15	GND	33	Vcc
16	NC ¹	34	NC ¹
17	GND	35	Vcc
18	RF2	36	CP1

1. NC = No Connection
2. For single supply operation VEE is internally generated and must remain isolated from external power supplies. Generated noise is typical of switching DC-DC converters. Connections and external components shown in functional schematic are required. 0.1µF Capacitors need to be located near pins 32 & 33.
3. The exposed pad centered on the package bottom must be connected to RF and DC ground. (For PQFN Packages)

5. During turn-on, the device requires an initial start up current (I_{CC}) specified as "Turn-on Current". Once operational, I_{CC} will drop to the specified levels. This is not applicable to dual supply operation.
6. The DC-DC converter is guaranteed to start in 100 μs as long as the power supplies have the maximum turn-on current available for start-up.
7. For single supply operation
8. For dual supply operation

9. Exceeding any one or combination of these limits may cause permanent damage to this device.
10. M/A-COM does not recommend sustained operation near these survivability limits.
11. When the RF input is applied to the terminated port, the absolute maximum power is +30 dBm.
12. Standard CMOS TTL interface, latch-up will occur if logic signal is applied prior to power supply.

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

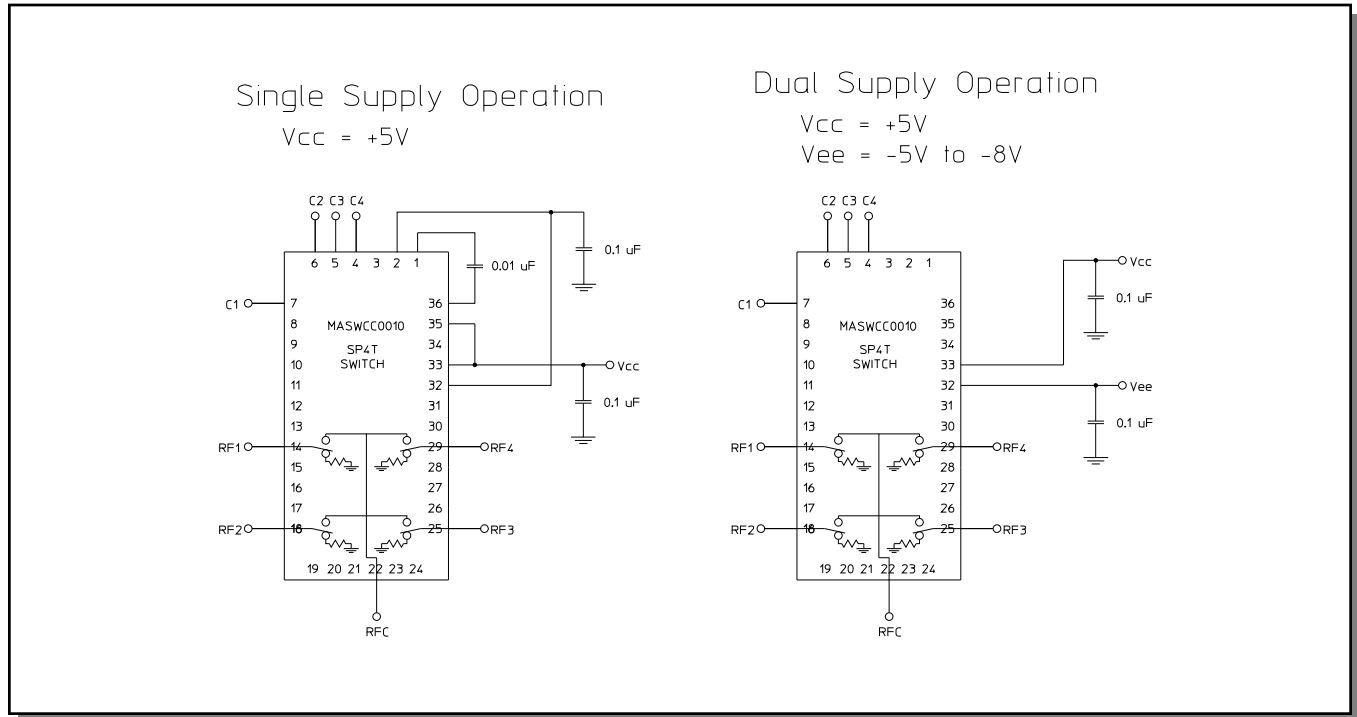

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.
