

# Phase-Reversal Analog Switches

## General Description

The MAX4526/MAX4527 are CMOS analog ICs configured as phase-reversal switches. The MAX4526 is optimized for high-speed applications, such as chopper amplifiers, while the MAX4527 is optimized for low-power applications.

The MAX4526/MAX4527 operate from a +4.5V to +36V single supply or  $\pm 4.5V$  to  $\pm 18V$  dual supplies. On-resistance ( $175\Omega$  max) is matched between switches to  $8\Omega$  maximum. Each switch can handle rail-to-rail analog signals. Maximum leakage current is only  $0.5nA$  at  $+25^\circ C$  and  $10nA$  at  $+85^\circ C$ .

All digital inputs have  $0.8V$  to  $2.4V$  logic thresholds, ensuring TTL/CMOS-logic compatibility.

## Applications

Chopper-Stabilized Amplifiers  
Balanced Modulators/Demodulators  
Data Acquisition  
Test Equipment  
Audio-Signal Routing

## Features

- ◆ 10pC (max) Charge Injection
- ◆ 2pC (max) Charge-Injection Match
- ◆  $175\Omega$  Signal Paths with  $\pm 15V$  Supplies
- ◆ Guaranteed Break-Before-Make
- ◆ Rail-to-Rail Signal Handling
- ◆ Transition Time  $< 100ns$  with  $\pm 15V$  Supplies
- ◆  $1\mu A$  Current Consumption (MAX4527)
- ◆  $> 2kV$  ESD Protection per Method 3015.7
- ◆ TTL/CMOS-Compatible Inputs
- ◆ Available in Small, 8-Pin  $\mu MAX$  Package

## Ordering Information

**Note 2:** The algebraic convention is used in this data sheet; the most negative value is shown in the minimum column.

**Note 3:** Guaranteed by design.

**Note 4:**  $\Delta R_{ON} = \Delta R_{ON(MAX)} - \Delta R_{ON(MIN)}$ .

**Note 5:** Resistance flatness is defined as the difference between the maximum and minimum values of on-resistance as measured over the specified analog-signal range.

**Note 6:** Leakage current is 100% tested at maximum rated hot temperature, and is guaranteed by correlation at TA = +25°C and minimum rated cold temperature.

**Note 7:** Off-isolation =  $20\log_{10} [(V_X \text{ or } V_Y) / (V_A \text{ or } V_B)]$ , VX or VY = output, VA or VB = input to off switch.

# Phase-Reversal Analog Switches

## Typical Operating Characteristics

( $V_+ = +15V$ ,  $V_- = -15V$ , GND = 0V,  $T_A = +25^\circ C$ , unless otherwise noted.)

# Phase-Reversal Analog Switches

## Typical Operating Characteristics (continued)

( $V_+ = +15V$ ,  $V_- = -15V$ , GND = 0V,  $T_A = +25^\circ C$ , unless otherwise noted.)

MAX4526/MAX4527

# Phase-Reversal Analog Switches

## Pin Configuration

PIN	NAME	FUNCTION
1	A	Analog-Switch Input Terminal A. Connected to Y when IN is low; connected to X when IN is high.
2	B	Analog-Switch Input Terminal B. Connected to X when IN is low; connected to Y when IN is high.
3	GND	Ground. Connect GND to digital ground. (Analog signals have no ground reference; they are limited to V+ and V-.)
4	IN	Logic-Level Control Inputs (see <i>Truth Table</i> ).
5	V-	Negative Analog Supply-Voltage Input. Connect V- to GND for single-supply operation.
6	Y	Analog-Switch Output Terminal Y.
7	X	Analog-Switch Output Terminal X.
8	V+	Positive Analog/Digital Supply-Voltage Input. Internally connected to substrate.

**Note:** A, B, X and Y pins are identical and interchangeable. Either may be considered as an input or output; signals pass equally well in either direction. However, AC symmetry is best when A and B are the input, and X and Y are the output. Reduce AC balance in critical applications by using A and X or A and Y as the input, and B and Y or B and X as the output.

## Detailed Description

The MAX4526/MAX4527 are phase-reversal analog switches, consisting of two normally open and two normally closed CMOS analog switches arranged in a bridge configuration. Analog signals are put into two input pins and taken out of two output pins. A logic-level signal controls whether the input signal is routed through normally or inverted. A low-resistance DC path goes from inputs to outputs at all times, yet isolation between the two signal paths is excellent. Analog signals range from V- to V+.

These parts are characterized and optimized with  $\pm 15V$  supplies, and they can operate from a single supply. The MAX4526 is optimized for high-frequency operation, and has a higher-speed logic-level translator and switch driver. The MAX4527 has identical analog switch characteristics, but has a slower logic-level translator and switch driver for lower current consumption.

The MAX4526/MAX4527 are designed for DC and low-frequency-signal phase-reversal applications, such as chopper amplifiers, modulator/demodulators, and self-zeroing or self-calibrating circuits. Unlike conventional CMOS switches externally wired in a bridge configuration, both DC and AC symmetry are optimized with a small 8-pin configuration that allows simple board layout and isolation of logic signals from analog signals.

Figure 1. Typical Application Circuits

# Phase-Reversal Analog Switches

## Power-Supply Considerations

### Overview

The MAX4526/MAX4527 construction is typical of most CMOS analog switches. It has three supply pins:  $V+$ ,  $V-$ , and GND.  $V+$  and  $V-$  drive the internal CMOS switches and set the analog-voltage limits on any switch. Reverse ESD-protection diodes are internally connected between each analog signal pin, and both  $V+$  and  $V-$ . One of these diodes conducts if any analog signal exceeds  $V+$  or  $V-$ .

Virtually all of the analog leakage current is through the ESD diodes to  $V+$  or  $V-$ . Although the ESD diodes on a given signal pin are identical and therefore fairly well balanced, they are reverse biased differently. Each is biased by either  $V+$  or  $V-$  and the analog signal. This means their leakages vary as the signal varies. The *difference* in the two diode leakages from the signal path to the  $V+$  and  $V-$  pins constitutes the analog-signal-path leakage current. All analog leakage current flows to the supply terminals, not to the other switch terminal. This explains how both sides of a given switch can show leakage currents of either the same or opposite polarity.

There is no connection between the analog-signal paths and GND. The analog-signal paths consist of an N-channel and P-channel MOSFET with their sources and drains paralleled and their gates driven out-of-phase to  $V+$  and  $V-$  by the logic-level translators.

$V+$  and GND power the internal logic and logic-level translator and set the input logic threshold. The logic-level translator converts the logic levels to switched  $V+$  and  $V-$  signals to drive the analog switches' gates. This drive signal is the only connection between GND and the analog supplies.  $V+$  and  $V-$  have ESD-protection diodes to GND. The logic-level input has ESD protection to  $V+$  and to  $V-$  but not to GND, so the logic signal can go below GND (as low as  $V-$ ) when bipolar supplies are used.

Increasing  $V-$  has no effect on the logic-level thresholds, but it does increase the drive to the internal P-channel switches, reducing the overall switch on-resistance.  $V-$  also sets the negative limit of the analog-signal voltage.

The logic-level input pin, IN, has ESD-protection diodes to  $V+$  and  $V-$  but not to GND, so it can be safely driven to  $V+$  and  $V-$ . The logic-level threshold,  $V_{IN}$ , is CMOS/TTL compatible when  $V+$  is between 4.5V and 36V (see *Typical Operating Characteristics*).

### Bipolar Supplies

The MAX4526/MAX4527 operate with bipolar supplies between  $\pm 4.5V$  and  $\pm 18V$ . However, since all factory characterization is done with  $\pm 15V$  supplies, specifications at other supplies are not guaranteed. The  $V+$  and  $V-$  supplies need not be symmetrical, but their sum cannot exceed the absolute maximum rating of 44V (see *Absolute Maximum Ratings*).

MAX4526/MAX4527

Figure 2. Balanced Modulator/Demodulator

# Phase-Reversal Analog Switches

## Single Supply

The MAX4526/MAX4527 operate from a single supply between +4.5V and +36V when V<sub>-</sub> is connected to GND. Observe all of the bipolar precautions when operating from a single supply.

## Applications Information

The MAX4526/MAX4527 are designed for DC and low-frequency-signal phase-reversal applications. Both DC and AC symmetry are optimized for use with  $\pm 15V$  supplies.

### Signal Phase/Polarity Reversal

The MAX4526/MAX4527 can reverse the phase or polarity of a pair of signals that are out-of-phase and balanced to ground. This is done by routing signals through the MAX4526/MAX4527 and under control of the IN pin, reversing the two signals paths inside the switch before sending out to a balanced output. Figure 1 shows a typical example. **The MAX4526/MAX4527 cannot reverse the phase or polarity of a single-grounded signal, as can be done with an inverting op amp or transformer.**

### Balanced Modulators/Demodulators

The MAX4526/MAX4527 can be used as a balanced modulator/demodulator at carrier frequencies up to 100kHz (Figure 2). Higher frequencies are possible, but as frequency increases, small imbalances in the

MAX4526/MAX4527's internal capacitance and resistance gradually impair performance. Similarly, imbalances in external circuit capacitance and resistance to GND reduce overall carrier suppression.

The carrier is applied as a logic-level square wave to IN. (Note that this voltage can go as negative as V<sub>-</sub>.) For best carrier suppression, the power-supply voltages should be equal, the square wave should have a precise 50% duty cycle, and both the input and output signals should be symmetrical about ground. Bypass V<sub>+</sub> and V<sub>-</sub> to GND with 0.1 $\mu$ F ceramic capacitors, as close to the IC pins as possible. Since the logic-level translator/driver in the MAX4526 is faster than the one in the MAX4527, it gives better results at higher frequencies. In critical applications, carrier suppression can be optimized by trimming duty cycle, DC bias around GND, or external source and load capacitance.

In signal lines, balancing both capacitance and resistance to GND produces the best carrier suppression.

Transformer coupling of input and output signals provides the best isolation and carrier suppression. Transformers can also provide signal filtering, impedance matching, or low-noise voltage gain. Use a center-tapped transformer or high-resistance voltage divider to provide a DC path to GND on either the input signal or output signal. This ensures a DC path to GND and symmetrical operation of the internal switches.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
