## FEATURES

### 3.3 V operation <br> Up to 11.3 Gbps operation <br> Typical 24 ps rise/fall times

Full back-termination of output transmission lines
Drives TOSAs with resistances ranging from $5 \Omega$ to $50 \Omega$
Bias current range: $\mathbf{1 0} \mathbf{~ m A}$ to $\mathbf{1 0 0} \mathbf{~ m A}$
Differential modulation current range: $\mathbf{1 0} \mathbf{~ m A}$ to $\mathbf{8 0} \mathbf{~ m A}$
Voltage input control for bias and modulation currents
Data inputs sensitivity: 150 mV p-p diff
Automatic laser shutdown (ALS)
Cross point adjustment (CPA)
XFP-compliant bias current monitor
SFP+ MSA compliant
Optical evaluation board available
Compact $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ LFCSP

## APPLICATIONS

SONET OC-192 and SDH STM-64 optical transceivers
10 Gb Fibre Channel transceivers
10 Gb Ethernet optical transceivers
SFP+/XFP/X2/XENPAK/XPAK/MSA 300 optical modules

## GENERAL DESCRIPTION

The ADN2526 laser diode driver is designed for direct modulation of packaged laser diodes that have a differential resistance ranging from $5 \Omega$ to $50 \Omega$. The active back-termination in the ADN2526 absorbs signal reflections from the TOSA end of the output transmission lines, enabling excellent optical eye quality to be achieved even when the TOSA end of the output transmission lines is significantly misterminated. ADN2526 is an SFP+ MSAcompliant device, and its small package and enhanced ESD protection provide the optimum solution for compact modules where laser diodes are packaged in low pin-count optical subassemblies.

The modulation and bias currents are programmable via the MSET and BSET control pins. By driving these pins with control voltages, the user has the flexibility to implement various average optical power and extinction ratio control schemes, including closed-loop or look-up table control. The automatic laser shutdown (ALS) feature allows the user to turn on/off the bias and modulation currents by driving the ALS pin with a LVTTL logic source.

The product is available in a space-saving $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ LFCSP specified from $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## ADN2526

## THEORY OF OPERATION

As shown in Figure 1, the ADN2526 consists of an input stage and two voltage-controlled current sources for bias and modulation. The bias current, which is available at the IBIAS pin, is controlled by the voltage applied at the BSET pin and can be monitored at the IBMON pin. The differential modulation current, which is available at the IMODP and IMODN pins, is controlled by the voltage applied to the MSET pin. The output stage implements the active back-match circuitry for proper transmission line matching and power consumption reduction. The ADN2526 can drive a load having differential resistance ranging from $5 \Omega$ to $50 \Omega$. The excellent back-termination in the ADN2526 absorbs the signal reflections from the TOSA end, enabling excellent optical eye quality, even though the TOSA is significantly misterminated.

## INPUT STAGE

The input stage of the ADN2526 converts the data signal applied to the DATAP and DATAN pins to a level that ensures proper operation of the high speed switch. The equivalent circuit of the input stage is shown in Figure 17.

Figure 17. Equivalent Circuit of the Input Stage
The DATAP and DATAN pins are terminated internally with a $100 \Omega$ differential termination resistor. This minimizes signal reflections at the input, which can otherwise lead to degradation in the output eye diagram. It is not recommended to drive the ADN2526 with single-ended data signal sources.
The ADN2526 input stage must be ac-coupled to the signal source to eliminate the need for matching between the commonmode voltages of the data signal source and the input stage of the driver (see Figure 18). The ac-coupling capacitors should have an impedance much less than $50 \Omega$ over the required frequency range. Generally, this is achieved using 10 nF to 100 nF capacitors.
In SFP+ MSA applications, the DATAP and DATAN pins need to be connected to the SFP+ connector directly. This connection requires enhanced ESD protection to support the SFP+ module hot plug-in application.

The bias current is generated internally using a voltage-to-current converter consisting of an internal operational amplifier and a transistor, as shown in Figure 19.

Figure 19. Voltage-to-Current Converter Used to Generate IBIAS
The voltage-to-current conversion factor is set at $100 \mathrm{~mA} / \mathrm{V}$ by the internal resistors, and the bias current is monitored using a current mirror with a gain equal to $1 / 100$. By connecting a $1 \mathrm{k} \Omega$ resistor between IBMON and VEE, the bias current can be monitored as a voltage across the resistor. A low temperature coefficient precision resistor must be used for the IBMON resistor ( $\mathrm{R}_{\text {IBMON }}$ ). Any error in the value of $\mathrm{R}_{\text {IBMON }}$ that is due to tolerances or to drift in its value over temperature contributes to the overall error budget for the IBIAS monitor voltage. If the IBMON voltage is connected to an ADC for analog-to-digital conversion, $\mathrm{R}_{\text {IBMON }}$ should be placed close to the ADC to minimize errors due to voltage drops on the ground plane.
The equivalent circuits of the BSET, IBIAS, and IBMON pins are shown in Figure 20, Figure 21, and Figure 22.

Figure 20. Equivalent Circuit of the BSET Pin

Figure 21. Equivalent Circuit of the IBIAS Pin

Figure 22. Equivalent Circuit of the IBMON Pin
The recommended configuration for BSET, IBIAS, and IBMON is shown in Figure 23.

Figure 23. Recommended Configuration for the BSET, IBIAS, and IBMON Pins
The circuit used to drive the BSET voltage must be able to drive the $1 \mathrm{k} \Omega$ input resistance of the BSET pin. For proper operation of the bias current source, the voltage at the IBIAS pin must be between the compliance voltage specifications for this pin over supply, temperature, and bias current range (see Table 1). The maximum compliance voltage is specified for only two bias current levels ( 10 mA and 100 mA ), but it can be calculated for any bias current by

$$
\begin{equation*}
V_{\text {COMPLIANCE_MAX }}(\mathrm{V})=V C C(\mathrm{~V})-0.75-4.4 \times I B I A S \tag{1}
\end{equation*}
$$

See the Applications Information section for examples of headroom calculations.

The function of the inductor, L , is to isolate the capacitance of the IBIAS output from the high frequency signal path. For recommended components, see Table 7.

## AUTOMATIC LASER SHUTDOWN (ALS)

The ALS pin is a digital input that enables/disables both the bias and modulation currents, depending on the logic state applied, as shown in Table 5.

Table 5. ALS Functions

| ALS Logic State | IBIAS and IMOD |
| :--- | :--- |
| High | Disabled |
| Low | Enabled |
| Floating | Enabled |

The ALS pin is compatible with 3.3 V CMOS and LVTTL logic levels. Its equivalent circuit is shown in Figure 24.

Figure 24. Equivalent Circuit of the ALS Pin

## MODULATION CURRENT

The modulation current can be controlled by applying a dc voltage to the MSET pin. This voltage is converted into a dc current by using a voltage-to-current converter using an operational amplifier and a bipolar transistor, as shown in Figure 25.

Figure 25. Generation of Modulation Current on the ADN2526
This dc current is switched by the data signal applied to the input stage (DATAP and DATAN pins) and amplified by the output stage to generate the differential modulation current at the IMODP and IMODN pins.
The output stage also generates the active back-termination, which provides proper transmission line termination. Active back-termination uses feedback around an active circuit to synthesize a broadband termination resistance. This provides excellent transmission line termination, while dissipating less power than a traditional resistor passive back-termination. A small portion of the modulation current flows in the virtual $50 \Omega$ active back-termination resistor. All of the preset IMOD modulation current, the range specified in Table 1, flows into the external load. The equivalent circuits for MSET, IMODP, and IMODN are shown in Figure 26 and Figure 27. The two $25 \Omega$ resistors in Figure 27 are not actual resistors. They represent the active back-termination resistance.

Figure 26. Equivalent Circuit of the MSET Pin

Figure 27. Equivalent IMODP and IMODN Pins, As Seen From Laser Side
The recommended configuration of the MSET, IMODP, and IMODN pins is shown in Figure 28. See Table 7 for the recommended components.

Figure 28. Recommended Configuration for the MSET, IMODP, and IMODN Pins
The ratio between the voltage applied to the MSET pin and the differential modulation current available at the IMODP and IMODN pins is a function of the load resistance value, as shown in Figure 29.

Figure 29. MSET Voltage-to-Modulation Current Ratio vs. Differential Load Resistance

Using the resistance of the TOSA, the user can calculate the voltage range that should be applied to the MSET pin to generate the required modulation current range (see the example in the Applications Information section).
The circuit used to drive the MSET voltage must be able to drive the $1 \mathrm{k} \Omega$ resistance of the MSET pin. To be able to drive 80 mA modulation currents through the differential load, the output stage of the ADN2526 (the IMODP and IMODN pins) must be ac-coupled to the load. The voltages at these pins have a dc component equal to VCC and an ac component with single-ended, peak-to-peak amplitude of IMOD $\times 25 \Omega$. This is the case even if the load impedance is less than $50 \Omega$ differential, because the transmission line characteristic impedance sets the peak-to-peak amplitude. For proper operation of the output stage, the voltages at the IMODP and IMODN pins must be between the compliance voltage specifications for these pins over supply, temperature, and modulation current range, as shown in Figure 30. See the Applications Information section for examples of headroom calculations.

Figure 30. Allowable Range for the Voltage at IMODP and IMODN

## LOAD MISTERMINATION

Due to its excellent S22 performance, the ADN2526 can drive differential loads that range from $5 \Omega$ to $50 \Omega$. In practice, many TOSAs have differential resistance less than $50 \Omega$. In this case, with $50 \Omega$ differential transmission lines connecting the ADN2526 to the load, the load end of the transmission lines are misterminated. This mistermination leads to signal reflections back to the driver. The excellent back-termination in the ADN2526 absorbs these reflections, preventing their reflection back to the load. This enables excellent optical eye quality to be achieved, even when the load end of the transmission lines is significantly misterminated. The connection between the load and the ADN2526 must be made with $50 \Omega$ differential ( $25 \Omega$ single-ended) transmission lines so that the driver end of the transmission lines is properly terminated.

## CROSSPOINT ADJUSTMENT

The optical eye cross point is adjustable between $35 \%$ and $65 \%$ using the cross point adjust (CPA) control input. The equivalent circuit for the CPA pin is shown in Figure 31. In a default CPA setting, leave CPA unconnected (maintain pin-to-pin compatibility with the ADN2525). The internal bias circuit presents about 1.9 V at the CPA pin and the eye cross point is set to $50 \%$. To set the cross point at various points, apply an external voltage to the CPA pin.

Figure 31. Equivalent Circuit for CPA Pin

## POWER SEQUENCE

To ensure reliable operation, the recommended power-up sequence is: the supply rail to ADN2526 first, then the BSET pin, followed by the MSET pin, and, finally, the CPA pin.
To turn off the ADN2526, the operation is reversed: shut down CPA first, then MSET, followed by BSET, and, last, the supply rail.

## POWER CONSUMPTION

The power dissipated by the ADN2526 is given by

$$
P=V C C \times\left(\frac{V_{M S E T}}{13.5}+I_{S U P P L Y}\right)+V_{I B I A S} \times I B I A S
$$

where:
$V C C$ is the power supply voltage.
$V_{M S E T}$ is the voltage applied to the MSET pin.
$I_{\text {sUPPLY }}$ is the sum of the currents that flow into VCC, IMODP, and IMODN, which are sank by the ADN2526 when $\mathrm{V}_{\text {BSET }}=$ $\mathrm{V}_{\text {MSET }}=0 \mathrm{~V}$, expressed in amps (see Table 1).
$V_{\text {IBIAS }}$ is the average voltage presented on the IBIAS pin. IBIAS is the bias current sank by the ADN2526.
Considering $\mathrm{V}_{\text {BSET }} /$ IBIAS $=10 \mathrm{mV} / \mathrm{mA}$ as the conversion factor from $V_{\text {BSET }}$ to IBIAS, the dissipated power becomes

$$
P=V C C \times\left(\frac{V_{M S E T}}{13.5}+I_{S U P P L Y}\right)+\frac{V_{B S E T}}{10} \times V_{I B I A S}
$$

To ensure long-term reliable operation, the junction temperature of the ADN2526 must not exceed $125^{\circ} \mathrm{C}$, as specified in Table 2. For improved heat dissipation, the SFP+ module case can work as a heat sink, as shown in Figure 32. A compact optical module is a complex thermal environment, and calculations of device junction temperature using the package
junction-to-ambient thermal resistance $\left(\theta_{J A}\right)$ do not yield accurate results.

Figure 32. Typical Optical Module Structure
The parameters in Table 6 can be used to estimate the IC junction temperature.

Table 6. Definitions

| Parameter | Description | Unit |
| :---: | :---: | :---: |
| TTop | Temperature at the top of the package | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {PAD }}$ | Temperature at the package exposed paddle | ${ }^{\circ} \mathrm{C}$ |
| TJ | IC junction temperature | ${ }^{\circ} \mathrm{C}$ |
| P | Power dissipation | W |
| $\theta_{\text {J-ToP }}$ | Thermal resistance from the IC junction to the package top | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\theta_{\text {J-PAD }}$ | Thermal resistance from the IC junction to the package exposed paddle | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

$\mathrm{T}_{\mathrm{TOP}}$ and $\mathrm{T}_{\mathrm{PAD}}$ can be determined by measuring the temperature at points inside the module, as shown in Figure 32. The thermocouples should be positioned to obtain an accurate measurement of the package top and paddle temperatures. Using the model shown in Figure 33, the junction temperature can be calculated by

$$
T_{J}=\frac{P \times\left(\theta_{I-P A D} \times \theta_{J-T O P}\right)+T_{T O P} \times \theta_{J-P A D}+T_{P A D} \times \theta_{J-T O P}}{\theta_{J-P A D}+\theta_{J-T O P}}
$$

where:
$\theta_{J-\text { TOP }}$ and $\theta_{J-P A D}$ are given in Table 2.
$P$ is the power dissipated by the ADN2526.

Figure 33. Electrical Model for Thermal Calculations

## APPLICATIONS INFORMATION

## TYPICAL APPLICATION CIRCUIT

Figure 34 shows the typical application circuit for the ADN2526. The dc voltages applied to the BSET and MSET pins control the bias and modulation currents. The bias current can be monitored as a voltage drop across the $1 \mathrm{k} \Omega$ resistor connected between the IBMON pin and GND. The ALS pin allows the user to turn on or turn off the bias and modulation currents, depending on the logic level applied to the pin. The data signal source must be connected to the DATAP and DATAN pins of the ADN2526 using $50 \Omega$ transmission lines. The modulation current outputs, IMODP and IMODN, must be connected to the load (TOSA) using $50 \Omega$ differential ( $25 \Omega$ single-ended) transmission lines. It is recommended that the components shown in Table 7 be used between the ADN2526 and the TOSA for an example ac coupling circuit. For up-to-date component recommendations, contact your local Analog Devices, Inc., sales representative.

Working with a TOSA laser sample, the circuit in Figure 34 delivers optical performance shown in Figure 15 and Figure 16. For additional applications information and optical eye performance of other laser samples, contact your local Analog Devices sales representative.

## LAYOUT GUIDELINES

Due to the high frequencies at which the ADN2526 operates, care should be taken when designing the PCB layout to obtain optimum performance. Well controlled transmission line impedance must be used for the high speed signal paths. The length of the transmission lines must be kept to a minimum to reduce losses and pattern-dependent jitter. The PCB layout must be symmetrical, on both the DATAP and DATAN inputs and the IMODP and IMODN outputs, to ensure a balance between the differential signals. All VCC and VEE pins must be connected to solid copper planes by using low inductance connections. When the connections are made through vias, multiple vias should be used in parallel to reduce the parasitic inductance. Each VEE pin must be locally decoupled with high quality capacitors. If proper decoupling cannot be achieved using a single capacitor, the user can use multiple capacitors in parallel for each VEE pin. A $20 \mu \mathrm{~F}$ tantalum capacitor must be used as a general decoupling capacitor for the entire module. For guidelines on the surface-mount assembly of the ADN2526, see the Amkor Technology ${ }^{\oplus}$ Application Notes for Surface Mount Assembly of Amkor's MicroLeadFrame ${ }^{*}$ (MLF*) Packages.

Table 7. Recommended Components for AC-Coupling

| Component | Value | Description |
| :--- | :--- | :--- |
| R1, R2 | $36 \Omega$ | 0603 size resistor |
| R3, R4 | $200 \Omega$ | 0603 size resistor |
| C3, C4 | 100 nF | 0603 size capacitor, Phycomp 223878615649 |
| L2, L3 | 20 nH | 0402 size inductor, Murata LQW15AN20NJ0 |
| L6, L7 | 0402 size ferrite | Murata BLM15HG102SN1 |
| L1, L4, L5, L8 | $10 \mu \mathrm{H}$ | 0603 size inductor, Murata LQM21FN100M70L |

Figure 34. Typical Application Circuit

## DESIGN EXAMPLE

This design example covers:

- Headroom calculations for the IBIAS, IMODP, and IMODN pins.
- Calculation of the typical voltage required at the BSET and MSET pins to produce the desired bias and modulation currents.

This design example assumes that the resistance of the TOSA is $25 \Omega$, the forward voltage of the laser at low current is $V_{F}=1 \mathrm{~V}$, IBIAS $=40 \mathrm{~mA}$, IMOD $=60 \mathrm{~mA}$, and $\mathrm{VCC}=3.3 \mathrm{~V}$.

## Headroom Calculations

To ensure proper device operation, the voltages on the IBIAS, IMODP, and IMODN pins must meet the compliance voltage specifications in Table 1.
Considering the typical application circuit shown in Figure 34, the voltage at the IBIAS pin can be written as

$$
V_{I B I A S}=V C C-V_{F}-\left(I B I A S \times R_{T O S A}\right)-V_{L A}
$$

where:
$V C C$ is the supply voltage.
$V_{F}$ is the forward voltage across the laser at low current.
$R_{\text {TOSA }}$ is the resistance of the TOSA.
$V_{L A}$ is the dc voltage drop across L5, L6, L7, and L8.
For proper operation, the minimum voltage at the IBIAS pin should be greater than 0.6 V , as specified by the minimum IBIAS compliance specification in Table 1.

Assuming that the voltage drop across the $25 \Omega$ transmission lines is negligible and that $\mathrm{V}_{\mathrm{LA}}=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{F}}=1 \mathrm{~V}$, and IBIAS $=$ 40 mA

$$
\begin{aligned}
& V_{I B I A S}=3.3-1-(0.04 \times 25)=1.3 \mathrm{~V} \\
& V_{I B I A S}=1.3 \mathrm{~V}>0.6 \mathrm{~V}, \text { which satisfies the requirement. }
\end{aligned}
$$

The maximum voltage at the IBIAS pin must be less than the maximum IBIAS compliance specification as described by

$$
\begin{equation*}
V_{\text {COMPLIANCE_MAX }}=V C C-0.75-4.4 \times I B I A S \tag{2}
\end{equation*}
$$

For this example,
$V_{\text {COMPLIANCE_MAX }}=V C C-0.75-4.4 \times 0.04=2.53 \mathrm{~V}$
$V_{\text {IBIAS }}=1.3 \mathrm{~V}<2.53 \mathrm{~V}$, which satisfies the requirement.
To calculate the headroom at the modulation current pins (IMODP and IMODN), the voltage has a dc component equal to VCC, due to the ac-coupled configuration, and a swing equal to IMOD $\times 25 \Omega$. For proper operation of the ADN2526, the voltage at each modulation output pin should be within the normal operation region shown in Figure 30.
$\mathrm{V}_{\text {Lb }}$ is the dc voltage drop across L1, L2, L3, and L4. Assuming that $\mathrm{V}_{\mathrm{LB}}=0 \mathrm{~V}$ and $\mathrm{IMOD}=60 \mathrm{~mA}$, the minimum voltage at the modulation output pins is equal to

$$
\begin{aligned}
& V C C-(I M O D \times 25) / 2=V C C-0.75 \\
& V C C-0.75>V C C-1.1 \mathrm{~V} \text {, which satisfies the requirement. }
\end{aligned}
$$

The maximum voltage at the modulation pins is equal to

$$
\begin{aligned}
& V C C+(I M O D \times 25) / 2=V C C+0.75 \\
& V C C+0.75<V C C+1.1 \mathrm{~V} \text {, which satisfies the requirement. }
\end{aligned}
$$

Headroom calculations must be repeated for the minimum and maximum values of the required IBIAS and IMOD ranges to ensure proper device operation over all operating conditions.

## BSET and MSET Pin Voltage Calculation

To set the desired bias and modulation currents, the BSET and MSET pins of the ADN2526 must be driven with the appropriate dc voltage. The voltage range required at the BSET pin to generate the required IBIAS range can be calculated using the BSET voltage to IBIAS gain specified in Table 1. Assuming that IBIAS $=40 \mathrm{~mA}$ and the typical IBIAS/V ${ }_{\text {bSET }}$ ratio of $100 \mathrm{~mA} / \mathrm{V}$, the BSET voltage is given by

$$
V_{B S E T}=\frac{\operatorname{IBIAS}(\mathrm{mA})}{100 \mathrm{~mA} / \mathrm{V}}=\frac{40}{100}=0.4 \mathrm{~V}
$$

The BSET voltage range can be calculated using the required IBIAS range and the minimum and maximum BSET voltage to IBIAS gain values specified in Table 1.
The voltage required at the MSET pin to produce the desired modulation current can be calculated using

$$
V_{M S E T}=\frac{I M O D}{K}
$$

where $K$ is the MSET voltage to IMOD ratio.
The value of K depends on the actual resistance of the TOSA. It can be read using the plot shown in Figure 29. For a TOSA resistance of $25 \Omega$, the typical value of K is equal to $120 \mathrm{~mA} / \mathrm{V}$. Assuming that $\mathrm{IMOD}=60 \mathrm{~mA}$ and using the preceding equation, the MSET voltage is given by

$$
V_{M S E T}=\frac{I M O D(\mathrm{~mA})}{120 \mathrm{~mA} / \mathrm{V}}=\frac{60}{120}=0.5 \mathrm{~V}
$$

The MSET voltage range can be calculated using the required IMOD range and the minimum and maximum K values. These can be obtained from the minimum and maximum curves in Figure 29.

## ADN2526

## OUTLINE DIMENSIONS

ORDERING GUIDE

| Model | Temperature Range | Package Description | Package Option | Branding |
| :--- | :--- | :--- | :--- | :--- |
| ADN2526ACPZ $^{1}$ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 16 -Lead LFCSP_VQ | $\mathrm{CP}-16-3$ | FOC |
| ADN2526ACPZ-R2 | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 16-Lead LFCSP_VQ, $7^{\prime \prime}$ Tape \& Reel, 250-Piece Reel | $\mathrm{CP}-16-3$ | F0C |
| ADN2526ACPZ-R7 $^{1}$ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 16-Lead LFCSP_VQ, $7^{\prime \prime}$ Tape \& Reel, 1,500-Piece Reel | CP-16-3 | F0C |

${ }^{1} \mathrm{Z}=$ RoHS Compliant Part.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
