serial Data Interface initialize to their default setting at power-up. The use of this interface is optional. Clock device register changes are normally made at system initialization, if any are required. The interface cannot be used during system operation for power management functions.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write/read operation, access the bytes in sequential order from lowest to highest (most significant bit first) with the ability to stop after any complete byte is transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code described in *Table 2*.

The block write and block read protocol is outlined in *Table 3* while *Table 4* outlines byte write and byte read protocol. The slave receiver address is 11010010 (D2h).

CKPWRGD#/PD (Power down) Clarification

The CKPWRGD#/PD pin is a dual-function pin. During initial power up, the pin functions as CKPWRGD#. Once CKPWRGD# has been sampled HIGH by the clock chip, the pin assumes PD functionality. The PD pin is an asynchronous active HIGH input used to shut off all clocks cleanly before shutting off power to the device. This signal is synchronized internally to the device before powering down the clock synthesizer. PD is also an asynchronous input for powering up the system. When PD is asserted HIGH, clocks are driven to a LOW value and held before turning off the VCOs and the crystal oscillator.

CKPWRGD#/PD (Power down) Assertion

When PD is sampled HIGH by two consecutive rising edges of CPUC, all single-ended outputs will be held HIGH on their next HIGH-to-LOW transition and differential clocks must held HIGH. When PD mode is desired as the initial power on state, PD must be asserted HIGH in less than 10 μs after asserting CKPWRGD.

CKPWRGD#/PD (Power Down) Deassertion

The power up latency is less than 1.8 ms. This is the time from the deassertion of the PD pin or the ramping of the power supply until the time that stable clocks are generated from the clock chip. All differential outputs stopped in a three-state condition, resulting from power down are driven high in less than 300 μs of PD deassertion to a voltage greater than 200 mV. After the clock chip's internal PLL is powered up and locked, all outputs are enabled within a few clock cycles of each clock. *Figure 2* is an example showing the relationship of clocks coming up.

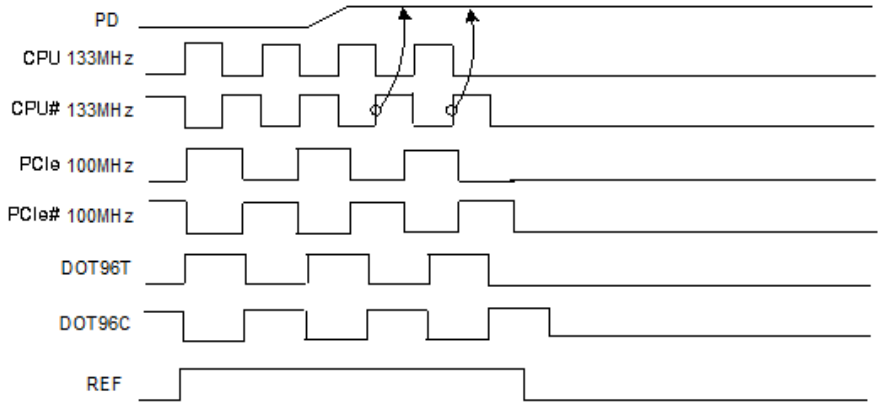

Figure 1. Power down Assertion Timing Waveform

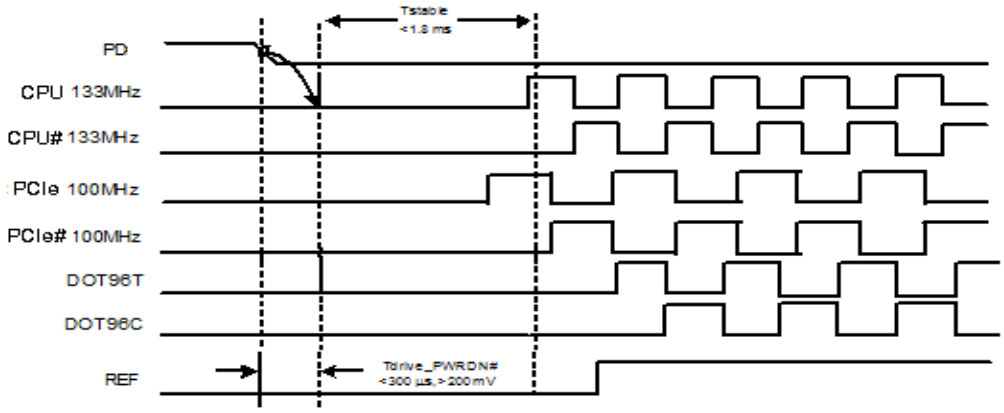

Figure 2. Power down Deassertion Timing Waveform

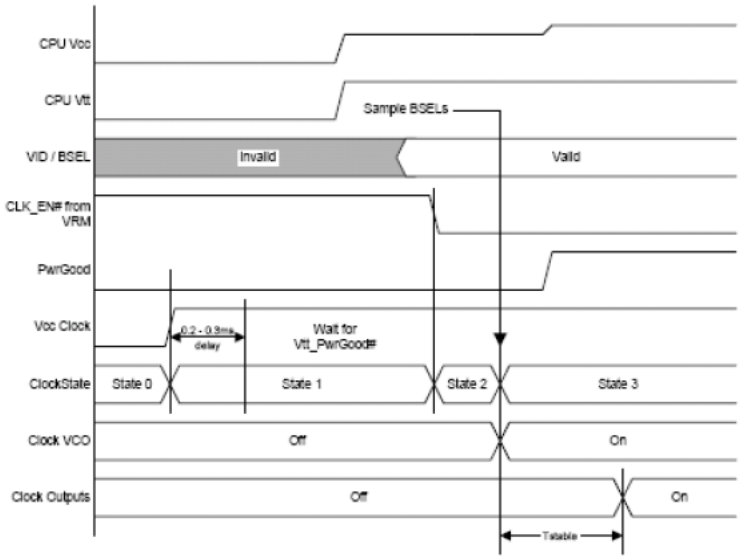

Figure 3. CKPWRGD# Timing Diagram

CPU_STP# Assertion

The CPU_STP# signal is an active LOW input used for synchronous stopping and starting the CPU output clocks while the rest of the clock generator continues to function. When the CPU_STP# pin is asserted, all CPU outputs that are set with the SMBus configuration to be stoppable are stopped within two to six CPU clock periods after sampled by two rising edges of the internal CPUC clock. The final states of the stopped CPU signals are CPUT = HIGH and CPUC = LOW.

CPU_STP# Deassertion

The deassertion of the CPU_STP# signal causes all stopped CPU outputs to resume normal operation in a synchronous manner. No short or stretched clock pulses are produced when the clock resumes. The maximum latency from the deassertion to active outputs is no more than two CPU clock cycles.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
