

1.5 Ω On Resistance, ±15 V/12 V/±5 V, *i*CMOS, Dual SPDT Switch

ADG1436

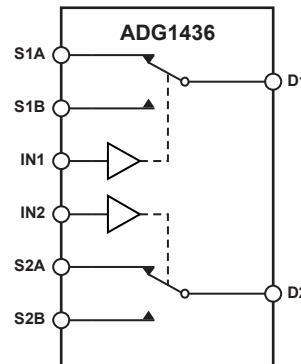

FEATURES

- 1.5 Ω on resistance
- 0.3 Ω on-resistance flatness
- 0.1 Ω on-resistance match between channels
- Continuous current per channel
 - LFCSP package: up to 400 mA
 - TSSOP package: up to 260 mA
- Fully specified at +12 V, ±15 V, and ±5 V
- No V_L supply required
- 3 V logic-compatible inputs
- Rail-to-rail operation
- 16-lead TSSOP and 4 mm × 4 mm, 16-lead LFCSP packages

APPLICATIONS

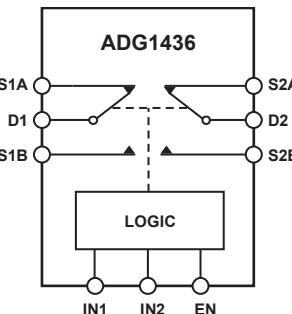

- Automatic test equipment
- Data acquisition systems
- Battery-powered systems
- Sample-and-hold systems
- Audio signal routing
- Communication systems
- Relay replacement

SWITCHES SHOWN FOR A ONE-INPUT LOGIC. 06817-002

Figure 2. LFCSP Package

GENERAL DESCRIPTION

The ADG1436 is a monolithic CMOS device containing two independently selectable SPDT switches. An EN input on the LFCSP package is used to enable or disable the device. When disabled, all channels are switched off. Each switch conducts equally well in both directions when on and has an input signal range that extends to the supplies. In the off condition, signal levels up to the supplies are blocked. Both switches exhibit break-before-make switching action for use in multiplexer applications.

The ADG1436 is designed on an *i*CMOS® process. *i*CMOS (industrial-CMOS) is a modular manufacturing process combining high voltage CMOS (complementary metal-oxide semiconductor) and bipolar technologies. It enables the development of a wide range of high performance analog ICs capable of 33 V operation

in a footprint that no previous generation of high voltage parts has been able to achieve. Unlike analog ICs using conventional CMOS processes, *i*CMOS components can tolerate high supply voltages while providing increased performance, dramatically lower power consumption, and reduced package size.

The on-resistance profile is very flat over the full analog input range, ensuring excellent linearity and low distortion when switching audio signals. *i*CMOS construction ensures ultralow power dissipation, making the part ideally suited for portable and battery-powered instruments.

PRODUCT HIGHLIGHTS

1. 2.6 Ω maximum on resistance over temperature.
2. Minimum distortion.
3. Ultralow power dissipation: <0.03 μW.
4. 16-lead TSSOP and 16-lead 4 mm × 4 mm LFCSP packages.

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 5.

Parameter	Ratings
V_{DD} to V_{SS}	35 V
V_{DD} to GND	-0.3 V to +25 V
V_{SS} to GND	+0.3 V to -25 V
Analog Inputs ¹	$V_{SS} - 0.3 \text{ V}$ to $V_{DD} + 0.3 \text{ V}$ or 30 mA, whichever occurs first
Digital Inputs ¹	GND - 0.3 V to $V_{DD} + 0.3 \text{ V}$ or 30 mA, whichever occurs first
Peak Current, S or D	600 mA (pulsed at 1 ms, 10% duty cycle maximum)
Continuous Current per Channel, S or D ²	Data + 15%
Operating Temperature Range Automotive (Y Version)	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C
Junction Temperature	150°C
16-Lead TSSOP, θ_{JA} Thermal Impedance (4-Layer Board)	112°C/W
16-Lead LFCSP, θ_{JA} Thermal Impedance	30.4°C/W
Reflow Soldering Peak Temperature, Pb Free	260(+0/-5)°C

¹ Over voltages at IN, S, and D are clamped by internal diodes. Current should be limited to the maximum ratings given.

² See data given in Table 4.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

08817-118

TERMINOLOGY

I_{DD}	The positive supply current.	C_D (Off)	The off-switch drain capacitance, which is measured with reference to ground.
I_{SS}	The negative supply current.	C_D, C_S (On)	The on-switch capacitance, which is measured with reference to ground.
V_D, V_S	The analog voltage on Terminal D and Terminal S.	C_{IN}	The digital input capacitance.
R_{ON}	The ohmic resistance between Terminal D and Terminal S.	t_{TRANSITION}	The delay time between the 50% and 90% points of the digital input and switch on condition when switching from one address state to another.
R_{FLAT(ON)}	Flatness that is defined as the difference between the maximum and minimum value of on resistance measured over the specified analog signal range.	Charge Injection	A measure of the glitch impulse transferred from the digital input to the analog output during switching.
I_s (Off)	The source leakage current with the switch off.	Off Isolation	A measure of unwanted signal coupling through an off switch.
I_d (Off)	The drain leakage current with the switch off.	Crosstalk	A measure of unwanted signal that is coupled through from one channel to another as a result of parasitic capacitance.
I_D, I_S (On)	The channel leakage current with the switch on.	Bandwidth	The frequency at which the output is attenuated by 3 dB.
V_{INL}	The maximum input voltage for Logic 0.	On Response	The frequency response of the on switch.
V_{INH}	The minimum input voltage for Logic 1.	Insertion Loss	The loss due to the on resistance of the switch.
I_{INL}, I_{INH}	The input current of the digital input.	THD + N	The ratio of the harmonic amplitude plus noise of the signal to the fundamental.
C_s (Off)	The off-switch source capacitance, which is measured with reference to ground.
